Abstract: The disclosure provides a personal care composition and method for forming the composition wherein the SCC polymer has at least one functionality selected from the group consisting of silicone, hydroxyl and carboxy. Such functionalized SCC polymers can be employed in a wide range of personal care compositions including skin care, body wash, and shampoo and hair treatments, among other personal care products.
TITLE OF THE INVENTION:
PERSONAL CARE COMPOSITIONS CONTAINING FUNCTIONALIZED POLYMERS

This Application claims the benefit of U.S. Provisional Application No. 60/799616, filed on May 11, 2006 and U.S. Provisional Application No. 60/900847, filed February 12, 2007. The disclosure of these Provisionals is hereby incorporated by reference.

BACKGROUND OF THE INVENTION

FIELD OF THE INVENTION

[0001] This invention relates to personal care or cosmetic compositions comprising functionalized polymers.

INTRODUCTION TO THE INVENTION

[0002] U.S. Patent Nos. 4,057,622, 4,057,623, 4,057,624, 5,318,995, 5,519,063 and 5,736,125 disclose the possibility of thickening oil-containing compositions with certain polymers containing (a) lipophilic groups (e.g. in units derived from long chain n-alkyl acrylates) and (b) certain other groups, namely amide groups (in units derived from arylamide), pyrrolidone groups (in units derived from N-vinyl pyrrolidone), imidazole groups (in units derived from N-vinyl imidazole), carboxylic acid and carboxylic acid salt groups (e.g. in units derived from acrylic or Methacrylic acid), sulphonic acid groups, and sulphonic acid salt groups.

[0004] The entire disclosure of the previously identified patents, and patent applications is incorporated herein by reference for all purposes.
BRIEF SUMMARY OF THE INVENTION

[0005] In accordance with certain aspects of the present invention, a broad range of functionalized side chain crystalline (SCC) polymers can be used to thicken oils, provided that the SCC polymer will dissolve in the oil at a temperature above the crystalline melting point of the polymer (referred to herein as $T_p$) and can crystallize when the solution of the polymer in the oil is cooled to a temperature which is below $T_p$ and at which the thickened oil composition is to be used. Without wishing to be bound by any theory or explanation, it is believed that the SCC polymer crystallizes into a network in which the polymer crystallites are connected to one another by semi-soluble chains.

[0006] In one aspect of the invention, the invention provides a personal care composition and method for making and using the composition wherein the SCC polymer has at least one functionality selected from the group consisting of silicone, hydroxy! and carboxy. Such functionalized SCC polymers can be employed in a wide range of personal care compositions including skin care, body wash, shampoo, hair styling and hair treatments (e.g., hair molding cream, combing cream and pomade, hair sprays, hair colorant), sunscreen, lipstick, anti-perspirant, deodorant, shaving and after shaving products and among other personal care products. The amount of SCC polymer is sufficient to thicken, modify rheology, film form, enhance aesthetics, or improve sensory and feel, especially silicone, among other benefits.

[0007] In another aspect, this invention provides a method of making a composition, the method comprising

(i) dissolving the SCC polymer in the oil at a temperature above $T_p$, and
(ii) cooling the solution to crystallize the polymer in the oil.

[0008] In a further aspect of the invention, an advantage of using these SCC polymers as thickening agents, particularly in water-in-oil emulsions, water-in-silicone, silicone-in-water or multi-phase emulsions, for example, water/oil/water or oil/water/oil, are that the need to use a surface active agent and any other water or oil phase thickener or rheology modifier other than SCC is reduced or removed. Thus the compositions can contain less than 5%, typically less than 2%, usually less than 1%, and in some cases about 0%, of surface active agents or other oil phase or water phase thickeners or rheology modifiers, the percentages being by weight based on the weight of the oil. This
is particularly useful in cosmetic and personal care products, since it is convenient for such products to contain surface active agents (for example, perfluoroalkyl organic compounds), and surface active agents can cause an adverse reaction when they contact human skin.

DETAILED DESCRIPTION OF THE INVENTION

[0009] In the Summary of the Invention above, and in the Detailed Description of the Invention, the Examples, and the Claims below, reference is made to particular aspects of the invention. It is to be understood that the disclosure of the invention in this specification includes all appropriate combinations of such particular features. For example, where a particular aspect or feature is disclosed in the context of a particular embodiment or a particular claim, that feature can also be used, to the extent appropriate, in the context of other particular embodiments and claims, and in the invention generally.

[0010] The invention is particularly useful for personal care compositions, for example cosmetics, toiletries, and cleansers, including but not limited to lipsticks, deodorant sticks, nail varnishes, creams, gels and oils, including sunscreen, hand protective products, night renewal products, body milks, creams and lotions, light facial products, protective day care products, liquid moisturizing emulsions, oil-in-water and water-in-oil creams, as well as thickened oil products with or without water and products designed to assist in removing other cosmetic, makeup or personal care products. The invention is also useful in other contexts, for example in paints, film-forming compositions, inks, and compositions carrying active ingredients such as UV absorbers, fragrances, antimicrobial agents, germicides, antioxidants, preservatives, enzymes, nutrients, minerals and if desired, the foregoing can be supplied in a controlled-release format.

[0011] The instant invention can employ at least one of functionalized side chain crystalline polymers (FSCC) and side chain crystalline polymers (SCC) to obtain improved cosmetic or personal care formulations. Non-limiting examples of such polymers comprise at least one member selected from the group consisting of Poly C12-22 AlkylAcrylates/Methacrylic Acid Crosspolymer (Intelimer® 8600, Intelimer® 8100), Poly C10-30 alkyl acrylate (Intelimer® IPA 13-1, Intelimer® IPA 13-6), Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer (Intelimer® 1261, Intelimer® 1266), Poly C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer (Intelimer® 1221,
Intelimert® 1281), ana hOiy ACryilC ACla/CO-ZC Alky: Acrylues Cym polymer (1281, Intelimer® 1286). The following are examples of some of the benefits that can be obtained by using the FSCC and/or SCC polymers;

1. Ability to modify the rheology of cosmetic emulsion products or anhydrous products by thickening the oil phase,
2. Ability to modify the rheology of cosmetic emulsion products or anhydrous products by thickening the oil phase of silicone oil based formulations,
3. Compatibility in wide variety of cosmetic ingredients,
4. Usage in 100% solid form, or emulsified,
5. Improved water resistance and rub off resistance in cosmetic formulation for skin and hair,
6. Incorporation of active ingredients in the amorphous crystalline matrix structure and ability to release active ingredient in more controlled manner
7. Ability to enhance SPF of sunscreen formulations,
8. Ability to provide breathable film in cosmetic formulations on skin,
9. Film properties can be strengthened and converted into more occlusive (moisture retaining) film in combination of other film forming polymers soluble in oil or water phase along with these polymer
10. Ability to provide fragrance retention and volatile ingredient retention,
11. Ability to make lamellar gels more water resistant without increasing their viscosity,
12. Ability to formulate water-resistant emulsions based on alcohol and/or nonionic ethoxylated emulsifiers,
13. Sensory and texture benefits can be modified and enhanced by using different SCC polymer functionalities, among other benefits that would be understood by a person having ordinary skill in this art.

Definitions and Abbreviations

[0012] In this specification, parts and percentages are by weight, except where otherwise noted. Temperatures are in °C. The onset-of-melting temperature, \( T_0 \), the peak melting temperature, \( T_p \), and the heat of fusion, J/g, are determined using a differential scanning calorimeter (DSC) at a rate of temperature change of 10 °C./min, for example from —10 to 150 °C, and on the second heat cycle. \( T_p \) is the temperature at the
peak of the DSC curve, and $I_0$ is the intersection of the baseline of the DSC peak and the onset line, the onset line being defined as the tangent to the steepest part of the DSC curve below $T_p$. The abbreviations $M_n$ and $M_w$ are used to denote number average and weight average molecular weight in daltons, respectively, measured in tetrahydrofuran using size exclusion chromatography, configured with a Wyatt laser light scattering detector. Bulk viscosities given in the Examples for the polymeric thickeners are in centipoise and were measured using a Brookfield LVT viscometer with an electrically thermostatted Thermosel heater, controlled for example to 95 °C, and small sample adapter using spindles 4 and 7. Wt% or %w/w refers to weight percent; and q.s. means to incorporate an amount of the indicated material sufficient to make the sum of all %w/w equal to 100.

[0013]  The abbreviation CxA is used to denote an n-alkyl acrylate in which the n-alkyl group contains $x$ carbon atoms, the abbreviation Cx alkyl is used to denote an n-alkyl group which contains $x$ carbon atoms, and the abbreviation CxM is used to denote an n-alkyl methacrylate in which the n-alkyl group contains $x$ carbon atoms. Other abbreviations are given elsewhere in the specification.

