FIELD OF THE DISCLOSURE

[0003] The invention relates to frataxin-based compositions and methods related to enhancing the expression of frataxin (FXN) whether *in vitro* or *in vivo* at least in part via the exploitation of novel engineered promoters. Such frataxin-based compositions may be delivered in an adeno-associated viral (AAV) vector. In other embodiments, a frataxin-based composition, such as an AAV-frataxin composition, is used to treat a subject in need thereof, such as a human subject diagnosed with Friedreich's Ataxia or other neurological condition resulting from a deficiency in the quantity and/or function of frataxin, or as a research tool in the study of diseases or conditions in cells or animal models of such disease or condition.

BACKGROUND

[0004] Friedreich's Ataxia (FA), as first described by German physician Nikolas Friedreich in the 1860s, is an autosomal recessive inherited disease that causes progressive damage to the nervous system. *See* Parkinson et al., *Journal of Neurochemistry*, 2013, 126 (Suppl. 1), 103-117, the contents of which are herein incorporated by reference in their entirety. Onset usually occurs at puberty, and almost always by age 25. *See* Campuzano, et al., Science, 271.5254 (Mar 8, 1996): 1423, the contents of which are herein incorporated by reference in their entirety. FA typically results from the degeneration of nervous tissue in the spinal cord due to reduced expression of the mitochondrial protein frataxin (FXN) in sensory neurons that (through connections with the cerebellum) direct muscle movement of the arms and legs. *See* Koeppen,

Arnulf; *J Neurol Sci.*, 2011, April 15; 303(1-2): 1–12, the contents of which are herein incorporated by reference in their entirety. The spinal cord becomes thinner and peripheral nerve cells lose some of their myelin sheath, which is the insulating covering on some nerve cells that helps conduct nerve impulses. Initial symptoms of FA include poor coordination such as gait disturbance, poor balance, leg weakness, decreased walking, impaired coordination, dysarthria, nystagmus, impaired sensation, kyphoscoliosis, and foot deformities. *See* Parkinson et al., *Journal of Neurochemistry*, 2013, 126 (Suppl. 1), 103-117. FA is also associated with scoliosis, heart disease, and diabetes. The disease generally progresses until a wheelchair is required for mobility. Incidence of FA among Caucasian populations is between about 1 in 20,000 and about 1 in 50,000, with a deduced carrier frequency of about 1 in 120 in European populations. *See* Nageshwaran and Festenstein, *Frontiers in Neurology*, Vol. 6, Art. 262 (2015); Campuzano, et al., Science, 271.5254 (Mar 8, 1996): 1423, the contents of each of which are herein incorporated by reference in their entirety.

[0005] The expansion of an intronic GAA triplet repeat in the FXN gene is the genetic cause of reduced expression of frataxin resulting in FA. *See* Parkinson et al., *Journal of Neurochemistry*, 2013, 126 (Suppl. 1), 103-117. Over time, the deficiency causes the aforementioned symptoms, as well as frequent fatigue due to effects on cellular metabolism.

[0006] Sclerosis and degeneration are most frequent in dorsal root ganglia, spinocerebellar tracts, lateral corticospinal tracts, and posterior columns. *See* Sandi et al., *Frontiers in Genetics*, Vol. 5, Art. 165 (June 2014), the contents of which are herein incorporated by reference in their entirety.

[0007] Progressive destruction of dorsal root ganglia causes thinning of dorsal roots, degeneration of dorsal columns, trans-synaptic atrophy of nerve cells in Clarke's column and dorsal spinocerebellar fibers, atrophy of gracile and cuneate nuclei, and neuropathy of sensory nerves. *See* Koeppen, Arnulf; *J Neurol Sci.*, 2011, April 15; 303(1-2): 1–12, the contents of which are herein incorporated by reference in their entirety. The lesion of the dentate nucleus consists of progressive and selective atrophy of large glutamatergic neurons and grumose degeneration of corticonuclear synaptic terminals that contain gamma-aminobutyric acid (GABA). Small GABA-ergic neurons and their projection fibers in the dentato-olivary tract survive. Atrophy of Betz cells and corticospinal tracts constitute a second lesion. Currently, no effective treatments exist for FA and patients are most often simply monitored for symptom management.

[0008] Consequently, there remains a long felt need in the art to develop pharmaceutical compositions and methods for the treatment of FXN related disorders and to ameliorate

deficiencies of the protein in patients afflicted with FA. Adeno-associated viruses (AAVs) have emerged as one of the most widely studied and utilized viral particles for delivery of therapeutically effective polypeptides to mammalian cells. *See, e.g.*, Tratschin et al., Mol. Cell Biol., 5(11):3251-3260 (1985) and Grimm et al., Hum. Gene Ther., 10(15):2445-2450 (1999), the contents of each of which are incorporated herein by reference in their entirety. As such, this modality is well suited to exploitation toward treatment of FA and the delivery of frataxin and frataxin related proteins and peptides.

DETAILED DESCRIPTION

I. Compositions

Adeno-associated viral (AAV) vectors

[0051] Viruses of the *Parvoviridae* family are small non-enveloped icosahedral capsid viruses characterized by a single stranded DNA genome. *Parvoviridae* family viruses consist of two subfamilies: *Parvovirinae*, which infect vertebrates, and *Densovirinae*, which infect invertebrates. This virus family may be used as a biological tool due to a relatively simple structure that may be manipulated with standard molecular biology techniques. The genome of the virus may be modified to contain a minimum of components for the assembly of a functional recombinant virus, or viral particle, which is loaded with or engineered to express or deliver a desired nucleic acid construct or payload, e.g., a transgene, polypeptide-encoding polynucleotide, or FXN, which may be delivered to a target cell, tissue, or organism. In some embodiments, the target cell is a CNS cell. In some embodiments, the target tissue is a CNS tissue.

[0052] The parvoviruses and other members of the *Parvoviridae* family are generally described in Kenneth I. Berns, "*Parvoviridae*: The Viruses and Their Replication," Chapter 69 in FIELDS VIROLOGY (3d Ed. 1996), the contents of which are hereby incorporated by reference in their entirety.

[0053] The *Parvoviridae* family comprises the *Dependovirus* genus which includes adeno-associated viruses (AAVs) capable of replication in vertebrate hosts including, but not limited to, human, primate, bovine, canine, equine, and ovine species.

[0054] An adeno-associated virus (AAV) is a dependent parvovirus (like other parvoviruses) which is a single stranded non-enveloped DNA virus having a genome of about 5000 nucleotides in length and which contains two open reading frames encoding the proteins responsible for replication (Rep) and the structural protein of the capsid (Cap). The open reading frames are flanked by two Inverted Terminal Repeat (ITR) sequences, which serve as the origin of

replication of the viral genome. The wild-type AAV viral genome comprises nucleotide sequences for two open reading frames, one for the four non-structural Rep proteins (Rep78, Rep68, Rep52, Rep40, encoded by Rep genes) and one for the three capsid, or structural, proteins (VP1, VP2, VP3, encoded by capsid genes or Cap genes). The Rep proteins are important for replication and packaging, while the capsid proteins are assembled to create the protein shell of the AAV, or AAV capsid. Alternative splicing and alternate initiation codons and promoters result in the generation of four different Rep proteins from a single open reading frame and the generation of three capsid proteins from a single open reading frame. Though it varies by AAV serotype, as a non-limiting example, for AAV9/hu.14 (SEQ ID NO: 123 of US 7,906,111, the contents of which are herein incorporated by reference in their entirety) VP1 refers to amino acids 1-736, VP2 refers to amino acids 138-736, and VP3 refers to amino acids 203-736. In other words, VP1 is the full length capsid sequence, while VP2 and VP3 are shorter components of the whole. As a result, changes in the sequence in the VP3 region, are also changes to VP1 and VP2, however, the percent difference as compared to the parent sequence will be greatest for VP3 since it is the shortest sequence of the three. Though described here in relation to the amino acid sequence, the nucleic acid sequence encoding these proteins can be similarly described. Together, the three capsid proteins assemble to create the AAV capsid protein. While not wishing to be bound by theory, the AAV capsid protein typically comprises a molar ratio of 1:1:10 of VP1:VP2:VP3. As used herein, an "AAV serotype" is defined primarily by the AAV capsid. In some instances, the ITRs are also specifically described by the AAV serotype (e.g., AAV2/9).

[0055] The AAV vector typically requires a co-helper (e.g., adenovirus) to undergo productive infection in infected cells. In the absence of such helper functions, the AAV virions essentially enter host cells but do not integrate into the cells' genome. As used herein, the term "AAV vector" or "AAV particle" comprises a capsid and a viral genome comprising a polynucleotide payload. As used herein, "payload" or "payload region" refers to one or more polynucleotides or polynucleotide regions encoded by or within a viral genome or an expression product of such polynucleotide or polynucleotide region, e.g., a transgene, a polynucleotide encoding a polypeptide or multi-polypeptide, e.g., FXN.

[0056] AAV vectors have been investigated for delivery because of several unique features. Non-limiting examples of the features include (i) the ability to infect both dividing and non-dividing cells; (ii) a broad host range for infectivity, including human cells; (iii) wild-type AAV has not been associated with any disease and has not been shown to replicate in infected cells; (iv) the lack of cell-mediated immune response against the vector, and (v) the non-integrative

nature in a host chromosome thereby reducing potential for long-term genetic alterations. Moreover, infection with AAV vectors has minimal influence on changing the pattern of cellular gene expression (Stilwell and Samulski et al., Biotechniques, 2003, 34, 148, the contents of which are herein incorporated by reference in their entirety).

[0057] Typically, AAV vectors for FXN delivery may be recombinant viral vectors which are replication defective as they lack sequences encoding functional Rep and Cap proteins within the viral genome. In some cases, the defective AAV vectors may lack most or all coding sequences and essentially only contain one or two AAV ITR sequences and a payload sequence. In certain embodiments, the viral genome encodes FXN. For example, the viral genome encodes human FXN.

[0058] In one embodiment, the AAV particles of the present disclosure may be introduced into mammalian cells.

[0059] AAV vectors may be modified to enhance the efficiency of delivery. Such modified AAV vectors of the present disclosure can be packaged efficiently and can be used to successfully infect the target cells at high frequency and with minimal toxicity.

[0060] In other embodiments, AAV particles of the present disclosure may be used to deliver FXN to the central nervous system (*see, e.g.*, U.S. Pat. No. 6,180,613; the contents of which is herein incorporated by reference in its entirety).

[0094] The contents of each of the patents, applications, and/or publications listed in Table 1 are hereby incorporated by reference in their entirety.

[0095] In some embodiments, the AAV serotype may be, or may comprise a sequence as described in International Patent Publication WO2015038958, the contents of which are herein incorporated by reference in their entirety, such as, but not limited to, AAV9 (SEQ ID NO: 2 and 11 of WO2015038958 or SEQ ID NO: 135 and 136 herein), PHP.B (SEQ ID NO: 8 and 9 of WO2015038958, herein SEQ ID NO: 3 and 4), G2B-13 (SEQ ID NO: 12 of WO2015038958, herein SEQ ID NO: 5), G2B-26 (SEQ ID NO: 13 of WO2015038958, herein SEQ ID NO: 3), TH1.1-32 (SEQ ID NO: 14 of WO2015038958, herein SEQ ID NO: 6), TH1.1-35 (SEQ ID NO: 15 of WO2015038958, herein SEQ ID NO: 7), or variants thereof. Further, any of the "targeting peptides" or "amino acid inserts" (used herein interchangeably to mean sequences that may be inserted into an AAV capsid sequence to facilitate delivery to CNS tissue) described in WO2015038958, may be inserted into any parent AAV serotype, such as, but not limited to, AAV9 (SEQ ID NO: 135 for the DNA sequence and SEQ ID NO: 136 for the amino acid sequence). In some embodiments, the amino acid insert is inserted between amino acids 586-592 of the parent AAV (e.g., AAV9). [0127] In some embodiments, the initiation codon for translation of the AAV VP1 capsid protein may be CTG, TTG, or GTG as described in US Patent No. US8163543, the contents of which are herein incorporated by reference in its entirety.

[0128] The present disclosure refers to structural capsid proteins (including VP1, VP2, and VP3), which are encoded by capsid (Cap) genes. These capsid proteins form an outer protein structural shell (i.e. capsid) of a viral vector such as AAV. VP capsid proteins synthesized from

Cap polynucleotides generally include a methionine as the first amino acid in the peptide sequence (Met1), which is associated with the start codon (AUG or ATG) in the corresponding Cap nucleotide sequence. However, it is common for a first-methionine (Met1) residue or generally any first amino acid (AA1) to be cleaved off after or during polypeptide synthesis by protein processing enzymes such as Met-aminopeptidases. This "Met/AA-clipping" process often correlates with a corresponding acetylation of the second amino acid in the polypeptide sequence (e.g., alanine, valine, serine, threonine, etc.). Met-clipping commonly occurs with VP1 and VP3 capsid proteins but can also occur with VP2 capsid proteins.

[0129] Where the Met/AA-clipping is incomplete, a mixture of one or more (one, two, or three) VP capsid proteins comprising the viral capsid may be produced, some of which may include a Met1/AA1 amino acid (Met+/AA+) and some of which may lack a Met1/AA1 amino acid as a result of Met/AA-clipping (Met-/AA-). For further discussion regarding Met/AA-clipping in capsid proteins, *see* Jin, et al. Direct Liquid Chromatography/Mass Spectrometry Analysis for Complete Characterization of Recombinant Adeno-Associated Virus Capsid Proteins. *Hum Gene Ther Methods*. 2017 Oct. 28(5):255-267; Hwang, et al. N-Terminal Acetylation of Cellular Proteins Creates Specific Degradation Signals. *Science*. 2010 February 19. 327(5968): 973–977; the contents of which are each incorporated herein by reference in their entirety.

[0130] According to the present disclosure, references to capsid proteins are not limited to either clipped (Met-/AA-) or unclipped (Met+/AA+) sequences and may, in context, refer to independent capsid proteins, viral capsids comprised of a mixture of capsid proteins, and/or polynucleotide sequences (or fragments thereof) which encode, describe, produce, or result in capsid proteins of the present disclosure. A direct reference to a "capsid protein" or "capsid polypeptide" (such as VP1, VP2, or VP3) may also comprise VP capsid proteins which include a Met1/AA1 amino acid (Met+/AA+) as well as corresponding VP capsid proteins which lack the Met1/AA1 amino acid as a result of Met/AA-clipping (Met-/AA-).

[0131] Further, according to the present disclosure, a reference to a specific SEQ ID NO (whether a protein or nucleic acid) that comprises or encodes, respectively, one or more capsid proteins that include a Met1/AA1 amino acid (Met+/AA+) should be understood to teach the VP capsid proteins that lack the Met1/AA1 amino acid as upon review of the sequence, it is readily apparent any sequence that merely lacks the first listed amino acid (whether or not methionine).

[0132] As a non-limiting example, reference to a VP1 polypeptide sequence which is 736 amino acids in length and which includes a "Met1" amino acid (Met+) encoded by the AUG/ATG start codon may also be understood to teach a VP1 polypeptide sequence that is 735

amino acids in length and that does not include the "Met1" amino acid (Met-) of the 736 amino acid Met+ sequence. As a second non-limiting example, reference to a VP1 polypeptide sequence that is 736 amino acids in length and that includes an "AA1" amino acid (AA1+) encoded by any NNN initiator codon may also be understood to teach a VP1 polypeptide sequence that is 735 amino acids in length and that does not include the "AA1" amino acid (AA1-) of the 736 amino acid AA1+ sequence.

[0133] References to viral capsids formed from VP capsid proteins (such as reference to specific AAV capsid serotypes) can incorporate VP capsid proteins that include a Met1/AA1 amino acid (Met+/AA1+), corresponding VP capsid proteins that lack the Met1/AA1 amino acid as a result of Met/AA1-clipping (Met-/AA1-), or combinations thereof (Met+/AA1+ and Met-/AA1-).

[0134] As a non-limiting example, an AAV capsid serotype can include VP1 (Met+/AA1+), VP1 (Met-/AA1-), or a combination of VP1 (Met+/AA1+) and VP1 (Met-/AA1-). An AAV capsid serotype can also include VP3 (Met+/AA1+), VP3 (Met-/AA1-), or a combination of VP3 (Met+/AA1+) and VP3 (Met-/AA1-); and can also include similar optional combinations of VP2 (Met+/AA1) and VP2 (Met-/AA1-).

The ITRs function as origins of replication comprising recognition sites for replication. ITRs comprise sequence regions which can be complementary and symmetrically arranged. ITRs incorporated into viral genomes of the disclosure may be

Untranslated Regions (UTRs)

[0179] By definition, wild type untranslated regions (UTRs) of a gene are transcribed but not translated. Generally, the 5' UTR starts at the transcription start site and ends at the start codon and the 3' UTR starts immediately following the stop codon and continues until the termination signal for transcription.

[0180] Features typically found in abundantly expressed genes of specific target organs may be engineered into UTRs to enhance the stability and protein production. As a non-limiting example, a 5' UTR from mRNA normally expressed in the liver (e.g., albumin, serum amyloid A, Apolipoprotein A/B/E, transferrin, alpha fetoprotein, erythropoietin, or Factor VIII) may be used in the viral genomes of the AAV particles of the disclosure to enhance expression in hepatic cell lines or liver.

[0181] While not wishing to be bound by theory, wild-type 5′ untranslated regions (UTRs) include features that play roles in translation initiation. Kozak sequences, which are commonly known to be involved in the process by which the ribosome initiates translation of many genes, are usually included in 5' UTRs. Kozak sequences have the consensus CCR(A/G)CCAUGG, where R is a purine (adenine or guanine) three bases upstream of the start codon (ATG), which is followed by another 'G'.

[0182] In some embodiments, the 5'UTR in the viral genome includes a Kozak sequence.

[0183] In some embodiments, the 5'UTR in the viral genome does not include a Kozak sequence.

[0184] While not wishing to be bound by theory, wild-type 3′ UTRs are known to have stretches of adenosines and uridines embedded therein. These AU rich signatures are particularly prevalent in genes with high rates of turnover. Based on their sequence features and functional properties, the AU rich elements (AREs) can be separated into three classes (Chen et al, 1995, the contents of which are herein incorporated by reference in their entirety): Class I AREs, such as, but not limited to, c-Myc and MyoD, contain several dispersed copies of an AUUUA motif within U-rich regions. Class II AREs, such as, but not limited to, GM-CSF and TNF-a, possess two or more overlapping UUAUUUA(U/A)(U/A) nonamers. Class III ARES, such as, but not limited to, c-Jun and Myogenin, are less well defined. These U rich regions do not contain an AUUUA motif. Most proteins binding to the AREs are known to destabilize the messenger, whereas members of the ELAV family, most notably HuR, have been documented to increase the stability of mRNA. HuR binds to AREs of all the three classes. Engineering the HuR specific binding sites into the 3′ UTR of nucleic acid molecules will lead to HuR binding and thus, stabilization of the message *in vivo*.

[0185] Introduction, removal or modification of 3′ UTR AU rich elements (AREs) can be used to modulate the stability of polynucleotides. When engineering specific polynucleotides, e.g., payload regions of viral genomes, one or more copies of an ARE can be introduced to make polynucleotides less stable and thereby curtail translation and decrease production of the resultant protein. Likewise, AREs can be identified and removed or mutated to increase the intracellular stability and thus increase translation and production of the resultant protein.

[0186] In some embodiments, the 3' UTR of the viral genome may include an oligo(dT) sequence for templated addition of a poly-A tail.

[0187] Any UTR from any gene known in the art may be incorporated into the viral genome of the AAV particle. These UTRs, or portions thereof, may be placed in the same orientation as in the gene from which they were selected or they may be altered in orientation or location. In some embodiments, the UTR used in the viral genome of the AAV particle may be inverted, shortened, lengthened, or made with one or more other 5′ UTRs or 3′ UTRs known in the art. As used herein, the term "altered," as it relates to a UTR, means that the UTR has been changed in some way in relation to a reference sequence. For example, a 3′ or 5′ UTR may be altered relative to a wild type or native UTR by the change in orientation or location as taught above or may be altered by the inclusion of additional nucleotides, deletion of nucleotides, swapping or transposition of nucleotides.

[0188] In some embodiments, the viral genome of the AAV particle comprises at least one artificial UTR, which is not a variant of a wild type UTR.

[0189] In some embodiments, the viral genome of the AAV particle comprises UTRs which have been selected from a family of transcripts whose proteins share a common function, structure, feature, or property.

miRNA target sites

[0190] In some embodiments, the viral genome may include at least one miRNA binding site. microRNAs (or miRNAs or miRs) are 19-25 nucleotide noncoding RNAs that bind to the sites of nucleic acid targets and down-regulate gene expression either by reducing nucleic acid molecule stability or by inhibiting translation. In some embodiments, the 3' UTR of the viral genome may be engineered to include at least one miRNA binding site.

[0191] In some embodiments, the viral genome comprises at least one sequence encoding a miRNA target site to reduce the expression of the transgene in a specific tissue. MiRNAs and their targeted tissues are well known in the art. In some embodiments, a miR-122 miRNA target site (miR-122TS), or tandem copies of the same, may be encoded in the viral genome to reduce the expression of the viral genome in the liver where miR-122 is abundantly expressed.

[0192] In some embodiments, the viral genome comprises at least one miR122 binding site. In some embodiments, the miR122 binding site comprises a sequence having at least 90%, at least 95%, at least 99%, or 100% identical to SEQ ID NO: 1827. In some embodiments, the AAV vector genome comprises three copies of a miR122 binding site, e.g., three copies of SEQ ID NO: 1827 or a variant thereof having at least 90% sequence identity. In some embodiments, the miR122 binding site series comprises a sequence having at least 90%, at least 95%, at least 99%, or 100% identical to SEQ ID NO: 1826. In some embodiments, the viral genome comprises one, two, or three miR122 binding sites as described above and a payload region encoding frataxin, e.g., encoding SEQ ID NO: 1725 or a variant thereof having at least 90% sequence identity thereto, or comprising the nucleic acid sequence SEQ ID NO: 1824 or a variant having at least 90% sequence identity thereto. In some embodiments, the viral genome comprises three miR122 binding sites as described above and a payload region encoding frataxin, e.g., encoding SEQ ID NO: 1725 or a variant thereof having at least 90% sequence identity thereto, or comprising the nucleic acid sequence SEQ ID NO: 1824 or a variant having at least 90% sequence identity thereto.

Backbone

[0193] In certain embodiments, a cis-element such as a vector backbone is incorporated into the viral particle encoding FXN. The backbone sequence may regulate transcription during viral production. The backbone sequence may contribute to the stability of FXN expression. The backbone sequence may contribute to the level of expression of FXN that may be cloned into pAAVsc or pcDNA3.1 vector backbones.

[0194] In some embodiments, the viral genome of the AAV particles of the present disclosure comprises at least one polyadenylation sequence. The viral genome of the AAV particle may comprise a polyadenylation sequence between the 3' end of the payload coding sequence and the 5' end of the 3'UTR.

Payload: Frataxin

[0266] In some embodiments, the payload is a frataxin protein. As used herein, the term "frataxin protein" or "FXN protein" is used interchangeably with "frataxin polypeptide" or "FXN polypeptide" and encompasses wild-type FXN as well as functional variants thereof. A functional variant is a variant that retains some or all of the activity of its wild-type counterpart, so as to achieve a desired therapeutic effect. For example, in some embodiments, a functional variant is effective to be used in gene therapy to treat a disorder or condition, for example, FXN deficiency or FA. Unless indicated otherwise, a variant of FXN as described herein (e.g., in the context of the constructs, vectors, genomes, methods, kits, compositions, etc. of the disclosure) is a functional variant.

[0267] Friedreich's ataxia (FA) is an autosomal recessive disorder that occurs when the frataxin (FXN) gene contains amplified intronic GAA repeats (an example of trinucleotide repeat expansion). *See* Parkinson et al., *Journal of Neurochemistry*, 2013, 126 (Suppl. 1), 103-117, the contents of which are herein incorporated by reference in their entirety. GAA repeat expansion within the gene causes FXN protein levels to be reduced. FXN is an iron-binding protein responsible for forming iron–sulfur clusters. One result of FXN protein deficiency is mitochondrial iron overload which can cause damage to many proteins. *See* Nageshwaran and Festenstein, *Frontiers in Neurology*, Vol. 6, Art. 262 (2015), the content of which is herein incorporated by reference in its entirety. The FXN gene is located on chromosome 9. *See* Sandi et al., *Frontiers in Genetics*, Vol. 5, Art. 165 (June 2014), the contents of which are herein incorporated by reference in their entirety.

[0268] The mutant gene contains expanded GAA triplet repeats in the first intron, and in a few instances, point mutations have been detected. Because the defect is located in an intron (which is removed from the mRNA transcript between transcription and translation), this mutation does not result in the production of abnormal FXN proteins. *See* Nageshwaran and Festenstein, *Frontiers in Neurology*, Vol. 6, Art. 262 (2015). Instead, the mutation causes gene silencing (i.e., the mutation decreases the transcription of the gene) through induction of a heterochromatin structure in a manner similar to position-effect variegation. Besides reducing expression of FXN protein, long tracts of GAA repeats induce chromosome breaks in *in vivo* yeast studies.

[0269] Low levels of FXN protein lead to insufficient biosynthesis of iron-sulfur clusters that are required for mitochondrial electron transport and assembly of functional aconitase and dysregulated iron metabolism of the entire cell. *See* Nageshwaran and Festenstein, *Frontiers in Neurology*, Vol. 6, Art. 262 (2015). In normal individuals, the *FXN* gene encodes a mitochondrial matrix FXN protein. This globular protein consists of two α helices and seven β strands and is highly conserved, occurring in all eukaryotes and some prokaryotes. FXN protein has a variety of known functions; most notably, it assists iron-sulfur protein synthesis in the electron transport chain to ultimately generate adenosine triphosphate (ATP), the energy currency necessary to carry out metabolic functions in cells. FXN protein also regulates iron transfer in the mitochondria in order to provide a proper amount of reactive oxygen species (ROS) to maintain normal processes. Without FXN protein, the energy in the mitochondria fails, and excess iron causes extra ROS to be created, leading to further cell damage.