The Polymeric Thickeners

[0014]  The FSCC and/or SCC polymers used as thickeners in the present invention can be homopolymers, or copolymers of two or more comonomers, including random copolymers, graft copolymers and block copolymers (including thermoplastic elastomers). Two or more SCC polymers can be used together. The number average molecular weight of the SCC polymer is generally from about 10,000 to about 1,500,000, normally 12,000 to 1,000,000. The molecular weight of an SCC polymer is relatively unimportant to its $T_p$, but is generally an important factor in determining the $T_p$ of other polymers.

[0015]  The SCC polymer usually melts over a relatively small temperature range. The closer $T_p$ is to room temperature, in general the more rapid the transition. The SCC polymer normally has an onset of melting temperature, $T_o$, such that $T_p - T_o$ is less than $T_p^{0.7}$, generally less than $T_p^{0.6}$, particularly less than 10 °C, especially less than 6 °C, $T_o$ and $T_p$ being in °C. The crystallinity of the SCC polymer is typically such that its heat of fusion is at least 20 J/g, particularly at least 40 J/g.
methacrylic, olefinic, epoxy, vinyl, ester-containing, amide-containing or ether-containing monomers. SCC polymers can comprise repeating units in which the side chains comprise linear polymethylene radicals containing 10 to 50, e.g. 16-50, especially 16 to 22, carbon atoms. Polymers containing such units can be prepared by polymerizing a monomer component comprising one or more corresponding linear aliphatic acrylates or methacrylates, or equivalent monomers such as acrylamides or methacrylamides. A number of such monomers are available commercially, either as individual monomers or as mixtures of identified monomers, for example C12A, C14A, C16A, C18A, C22A, a mixture of C18A, C20A and C22A, and a mixture of C26A to C40A. The polymers may also contain units derived from one or more other comonomers, for example straight or branched chain alkyl acrylates or methacrylates in which the alkyl group contains less than 12 carbon atoms, and monomers containing suitable functional groups, for example functional groups comprising at least one member selected from the group consisting of oxygen-, nitrogen- or silicon-containing, carboxy- or hydroxyl- groups, cationic functionality (quaternized compounds such as those containing nitrogen) dimethyl amines (e.g. arylamide), among other functionality. Such monomers include, for example, those listed below. In the list below, the term (meth)acrylate means that the compound may be either an acrylate or a methacrylate:

(a) Nitrogen-containing monomers, for example N,N-dialkylamino (in particular, dimethylamino) (meth)acrylates; ammonium salt-containing (meth)acrylates, for example 2-trimethylammonium methylmethacrylate chloride, methacrylamidopropyl trimethylammonium chloride, N,N- (diethyl or dimethyl)aminoethyl(meth)acrylate methosulfate; imides like the ring-closed reaction products of maleic or itaconic anhydride with primary amines; 2-methacryloxy-N-ethylmorpholine; 2-t-butylaminoethyl methacrylate; (meth)acrylonitrile; t-butylaminoethyl (meth)acrylate; acryloylmorpholine; N-(2-hydroxyethyl)acetamide; 1-piperidinoethyl (meth)acrylate; vinyl pyrrolidone; and vinyl pyridines.

(b) Oxygen-containing monomers which are substantially free of carboxylic acid groups, carboxylic acid salt groups, sulphon acid groups, sulphon acid salt groups, and amido groups, for example hydroxyalkyl (in particular, hydroxyethyl, hydroxypropyl, and hydroxybutyl) (meth)acrylates; tetrahydrofurfuryl (meth)acrylate; glycidyl methacrylate;
alKoxyaiKyi (metn)acryiaie, e.g. metπ oxyexπ y i ^mein;acry iae; i-acryioxy-
2-hydroxy-3-phenoxypropane; methylol methacrylate; ethoxyethyl
(meth)acrylate; 2-(2-ethoxyethoxy)ethylacrylate; acetoacetoxyethyl
(meth)acrylate; phenoxyethyl (meth)acrylate and (meth)acrolein; vinyl
alcohol; vinyl ethers; and vinyl esters.

(c) Silicon-containing, e.g. silyl, monomers, for example trimethylsiloxo
ethyl(meth)acrylate, 3-acryloxypropyl trimethoxysilane, polydimethyl-
siloxane monomethyl methacrylate terminated, and 3-acryloxypropyl
tris(trimethylsiloxy)silane.

[0017] When the SCC polymer comprises a graft or block copolymer, it can be
prepared by copolymeriz πng a vinyl type macromonomer with other monomers, or by
making an SCC polymer, and then reacting the functionalized polymer with the second
block material, for example a urethane block, an epoxy block, a polyether block, e.g. a
polyethyleneoxide, polypropyleneoxide or polytetramethyleneoxide block, a polysiloxane
block, or a poly(alkyl or alkoxy)silane block, or it can be prepared by using any other
suitable method of polymerization such as emulsion or suspension polymerization in the
presence of surface active agents and/or colloids, or bulk polymerization or solution
polymerization. Non-limiting examples of surface active agents comprise at least one
member of cetearth, laureth, pareth, PEG and/or PPG or POE esters and ethers of
sorbitan Oleate, octyl phenyl and/or ester of nonylphenyl and sulfosuccinate, sodium or
Disoditum salts like Disodium C-isodecylsIfosuccinate, sodium isostearate, esters or
others of of natural and synthetic oils and waxes like PEG and/or PPG hydrogenated
caster oils, among others. Non-limiting examples of colloids comprise at least one
member of stearyl alcohols; behenyl alcohols; modified and unmodified gums like
carageenans, celluloses, carbomers; PVP; Hydrogenated and hydrolyzed waxes and/or
oils; among others.

[0018] The SCC polymer can contain sufficient long chain groups that it will dissolve in
the oil at a temperature above \( T_p \). When the SCC polymer is used to thicken an oil or a
mixture of oils which is free from water, the polymer generally contains at least about 50
\%, normally at least about 60\%, particularly at least about 70\%, especially at about least
80\%, of units comprising a linear radical containing about 10 to about 50 carbon atoms,
and can contain up to 100% of such units. Particularly when the SCC polymer is used to
thicken a water-in-oil or water-in-Silicone or multiple-phase emulsion, it may contain at
At least about 5%, usually at least 1 UV0, a functional group, such as at least one of hydroxyl, COOH and silicone functional groups and may contain higher amounts (e.g. up to 25% or 30wt%), provided that the SCC polymer will at least partially dissolve in the oil.

[0019] In one aspect of the invention, the SCC polymer consists essentially of

(i) 70-99% by weight of repeating units derived from at least one n-alkyl acrylate or methacrylate ester in which the n-alkyl group contains 16 to 22 carbon atoms,

(ii) 1-50%, usually 15-25%, by weight of repeating units derived from at least one acrylate or methacrylate ester in which the ester group contains a hydroxyl-substituted alkyl group containing less than 12 carbon atoms, and

(iii) 0-30% by weight of repeating units derived from at least one acrylate or methacrylate ester in which the ester group contains an unsubstituted alkyl group containing less than 16 carbon atoms to lower the Tp.

[0020] Suitable polymers within the foregoing aspect can include SCC polymers consisting essentially of

(i) 70-99% by weight of the repeating units derived from at least one n-alkyl acrylate or methacrylate ester in which the n-alkyl group contains 16 to 22 carbon atoms, and

(ii) 1-50%, typically 15-25%, by weight of the repeating units derived from at least one acrylate or methacrylate ester in which the ester group contains a hydroxyethyl, hydroxypropyl, or hydroxybutyl group.

[0021] In another aspect of the invention, the SCC polymer consists essentially of

(i) 70-99% by weight of repeating units derived from at least one n-alkyl acrylate or methacrylate ester in which the n-alkyl group contains 16 to 22 carbon atoms,

(ii) 1-50%, usually 15-25%, by weight of repeating units derived from at least one silicon-containing monomer containing less than 12 carbon atoms, and
(iii) 0-30% by weight of repeating units derived from at least one acrylate or methacrylate ester in which the ester group contains an unsubstituted alkyl group containing less than 16 carbon atoms to lower the Tp.

[0022] Suitable polymers within the foregoing aspect can include SCC polymers consisting essentially of

(i) 70-99% by weight of the repeating units derived from at least one n-alkyl acrylate or methacrylate ester in which the n-alkyl group contains 16 to 22 carbon atoms, and

(ii) 1-50%, typically 15-25%, by weight of the repeating units derived from at least one silicon-containing monomer comprising a member from at least one of butyl dimethicone methacrylate, trimethylsiloxy ethyl(meth)acrylate, polymethysiloxane monomethyl methacrylate terminated, or 3 acryloxypropyl trimethoxysilane.

[0023] In a further aspect of the invention, the SCC polymer consists essentially of

(i) 70-99% by weight of repeating units derived from at least one n-alkyl acrylate or methacrylate ester in which the n-alkyl group contains 16 to 22 carbon atoms,

(ii) 1-50%, usually 15-25%, by weight of repeating units derived from at least one monomer containing a carboxylic group (COOH) containing less than 12 carbon atoms, and

(iii) 0-30% by weight of repeating units derived from at least one acrylate or methacrylate ester in which the ester group contains an unsubstituted alkyl group containing less than 16 carbon atoms to lower the Tp.

[0024] Suitable polymers within the foregoing aspect can include SCC polymers consisting essentially of

(i) 70-99% by weight of the repeating units derived from at least one n-alkyl acrylate or methacrylate ester in which the n-alkyl group contains 16 to 22 carbon atoms, and

(ii) 1-50%, typically 15-25%, by weight of the repeating units derived from at least one monomer comprised from the list of acrylic acid, methacrylic acid, or maleic anhydride.
The molecular weight and other properties of the polymer must be sufficiently controlled such that the polymer, after it has been dissolved in the oil, will crystallize in the oil when the heated mixture is cooled to the expected temperature of use, for example to a temperature 10-20 °C. below \( T_p \), thus producing an opaque or clear mixture.

\[ \text{[0025]} \]

The \( T_p \) of the thickening polymer is normally 10-40 °C. above, particularly 10-30 °C. above, especially about 20 °C. above, the temperature at which the composition is to be used, which is generally 15-40 °C. It appears that the oil plasticizes the thickening polymer, so that its melting point in the composition is for example 5-20 °C. lower than \( T_p \). It is therefore desirable that \( T_p \) is sufficiently above the temperature of use to ensure that the thickening polymer does not melt during use. Thus for compositions to be used at around 20-35 °C. the thickening polymer can have a \( T_p \) of above 40 °C, usually 40-70 °C. On the other hand, if the \( T_p \) of the thickening polymer is too far above the temperature of use, this can result in excessive crystallization and then precipitation of the polymer, thus reducing the thickening effect. It is useful, therefore, that \( T_p \) is not more than about 30 °C. above, usually not more than 20 °C. above, the temperature of use. Depending on the expected temperature of use, \( T_p \) may be from 0-150 °C, generally 10-100 °C, typically 40-70 °C, particularly 43-55 °C.

\[ \text{[0026]} \]

The amount of the polymeric thickener used may vary with the application. It is usually unnecessary for the amount of the thickener to be more than about 10% by weight based on the weight of the oil. Smaller amounts such as about 2 to about 7% based on the weight of the oil in compositions which are free of water, and about 0.5 to about 5% based on the weight of composition in water-in-oil, water-in-silicone, or multiple phase emulsions, are often effective. In one aspect of the invention, the amount of polymeric thickener is sufficient to form an emulsion (e.g., a water in oil, or an oil in water emulsion), having enhanced rheology and sensory properties. These properties can provide a sunscreen skin care emulsion having enhanced film building properties upon the skin and in turn increase the SPF of the sunscreen.

\[ \text{[0027]} \]

In another aspect of the invention, the amount of polymeric thickener is tailored to impart enhanced water/moisture and rub-off resistance to a cosmetic composition.

\[ \text{[0028]} \]

In a further aspect of the invention, the amount of polymeric thickener is tailored to impart increased moisture retention or occlusivity of a cosmetic skin care product.
In all embodiments, the amount of polymeric thickener is sufficient to impart enhanced or controlled release of an active ingredient of a cosmetic composition, for example, by incorporating actives in the cosmetic media into amorphous crystalline matrix structure and releasing the actives in controlled manner at or near to body temperature. For example, the inventive composition can comprise an FSCC and/or SCC polymer containing antiperspirant or deodorant composition, or the composition can comprise one or actives such as sunscreen actives or salicylic acid or any other cosmetic/personal care active used in anhydrous or emulsion formulations.

Oils

[0031] The functionalized polymeric thickeners are effective with a broad range of oils such as at least one member selected from the group consisting of esters (C12-15 Alkyl benzoate), triglyceride (Caprylic/Caprylate triglyceride) hydrocarbons (mineral oil, sunflower oil) natural oils (jojoba oil, safflower oil) castor oil, among others. Suitable oils are also disclosed, for example, at column 3, line 37, to column 4, line 4, of U.S. Patent No. 5,736,125; hereby incorporated by reference. For thickening silicone oils, it is useful to use an SCC polymer containing units derived from a monomer containing silicon, for example a block copolymer containing SCC blocks and polysiloxane blocks. SCC/polysiloxane polymers of this type are described for example in WO 93/07194 and WO 00/04787; hereby incorporated by reference. Non-limiting examples of silicone oils can comprise at least one of dimethicone, pdms, organo silicone oils, dimethicones and cyclomethicones. In one aspect of the invention, the SCC polymers are employed as rheology modifiers (e.g., thickener) for at least one of dimethicone, cyclomethicone, and other low viscosity silicone oils.

[0032] In one aspect of the invention, thickened oils with functionalized SCC provide a cosmetic formulation having unique aesthetic benefits (e.g., texture and feel). In some cases, the functionalized SCC and be combined with one or more SCC polymers. The ratio of SCC to functionalized SCC can range from about 0:1 to about 10:1. The following are non-limiting examples of cosmetic formulations containing thickened oils having such benefits:

A. Thickened Anhydrous Oils suitable for personal care applications (e.g. hair gels) comprising:

Oils - about 50 to about 95wt%
5 B. Anhydrous Scalp Serum comprising:
Oils - about 50 to about 95wt%
Silicone oils - about 10 to about 95wt%
Functionalized SCC and/or SCC - about 1 to about 20wt%
Other additives/actives - about 0.1 to about 30%

10 C. Anhydrous Sunscreen Stick or Gel comprising:
Oils - about 50 to about 95wt%
Silicone oils - about 10 to about 95wt%
Functionalized SCC and/or SCC - about 1 to about 20wt%
Other additives/actives - about 0.1 to about 30%

15 D. Anhydrous Antiperspirant Deodorant (APDO) Stick or Gel comprising:
Emollient - about 50 to about 95wt%
Functionalized SCC and/or SCC - about 1 to about 20wt%
APDO actives - about 0.1 to about 30wt%
Other Additives - about 1 to about 30wt%

20 E. Color Cosmetic such as blush, lipstick, among others comprising:
Oil - about 50 to about 95 wt%
Pigment - about 0.1 to about 30wt%
Other additive - about 0.1 to about 10 wt.%
Functionalized SCC and/or SCC - about 1 to about 20wt%

[0033] If desired, the color cosmetic is thickened only with at least one of FSCC and SCC polymers. If desired, however, conventional thickeners such as waxes like Carnauba wax, Bees wax, Candellila wax, among others can employed along with the FSCC and SCC polymers.

Water-in-oil Emulsions

[0034] Water-in-oil emulsions are typically prepared by mixing together (1) a hot solution of the thickener in the oil and (2) the aqueous phase, the aqueous phase being at a temperature similar to the oil solution (e.g. not more than 10 °C. different); and then cooling the mixture while stirring. The ratio of the aqueous phase to the oil phase can be, for example, about 0.5:1 to about 9:1.

[0035] One aspect of the invention, relates to using at least one of SCC and functionalized SCC polymers to prepare a water-in-oil emulsion. When employing SCC and functionalized SCC, the ratio of SCC to functionalized SCC can range from about
0:1 to about 10:1 The following are non-limiting examples of water-in-oil emulsions comprising water-in-oil emulsions:

A. Water in Silicone Oil Emulsions Containing Functionalized SCC and SCC
   i) Skin Moisturizer
   Water - about 50 to about 90wt%
   Silicone - about 1 to about 10wt%
   Emulsifier - about 0.5 to about 5wt%
   Emollient - about 5 to about 20wt%
   Functionalized SCC and/or SCC - about 0.5 to about 3%
   Other Additives - about 0.1 to about 3wt%

   ii). Sunscreen
   Water - about 50 to about 90wt%
   Silicone - about 1 to about 10wt%
   Emulsifier - about 0.5 to about 5wt%
   Emollient - about 5 to about 20wt%
   Functionalized SCC and/or SCC - about 0.5 to about 3wt%
   Sunscreen Active - about 1 to about 25wt%
   Other Additives - about 0.1 to about 3wt%

   iii) APDO
   Water - about 50 to about 90wt%
   Silicone - about 1 to about 10wt%
   Emulsifier - about 0.5 to about 5wt%
   Emollient - about 1 to about 20wt%
   Functionalized SCC and/or SCC - about 0.5 to about 6wt%
   Antiperspirant active - about 1 to about 25wt%
   Other Additives - about 0.1 to about 5wt%