[0270] Other disorders of the central nervous system may ultimately be found to be related to aberrant expression or a deficiency in the quantity or function of FXN protein. Such disorders

may include, but are not limited to, neurological or neuromuscular disorders such as Alzheimer's disease, Huntington's disease, autism, Parkinson's disease, and spinal muscular atrophy, or other neurological or neuromuscular diseases, disorders, or conditions described herein.

[0271] As used herein, "associated with decreased frataxin protein levels" or "associated with decreased expression" means that one or more symptoms of the disease are caused by lower-than-normal frataxin protein levels in a target tissue or in a biofluid such as blood. A disease or condition associated with decreased frataxin protein levels or expression may be a disorder of the central nervous system. Such a disease or condition may be a neuromuscular or a neurological disorder or condition. For example, a disease associated with decreased frataxin protein levels may be FA, or may be another neurological or neuromuscular disorder described herein.

[0272] The present disclosure addresses the need for new technologies by providing FXN related treatment deliverable by AAV-based compositions and complexes for the treatment of FA.

[0273] While delivery is exemplified in the AAV context, other viral vectors, non-viral vectors, nanoparticles, or liposomes may be similarly used to deliver the therapeutic FXN and include, but are not limited to, vector genomes of any of the AAV serotypes or other viral delivery vehicles or lentivirus, etc. The observations and teachings extend to any macromolecular structure, including modified cells, introduced into the CNS in the manner as described herein.

[0274] Given in Table 2 are the sequence identifiers of representative polynucleotide and polypeptide sequences for frataxin that may be used in the viral genomes disclosed herein and which may constitute a frataxin payload. Functional variants, e.g., those retaining at least about 90% or at least 95% sequence identity to a sequence shown in Table 2, may also be used. Codon-optimized and other variants that encode the same or essentially the same FXN amino acid sequence (e.g., those having at least about 90% amino acid sequence identity) may also be used.

[0361] In some embodiments, the AAV particle viral genome comprises one polyA sequence region. As a non-limiting example, the polyA sequence comprises a human growth hormone polyadenylation sequence.

[0362] In one embodiment, the AAV particle viral genome comprises more than one polyA sequence region.

[0410] Cells for the production of AAV, e.g., rAAV, particles may comprise, in some embodiments, mammalian cells (such as HEK293 cells) and/or insect cells (such as Sf9 cells).

[0411] In various embodiments, AAV production includes processes and methods for producing AAV particles and vectors which can contact a target cell to deliver a payload, e.g. a recombinant viral construct, which includes a nucleotide encoding a payload molecule. In certain embodiments, the viral vectors are adeno-associated viral (AAV) vectors such as recombinant adeno-associated viral (rAAV) vectors. In certain embodiments, the AAV particles are adeno-associated viral (AAV) particles such as recombinant adeno-associated viral (rAAV) particles.

[0412] In various embodiments, methods are provided herein of producing AAV particles or vectors by (a) contacting a viral production cell with one or more viral expression constructs encoding at least one AAV capsid protein, and one or more payload constructs encoding a

payload molecule, which can be selected from: a transgene, a polynucleotide encoding protein, and a modulatory nucleic acid; (b) culturing the viral production cell under conditions such that at least one AAV particle or vector is produced, and (c) isolating the AAV particle or vector from the production stream.

[0413] In these methods, a viral expression construct may encode at least one structural protein and/or at least one non-structural protein. The structural protein may include any of the native or wild type capsid proteins VP1, VP2, and/or VP3, or a chimeric protein thereof. The non-structural protein may include any of the native or wild type Rep78, Rep68, Rep52, and/or Rep40 proteins or a chimeric protein thereof.

[0414] In certain embodiments, contacting occurs via transient transfection, viral transduction, and/or electroporation.

[0415] In certain embodiments, the viral production cell is selected from a mammalian cell and an insect cell. In certain embodiments, the insect cell includes a *Spodoptera frugiperda* insect cell. In certain embodiments, the insect cell includes a Sf9 insect cell. In certain embodiments, the insect cell includes a Sf21 insect cell.

[0416] The payload construct vector of the present disclosure may include, in various embodiments, at least one inverted terminal repeat (ITR) and may include mammalian DNA.

[0417] Also provided are AAV particles and viral vectors produced according to the methods described herein.

[0418] In various embodiments, the AAV particles of the present disclosure may be formulated as a pharmaceutical composition with one or more acceptable excipients.

[0419] In certain embodiments, an AAV particle or viral vector may be produced by a method described herein.

[0420] In certain embodiments, the AAV particles may be produced by contacting a viral production cell (e.g., an insect cell or a mammalian cell) with at least one viral expression construct encoding at least one capsid protein and at least one payload construct vector. The viral production cell may be contacted by transient transfection, viral transduction, and/or electroporation. The payload construct vector may include a payload construct encoding a payload molecule such as, but not limited to, a transgene, a polynucleotide encoding protein, and a modulatory nucleic acid. The viral production cell can be cultured under conditions such that at least one AAV particle or vector is produced, isolated (e.g., using temperature-induced lysis, mechanical lysis and/or chemical lysis) and/or purified (e.g., using filtration, chromatography, and/or immunoaffinity purification). As a non-limiting example, the payload construct vector may include mammalian DNA.

[0421] In certain embodiments, the AAV particles are produced in an insect cell (e.g., *Spodoptera frugiperda* (Sf9) cell) using a method described herein. As a non-limiting example, the insect cell is contacted using viral transduction which may include baculoviral transduction.

[0422] In certain embodiments, the AAV particles are produced in an mammalian cell (e.g., HEK293 cell) using a method described herein. As a non-limiting example, the mammalian cell is contacted using viral transduction which may include multiplasmid transient transfection (such as triple plasmid transient transfection).

[0423] In certain embodiments, the AAV particle production method described herein produces greater than 10^1, greater than 10^2, greater than 10^3, greater than 10^4, or greater than 10^5 AAV particles in a viral production cell.

[0424] In certain embodiments, a process of the present disclosure includes production of viral particles in a viral production cell using a viral production system which includes at least one viral expression construct and at least one payload construct. The at least one viral expression construct and at least one payload construct can be co-transfected (e.g. dual transfection, triple transfection) into a viral production cell. The transfection is completed using standard molecular biology techniques known and routinely performed by a person skilled in the art. The viral production cell provides the cellular machinery necessary for expression of the proteins and other biomaterials necessary for producing the AAV particles, including Rep proteins which replicate the payload construct and Cap proteins which assemble to form a capsid that encloses the replicated payload constructs. The resulting AAV particle is extracted from the viral production cells and processed into a pharmaceutical preparation for administration.

[0425] In various embodiments, once administered, an AAV particle disclosed herein may, without being bound by theory, contact a target cell and enter the cell, e.g., in an endosome. The AAV particles, e.g., those released from the endosome, may subsequently contact the nucleus of the target cell to deliver the payload construct. The payload construct, e.g. recombinant viral construct, may be delivered to the nucleus of the target cell wherein the payload molecule encoded by the payload construct may be expressed.

[0426] In certain embodiments, the process for production of viral particles utilizes seed cultures of viral production cells that include one or more baculoviruses (e.g., a Baculoviral Expression Vector (BEV) or a baculovirus infected insect cell (BIIC) that has been transfected with a viral expression construct and a payload construct vector). In certain embodiments, the seed cultures are harvested, divided into aliquots and frozen, and may be used at a later time point to initiate an infection of a naïve population of production cells.

[0427] In some embodiments, large scale production of AAV particles utilizes a bioreactor. Without being bound by theory, the use of a bioreactor may allow for the precise measurement and/or control of variables that support the growth and activity of viral production cells such as mass, temperature, mixing conditions (impellor RPM or wave oscillation), CO_2 concentration, O_2 concentration, gas sparge rates and volumes, gas overlay rates and volumes, pH, Viable Cell Density (VCD), cell viability, cell diameter, and/or optical density (OD). In certain embodiments, the bioreactor is used for batch production in which the entire culture is harvested at an experimentally determined time point and AAV particles are purified. In some embodiments, the bioreactor is used for continuous production in which a portion of the culture is harvested at an experimentally determined time point for purification of AAV particles, and the remaining culture in the bioreactor is refreshed with additional growth media components.

[0428] In various embodiments, AAV viral particles can be extracted from viral production cells in a process which includes cell lysis, clarification, sterilization and purification. Cell lysis includes any process that disrupts the structure of the viral production cell, thereby releasing AAV particles. In certain embodiments, cell lysis may include thermal shock, chemical, or mechanical lysis methods. Clarification can include the gross purification of the mixture of lysed cells, media components, and AAV particles. In certain embodiments, clarification includes centrifugation and/or filtration, including but not limited to depth end, tangential flow, and/or hollow fiber filtration.

[0429] In various embodiments, the end result of viral production is a purified collection of AAV particles which include two components: (1) a payload construct (e.g. a recombinant AAV vector genome construct) and (2) a viral capsid.

[0430] In certain embodiments, a viral production system or process of the present disclosure includes steps for producing baculovirus infected insect cells (BIICs) using Viral Production Cells (VPC) and plasmid constructs. Viral Production Cells (VPCs) from a Cell Bank (CB) are thawed and expanded to provide a target working volume and VPC concentration. The resulting pool of VPCs is split into a Rep/Cap VPC pool and a Payload VPC pool. One or more Rep/Cap plasmid constructs (viral expression constructs) are processed into Rep/Cap Bacmid polynucleotides and transfected into the Rep/Cap VPC pool. One or more Payload plasmid constructs (payload constructs) are processed into Payload Bacmid polynucleotides and transfected into the Payload VPC pool. The two VPC pools are incubated to produce P1 Rep/Cap Baculoviral Expression Vectors (BEVs) and P1 Payload BEVs. The two BEV pools are expanded into a collection of Plaques, with a single Plaque being selected for Clonal Plaque (CP) Purification (also referred to as Single Plaque Expansion). The process can include a single CP

Purification step or can include multiple CP Purification steps either in series or separated by other processing steps. The one-or-more CP Purification steps provide a CP Rep/Cap BEV pool and a CP Payload BEV pool. These two BEV pools can then be stored and used for future production steps, or they can be then transfected into VPCs to produce a Rep/Cap BIIC pool and a Payload BIIC pool.

[0431] In certain embodiments, a viral production system or process of the present disclosure includes steps for producing AAV particles using Viral Production Cells (VPC) and baculovirus infected insect cells (BIICs). Viral Production Cells (VPCs) from a Cell Bank (CB) are thawed and expanded to provide a target working volume and VPC concentration. The working volume of Viral Production Cells is seeded into a Production Bioreactor and can be further expanded to a working volume of 200-2000 L with a target VPC concentration for BIIC infection. The working volume of VPCs in the Production Bioreactor is then co-infected with Rep/Cap BIICs and Payload BIICs, with a target VPC:BIIC ratio and a target BIIC:BIIC ratio. VCD infection can also utilize BEVs. The co-infected VPCs are incubated and expanded in the Production Bioreactor to produce a bulk harvest of AAV particles and VPCs.

[0442] In certain embodiments, a viral expression construct or a payload construct of the present disclosure can be a bacmid, also known as a baculovirus plasmid or recombinant baculovirus genome. In certain embodiments, a viral expression construct or a payload construct

of the present disclosure (e.g. bacmid) can include a polynucleotide incorporated by homologous recombination (transposon donor/acceptor system) into the bacmid by standard molecular biology techniques known and performed by a person skilled in the art.

[0443] In certain embodiments, the polynucleotide incorporated into the bacmid (i.e. polynucleotide insert) can include an expression control sequence operably linked to a protein-coding nucleotide sequence. In certain embodiments, the polynucleotide incorporated into the bacmid can include an expression control sequence which includes a promoter, such as p10 or polh, and which is operably linked to a nucleotide sequence which encodes a structural AAV capsid protein (e.g. VP1, VP2, VP3 or a combination thereof). In certain embodiments, the polynucleotide incorporated into the bacmid can include an expression control sequence which includes a promoter, such as p10 or polh, and which is operably linked to a nucleotide sequence which encodes a non-structural AAV capsid protein (e.g. Rep78, Rep52, or a combination thereof).

[0444] The method of the present disclosure is not limited by the use of specific expression control sequences. However, when a certain stoichiometry of VP products are achieved (close to 1:1:10 for VP1, VP2, and VP3, respectively) and also when the levels of Rep52 or Rep40 (also referred to as the p19 Reps) are significantly higher than Rep78 or Rep68 (also referred to as the p5 Reps), improved yields of AAV in production cells (such as insect cells) may be obtained. In certain embodiments, the p5/p19 ratio is below 0.6 more, below 0.4, or below 0.3, but always at least 0.03. These ratios can be measured at the level of the protein or can be implicated from the relative levels of specific mRNAs.