B. Water in oil Emulsion Containing Functionalized SCC
   i) Skin Moisturizer
   Water - about 50 to about 90wt%
   Emulsifier - about 0.5 to about 5wt%
   Emollient - about 5 to about 20wt%
   Functionalized SCC - about 0.5 to about 3wt%
   Other Additives - about 0.1 to about 3wt%

   ii). Sunscreen
   Water - about 50 to about 90wt%
   Emulsifier - about 0.5 to about 5wt%
   Emollient - about 5 to about 20wt%
   Functionalized SCC - about 0.5 to about 3wt%
   Sunscreen Active - about 1 to about 25wt%
   Other Additives - about 0.1 to about 3wt%

30 Oil-in-water Emulsions

[0036] Oil-in-water emulsions are typically prepared by mixing together an oil phase into a water phase. The ratio of the Oil phase to the water phase can be, for example,
about 0:1 to about 1:1. One aspect of the invention relates to using at least one of functionalized SCC and/or SCC polymers to prepare an oil-in-water emulsion. When employing functionalized SCC and SCC polymers, the ratio of SCC to functionalized SCC can range from about 0:1 to about 10:1. The following are non-limiting examples of cosmetic formulations comprising oil-in-water emulsions:

A. Oil in Water Emulsions

i) Skin Moisturizer

Multiple Phase Emulsions

[0037] The previously described water-in-oil and oil-in-water emulsions can be used to prepare a multiple phase emulsion (e.g. water/oil/water, or oil/water/oil). Multiple phase
emulsions can also prepare α D β prepare α D y comDini D π g m e prepare α D y comDini π g m e previously α esuri D prepare α D y comDini π g m e. In-water emulsions with at least one of SCC or FSCC, where the SCC or FSCC is in an emulsion or suspension form (e.g., emulsified Poly C12-22 AlkylAcrylates/Methacrylic Acid Crosspolymer).

5 Alcohol Or Aqueous Systems

[0038] One aspect of the invention, relates to using at least one of functionalized SCC and SCC polymers to prepare an alcohol or aqueous systems including emulsion. When employing functionalized SCC and SCC, the ratio of SCC to functionalized SCC can range from about 0:1 to about 10:1. These polymers can be used to thicken the alcohol or aqueous systems, as well as to provide benefits of film forming, controlled delivery or deposition of actives, and fragrance or volatiles retention. The following are non-limiting examples of cosmetic formulations comprising alcohol or aqueous systems:

[0039] Alcohol or Aqueous system with at least one of FSCC and/or SCC polymers:

i). Mascara based upon FSCC,

ii). Coloring Shampoo
Water - about 50 to about 90wt%
Surfactant - about 2 to about 20wt%
Foam booster —about 2 to about 20%
FSCC and/or SCC - about 0.5 to about 5 wt.%
Other additives about 0.1 to about 10wt%

iii). Hair Spray (aerosol and non-aerosol)
Water - about 10 to about 90wt%
FSCC and/or SCC - about 0.5 to about 5wt%
Ethanol or other solvents —about 33 to about 90wt%
Optional Propellant for an aerosol - about 0 to about 50wt%
Other additives - about 0.1 to about 2wt%

iv). Shampoo
Water - about 50 to about 90wt%
Surfactant - about 2 to about 20wt%
Foam booster - about 2 to about 20wt%
FSCC and/or SCC - about 0.1 to about 2 wt.%
Other additives 0.1-10%,

v). Hair Styling products
Water - about 10 to about90wt%
FSCC and/or SCC - about 0.5 to about5wt%
Ethanol or other solvents - about 0 to about 10wt%
Other additives - about 0.1 to about 10wt%,
vi). Body Wash / Hand cleansing product
Water - about 50 to about 90 wt.
Surfactant - about 2 to about 20 wt.
FSCC and/or SCC - about 0.5 to about 5 wt.
Foam booster - about 2 to about 20 wt.
Other additives - about 0.1 to about 10 wt.

Additives

[0040] If desired, one or more properties of a cosmetic composition can be controlled by adding a plasticizing compound to the composition. Examples of such compounds comprise at least one member selected from the group consisting of silicone based plasticizers, natural or synthetic compounds (e.g., polysaccharides, natural or synthetic Gums, stabilizers, anionic and nonionic associative thickeners or rheology modifiers soluble in oil or water phase), other film forming polymers like polyurethanes, pyrolidines (e.g., polyvinylpyrolidines), among other compounds. In one aspect of the invention, the additives comprise at least one member selected from the group consisting of preservatives, stabilizers (e.g., Xanthan Gum), humectant (e.g., at least one of Glycerine, MP Diol, Sorbitol, and Hexylene Glycol), antioxidant (e.g., Vitamins), rheology modifiers, fragrances, pigments, among other additives. In a further aspect of the invention, the additive can comprise at least one of surfactants and foam boosters.

While any suitable surfactant and/or foam booster can be employed, examples of such comprise at least one member selected from the group consisting of sodium lauryl sulfate, sodium lauryl sulfate, ammonium laureth sulfate, ammonium lauryl sulfate, cocamidopropyl betaine, among others. In a still further aspect of the invention, the additive can comprise at least one propellant and solvent such as at least one of isobutene, butane, dimethyl ether, ethanol, among others. The amount of additive typically ranges from about 0.1 to about 30 wt.

Emulsifiers

[0041] If desired, one or more emulsifiers can be incorporated with the inventive composition. While any suitable emulsifier can be employed, examples of suitable emulsifiers comprise at least one member selected from the group consisting of glyceryl stearate, PEG-150 distearate, dlyceryl dilaurate, PEG-20 stearate, PEG-150 distearate, cetearyl alcohol (and) ceteareth-20, PEG-30 Dipolyhydroxystearate, among other compounds capable of forming or stabilizing an emulsion. The amount of emulsifier can range from about 0.5 to about 6 wt.

- 16 -
Emollients

[0042] If desired, one or more emollients can be incorporated within the inventive composition. While any suitable emollient can be employed, examples of suitable emollients comprise at least one member selected from the group consisting of esters (e.g., C12-15 alkyl benzoate) and triglycerides (e.g., Caprylic/caprylate triglyceride); hydrocarbon oils (e.g., mineral oil), natural oil (e.g., Jojoba oil, safflower oil), tridecyl trimellitate, sunflower oil, castor oil, among other compounds used to impart improved sensory or aesthetic properties of a personal care composition. The amount of emollient can range from about 1 to about 30 wt.% of the composition.

Active Compounds

[0043] If desired, the inventive composition can be employed for delivering active compounds that interact with or protect skin or hair. Examples of such active compounds comprise at least one member selected from the group consisting of sunscreen active (zinc oxide, titanium dioxide, octinoxate, octocrylene, ethylhexyl Salicylate, oxybenzone, among others); Skin whitener (salicylic acid, among others); APDO actives (aluminum chlorohydrate, aluminum zirconium tetra chlorohydrex, among others), Vitamins (Tocopherol natural, Synthetic Tocopherol, Synthetic tocopherol acetate, Retinol, Retinyl palmitate, acetate, Provitamin B-5, Ascorbic acid, Sodium ascorbyl phosphate, Ascorbyl glucoside, Magnesium ascorbyl phosphate, among others); Polysaccharides (Hyaluronic acid, B-1,3-glucans, Chitosan, among others); Botanicals (Aloe vera, Green tea extract, Grape seed extract, Isoflavones, Chamomille/bisabolol, Fennel, Ginko, Ginseng, Guava, among others); Alpha Hydroxy Acids (Citric acid, Glycoloc acid, Lactic acid, among others), Sugar cane extracts; Coenzymes and Enzymes (Ubiquinone, Coenzyme Q10, among others); and cosmeceuticals, among other active ingredients

[0044] One aspect of the invention comprises a method for using the inventive compositions to control the rate at which active compounds are provided. The rate can be controlled to be faster or slower than that possible without the inventive compositions. For example, the inventive compositions can be used for controlling the delivery rate of at least one of the following sunscreen actives (e.g., organic or inorganic), antiperspirant (e.g., aluminum APDO emulsion and stick), cosmeceutical compounds, antimicrobial compounds, among other compounds wherein controlled release is desirable. Another
aspect of the invention relates to controlling the deposition or release of compounds such as relatively volatile compounds (e.g., fragrances), colorants (e.g., a coloring shampoo), among other compounds wherein it is desirable to control their deposition, delivery and/or release.

5 [0045] Certain aspects of the instant invention are illustrated by the following non-limiting Examples. The procedures used in the Examples to compare the effectiveness of the polymeric thickeners were as follows. In Examples 1-6, the thickener, 5 parts, was dissolved in hydrogenated polyisobutylene (HPIB, light oil), 95 parts, with stirring at 120 °C. The resulting solution was placed in an incubator at 20 °C for 16 hours. The viscosity of the cooled product in centipoise was determined using a Brookfield DV-I+ digital viscometer with CP-51 spindle using a sample adapter which was thermostatically controlled, for example, to 25 °C. The viscosities were measured after four minutes at a speed of 2.5 rpm, i.e. after 10 revolutions. In Examples 7-12, the oil (as identified in Table 2), 14 parts, was heated to 80 °C, and the thickener, 0.75 parts, was dissolved therein. Water, 35 parts, containing MgSO₄·H₂O, 0.25 part, was heated to 80 °C. The oil and the water, both at 80 °C, were mixed together, and then cooled to 25 °C, with continued stirring. The product, a milky white water-in-oil emulsion, was left overnight, and its viscosity at 25 °C was then measured using a Brookfield cone and plate viscometer. The viscosity was measured after 0.5, 1, 2 and 4 minutes, to assess the effect of shear on the emulsion.

10 [0046] The remaining Examples illustrate formulations of compositions incorporating functionalized SCC and/or SCC polymers. These Examples illustrate personal care formulations comprising skin care creams, lotions, and sun screens, body cleansing compositions (e.g., shower mouse), hair care (e.g., hair styling and conditioning), among other formulations.

20 EXAMPLES

Examples 1-12

[0047] Polymers and copolymers were made using the ingredients and amounts thereof shown in the Table below, using the following generalized method. To a resin kettle equipped with overhead stirrer and condenser was added 20% of the monomers and chain transfer agents. The mixture in the resin kettle was heated to 110 °C, and oxygen was removed from the system through nitrogen purge for about 30 min followed by addition of 20% of the starting initiator charge. After allowing sufficient time for any
initial exotherm to abate, the remaining monomers, chain transfer agents and starting initiator were pumped into the reaction vessel over 60-90 min. The polymer mixture was allowed to continue reacting for 60 min followed by addition of the chase initiator and reaction for 60 min. The mixture was put under reduced pressure for 60 min to remove volatile residuals. The resulting polymers were generally yellow to white solids. The molecular weight, $T_p$, and viscosity of each sample were measured. The effectiveness of the polymers as thickeners was measured as described above, and the results are shown in Tables 1 and 2 below.

The following abbreviations are used in the Tables. ME = mercaptoethanol; MA = methacrylic acid; DMAEA = N,N-dimethylaminoethyl acrylate; HEA = 2-hydroxyethyl acrylate; TAPO = t-amylperoxy 2-ethylhexanoate sold by Witco as Esperox 570P, 75% active in liquid; TBPB = t-butylperoxybenzoate sold by Witco as Esperox 10; Estol is propylene glycol dicaprylate/caprate sold by Uniqema under the tradename Estol 1526; Min'l is mineral oil; and opq = opaque in appearance.

</tbody>
</table>

In Example 2, within the HPIB oil the polymer had a $T_p$ above a desirable range, which resulted in excessive crystallinity and poor thickening under the test conditions. However, in other oils (e.g. isopropyl palmitate, or isopropyl myristate)
sufficient plasticization of Tp for the polymer of Example 2 may still result in effective thickening. In Example 4, within the HPIB oil the polymer had a Tp below the desired range, and was ineffective as a thickener under the test conditions, because it did not crystallize on cooling. However, the polymer of Example 4 could still provide thickening or film forming benefits within an oil where little plasticization occurred (e.g. mineral oil, or ethanol).

Example 13

[0050] Example 13 Sunscreen emulsion is formulated using following ingredients and procedure:

Ingredients: % w/w

Phase A:

Deionized Water q.s.
DOWICIL* 200 preservative 0.10
MP Diol 1.50
Xanthan Gum 0.20
Titanium dioxide 5.0
C8-22 AlkylAcrylates/Methacrylic Acid Crosspolymer 2.00

Phase B:
Octocrylene  8.0
Oxybenzone  4.0
Octinoxat  θ  1.0
Caprylate/Caprate  2.35
Glyceryl Stearate  1.60
PEG-1 5 0 Distearate  1.25
Tridecyl Trimellitate  0.75
Stearic Acid, triple press  0.65
Emulsifying Wax, NF  0.35
Vitamin E  0.10
Vitamin A, Palmitate  0.10

Phase C:
Deionized water  1.00
Imidazolidinyl Urea  0.25

Phase D:
Fragrance  0.3

PROCEDURE
1. Combine water and glycol of Phase A at RT. Slowly sprinkle Carbopol into Phase A at RT with stirring. When uniform, begin heating to 70-75°C with stirring.
2. Combine Phase B; heat to 75-80°C; stir until uniform.
3. Slowly add Phase B to Phase A with homogenization at 70°C. When batch appears uniform; add Phase C with homogenization. When batch appears uniform, turn off heat. Switch to sweep at 60°C. Continue sweep throughout cool-down;
4. Add Phase D with stirring at 45°C.

Result: This body lotion is intended as an all-over body/face and hand moisturizer with SPF. The SCC Polymer acts as a viscosity modifier, imparts water resistance and lubricity while also yielding a non-oily feeling.

Example 13a: The preparation of example 13 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer
Example 13b: The preparation of example 13 is repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer
Example 13c: The preparation of example 13 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 14

[0051] Sunscreen multi-phase emulsion is formulated using following ingredients and procedure:

INGREDIENTS %W/W
PHASE A
Deionized Water 62.80
Disodium EDTA 0.10
Propylene Glycol 2.00
Xanthan Gum (Keltrol T) 0.20
Sorbitol 70% 5.0

PHASE B
Octinoxate 7.50
Oxybenzone 3.00
Ethylhexyl Salicylate 3.00
Ethylhexyl Palmitate 2.00
Tridecyl Neopentanoate 2.00
Glyceryl Dilauroate 1.50
Mineral Oil 6.00

PHASE C
Deionized Water 5.00

PHASE D
Diazolidinyl Urea (and) Iodopropynyl Butylcarbamate 0.30
Methylparaben 0.20
Butylene Glycol 1.00

PHASE E
C8-22 AlkylAcrylates/Methacrylic Acid Crosspolymer 2.0

PROCEDURE

1. Combine DI water Phase A with stirring at RT. When uniform, begin heating to 75-80°C with stirring.
2. Combine Phase B; heat to 75-80°C, stir until uniform.
3. Add Phase B to Phase A with homogenization at 75-80°C. When uniform, turn off heat.
4. Combine Phase C, mix until uniform. Slowly add Phase C to the batch with homogenization at 60°C.
5. When batch reaches 50°C, switch to sweep.
6. Individually add Phase D and E ingredients in order with sweep at 45°C, mixing well between additions.

Results: C8-22 AlkylAcrylates/Methacrylic Acid Crosspolymer provide very water resistance SPF formulation

Example 14a: The preparation of example 14 is repeated using Poly C10-30 alkyl acrylate
Example 14b: The preparation of example 14 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer

Example 14c: The preparation of example 14 is repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer

Example 14d: The preparation of example 14 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 15

| Deionized Water                                  | q.s  |

PROCEDURE

1. Combine ingredients in Phase A. Mix and heat to 85°C until uniform. Cool back to 70°C.
2. At 70°C add Phase B to Phase A. Mix and cool to 50°C.
3. Combine ingredients in Phase D. Mix and heat to 55°C.
4. With fast agitation, combine Phase D to Phases A and B. The incorporation should take at least 10 minutes.
5. Mix and cool to 35-40°C. Homogenize Phase C into batch when uniform.
Result: w/Si sunscreen emulsion is intended as an all-over body/face and hand SPF. The SCC Polymer acts as a viscosity modifier, imparts water resistance and lubricity while yielding a non-oily feeling.

Example 15a: The preparation of example 15 is repeated using Poly C10-30 alkyl acrylate.

PROCEDURE
1. Combine Phase A at RT. Slowly sprinkle Carbopol into Phase A at RT with stirring. When uniform, begin heating to 70-75°C with stirring.
2. Combine Phase B; heat to 75-80°C; stir until uniform.
3. Slowly add Phase B to Phase A with homogenization at 70°C. When batch appears uniform; add Phase C with homogenization. When batch appears uniform, turn off heat. Switch to sweep at 60°C. Continue sweep throughout cooldown.
4. Add Phase D with stirring at 65°C.
5. Add Phase E with stirring at 45°C.

Result: Water resistance Sunscreen emulsion is intended as an all-over body/face and hand moisturizer and SPF. The SCC Polymer acts as a viscosity modifier, imparting water resistance and lubricity while yielding non-oily feeling.

Example 16a: The preparation of example 16 is repeated using Poly C10-30 alkyl acrylate

Example 16b: The preparation of example 16 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer

Example 16c: The preparation of example 16 is repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer

Example 16d: The preparation of example 16 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 17

[0054] Example 17 illustrates personal care formulations using a silicone functional SCC polymer C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer. This polymer is an associative oil phase thickener designed to thicken a wide variety of silicone oils and silicone oil containing formulations including cyclomethicone, dimethicone, and various aliphatic and aromatic silicone oils. C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer has a built-in temperature switch (48°C) to allow change in properties at trigger temperature.