[0445] In certain embodiments, AAV particles are produced in viral production cells (such as mammalian or insect cells) wherein all three VP proteins are expressed at a stoichiometry approaching, about or which is: 1:1:10 (VP1:VP2:VP3); 2:2:10 (VP1:VP2:VP3); 2:0:10 (VP1:VP2:VP3); 1-2:0-2:10 (VP1:VP2:VP3); 1-2:1-2:10 (VP1:VP2:VP3); 2-3:0-3:10 (VP1:VP2:VP3); 2-3:2-3:10 (VP1:VP2:VP3); 3:3:10 (VP1:VP2:VP3); 3-5:0-5:10 (VP1:VP2:VP3); or 3-5:3-5:10 (VP1:VP2:VP3).

exactly 1-4:1-4:10; about or exactly 1-5:1-5:10; about or exactly 2-3:0-3:10; about or exactly 2-3:2-3:10; about or exactly 2-4:2-4:10; about or exactly 2-5:2-5:10; about or exactly 3-4:3-4:10; about or exactly 3-5:3-5:10; and about or exactly 4-5:4-5:10.

[0447] In certain embodiments of the present disclosure, Rep52 or Rep78 is transcribed from the baculoviral derived polyhedron promoter (polh). Rep52 or Rep78 can also be transcribed from a weaker promoter, for example a deletion mutant of the ie-1 promoter, the Δie-1 promoter, has about 20% of the transcriptional activity of that ie-1 promoter. A promoter substantially homologous to the Δie-1 promoter may be used. In respect to promoters, a homology of at least 50%, 60%, 70%, 80%, 90% or more, is considered to be a substantially homologous promoter.

[0448] Viral production of the present disclosure disclosed herein describes processes and methods for producing AAV particles or viral vector that contacts a target cell to deliver a payload construct, e.g. a recombinant AAV particle or viral construct, which includes a nucleotide encoding a payload molecule. The viral production cell may be selected from any biological organism, including prokaryotic (e.g., bacterial) cells, and eukaryotic cells, including, insect cells, yeast cells and mammalian cells.

[0449] In certain embodiments, the AAV particles of the present disclosure may be produced in a viral production cell that includes a mammalian cell. Viral production cells may comprise mammalian cells such as A549, WEH1, 3T3, 10T1/2, BHK, MDCK, COS 1, COS 7, BSC 1, BSC 40, BMT 10, VERO, W138, HeLa, HEK293, HEK293T (293T), Saos, C2C12, L cells, HT1080, Huh7, HepG2, C127, 3T3, CHO, HeLa cells, KB cells, BHK and primary fibroblast, hepatocyte, and myoblast cells derived from mammals. Viral production cells can include cells derived from any mammalian species including, but not limited to, human, monkey, mouse, rat, rabbit, and hamster or cell type, including but not limited to fibroblast, hepatocyte, tumor cell, cell line transformed cell, etc.

[0450] AAV viral production cells commonly used for production of recombinant AAV particles include, but is not limited to other mammalian cell lines as described in U.S. Pat. Nos. 6,156,303, 5,387,484, 5,741,683, 5,691,176, 6,428,988 and 5,688,676; U.S. patent application 2002/0081721, and International Patent Publication Nos. WO 00/47757, WO 00/24916, and WO 96/17947, the contents of each of which are herein incorporated by reference in their entireties insofar as they do no conflict with the present disclosure. In certain embodiments, the AAV viral production cells are trans-complementing packaging cell lines that provide functions deleted

from a replication-defective helper virus, e.g., HEK293 cells or other Ea trans-complementing cells.

[0451] In certain embodiments, the packaging cell line 293-10-3 (ATCC Accession No. PTA-2361) may be used to produce the AAV particles, as described in US Patent No. US 6,281,010, the contents of which are herein incorporated by reference in its entirety as related to the 293-10-3 packaging cell line and uses thereof.

[0452] In certain embodiments, of the present disclosure a cell line, such as a HeLA cell line, for trans-complementing E1 deleted adenoviral vectors, which encoding adenovirus E1a and adenovirus E1b under the control of a phosphoglycerate kinase (PGK) promoter can be used for AAV particle production as described in US Patent No. 6365394, the contents of which are incorporated herein by reference in their entirety as related to the HeLa cell line and uses thereof.

[0453] In certain embodiments, AAV particles are produced in mammalian cells using a multiplasmid transient transfection method (such as triple plasmid transient transfection). In certain embodiments, the multiplasmid transient transfection method includes transfection of the following three different constructs: (i) a payload construct, (ii) a Rep/Cap construct (parvoviral Rep and parvoviral Cap), and (iii) a helper construct. In certain embodiments, the triple transfection method of the three components of AAV particle production may be utilized to produce small lots of virus for assays including transduction efficiency, target tissue (tropism) evaluation, and stability. In certain embodiments, the triple transfection method of the three components of AAV particle production may be utilized to produce large lots of materials for clinical or commercial applications.

[0454] AAV particles to be formulated may be produced by triple transfection or baculovirus mediated virus production, or any other method known in the art. Any suitable permissive or packaging cell known in the art may be employed to produce the vectors. In certain embodiments, trans-complementing packaging cell lines are used that provide functions deleted from a replication-defective helper virus, e.g., 293 cells or other E1a trans-complementing cells.

[0455] The gene cassette may contain some or all of the parvovirus (e.g., AAV) cap and rep genes. In certain embodiments, some or all of the cap and rep functions are provided in trans by introducing a packaging vector(s) encoding the capsid and/or Rep proteins into the cell. In certain embodiments, the gene cassette does not encode the capsid or Rep proteins. Alternatively, a packaging cell line is used that is stably transformed to express the cap and/or rep genes.

[0456] Recombinant AAV virus particles are, in certain embodiments, produced and purified from culture supernatants according to the procedure as described in US2016/0032254, the contents of which are incorporated by reference in its entirety as related to the production and

processing of recombinant AAV virus particles. Production may also involve methods known in the art including those using 293T cells, triple transfection or any suitable production method.

[0457] In certain embodiments, mammalian viral production cells (e.g. 293T cells) can be in an adhesion/adherent state (e.g. with calcium phosphate) or a suspension state (e.g. with polyethyleneimine (PEI)). The mammalian viral production cell is transfected with plasmids required for production of AAV, (i.e., AAV rep/cap construct, an adenoviral helper construct, and/or ITR flanked payload construct). In certain embodiments, the transfection process can include optional medium changes (e.g. medium changes for cells in adhesion form, no medium changes for cells in suspension form, medium changes for cells in suspension form if desired). In certain embodiments, the transfection process can include transfection mediums such as DMEM or F17. In certain embodiments, the transfection medium can include serum or can be serum-free (e.g. cells in adhesion state with calcium phosphate and with serum, cells in suspension state with PEI and without serum).

[0458] Cells can subsequently be collected by scraping (adherent form) and/or pelleting (suspension form and scraped adherent form) and transferred into a receptacle. Collection steps can be repeated as necessary for full collection of produced cells. Next, cell lysis can be achieved by consecutive freeze-thaw cycles (-80C to 37C), chemical lysis (such as adding detergent triton), mechanical lysis, or by allowing the cell culture to degrade after reaching ~0% viability. Cellular debris is removed by centrifugation and/or depth filtration. The samples are quantified for AAV particles by DNase resistant genome titration by DNA qPCR.

[0459] AAV particle titers are measured according to genome copy number (genome particles per milliliter). Genome particle concentrations are based on DNA qPCR of the vector DNA as previously reported (Clark et al. (1999) Hum. Gene Ther., 10:1031-1039; Veldwijk et al. (2002) Mol. Ther., 6:272-278, the contents of which are each incorporated by reference in their entireties as related to the measurement of particle concentrations).

Insect cells

[0460] Viral production of the present disclosure includes processes and methods for producing AAV particles or viral vectors that contact a target cell to deliver a payload construct, e.g., a recombinant viral construct, which includes a nucleotide encoding a payload molecule. In certain embodiments, the AAV particles or viral vectors of the present disclosure may be produced in a viral production cell that includes an insect cell.

[0461] Growing conditions for insect cells in culture, and production of heterologous products in insect cells in culture are well-known in the art, see U.S. Pat. No. 6,204,059, the contents of

which are herein incorporated by reference in their entirety as related to the growth and use of insect cells in viral production.

[0462] Any insect cell which allows for replication of parvovirus and which can be maintained in culture can be used in accordance with the present disclosure. AAV viral production cells commonly used for production of recombinant AAV particles include, but is not limited to, *Spodoptera frugiperda*, including, but not limited to the Sf9 or Sf21 cell lines, *Drosophila* cell lines, or mosquito cell lines, such as *Aedes albopictus* derived cell lines. Use of insect cells for expression of heterologous proteins is well documented, as are methods of introducing nucleic acids, such as vectors, e.g., insect-cell compatible vectors, into such cells and methods of maintaining such cells in culture. *See*, for example, Methods in Molecular Biology, ed. Richard, Humana Press, NJ (1995); O'Reilly et al., Baculovirus Expression Vectors, A Laboratory Manual, Oxford Univ. Press (1994); Samulski et al., J. Vir.63:3822-8 (1989); Kajigaya et al., Proc. Nat'l. Acad. Sci. USA 88: 4646-50 (1991); Ruffing et al., J. Vir. 66:6922-30 (1992); Kimbauer et al.,Vir.219:37-44 (1996); Zhao et al., Vir.272:382-93 (2000); and Samulski et al., U.S. Pat. No. 6,204,059, the contents of each of which are herein incorporated by reference in their entirety as related to the use of insect cells in viral production.

[0463] In some embodiments, the AAV particles are made using the methods described in WO2015/191508, the contents of which are herein incorporated by reference in their entirety insofar as they do not conflict with the present disclosure.

[0464] In certain embodiments, insect host cell systems, in combination with baculoviral systems (e.g., as described by Luckow et al., Bio/Technology 6: 47 (1988)) may be used. In certain embodiments, an expression system for preparing chimeric peptide is *Trichoplusia ni*, Tn 5B1-4 insect cells/baculoviral system, which can be used for high levels of proteins, as described in US Patent No. 6660521, the contents of which are herein incorporated by reference in their entirety as related to the production of viral particles.

[0465] Expansion, culturing, transfection, infection and storage of insect cells can be carried out in any cell culture media, cell transfection media or storage media known in the art, including Hyclone™ SFX-Insect™ Cell Culture Media, Expression System ESF AF™ Insect Cell Culture Medium, ThermoFisher Sf-900II™ media, ThermoFisher Sf-900III™ media, or ThermoFisher Grace's Insect Media. Insect cell mixtures of the present disclosure can also include any of the formulation additives or elements described in the present disclosure, including (but not limited to) salts, acids, bases, buffers, surfactants (such as Poloxamer 188/Pluronic F-68), and other known culture media elements. Formulation additives can be incorporated gradually or as "spikes" (incorporation of large volumes in a short time).

Baculovirus-production systems

[0466] In certain embodiments, processes of the present disclosure can include production of AAV particles or viral vectors in a baculoviral system using a viral expression construct and a payload construct vector. In certain embodiments, the baculoviral system includes Baculovirus expression vectors (BEVs) and/or baculovirus infected insect cells (BIICs). In certain embodiments, a viral expression construct or a payload construct of the present disclosure can be a bacmid, also known as a baculovirus plasmid or recombinant baculovirus genome. In certain embodiments, a viral expression construct or a payload construct of the present disclosure can be polynucleotide incorporated by homologous recombination (transposon donor/acceptor system) into a bacmid by standard molecular biology techniques known and performed by a person skilled in the art. Transfection of separate viral replication cell populations produces two or more groups (e.g. two, three) of baculoviruses (BEVs), one or more group which can include the viral expression construct (Expression BEV), and one or more group which can include the payload construct (Payload BEV). The baculoviruses may be used to infect a viral production cell for production of AAV particles or viral vector.

[0467] In certain embodiments, the process includes transfection of a single viral replication cell population to produce a single baculovirus (BEV) group which includes both the viral expression construct and the payload construct. These baculoviruses may be used to infect a viral production cell for production of AAV particles or viral vector.

[0468] In certain embodiments, BEVs are produced using a Bacmid Transfection agent, such as Promega FuGENE® HD, WFI water, or ThermoFisher Cellfectin® II Reagent. In certain embodiments, BEVs are produced and expanded in viral production cells, such as an insect cell.

[0469] In certain embodiments, the method utilizes seed cultures of viral production cells that include one or more BEVs, including baculovirus infected insect cells (BIICs). The seed BIICs have been transfected/transduced/infected with an Expression BEV which includes a viral expression construct, and also a Payload BEV which includes a payload construct. In certain embodiments, the seed cultures are harvested, divided into aliquots and frozen, and may be used at a later time to initiate transfection/transduction/infection of a naïve population of production cells. In certain embodiments, a bank of seed BIICs is stored at -80 °C or in LN2 vapor.

[0470] Baculoviruses are made of several essential proteins which are essential for the function and replication of the Baculovirus, such as replication proteins, envelope proteins and capsid proteins. The Baculovirus genome thus includes several essential-gene nucleotide sequences encoding the essential proteins. As a non-limiting example, the genome can include an essential-gene region which includes an essential-gene nucleotide sequence encoding an essential

protein for the Baculovirus construct. The essential protein can include: GP64 baculovirus envelope protein, VP39 baculovirus capsid protein, or other similar essential proteins for the Baculovirus construct.

[0471] Baculovirus expression vectors (BEV) for producing AAV particles in insect cells, including but not limited to *Spodoptera frugiperda* (Sf9) cells, provide high titers of viral vector product. Recombinant baculovirus encoding the viral expression construct and payload construct initiates a productive infection of viral vector replicating cells. Infectious baculovirus particles released from the primary infection secondarily infect additional cells in the culture, exponentially infecting the entire cell culture population in a number of infection cycles that is a function of the initial multiplicity of infection, *see* Urabe, M. et al. J Virol. 2006 Feb;80(4):1874-85, the contents of which are herein incorporated by reference in their entirety as related to the production and use of BEVs and viral particles.

[0472] Production of AAV particles with baculovirus in an insect cell system may address known baculovirus genetic and physical instability.

[0473] In certain embodiments, the production system of the present disclosure addresses baculovirus instability over multiple passages by utilizing a titerless infected-cells preservation and scale-up system. Small scale seed cultures of viral producing cells are transfected with viral expression constructs encoding the structural and/or non-structural components of the AAV particles. Baculovirus-infected viral producing cells are harvested into aliquots that may be cryopreserved in liquid nitrogen; the aliquots retain viability and infectivity for infection of large scale viral producing cell culture. Wasilko DJ et al. Protein Expr Purif. 2009 Jun;65(2):122-32, the contents of which are herein incorporated by reference in their entirety as related to the production and use of BEVs and viral particles.

[0474] A genetically stable baculovirus may be used to produce a source of the one or more of the components for producing AAV particles in invertebrate cells. In certain embodiments, defective baculovirus expression vectors may be maintained episomally in insect cells. In such embodiments, the corresponding bacmid vector is engineered with replication control elements, including but not limited to promoters, enhancers, and/or cell-cycle regulated replication elements.

[0475] In certain embodiments, stable viral producing cells permissive for baculovirus infection are engineered with at least one stable integrated copy of any of the elements necessary for AAV replication and vector production including, but not limited to, the entire AAV genome, Rep and Cap genes, Rep genes, Cap genes, each Rep protein as a separate transcription cassette,

each VP protein as a separate transcription cassette, the AAP (assembly activation protein), or at least one of the baculovirus helper genes with native or non-native promoters.

A fragment may also refer to a truncation (e.g., an N-terminal and/or C-terminal truncation) of a protein or a truncation (e.g., at the 5' and/or 3' end) of a nucleic acid. A protein fragment may be obtained by expression of a truncated nucleic acid, such that the nucleic acid encodes a portion of the full-length protein.

[0664] *Gene expression*: The term "gene expression" refers to the process by which a nucleic acid sequence undergoes successful transcription and in most instances translation to produce a

protein or peptide. For clarity, when reference is made to measurement of "gene expression", this should be understood to mean that measurements may be of the nucleic acid product of transcription, e.g., RNA or mRNA or of the amino acid product of translation, e.g., polypeptides or peptides. Methods of measuring the amount or levels of RNA, mRNA, polypeptides, and peptides are well known in the art.

[0665] *Homology*: As used herein, the term "homology" refers to the overall relatedness between polymeric molecules, *e.g.* between nucleic acid molecules (*e.g.* DNA molecules and/or RNA molecules) and/or between polypeptide molecules. In some embodiments, polymeric molecules are considered to be "homologous" to one another if their sequences are at least 25%, 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 95%, or 99% identical or similar. The term "homologous" necessarily refers to a comparison between at least two sequences (polynucleotide or polypeptide sequences). In accordance with the disclosure, two polynucleotide sequences are considered to be homologous if the polypeptides they encode are at least about 50%, 60%, 70%, 80%, 90%, 95%, or even 99% identical for at least one stretch of at least about 20 amino acids. In some embodiments, homologous polynucleotide sequences are characterized by the ability to encode a stretch of at least 4–5 uniquely specified amino acids. For polynucleotide sequences less than 60 nucleotides in length, homology is typically determined by the ability to encode a stretch of at least 4–5 uniquely specified amino acids. In accordance with the disclosure, two protein sequences are considered to be homologous if the proteins are at least about 50%, 60%, 70%, 80%, or 90% identical for at least one stretch of at least about 20 amino acids. In many embodiments, homologous protein may show a large overall degree of homology and a high degree of homology over at least one short stretch of at least 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 25, 30, 35, 40, 45, 50, or more amino acids. In many embodiments, homologous proteins share one or more characteristic sequence elements. As used herein, the term "characteristic sequence element" refers to a motif present in related proteins. In some embodiments, the presence of such motifs correlates with a particular activity (such as biological activity).

[0666] *Humanized*: As used herein, the term "humanized" refers to a non-human sequence of a polynucleotide or a polypeptide which has been altered to increase its similarity to its corresponding human sequence.

[0667] *Identity*: As used herein, the term "identity" refers to the overall relatedness between polymeric molecules, *e.g.*, between oligonucleotide molecules (*e.g.* DNA molecules and/or RNA molecules) and/or between polypeptide molecules. Calculation of the percent identity of two polynucleotide sequences, for example, may be performed by aligning the two sequences for

optimal comparison purposes (*e.g.*, gaps can be introduced in one or both of a first and a second nucleic acid sequences for optimal alignment and non-identical sequences can be disregarded for comparison purposes). In certain embodiments, the length of a sequence aligned for comparison purposes is at least 30%, at least 40%, at least 50%, at least 60%, at least 70%, at least 80%, at least 90%, at least 95%, or 100% of the length of the reference sequence. The nucleotides at corresponding nucleotide positions are then compared. When a position in the first sequence is occupied by the same nucleotide as the corresponding position in the second sequence, then the molecules are identical at that position. The percent identity between the two sequences is a function of the number of identical positions shared by the sequences, taking into account the number of gaps, and the length of each gap, which needs to be introduced for optimal alignment of the two sequences. The comparison of sequences and determination of percent identity between two sequences can be accomplished using a mathematical algorithm. For example, the percent identity between two nucleotide sequences can be determined using methods such as those described in Computational Molecular Biology, Lesk, A. M., ed., Oxford University Press, New York, 1988; Biocomputing: Informatics and Genome Projects, Smith, D. W., ed., Academic Press, New York, 1993; Sequence Analysis in Molecular Biology, von Heinje, G., Academic Press, 1987; Computer Analysis of Sequence Data, Part I, Griffin, A. M., and Griffin, H. G., eds., Humana Press, New Jersey, 1994; and Sequence Analysis Primer, Gribskov, M. and Devereux, J., eds., M Stockton Press, New York, 1991; each of which is incorporated herein by reference in its entirety. For example, the percent identity between two nucleotide sequences can be determined, for example using the algorithm of Meyers and Miller (CABIOS, 1989, 4:11-17), which has been incorporated into the ALIGN program (version 2.0) using a PAM120 weight residue table, a gap length penalty of 12 and a gap penalty of 4. The percent identity between two nucleotide sequences can, alternatively, be determined using the GAP program in the GCG software package using an NWSgapdna.CMP matrix. Methods commonly employed to determine percent identity between sequences include, but are not limited to those disclosed in Carillo, H., and Lipman, D., SIAM J Applied Math., 48:1073 (1988); incorporated herein by reference in its entirety. Techniques for determining identity are codified in publicly available computer programs. Computer software to determine homology between two sequences include, but are not limited to, GCG program package, Devereux, J., *et al.*, *Nucleic Acids Research*, 12(1), 387 (1984)), BLASTP, BLASTN, and FASTA Altschul, S. F. *et al.*, *J. Molecular Biol.*, 215, 403 (1990)).

IX. EXAMPLES

Example 1. Design of promoter variants

A. Promoters

[0726] Previous studies have shown that CMV promoters drive the highest level of frataxin expression, with CBA showing less efficacy in driving expression. PGK and FXN promoters have been shown to be even weaker promoters for driving protein expression. Variants of the CMV, CBA and FXN promoters were generated to determine which promoters would lead to the highest expression of a payload (e.g., frataxin or luciferase). The promoters were inserted into a vector expressing luciferase which was built using standard molecular cloning techniques.

[0727] The designed promoters are described in Table 3 above. In Table 3, CMV stands for "cytomegalovirus," CBA stands for "chicken β-actin" which may have a CMV IE enhancer region and a promoter region, CAG stands for CMV enhancer, CBA promoter, and rabbit beta-globin splice acceptor site, FXN stands for "Frataxin," and mCBA stands for a variant of the CBA promoter which was generated using PCR.

[0728] Each of the engineered promoter variants was analyzed by gel electrophoresis, digested (Sac1 and HindIII), verified and sequenced.

B. In Vitro Evaluation of Promoters

[0729] Seven frataxin promotor variants, 15 CBA promoter variants and 8 CMV promoter variants were evaluated for expression activity *in vitro*. HEK293 cells were plated in 96-well plates (3.0×10^4 cells/well with 0.3 ul per well of FuGENE® HD transfection reagent) and transfected (5 transfections) in either duplicate or triplicate with a plasmid comprising a promoter from Table 3 and a luciferase payload (either firefly (~75 ng) or renilla (25 ng)). 48 hours after transfection, the activity and expression of luciferase was determined using the DUAL-GLO® luciferase assay system. In short, an equal volume of Dual-Glo® Luciferase Reagent was added directly to cells in growth medium, incubated for 10mins, then measured for firefly luciferase expression. The same volume of reagent was then added to quench the firefly luminescence and the renilla luciferase activity was measured 10 min later. A control of pGL3-basic promoterless vector was used as control.

[0730] The activity of the promoter variants as determined by firefly and renilla luciferase expression is shown in Tables 18-20, quantified in relative light units (RLU). Table 18 shows data for initial FXN, CBA and CMV promoter variants while Table 19 shows data for a second generation of PCR generated CBA promoter variants. Table 20 shows data for all promoter variants run together.

[0731] The activities of the promoters ranged from 0.4 to 125-fold increase as compared to the control. This is a 321-fold difference in activity between the promoter with the lowest expression and the promoter leading to the highest expression. The CMV (SEQ ID NO: 1743) promoter provided the greatest activity, with the CBA (SEQ ID NO: 1734), mCBA (SEQ ID NO: 1760), CMV-D2 (SEQ ID NO: 1745), CBA-D1 (SEQ ID NO: 1735), CBA-D2 (SEQ ID NO: 1736), CMV-D6 (SEQ ID NO: 1749), mCBA-D1 (SEQ ID NO: 1761), and CMV-D4 (SEQ ID

NO: 1747) promoters each showing decreasing efficacy in inducing expression of luciferase. An overall activity ranking of the promoter variants was as follows, listed in order of promoter with the highest expression to the promoter with the least activity: CMV (SEQ ID NO: 1743), mCBA (SEQ ID NO: 1760), CBA (SEQ ID NO: 1734), CMV-D2 (SEQ ID NO: 1745), CMV-D1 (SEQ ID NO: 1744), CBA-D1 (SEQ ID NO: 1735), CBA-D2 (SEQ ID NO: 1736), CMV-D6 (SEQ ID NO: 1749), mCBA-D1 (SEQ ID NO; 1761), CMV-D4 (SEQ ID NO: 1747), CMV-D5 (SEQ ID NO: 1748), CMV-D3 (SEQ ID NO: 1746), mCBA-D3 (SEQ ID NO: 1763), mCBA-D2 (SEQ ID NO: 1762), CBA-D5 (SEQ ID NO: 1739), CBA-D6 (SEQ ID NO: 1740), mCBA-D6 (SEQ ID NO: 1766), CBA-D3 (SEQ ID NO: 1737), mCBA-D5 (SEQ ID NO: 1765), mCBA-D4 (SEQ ID NO: 1764), CBA-D4 (SEQ ID NO: 1738), CBA-D7 (SEQ ID NO: 1741), CMV-D7 (SEQ ID NO: 1750), CMV-D8 (SEQ ID NO: 1751), CBA-D8 (SEQ ID NO: 1742), pGL3-FXNpro1336 (SEQ ID NO: 1759), pGL3-FXNpro1060 (SEQ ID NO: 1756), pGL3-FXNpro1226 (SEQ ID NO: 1757), pGL3-FXNpro534 (SEQ ID NO: 1754), pGL3-FXNpro363 (SEQ ID NO: 1753), pGL3-FXNpro223 (SEQ ID NO: 1752) and pGL3-basic.