Experimental Details:

[0055] Preparation of thickened oil: C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer and oil (10/90 by wt) were heated together to 80°C with agitation ensuring dissolution, followed by cooling in a 25°C bath for at least 16 hours before measuring viscosity.
[0056] Preparation of emulsions: C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer (3.0g) was dissolved in oil (27.0g) at 80°C. DI water containing 0.5% magnesium sulfate (7.0g) was heated to 80°C and added to the stirred hot oil phase. The water/oil mixture was agitated with a homogenizer during cooling. The formulation was allowed to sit in a 25°C bath for at least 16 hours prior to testing viscosity.

[0057] Viscosity was evaluated at 25°C using a Brookfield DV-I+ viscometer equipped with cone and plate spindle CP51 at 2.5 rpm. Data points were taken at 30, 60, 120 and 240 seconds and reported in cps.

The SCC polymers are able to thicken different oils in cosmetic media examples of oils are esters like C12-15 alkyl benzoate, triglycerides such as Caprylic/caprylate triglyceride, hydrocarbon like mineral oil, sunflower oil, natural oils like jojoba oil, safflower oil, caster oil, organo-silicones, dimethicones, and cyclomethicones.

Example 18

[0058] Water-in-Silicone Moisturizing Cream is formulated using following ingredients and procedure:

**Ingredients:**

**Phase A:**
- Stearic acid, triple press: 1.20%
- Cetearyl alcohol (and) ceteareth-20: 1.85%
- PEG-30 dipolyhydroxysterate: 1.85%
- Mineral oil: 1.35%
- Cyclomethicone: 5.00%
- Cetyl alcohol: 1.10%
- PEG 150 distearate: 1.00%
- Dimethicone: 4.60%
- Emulsifying Wax: 0.60%
- Tridecyl Trimellitate: 0.50%
- Mango Butter: 0.50%
- C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer: 2.00%

**Phase B:**
- Deionized Water q.s.
- Xanthan gum: 0.25%
- MP Diol: 5.00%
- Imidazolidinyl Urea: 0.25%

**Phase C:**
- Fragrance: 0.3%
PROCEDURE:
1. Combine Phase A ingredients with stirring and heating to 70-75°C.
2. Combine Phase B at RT when uniform heat to 75-80°C; stir until uniform.
3. Slowly add Phase B to Phase A with homogenization at 65°C. When batch appears uniform, turn off heat. Switch to sweep at 60°C. Continue sweep throughout cool-down. Add Phase C at 40°C.

Results: Cream is formulated to soften and moisturize skin. The lubricity of C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer helps provide relatively easy application qualities and after feel. The skin is left with an emollient, non-oily, velvety feeling. The SCC Polymer acts as a viscosity modifier, imparts water resistance and lubricity while yielding a non-oily feeling.

Example 18a: The preparation of example 18 is repeated using Poly C10-30 alkyl acrylate

Example 18b: The preparation of example 18 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer

Example 18c: The preparation of example 18 is repeated using C8-22 AlkylAcrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase C.

Example 18d: The preparation of example 18 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 19

[0059] Water-in-oil SPF and Moisturizing Lotion is formulated using following ingredients and procedure:

Ingredients: % w/w

Phase A:
Octocrylene 8.0
Oxybenzone 4.0
Octinoxate 10.0
Caprylate/Caprate triglyceride 2.35
Glyceryl Stearate (and)
PEG-100 sterate 1.60
PEG-150 Distearate 1.25
Tridecyl Trimellitate 0.75
Stearic Acid, triple press 0.65
Emulsifying Wax, NF 0.35
Vitamin E 0.10
Vitamin A, Palmitate 0.10
C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer 3.00

- 27 -
Phase B:
Deionized Water q.s.
MP Diol 1.50
Xanthan Gum 0.20
Titanium dioxide 5.0
Dow Corning 193 3.50
Imidazolidinyl Urea 0.25

Phase C:
Fragrance 0.3

PROCEDURE
1. Combine water and glycol of Phase B at RT. Slowly sprinkle Xanthan Gum into Phase B at RT with stirring. When uniform, begin heating to 70-75°C with stirring.
2. Combine Phase A; heat to 75-80°C; stir until uniform.
3. Slowly add Phase B to Phase A with homogenization at 60°C. When batch appears uniform; add Phase C with homogenization and stirring at 45°C.

Results: Emollient skin feel lotion is intended as an all-over body/face and hand moisturizer and SPF. The C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer acts as a viscosity modifier, imparts water resistance and lubricity while yielding a non-oily feeling.

Example 19a: The preparation of example 19 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer
Example 19b: The preparation of example 19 is repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase C.
Example 19c: The preparation of example 19 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

PROCEDURE
1. Combine Phase B with stirring and begin heating to 75-80°C with stirring.
2. Combine Phase A; heat to 75-80°C, stir until uniform.
3. Add Phase B to Phase A with homogenization at 65°C. When uniform, turn off heat.
4. Combine Phase C, mix until uniform. Slowly add Phase C to the batch with homogenization at 60°C.
5. When batch reaches 50°C, switch to sweep.
6. Individually add Phase D ingredients in order with sweep at 45°C, mixing well between additions.

Results: Lotion with smooth, elegant feel/touch and easy spreadibility

Example 20a: The preparation of example 20 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer
Example 20b: The preparation of example 20 is repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase C.
Example 20c: The preparation of example 20 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 21

[0061] Water-in-Silicone (w/Si) Sunscreen is formulated using following ingredients and procedure:

INGREDIENTS %W/W
PHASE A

- 29 -
Dimethicone 200/100 5.00
Mineral Oil 1.00
Ethylhexyl Palmitate 1.00
Octinoxate 7.50
Ethylhexyl Salicylate 5.00
Castor Oil 0.50
Beeswax 0.50
Polyethylene 1.00
PEG-30 Dipolyhydroxystearate 2.00
C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer 2.00

PHASE B
Cyclopentasiloxane 5.00
Dimethicone 5.00

PHASE C
Diazolidinyl Urea (and) Iodopropynyl Butylcarbamate 0.5

PHASE D
Sodium Chloride 0.60
Deionized Water q.s

PROCEDURE

1. Combine ingredients in Phase A. Mix and heat to 80°C until uniform. Cool back to 70°C.
2. At 70°C add Phase B to Phase A. Mix and cool to 50°C.
3. Combine ingredients in Phase D. Mix and heat to 55°C.
4. With fast agitation, combine Phase D to Phases A and B. The incorporation should take at least 10 minutes.
5. Mix and cool to 35-40°C. Homogenize Phase C and D into batch when uniform.

Results: Water-in-Silicone sunscreen emulsion with easy pick-up

Example 21a: The preparation of example 21 is repeated using Poly C10-30 alkyl acrylate

Example 21b: The preparation of example 21 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer except this polymer is added in phase C.

Example 21c: The preparation of example 21 is repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer

**PROCEDURE**

Combine Phase A with mixing and heat to 80°C. Combine Phase B in a separate vessel, combine the components of Phase B and heat to 80°C. Add Phase B to Phase A with agitation. Maintain the temperature and add Phase C. Continue mixing and cool to 45°C. Use Phase D to adjust the pH if needed.

**Results:** In addition to conditioning normal hair, the combing cream provides curl definition, reducing the volume and making it easier to control. C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer maintains the natural shape of curls while offering a soft appearance along with temperature control restyling benefits. C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer provides a smooth and silky feel to the hair and improves the emulsion stability.
Example 24a: The preparation of example 24 is repeated using Poly C10-30 alkyl acrylate
Example 24b: The preparation of example 24 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer
Example 24c: The preparation of example 24 is repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase B
Example 24d: The preparation of example 24 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 25

PROCEDURE:
Charge deionized water into vessel. Using good agitation, slowly sift in the Xanthan Gum. When completely hydrated, add the preservative and the oil. Maintain good agitation and add the C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer and increase temperature to 75°C. Once dispersed, homogenize if necessary adjust the pH to 4.8 to 5.0 if needed.

Results: This cream-gel formulation provides enhanced hold, high humidity curl retention, and shine to the hair. C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer polymer gives thickening and hold.

[0068] 80% VOC Pump Hair Spray is formulated using following ingredients and procedure:
Ingredients % W/W
C8-22 Alkyl Acrylates/Butyl Dimethicone

- Methacrylate Copolymer  5.00
- AMP 95 Aminomethyl Propanol to pH 8.5 to 8.9
- Deionized Water q.s.
- SD Alcohol 40 80.00

PREPARATION:
Dissolve AMP in SD Alcohol 40 and water. While maintaining proper agitation, slowly add Intelimer 1221. Mix until homogenous. Filter and fill containers.

Results: This formulation provides excellent spray aesthetics and elegant feel.