[0732] Based on these findings, 12 promoter variants were selected for further studies. These included CMV (SEQ ID NO: 1743), CBA (SEQ ID NO: 1734), CMV-D1 (SEQ ID NO: 1744), mCBA-D1 (SEQ ID NO: 1761), CMV-D3 (SEQ ID NO: 1746), mCBA-D2 (SEQ ID NO: 1762), CBA-D6 (SEQ ID NO: 1740), CBA-D4 (SEQ ID NO: 1738), CMV-D7 (SEQ ID NO: 1750), CBA-D8 (SEQ ID NO: 1742), pGL3-FXNpro1060 (SEQ ID NO: 1756), and pGL3-FXNpro534 (SEQ ID NO: 1754). Promoters were selected that demonstrated low, medium, and high expression.

Example 2. Design of payload constructs encoding Frataxin

[0733] Payload constructs were designed to comprise at a minimum a nucleic acid sequence encoding a frataxin protein. Payload constructs were built using standard molecular cloning techniques. FXN-tag transgenes were cloned into an AAV expression vector and the resulting clones were further sequenced to confirm the correctness of all elements such as ITRs, promoters, and tags.

[0734] To build cynomolgus monkey frataxin (cFXN) payload constructs, hemagglutinin (HA) tagged cFXN transgene was cloned into a plasmid containing 5' and 3' ITR sequences (141 nucleotides) derived from an AAV2 genome, a CBA, CMV or FXN promoter, a hβglobin intron region, a hGH poly (A) signal and three miR-122 binding sites (miR-122 BS) for liver-detargeting. Deletion variants of the CBA, CMV or FXN promoter were evaluated. A human albumin sequence of 450 bp (Alb450) was tested as a filler sequence in three constructs (*see* Table 4; ITR to ITR sequences).

[0735] To build human frataxin (hFXN) payload constructs with different configurations, a starting construct comprising 5' and 3' ITR sequences (141 nucleotides) derived from an AAV2 genome, a CBA promoter, a hβglobin intron region, a hFXN gene, and a hGH poly (A) signal, was utilized. Subsequent payload constructs derived from the starting construct contained one of the following four promoter deletion variants: CBA-D8, CMV, CMV-D7, and FXNpro1060. To have full genome size, human albumin was chosen to serve as a filler (Alb1384, Alb1856, Alb450, Alb2266, Alb2335, Alb1785, Alb2264, or Alb1313) and was added to the subsequent payload constructs. Human frataxin constructs containing the filler sequences were built with or without the miR-122 binding sites (miR-122 BS) for liver-detargeting (*see* Table 4).

[0736] Plasmids containing the payload constructs are described in Table 4. These payload constructs comprise a vector backbone, 5' and 3' ITR sequences (141 nucleotides) derived from an AAV2 genome, a human β-globin (hβglobin) intron region, a human growth hormone (hGH) poly (A) signal, and may also comprise the following components: a CBA, mCBA, CMV, or FXN promoter or a deletion variant thereof; a cynomolgus monkey frataxin (cFXN) or human frataxin (hFXN) gene; a hemagglutinin (HA) tag; three miR-122 binding sites (BS); and a filler sequence of various length derived from the human albumin gene. The hβglobin intron region comprises an immediate-early protein 1 (ie1) exon 1, a partial ie1 intron, a hβglobin intron 2 and a hβglobin exon 3. The components between the ITR sequences are presented from 5' to 3' in Table 4.

[0737] Construct ITR to ITR sequences were confirmed by sequencing and are given as SEQ ID NO: 1778-1804.

Example 3. Verification of cFXN constructs and components thereof

A. Identification of promoter variants and hβglobin intron

[0738] To verify the promoter and hβglobin intron region in engineered cFXN constructs driven by CMV, CBA, and FXN promoter variants, the constructs were digested with the high-fidelity restriction enzymes MluI-HF and AgeI-HF. The double digestion yields a cleavage product consisting of the promoter and hβglobin intron region. The digested samples were analyzed by agarose gel electrophoresis. The variants tested included cFXN1-cFXN18 (SEQ ID NO: 1778-1795). Gel revealed bands with a pattern corresponding to the sizes of the promoter variants.

B. Identification of miR-122 and hGH poly(A)

[0739] To verify the miR-122 and hGH poly(A) region in the engineered cFXN constructs driven by CMV, CBA, and FXN promoter variants, the constructs were digested with the restriction enzymes XhoI and ClaI. The double digestion yields a cleavage product consisting of

the miR-122 binding sites, the hGH poly (A) sequence and in some cases the filler sequence. The digested samples were analyzed by agarose gel electrophoresis. The variants tested included cFXN1-cFXN18 (SEQ ID NO: 1778-1795). A band corresponding to the miR-122 and hGH poly(A) region was detected in most constructs. Variants lacking the miR-122 sequence exhibited a lower band compared to the constructs having a miR-122 sequence. Variants with a filler sequence exhibited a higher band, confirming the presence of the filler.

C. Identification of ITRs

[0740] To verify the inverted terminal repeats (ITRs) in the engineered cFXN constructs driven by CMV, CBA, and FXN promoter variants, the constructs were digested with the restriction enzymes XmaI or MscI individually. Both XmaI and MscI cleave within the ITRs and at one additional site in the construct. The digested samples were analyzed by agarose gel electrophoresis. The variants tested included cFXN1-cFXN18 (SEQ ID NO: 1778-1795). Both gels revealed three cleavage products in all constructs, confirming the presence of the ITRs.

Example 4. Production of cFXN constructs in mammalian cells

[0741] cFXN constructs (SEQ ID NO: 1778-1795) were used to transfect HEK-293T or Huh7 cells. Transfection was performed in a 12-well plate with approximately $1.5x10^5$ cells per well. Cells were incubated with 1.0 μg cFXN construct, 1.0 μg control plasmid containing an EGFP gene, and 4.0 μl FUGENE® HD Transfection Reagent (Promega, Madison, WI). At 72 hours post-transfection, cells were analyzed for EGFP expression by fluorescence microscopy. Cells transfected with EGFP plasmid alone exhibited fluorescence and served as the positive control, whereas untransfected cells served as the negative control and did not exhibit any fluorescence. The various constructs exhibited similar levels of EGFP expression, demonstrating efficient transfection. Cells were then subjected to RNA and protein extraction for subsequent analysis.

Example 5. Detection of hβglobin intron splicing

[0742] A forward primer and a reverse primer were used to amplify a fragment covering the hβglobin intron and cFXN-HA transgene sequence from the cFXN constructs. PCR reactions were performed and products were analyzed by agarose gel electrophoresis. All constructs exhibited an identical band corresponding to the fragment retaining the hβglobin intron.

[0743] cDNA was synthesized by reverse transcription from the RNA extracted from transfected HEK-293T or Huh7 cells. PCR reactions were repeated with the cDNA templates and products were analyzed by agarose gel electrophoresis. The cDNA reactions yielded a smaller fragment compared to the fragment amplified directly from the constructs. The size difference coincided with the length of ie1 intron and hβglobin intron 2. The result demonstrated successful splicing of hβglobin intron after transfection.

Example 6. Expression of cFXN protein in HEK-293T and Huh7 cells

A. HEK-293T cells

[0744] The expression of cFXN (SEQ ID NO: 1778-1795) in HEK293T cells subsequent to introduction of different cFXN constructs was detected via Western blot. Total protein was extracted from HEK-293T cells transfected with different cFXN constructs including cFXN1-cFXN18 (SEQ ID NO: 1778-1795). A total of 10 μg protein was loaded for each sample. GAPDH served as the internal control. Western blot revealed three different species of the cFXN protein, namely, a precursor protein (~25 KDa), an intermediate protein (~20 KDa), and a mature protein (~15 KDa). cFXN protein was not detected in cells transfected with EGFP only. Almost all constructs exhibited robust expression of cFXN protein, except for cFXN17 (SEQ ID NO: 1794) and cFXN18 (SEQ ID NO: 1795). cFXN11 (SEQ ID NO: 1788), cFXN12 (SEQ ID NO: 1789), cFXN13 (SEQ ID NO: 1790), cFXN14 (SEQ ID NO: 1791) had the highest expression.

[0745] The amount of cFXN protein expressed was quantified via enzyme-linked immunosorbent assay (ELISA). A total of 20 ng protein was used per group. cFXN constructs expressed cFXN at different levels and the levels of cFXN expression were highly consistent with promoter activity of CBA/CMV/FXN promoter variants. Table 21 lists the cFXN protein concentration expressed by different cFXN constructs in HEK-293T cells.

[0746] The expression of cFXN in Huh7 cells after introduction of different cFXN constructs was detected via Western blot. Total protein was extracted from Huh7 cells transfected with different cFXN constructs including cFXN1-cFXN18 (SEQ ID NO: 1778-1795). A total of 10 μg

protein was loaded for each sample. GAPDH served as the internal control. Western blot revealed three different species of the cFXN protein, namely, a precursor protein (25 KDa), an intermediate protein (20 kDa), and a mature protein (15 kDa). cFXN protein was not detected in cells transfected with EGFP only. A light band was seen in cells transfected with constructs containing miR-122 binding sites indicating that miR-122 effectively reduced cFXN protein expression in liver cells.

[0747] The amount of cFXN protein expressed was quantified via enzyme-linked immunosorbent assay (ELISA). A total of 20 ng protein was used per construct. cFXN constructs expressed cFXN at different levels and the levels of cFXN expression were highly consistent with promoter activity of CBA/CMV/FXN promoter variants. Cells transfected with constructs containing miR-122 binding sites showed significantly lower levels of cFXN protein compared to cells transfected with non-miR-122 constructs. Table 22 lists the cFXN protein concentration expressed by different cFXN constructs in Huh7 cells.

Example 7. *In vitro* testing of hFXN1 constructs

[0748] hFXN1 (SEQ ID NO: 1796) was co-transfected with an AAV PHP.B packaging plasmid into HEK-293T cells. Four dishes of transfected cells were used to purify the AAV particles. AAV particles were purified by iodixanol gradient ultracentrifugation. The purified sample contained 1E12vg/ml AAV particles. The sample was run on a sodium dodecyl sulfate (SDS)-gel followed by silver staining to visualize the transgene band and check for impurities.

Gel revealed the copurified hFXN protein, confirming successful packaging of the transgene into AAV.

[0749] Three different AAV multiplicity of infections (MOIs) were utilized to transfect HEK-293T cells, namely 5 x 10^5, 1 x 10^5, and 2 x 10^4. Following transfection, protein was extracted from the cells and expression detected by performing a Western blot. Expression of hFXN was directly proportional to the MOI of the transfection. Robust hFXN expression was seen for cells infected with the highest MOI of 5 x 10^5. hFXN protein was not detected for HEK-293T cells transfected with a MOI of 2 x 10^4, whereas it was detected for HEK-293T cells transduced with a MOI of 1 x 10^5.

[0750] The size of the AAV viral genome was analyzed using denaturing agarose gel electrophoresis. A single band was detected that corresponds to the expected genome size (2881 bp).

Example 8. Generation of human hFXN constructs

A. Alternative promoter design for constructs encoding hFXN1

[0751] The hFXN1 (SEQ ID NO: 1796) construct was utilized as a starting template to generate four intermediate plasmids by swapping the promoters. The four intermediate plasmids generated each contained one of the following promoters: FXNpro1060 (SEQ ID NO: 1756), CMV (SEQ ID NO: 1743), CMV-D7 (SEQ ID NO: 1750), and CBA-D8 (SEQ ID NO: 1742). Intermediate plasmids were generated by subcloning the four promoter sequences into the hFXN1 template using MluI and Hind3 restriction sites. The ligation products were transformed into bacterial cells and plasmids were purified using standard miniprep protocol. Purified plasmids were verified by restriction digestion with MluI/Hind3 or MluI/AgeI followed by agarose gel electrophoresis.

B. Insertion of human albumin (Alb) filler sequences

[0752] To ensure full genome size, human albumin DNA was chosen to serve as filler. Genomic DNA of human albumin was isolated from HEK-297T and HeLa cells. PCR reactions were carried out to amplify 8 different sizes of albumin DNA, namely, 1313 bp (SEQ ID NO: 1831), 1384 bp (SEQ ID NO: 1832), 1785 bp (SEQ ID NO: 1833), 1856 bp (SEQ ID NO: 1835), 2264 bp (SEQ ID NO: 1840), 2266 bp (SEQ ID NO: 1841), and 2335 bp (SEQ ID NO: 1842). The four intermediate plasmids were digested with either one restriction enzyme AvrII, which makes a cut between the miR-122 binding sites and the 3' ITR, or two restriction enzymes AvrII and BspEI, which excise a fragment containing the miR-122 binding sites. The 8 albumin PCR products were ligated with the enzyme-digested plasmids with or without miR-122 binding sites

via Gibson Assembly. The ligation products were transformed into bacterial cells and plasmids were purified using standard miniprep protocol. Purified plasmids were verified by restriction digestion with XbaI/KpnI followed by agarose gel electrophoresis.

[0753] The final 8 constructs having genome size of 4.6 kb were sequenced from inverted terminal repeat (ITR) to ITR to confirm sequence integrity.