Example 28a: The preparation of example 28 is repeated using Poly C10-30 alkyl acrylate.
Example 28b: The preparation of example 28 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer.
Example 28c: The preparation of example 28 is repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase B.
Example 28d: The preparation of example 28 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer.

Example 29

[0069] Styling Hair Gel with is formulated using following ingredients and procedure:

Ingredients % W/W
Phase A
- Carbomer 940 0.25
- Deionized Water q.s.

Phase B
- C8-22 Alkyl Acrylates/Butyl Dimethicone

- Methacrylate Copolymer 3.00
- Dimethicone 200 5cst fluid 0.50
- Mineral oil 0.10
- Hydrolyzed Wheat Protein (and) 0.10
- Hydrolyzed Wheat Starch

Phase C
- Propylene Glycol and Diazolidinyl Urea and Methylparaben and Propylparaben 1.00
- Triethanolamine 99% to adjust to pH 8
PREPARATION

Prepare Phase A into warm water (~50°C) with agitation until completely dispersed. Once solution is homogenous, add Phase B and mix well. Add the Triethanolamine drop wise to bring the pH up to around 8. When the pH is close to 8, the formulation will thicken and become clear.

Example 29 a: The preparation of example 29 is repeated using Poly C10-30 alkyl acrylate

Example 29 b: The preparation of example 29 is repeated using Poly C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer

Example 29 c: The preparation of example 29 is repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase B

Example 29d: The preparation of example 29 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 30

[0070] Example 30 illustrates personal care formulations using a carboxy functional SCC polymer.

INCI NAME:
Acrylic Acid/C12-22 Alkyl Acrylates Copolymer

Features:

[0071] Associative oil phase thickener designed to thicken a wide variety of oils including mineral oils, hydrogenated polyisobutylene (HPIB), vegetable oils, oil esters, triglycerides, etc. Acrylic Acid/C12-22 Alkyl Acrylates Copolymer has a built-in temperature switch (65°C) to allow change in properties at the trigger temperature.

Particularly effective in polar oils and for suspending particles

Experimental Details:

[0072] Preparation of thickened oil: Acrylic Acid/C12-22 Alkyl Acrylates Copolymer and oil (10/90 by wt) were heated together to 80°C with agitation ensuring dissolution, followed by cooling in a 25°C bath for at least 16 hours before measuring viscosity.

Preparation of emulsions: Acrylic Acid/C12-22 Alkyl Acrylates Copolymer (3.Og) was dissolved in oil (27.Og) at 80°C. DI water containing 0.5% magnesium sulfate (7Og) was heated to 80°C and added to the stirred hot oil phase. The water/oil mixture was
agitated with a homogenizer during cooling. The formulation was allowed to sit in a 25°C bath for at least 16 hours prior to testing viscosity.

[0073] Viscosity was evaluated at 25°C using a Brookfield DV-I+ viscometer equipped with cone and plate spindle CP51 at 2.5 rpm. Data points were taken at 30, 60, 120 and 240 seconds and reported in cps.

Example 31

[0074] Example 31 illustrates personal care formulations using a hydroxyl functional SCC polymer

10 INCI NAME:
C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer

Features:
[0075] Associative oil phase thickener designed to thicken a wide variety of oils including mineral oils, hydrogenated polyisobutylene (HPIB), vegetable oils, oil esters, triglycerides, etc. C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer has a built-in temperature switch (65°C) to allow change in properties at the trigger temperature. Particularly effective in polar oils.

Experimental Details:

[0076] Preparation of thickened oil: C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer and oil (10/90 by wt) were heated together to 80°C with agitation ensuring dissolution, followed by cooling in a 25°C bath for at least 16 hours before measuring viscosity.

Preparation of emulsions: C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer

[0077] (3.Og) was dissolved in oil (27.Og) at 80°C. DI water containing 0.5% magnesium sulfate (7Og) was heated to 80°C and added to the stirred hot oil phase. The water/oil mixture was agitated with a homogenizer during cooling. The formulation was allowed to sit in a 25°C bath for at least 16 hours prior to testing viscosity.

Example 32

[0078] Mild Deep Cleansing Shampoo with is formulated using following ingredients and procedure:

<table>
<thead>
<tr>
<th>Ingredient</th>
<th>%VWW</th>
</tr>
</thead>
</table>

- 39 -
Phase A
Deionized Water
Stepan Mild BSB (42% active)
Water, PEG-80 Sorbitan Laurate, Cocamidopropyl Betaine, Sodium
5 Trideceth Sulfate, Disodium Lauroamphodiacetate, PEG-150
Distearate, Sodium Laureth-13, Carboxylate, Quaternium-15,
Tetrasodium EDTA, DMDM Hydantoin, Citric Acid
Standapol A (29% active) Ammonium Lauryl Sulfate

10 Phase B
Mineral oil
Intelimer Polymer

15 Phase C
Glydant DMDM Hydantoin

PROCEDURE
Combine phase A and increase temperature to 75°C. Dissolve Intelimer Polymer in mineral oil by increasing temperature to 75°C. Add phase B to phase A slowly. Add all other ingredients one at a time allowing the system to become homogeneous before next addition. Add phase C at 45°C. Adjust the pH to 5.5 - 6.0

Example 32a: The preparation of example 32 is repeated using Poly C10-30 alkyl acrylate

Example 32b: The preparation of example 32 is repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer

Example 32c: The preparation of example 32 is repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase B

Example 32d: The preparation of example 32 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 33

[0079] Temporary coloring shampoo is formulated using following ingredients and procedure:

Ingredients % W/W
Phase A
Arianor Dye (any color) 1.00 Warner Jenkinson
Distilled Water q.s. to 100

Phase B
Miranol C2M-SF Disodium
Cocoamphodipropionate 8.00
Incromine Oxide L (30%) Lauramine Oxide 14.00
Promidium CO PPG-2 Hydroxyethyl Cocamide 3.00
Phase C
Mineral Oil 4.00
C8-22 Alkyl Acrylates/Butyl Dimethicone 4.00
Methacrylate Copolymer 1.00
Phase D
Distilled Water 28.00
Glydant (55%) DMDM Hydantoin 0.50

PREPARATION
Combine Phase A. Mix well. Combine Phase B with overhead agitation. Mix well.
Combine Phase C and increase the temperature of all phases separately to 75C. Add
Phase C to Phase B. Mix well. Combine Phase D. Mix well. Add Phase D to Phase BC.
Mix well. Add Phase A to Phases BCD making sure to completely disperse dye. Mix
well for ten minutes.

Results: C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer builds viscosity in this
cold shampoo also provides moderate conditioning and assist in delivering color pigment
effectively.

Example 33a: The preparation of example 33 is repeated using Poly C10-30 alkyl
acrylate
Example 33b: The preparation of example 33 is repeated using C8-22 Alkyl
Acrylates/Butyl Dimethicone Methacrylate Copolymer
Example 33c: The preparation of example 33 is repeated using C8-22
Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase B
Example 33d: The preparation of example 33 is repeated using Poly Acrylic Acid/C8-22
Alkyl Acrylate Copolymer

Example 34

[0080] Hot Blusher is formulated using following ingredients and procedure:

</tr>
</tbody>
</table>
PROCEDURE
Charge all ingredients into main kettle, heat to 82°C. Mix for 20-30 minutes or until uniform. Check for color dispersion via draw-down. Pour into appropriate pans at 77-79°C.

Results: C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer is an oil soluble polymer that allows high load of emollients while still obtaining an elegant matte finish.

Due to its oil solubility this copolymer can be used in any color cosmetic application without any need of different waxes that are commonly used in color cosmetic like carnauba wax, candela wax, bees wax that including lip sticks and mascara. If desired, however, the above mentioned polymer can be combined with such waxes.

Example 34a: The preparation of example 34 is repeated using Poly C10-30 alkyl acrylate

Example 34b: The preparation of example 34 is repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer

Example 34c: The preparation of example 34 is repeated using C8-22 AlkylAcrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase B

Example 34d: The preparation of example 34 is repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 35

[0081] Water-in-oil emulsion was formulated using following ingredients and procedure:
Ingredients % w/w
Phase A
C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer 1.00
Isopropyl Palmitate 4.00
Isopropyl Myristate 4.00
Mineral Oil USP 1.00
PEG-30 DiPoly Hydroxy Stearate 0.50
Bis-PEG/PPG-14/14 Dimethicone 2.00
Cyclomethicone 11.5
Phase B
DI Water 69.5
MgSO4 0.50
Glycerin 5.00
Propylene Glycol (and) Diazolidinyl Urea(and) Methyl Paraben (and) Propyl Paraben 1.00
Total 100

PROCEDURE
1. Phase A; ingredients were combined at RT and heated to 75-80°C with stirring.
2. Phase B; ingredients were combined and heated to 75-80°C; stirred until uniform.
3. Phase B was added to Phase A with homogenization at 80°C. Batch was homogenized for 3 to 5 minutes switched to sweep at 60°C. Continue sweep throughout cool-down process.