Example 9. Expression of hFXN protein in HEK-293T cells

[0754] The hFXN constructs were transfected into HEK-293T cells and hFXN protein expression was assessed via Western blots and ELISA. Transfection was performed as described previously. A GFP plasmid was used as an internal control. A total of 10 µg protein was loaded per sample. Western blot detected three forms of hFXN protein: precursor, intermediate and mature hFXN. Construct hFXN4 and hFXN5 (SEQ ID NO: 1799 and 1800) had the strongest hFXN expression, whereas hFXN2, hFXN3, hFXN6, and hFXN7 (SEQ ID NO: 1797, 1798, 1801, and 1802) exhibited limited expression, and hFXN8-hFXN9 (SEQ ID NO: 1803-1804) had weak to non-detectable expression.

[0755] The amount of hFXN protein and GFP expression was quantified via ELISA. Among the hFXN constructs, hFXN4 (SEQ ID NO: 1799) and hFXN5 (SEQ ID NO: 1800) demonstrated the highest hFXN protein concentration with relative hFXN expression of >20 times higher than the others. Table 23 lists the hFXN protein concentration and GFP expression in HEK-293T cells. Relative hFXN expression was calculated as hFXN/GFP ratio, showing fold change to endogenous hFXN control.

Example 10. In vivo promoter selection studies

[0756] ITR to ITR sequences comprising promoters were packaged into AAV6 capsids and delivered by intrastriatal injection to Sprague Dawley rats at a dose of $1x10^{10}$ VG. Tissue samples were collected at 3 weeks or 10 weeks and frataxin protein levels quantified. Constructs cFXN2 (SEQ ID NO: 1779), cFXN3 (SEQ ID NO: 1780), cFXN4 (SEQ ID NO: 1781), cFXN13

(SEQ ID NO: 1790), cFXN14 (SEQ ID NO: 1791), cFXN17 (SEQ ID NO: 1794), cFXN18 (SEQ ID NO: 1795), hFXN2 (SEQ ID NO: 1797), hFXN4 (SEQ ID NO: 1799), hFXN5 (SEQ I DNO: 1800), and hFXN6 (SEQ ID NO: 1801) were used for these studies.

[0757] Based on the quantification of frataxin expression, constructs demonstrating 3-fold (hFXN4; SEQ ID NO: 1799), 5-fold (hFXN8; SEQ ID NO: 1803), 8-fold (hFXN2; SEQ ID NO: 1797) and 25-fold (hFXN6; SEQ ID NO: 1801) weaker expression than cFXN2 were selected for further study. Wildtype CBA and CMV promoter-containing constructs (e.g., cFXN1; SEQ ID NO: 1778) were used as controls. The viral genomes were packaged into capsid VOY201 (SEQ ID NO: 1724) and administered by intravenous delivery to Sprague Dawley rats at a dose of either $6.3x10^{12}$ or $2x10^{13}$ VG/kg. After 28 or 90 days, tissue samples were collected and processed for quantification of frataxin expression (ng/mg).

[0758] Promoters CMV-D7 (SEQ ID NO: 1750) and CBA-D8 (SEQ ID NO: 1742) demonstrated the target moderate frataxin expression as compared to the other constructs and were therefore selected for further study.

[0759] To test the durability and persistence of frataxin expression driven by the CMV-D7 (SEQ ID NO: 1750) and CBA-D8 (SEQ ID NO: 1742) promoters, a time course study was conducted. Viral genomes comprising a CMV-D7 (SEQ ID NO: 1750), CBA-D8 (SEQ ID NO: 1742), CBA (SEQ ID NO: 1734) or CMV (SEQ ID NO: 1743) promoter with a frataxin payload sequence were packaged into VOY101 (SEQ ID NO: 1) capsids to generate AAV particles. These AAV particles were administered by intravenous delivery via the tail vein to male Sprague Dawley rats at one of two doses ($6.3x10^{12}$ or $2x10^{13}$). At 28, 90, or 180 days after administration, tissue samples were collected (heart, liver, cerebellum, thoracic and lumbar DRG) and processed for quantification of vector genome per diploid cell and frataxin expression levels based on an Anti-Frataxin SimpleStep ELISA. Data are shown below in Tables 24 and 25, FIG. 1A, FIG. 1B, FIG. 1C and FIG. 1D.

[0760] In tissue collected from the heart ventricle, driving frataxin expression using the CMV-D7 (SEQ ID NO: 1750) promoter enhanced frataxin expression 0.2-2.5x, while driving frataxin expression using the CBA-D8 (SEQ ID NO: 1742) promoter enhanced frataxin expression 0.3-7.8x. As comparison, the CBA (SEQ ID NO: 1734) promoter enhanced frataxin expression 41.2-70x and the CMV (SEQ ID NO: 1743) promoter enhanced frataxin expression 297x as compared to normal frataxin expression.

[0761] In tissue collected from the cerebellum, driving frataxin expression using the CMV-D7 (SEQ ID NO: 1750) promoter enhanced frataxin expression 0.01-0.31x, while driving frataxin expression using the CBA-D8 (SEQ ID NO: 1742) promoter enhanced frataxin expression 0.01-0.28x. As comparison, the CBA (SEQ ID NO: 1734) promoter enhanced frataxin expression 0.0-0.9x and the CMV (SEQ ID NO: 1743) promoter enhanced frataxin expression 0.21x as compared to normal frataxin expression.

[0762] In tissue collected from the lumbar DRG, driving frataxin expression using the CMV-D7 (SEQ ID NO: 1750) promoter enhanced frataxin expression 1.6-6.2x, while driving frataxin expression using the CBA-D8 (SEQ ID NO: 1742) promoter enhanced frataxin expression 1.1-5.2x. As comparison, the CBA (SEQ ID NO: 1734) promoter enhanced frataxin expression 0.0-5.4x and the CMV (SEQ ID NO: 1743) promoter enhanced frataxin expression 0.5x as compared to normal frataxin expression.

[0763] Immunohistochemical analysis was performed on 30μm tissue samples collected 28 days after AAV particle administration. An anti-hFXN antibody (1/50,000) was used. Frataxin expression driven by the CMV-D7 (SEQ ID NO: 1750) and CBA-D8 (SEQ ID NO: 1742) promoters was detected in the dentate nucleus of treated rats.

[0764] Each of CMV-D7 (SEQ ID NO: 1750), CBA-D8 (SEQ ID NO: 1742) and CBA (SEQ ID NO: 1734) promoters showed similar distribution and expression patterns in the DRG and brain. In the heart, CMV-D7 and CBA-D8 promoters generated FXN expression approximately 50-260 fold lower than CBA-driven frataxin expression.

[0765] The CMV-D7 (SEQ ID NO: 1750) and CBA-D8 (SEQ ID NO: 1742) promoters both drive frataxin expression in the cerebellum, heart and DRG at 180 days after administration of the AAV particles. At this time point, expression in the cerebellum is approximately 3-fold greater than that achieved using the reference CBA promoter, indicating that the CMV-D7 and CBA-D8 promoters are active in target cells of the cerebellum.

Example 11. In vivo cFXN expression levels following intra-striatal administration of a viral genome comprising alternative promoter variants in rats.

[0766] To test frataxin expression driven by alternative promoter variants, a viral genome comprising one promoter selected from any of the following promoters: CMV-D1 (SEQ ID NO: 1744) , CMV-D3 (SEQ ID NO: 1746), CBA-D4 (SEQ ID NO: 1738) and CBA-D6 (SEQ ID NO: 1740) (as taught in Table 3), AAV2 wild-type ITRs, *Macaca fascicularis* frataxin (cynoFXN or cFXN) with a HA-tag, triple repeat of a miR-122 target and a human growth hormone polyadenylation sequence was packaged into an AAV6 capsid and delivered by intra-striatal injection to Sprague Dawley rats at a dose of $1x10^{10}$ VG/kg, unless noted otherwise. As controls, FXNpro534 (SEQ ID NO: 1754), FXNpro1060 (SEQ ID NO: 1756), CMV (SEQ ID NO: 1743), CBA (SEQ ID NO: 1734) promoters or their variants were used to drive cFXN expression from a viral genome and packaged into an AAV6 capsid. Tissue samples were collected 3 weeks after injection and striatal cFXN protein levels were quantified by ELISA. Data are shown below in Table 26 and FIG. 2.

[0767] Striatal cFXN expression driven by the FXNpro534 (SEQ ID NO: 1754) promoter was comparable to the endogenous frataxin level, while the FXNpro1060 (SEQ ID NO: 1756) promoter resulted in 6.6x of the endogenous FXN level. As controls, high levels of cFXN expression were achieved by CMV.miR122 (24.4x), CBA.miR122 (34.7x) or CBA (86x) promoters, respectively. Moderate expression levels of cFXN driven by CMV-D7 (SEQ ID NO: 1750) or CBA-D8 (SEQ ID NO: 1742) promoters were observed by 1.4x and 4.2x, respectively, which were within the ranges of those driven by two FXN promoter variants. Alternative promoter variants CMV-D1 (SEQ ID NO: 1744), CMV-D3 (SEQ ID NO: 1746), CBA-D4 (SEQ ID NO: 1738) and CBA-D6 (SEQ ID NO: 1749) resulted in higher cFXN expression than either CMV-D7 (SEQ ID NO: 1750) or CBA-D8 (SEQ ID NO: 1742), but still much lower than CMV.miR122. In summary, these data indicated that additional promoter variants were effective to induce cFXN expression in rat striatum.

Example 12. In vivo cFXN expression and vector genome biodistribution following intrathalamic administration of VOY101-cFXN-HA AAV vectors

[0768] To achieve widespread expression of cFXN in deep cerebellar nuclei and associated cFXN levels in spinal cord and dorsal root ganglion, VOY101-cFXN-HA (SEQ ID NO: 1778) vectors were administered by bilateral intrathalamic injection into Sprague Dawley rats.

[0769] Single strand viral genome comprising a CBA promoter and cFXN-HA sequence were packaged into VOY101 particles and injected intrathalamically at the dose of $5x10^{10}$ vg/injection. The injection volume and injection rate were 12 µl/injection and 0.5 µl/min, respectively. One rat was treated with vehicle control. Six weeks after treatment, immunohistochemical analysis was performed to assess the expression of cFXN-HA in the dentate nucleus of the cerebellum and spinal cord using anti-HA immunostaining. Compared to the vehicle control, strong HA staining was observed throughout the whole dentate nucleus of cerebellum in all treated animals. Furthermore, widespread cFXN expression were evident in dorsal column, central canal, ventral horn and Clarke's column of the cervical, thoracic and lumbar spinal cord distal from the injection site. These results together indicated that intrathalamic injection of VOY101-CBA-

cFXN vectors could cause efficient transduction of deep cerebellar nuclei and neurons of spinal cord and drive the expression of FXN protein.

Example 13. Transgene expression levels of hFXN following intravenous administration of *Pvalb* cKO mice with VOY101-CMV-D7-hFXN or VOY101-CBA-D8-hFXN AAV particles

[0770] Friedreich's Ataxia (FA) is caused by an intronic GAA expansion in the frataxin gene which significantly reduces FXN expression in mitochondria. Patients at the early stage of Friedreich's Ataxia exhibit difficulty in walking and loss of balance due to the loss of large proprioceptive neurons in the peripheral dorsal root ganglia (DRG). Subsequently trunk and arm functions deteriorate because of increasing spino-cerebellar neuronal impairment. Patients become wheelchair bound and incapacitated, leading to a reduced average life span of about 40 years of age. To model the selective nature of neuronal loss in FA, a transgenic mouse was created in which FXN expression is abolished via the Cre Lox system in parvalbumin expressing cells (Pvalb cKO mice) (Piguet et al. 2018). The Pvalb cKO mice showed loss of proprioceptive sensory function and progressive ataxia within weeks after birth.

[0771] A viral genome comprising CMV-D7-hFXN (SEQ ID NO: 1801) or CBA-D8-hFXN (SEQ ID NO: 1797) was used to generate AAV particles, having a capsid serotype of VOY101 (SEQ ID NO: 1). The viral genome comprising a promoter (CMV-D7 or CBA-D8), two AAV2 ITRs, hFXN, triple repeat of a miR-122 target and a human growth hormone polyadenylation sequence was packaged into VOY101 AAV particles by triple transfection of HEK293 cells. The AAV particles were purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68, and then administered intravenously to mice at the dose of $2X10^{13}$ VG/kg.

[0772] To test hFXN expression levels in *Pvalb* cKO animals administrated intravenously with the single stranded VOY101-CMV-D7-hFXN or VOY101-CBA-D8-hFXN AAV particles, the particles were administered intravenously to *Pvalb* cKO mice at the age of 7.5 weeks at one of three doses of 6.32×10^{12} VG/kg, or $2.0x10^{13}$ VG/kg. A group of *Pvalb* cKO mice was treated intravenously with AAV9-hFXN particles at 7.0×10^{12} VG/kg. WT or *Pvalb* cKO mice were also administered with vehicle control.