Results: This Example demonstrates the ability to modify the rheology and oil phase thickener in Cosmetic/Personal Care formulations:

Example 35a: The preparation of example 35 was repeated using Poly C10-30 alkyl acrylate
Example 35b: The preparation of example 35 was repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer

**PROCEDURE:**

1. Phase A; ingredients were combined at RT and heated to 75-80°C with stirring.
2. Phase B; ingredients were combined and heated to 75-80°C; stirred until uniform.
3. Phase B was added to Phase A with homogenization at 80°C. Batch was homogenized for 3 to 5 minutes. Phase C was added during homogenization process, switched to sweep at 60°C. Continue sweep throughout cool-down process.

**Results:** Cosmetic/personal care formulations having enhanced SPF and resistance to water rub off/removal:

Example 38a: The preparation of examples 38 were repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer

Example 38b: The preparation of examples 38 were repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in water phase

Example 38c: The preparation of examples 38 were repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer
Example 38d: The preparation of examples 38 were repeated using Poly C10-30 alkyl acrylate β Copolymer

Example 39

5 [0085] Moisturizing emulsion was formulated using following ingredients and procedure:

Phase A

- DI Water: q.s. to 100
- Xanthan Gum: 0.2
- Allantoin: 0.25

Phase B

- Glyceryl Stearate and PEG-100 Stearate: 2.6
- Polyoxyethylene 40 Stearate: 2.5
- Hydrogenated Castor oil: 2.0
- Cetearyl Alcohol Ceteareth-20: 2.5
- Isopropyl Myristate: 15.5
- Cocoyl Capric caprylate: 5.0
- C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer: 2.0
- Panthenol: 0.25
- Phase D
  - Diazolidinyl Urea(and) Methyl Paraben (and) Propyl Paraben: 1.0
- Total: 100

PROCEDURE:

1. Phase A; ingredients were combined at RT and heated to 75-80°C with stirring.
2. Phase B; ingredients were combined and heated to 75-80°C; stirred until uniform.
3. Phase B was added to Phase A with homogenization at 80°C. Batch was homogenized for 3 to 5 minutes. Phase C was added during homogenization process, switched to sweep at 6°C. Continue sweep throughout cool-down process.

15 Results: Example 39 illustrates a cosmetic/personal care composition having enhanced Trans Epidermal Water Loss (TEWL) prevention or occlusivity.
Example 39 a: The preparation of example 39 was repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer

Acrylates/Hydroxyethylacrylate Copolymer  
Pigment Pre-blend %W/W  
Ricinus Communis [castor] seed oil 96.81  
Black iron oxide[and] ricinus communis [castor] seed oil 0.44  
D&C Red #27 Aluminum Lake [and] ricinus communis [castor] seed oil 1.5  
D&C Red #7 Calcium Lake [and] ricinus communis [castor] seed oil 1.0  
Iron Oxide [and] ricinus communis [castor] seed oil 0.25

PROCEDURE

Combine Phase A ingredients in the order above in a main vessel and begin heating to 75-80°C while stirring. Continue to stir until all ingredients are completely dispersed and uniform. Once uniform, pour batch into a proper mold at 70-72°C.

Results: Example 43 illustrates a cosmetic/personal care formulation having Lipstick with thickening provided by C12-22 Alkyl Acrylates/Hydroxyethylacrylate Copolymer.

Due to its oil solubility this copolymer can be used in any color cosmetic application without any need of different waxes that are commonly used in color cosmetic like carnauba wax, candela wax, bees wax that including lip sticks and mascara. If desired, however, the above mentioned polymer can be combined with such waxes.

Example 43a: The preparation of example 43 was repeated using C8-22 Alkyl Acrylates/Butyl Dimethicone Methacrylate Copolymer

Example 43b: The preparation of example 43 was repeated using C8-22 Alkyl Acrylates/Methacrylic Acid Crosspolymer except this polymer is added in phase B

Example 43c: The preparation of example 43 was repeated using Poly Acrylic Acid/C8-22 Alkyl Acrylate Copolymer

Example 43d: The preparation of example 43 was repeated using Poly C10-30 alkyl acrylate

[0090] The invention has been described with reference to certain aspects, but other aspects and embodiments are apparent to persons of skill in the art, and are included within the scope of the claims.
CLAIMS

1. A cosmetic composition comprising
   (1) at least one silicone based oil,
   (2) at least one side chain crystalline (SCC) polymer which contains at
   least one functional group selected from the group consisting of silicone,
   carboxy and hydroxyl groups wherein the amount of SCC is sufficient to
   form a gel or an emulsion, and;
   (3) At least one member selected from the group consisting of
   triglycerides, alkyl palmitates, alkyl myristate, alkyl benzoates, mineral oil,
   natural oils and natural waxes.

2. The cosmetic composition of Claim 1 wherein the silicone oil comprises at least one
   of dimethicone, cyclomethicone and cyclopentasiloxane.

3. The cosmetic composition of Claim 1 wherein said member comprises triglycerides.

4. The cosmetic composition of Claim 1 wherein said member comprises alkyl
   palmitates.

5. The cosmetic composition of Claim 1 wherein said member comprises one of mineral
   oil and natural oil.

6. A cosmetic composition comprising
   (1) at least one oil,
   (2) at least one side chain crystalline (SCC) polymer which contains at
   least one functional group selected from the group consisting of silicone
   and hydroxyl groups wherein the amount of SCC is sufficient to form a gel
   or an emulsion, and;
   (3) at least one member selected from the group consisting of glycerine,
   glycols, natural gums, polysaccharides, and natural waxes.

7. A personal care composition comprising
   (1) water,
   (2) at least one oil or one emollient,
(3) At least one side chain crystalline polymer which contains at least one functional group selected from the group consisting of silicone, carboxy and hydroxyl groups wherein the amount of polymer is sufficient to form an emulsion; and

(4) at least one emulsifier.

8. The composition of Claim 7 wherein the oil comprises at least one silicone oil.

9. The composition of Claim 7 wherein the composition comprises an oil-in-water emulsion.

10. The composition of Claim 7 wherein the composition comprises a silicone-in-water emulsion.

11. The composition of Claim 7 wherein the composition comprises a water-in-oil emulsion.

12. The composition of Claim 7 wherein the composition comprises a water-in-silicone emulsion.

13. The composition of Claim 7 further comprising at least one active compound.

14. The composition of Claim 7 further comprising at least one surfactant.

15. The composition of Claim 7 further comprising at least one propellant.

16. The composition of Claim 7 further comprising at least one solvent.

17. The composition of Claim 13 wherein said active compound comprises at least one member selected from the group consisting of zinc oxide, titanium dioxide, octinoxate, ctocrylene, ethylhexyl Salicylate, oxybenzone; and salicylic acid, aluminum chlorohydrate, aluminum zirconium tetra chlorohydrrex, vitamin E and vitamin A.Tocopherol natural, Synthetic Tocopherol, Synthetic tocopherol acetate, Retinol, Retinyl palmitate, acetate, Provitamin B-5, Ascorbic acid, Sodium ascorbyl phosphate,
Ascorbyl glucoside, Magnesium ascorbyl phosphate, Polysaccharides, Hyaluronic acid, B-1,3-glucans, Chitosan, Botanicals, Aloe vera, Green tea extract, Grape seed extract, Isoflavones, Chamomille/bisabolol, Fennel, Ginko, Ginseng, Guava, Alpha Hydroxy Acids, Citric acid, Glycoloc acid, Lactic acid, Sugar cane extracts, Coenzymes and Enzymes, Ubiquinone, and Coenzyme Q10.

18. The composition of Claim 7 wherein said emulsifier comprises at least one member selected from the group consisting of glyceryl stearate, PEG-150 distearate, glyceryl dilaurate, PEG-20 stearate, PEG-150 distearate, cetearyl alcohol (and) ceteareth-20, and PEG-30 Dipolyhydroxystearate.

19. The composition of Claim 7 wherein said emollient comprises at least one member selected from the group consisting of esters, triglycerides, hydrocarbon oils, natural oils, silicone oils, and tridecyl trimellitate.

20. The composition of Claim 7 wherein the composition comprises at least one member selected from the group consisting of cosmetics, color cosmetics, toiletries, cleansers, blush, lipsticks, antiperspirant deodorants, deodorants, nail varnishes, sunscreens, hand protective products, anti-aging or skin renewal products, night renewal products, body milks, facial products, protective day care products, moisturizer, shampoo, hair gel, mascara, and hair sprays.

21. A method for controllable release of at least one member selected from the group consisting of active compounds, APDO actives, fragrances, botanicals, vitamins, cosmeceuticals, colorants, and antimicrobials by combining said member with at least one member of SCC polymers or the composition of Claim 7.