[0773] Four weeks after administration, mice 11.5 weeks old were euthanized. The cerebellum and lumbar DRG tissues were collected and processed for quantification of hFXN expression levels. hFXN protein levels were measured by ELISA and reported in ng hFXN/mg of total protein. Fold changes of hFXN expression in cerebellum or lumbar DRG relative to the WT endogenous FXN levels were calculated. Data are shown at Table 27, FIG. 3A, and FIG. 3B.

[0774] In tissue collected from the lumbar DRG, intravenous administration of VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) particles in *Pvalb* cKO animals enhanced hFXN expression by 2.8-6.4x as compared to the WT endogenous FXN levels 4 weeks after delivery. Intravenous administration of VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) particles in *Pvalb* cKO animals enhanced hFXN expression by 0.8-2.6x 4 weeks after delivery.

[0775] In tissue collected from the cerebellum, intravenous administration of VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) particles in *Pvalb* cKO animals enhanced hFXN expression by 10.3-24.3x as compared to the WT endogenous FXN levels 4 weeks after delivery. Intravenous administration of VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) particles in *Pvalb* cKO animals enhanced hFXN expression by 6.4-18.8x as compared to the WT endogenous FXN levels 4 weeks after delivery.

[0776] In summary, high hFXN expression levels in the cerebellum and lumbar DRG of *Pvalb* cKO animals indicated that either VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) particles were capable of transducing these tissues.

Example 14. Correction of proprioceptive deficit and rescue of motor function and muscular functions in *Pvalb* cKO mice following intravenous administration of VOY101-CMV-D7-hFXN or VOY101-CBA-D8-hFXN AAV particles.

[0777] To evaluate the therapeutic efficacy of VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) vectors, the rescue of proprioceptive deficit in *Pvalb* cKO mice were tested by electromyogram analysis after intravenous (IV) delivery of these vectors at a dose of 6.32×10^{12} VG/kg or $2.0x10^{13}$ VG/kg.

[0778] The single-stranded VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) particles were purified and formulated in 192 mM sodium chloride, 2.7 mM potassium chloride, 2 mM potassium phosphate (monobasic) and 10 mM sodium phosphate (dibasic) with 0.001% pluronic acid (Pluronic F-68) and at pH 7.4, and

administered via intravenous injection to adult *Pvalb* cKO mice at 7.5 weeks of age at a single dose of 6.32×10^{12} VG/kg or $2.0x10^{13}$ VG/kg. A control group received intravenous injection of AAV9-hFXN particle at the dose of $7x10^{12}$ VG/kg.

[0779] Electromyogram analyses were performed using the Natus UltraProS100 apparatus (Mag2Health, France). *Pvalb* cKO mice were anesthetized using IP injection with ketamine/xylazine (130/13 mg/kg). Animals were maintained at 37°C throughout the electrophysiological assessment. Latency and amplitude of the spinal somatosensory evoked response (H wave) were recorded in the plantar hind paw muscle after sciatic nerve stimulation (0.1 ms and 8 mA intensity). Electromyogram analysis was performed by recording spinal somatosensory evoked response (H wave) every week, two weeks or three weeks, depending on age of the mice, starting at 6.5 weeks of age according to Piguet et al 2018.

[0780] As shown in FIG. 4, H wave intensity in the *Pvalb* cKO mice at the age of 6.5 weeks was reduced significantly compared to the WT mice. In the cKO mice at the age of 8.5 weeks-one week after the injection, the H wave levels were no longer measurable. In contrast, intravenous injections of either VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) particles within a week of dosing almost completely restored H wave intensity to levels comparable to those seen in WT animals, indicating a reversal of the proprioceptive deficit of *Pvalb* cKO mice. Complete rescue was observed after 4 weeks of high dosing at $2.0x10^{13}$ VG/kg using either of AAV particles.

[0781] These results demonstrated a dose-dependent effect of IV VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY-CBA-D8-hFXN (SEQ ID NO: 1797) on spinal somatosensory evoked response, especially IV dose from 6.32×10^{12} VG/kg to 2.00×10^{13} VG/kg in mice at the age of weeks 11.5.

[0782] To test the rescue of motor and muscular function in *Pvalb* cKO animals after intravenous delivery of either VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) particles, a notched-bar experiment (scored number of slips of the upper or lower limbs – 'falls') as previously described (Piguet el al. 2018) was conducted in cKO animals at 7.5, 8.5, 9.5 and 11.5 weeks of age. The VOY101 particles were administered by IV injection to cKO animals (7.5 weeks of age) as described as above.

[0783] As shown in FIG. 5, the *Pvalb* cKO mice quickly developed ataxic deficit from weeks 7.5 to 11.5. In contrast, intravenous administration of either VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101CBA-D8-hFXN (SEQ ID NO: 1797) particles at doses of $6.3x10^{12}$ or $2.0x10^{13}$ VG/kg rapidly reversed the ataxic phenotype one week after injection. The rescue effect still persisted in the cKO animals 4 weeks after treatment.

Example 15. In vivo hFXN expression and vector genome biodistribution after intravenous dosing of VOY101-CMV-D7 or VOY101-CBA-D8-hFXN AAV particles in non-human primates (NHP)

[0784] A single stranded viral genome comprising two AAV2 ITRs, a promoter (CMV-D7 or CBA-D8), hFXN cDNA sequence, triple repeat of a miR-122 target, a human growth hormone polyA sequence, a fragment of human albumin as a stuffer sequence, is packaged into VOY101 capsids, produced by triple transfection, purified and formulated in phosphate buffered saline (PBS) with 0.001% F-68.

[0785] Three groups of adult cynomolgus monkeys (3 animals per group), approximately 2.7-5.8 years old, pre-screened for low anti-AAVVoy101 antibodies using both LEC2 nAb in vitro assay and IgG ELISA, will receive vehicle (PBS with 0.001% F-68), VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) at the dose of $5x10^{13}$ VG/kg (titer $1.0x10^{13}$ VG/ml) via intravenous injection. The injection rate will be 3ml/min and the dose volume will be 5mL/kg (~17.5 mL/animal).

[0786] To test the distribution and expression of VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) in NHP, any test known in the art may be utilized. The hFXN protein and mRNA expression will be assessed by ELISA, PCR, immunohistochemistry, in situ hybridization (ISH) and liquid chromatography tandem mass spectrometry (LC-MS/MS). Vector genome levels in different tissues will be quantified using PCR and ISH.

[0787] The following samples may be collected: cervical, thoracic and/or lumbar DRG, cervical, thoracic, and/or lumbar spinal cord, frontal cortex, motor cortex, hippocampus, striatum, cerebellum, brainstem, liver, heart, heart atrium, heart ventricle. Tissues of the DRG, heart ventricle, lower lumbar spinal cord, upper lumbar spinal cord, frontal cortex, cerebellum and liver will be used to determine hFXN expression in target tissues using ELISA and LC-MS and digital droplet PCR to quantify vector genome/diploid cell. The expression and distribution of hFXN will be measured in cells of DRG, cerebellar dentate nucleus, Clarke's column, gracile and cuneate nuclei and heart by in situ hybridization (ISH). The resulting data will be used to confirm expected tissue biodistribution and transgene hFXN expression of VOY101-CMV-D7-hFXN (SEQ ID NO: 1801) or VOY101-CBA-D8-hFXN (SEQ ID NO: 1797) AAV particles in non-human primates.

Example 16. In vivo promoter selection studies in non-human primate (NHP)

[0788] Select AAV particles with viral genomes comprising promoter variant sequences will be tested in non-human primates to determine frataxin expression in target cells and tissues.

[0789] AAV particles which include the selected hFXN ITR-to-ITR constructs in VOY101 capsids will be produced by triple transfection using mammalian HEK293 cells according to the present disclosure. The resulting AAV particles will be purified and then formulated into Formulation 1 (192 mM sodium chloride, 2.7 mM potassium chloride, 2 mM potassium phosphate (monobasic) and 10 mM sodium phosphate (dibasic) with 0.001% pluronic acid (Pluronic F-68) and at pH 7.4).

The cynomolgus monkeys will receive AAV particles via intravenous injection (saphenous) according to the testing parameters of Table 28.

[0791] The resulting distribution and expression of the selected hFXN constructs will be tested in various tissues, including one or more of the following: cervical DRG, thoracic DRG, lumbar DRG, cervical spinal cord, thoracic spinal cord, lumbar spinal cord, frontal cortex, motor cortex, hippocampus, striatum, cerebellum, brainstem, liver, heart, heart atrium, and heart ventricle.

[0792] The following primary readouts will be measured and collected from the test subjects: Complete Blood Count (CBC), serum chemistry, serum cytokine proteins, cage-side observations, Body Weight, AAV Vector Genome (VG) distribution, hFXN protein distribution, and hFXN protein expression. These primary readouts will be tested and measured according to various methods known in the art, including ELISA, PCR, immunohistochemistry, in situ hybridization (ISH) and liquid chromatography tandem mass spectrometry (LC-MS/MS).

Example 17. Testing of promoter constructs with alternative capsids

[0793] Viral genomes (e.g., hFXN2; SEQ ID NO: 1797, hFXN6; SEQ ID NO: 1801) comprising select promoter variant constructs from Table 4 will be incorporated into AAV particles having alternative capsids selected from Table 1. These capsids may have a sub-optimal or non-canonical initiation codon for translation of VP1, such as, but not limited to CTG. Such AAV particles will be used to deliver frataxin protein to target cells in a mouse by intravenous injection via the tail vein. Twenty-three male C57BL/6J mice will be given a $2x10^{13}$ VG/kg dose of an AAV particle composition. Fourteen days after delivery, mice will undergo transcardiac perfusion with cold 1x PBS and tissue samples will be collected.

[0794] Any or all of the following tissue samples will be collected. Cervical, thoracic and/or lumbar DRG, cervical, thoracic, and/or lumbar spinal cord, frontal cortex, motor cortex, hippocampus, striatum, cerebellum, brainstem, liver, heart, heart atrium, heart ventricle, and/or gastrocnemius muscle. Tissue of the lumbar DRG, heart ventricle, lower lumbar spinal cord, frontal cortex and cerebellum will be used for ELISA to determine frataxin expression in the target tissue. Thoracic DRG, heart ventricle, upper lumbar spinal cord, frontal cortex, cerebellum, and/or liver will be used for digital droplet PCR to quantify vector genome/diploid cell. The resulting data will be used to confirm expected tissue biodistribution and transduction.

It is anticipated that the use of an alternative capsid will result in similar if not better biodistribution and transduction as compared to VOY101, VOY201, and/or AAV9 or a variant thereof.

Example 18. In vivo promoter selection studies in rats

[0795] Select AAV particles with viral genomes comprising promoter variant sequences were tested in rats to determine frataxin expression in target cells and tissues. The following hFXN ITR-to-ITR constructs selected from Table 4 were used: hFXN2 (SEQ ID NO: 1797), hFXN10 (SEQ ID NO: 1805), hFXN11 (SEQ ID NO: 1806), hFXN12 (SEQ ID NO: 1807), hFXN13 (SEQ ID NO: 1808), hFXN14 (SEQ ID NO: 1809), and hFXN15 (SEQ ID NO: 1810). AAV particles which included the selected hFXN ITR-to-ITR constructs in VOY101 capsids were produced by triple transfection using mammalian HEK293 cells according to the present disclosure. The resulting AAV particles were purified and then formulated into 192 mM sodium chloride, 2.7 mM potassium chloride, and 10 mM sodium phosphate (dibasic) with 0.001% pluronic acid (Pluronic F-68) and at pH 7.4).

[0796] The AAV particles were administered by intravenous delivery via the tail vein into male Sprague Dawley rats (5 per group) at one of two doses: $6.3x10^{12}$ vg/kg or $2x10^{13}$ vg/kg (5 ml/kg over 1 hour). At 28 days after administration, tissue samples were collected (heart ventricle and DRG) and analyzed for frataxin expression levels based on Anti-Frataxin SimpleStep ELISA. Data are shown in FIG. 6A, FIG. 6B, FIG. 6C, and FIG. 6D.

[0797] hFXN13 (CBA.D4), hFXN14 (CBA.D6) and hFXN2 (CBA.D8) were well tolerated at $6.3x10^{12}$ vg/kg or $2x10^{13}$ vg/kg, with low expression levels in both DRG and heart ventricle tissue compared to hFXN10, hFXN11, hFXN12 and hFXN15.

Example 19. *In Vitro* evaluation of promoter variants

[0798] Seven promotor variant constructs including hFXN2 (SEQ ID NO: 1797), hFXN6 (SEQ ID NO: 1801), hFXN10 (SEQ ID NO: 1805), hFXN11 (SEQ ID NO: 1806), hFXN12 (SEQ ID NO: 1807), hFXN13 (SEQ ID NO: 1808), and hFXN14 (SEQ ID NO: 1809) were evaluated for expression activity *in vitro* in HEK293 cells. CMV and CBA promoter constructs were used as controls. The cells were transfected with a plasmid comprising one of the hFXN constructs or controls and a luciferase payload. The activity and expression of luciferase was determined using a luciferase assay system. 239T cells were used as a negative control.

[0799] The activity of the promoter variants as determined by luciferase expression is shown in FIG. 7.
