ABSTRACT

A heater assembly can be used with a gas appliance. The gas appliance can be a dual fuel appliance for use with one of a first fuel type or a second fuel type different than the first. The heater assembly can include at least one pressure regulator, a housing, and an actuation member. The housing has a first fuel hook-up for connecting the first fuel type to the heater assembly, and a second fuel hook-up for connecting the second fuel type to the heater assembly. The actuation member can control a flow through the heater assembly based on whether the first or the second fuel hook-up is used.

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] Any and all applications for which a foreign or domestic priority claim is identified in the Application Data Sheet as filed with the present application, are hereby incorporated by reference under 37 CFR 1.57. This application is a continuation of U.S. application Ser. No. 13/791,530, filed Mar. 8, 2013, now U.S. Pat. No. 9,170,016, which claims priority to U.S. Provisional Appl. Nos. 61/748,071 (PROCU.SA.091PR1), filed Dec. 31, 2012, 61/748,074 (PROCU.SA.091PR2), filed Jan. 1, 2013, and 61/748,078 (PROCU.SA.091PR3), filed Jan. 1, 2013, application Ser. No. 13/791,530 also claims priority to Chinese Pat. Appl. Nos. 201220418089.X and 20121030273.9, both filed Aug. 22, 2012 titled Dual Fuel Regulator with Automatic Pilot Selection, and Chinese Pat. Appl. Nos. 201210337908.2 and 201220465928.8, both filed Sep. 13, 2012 titled No Step Dual Fuel Heating Controller. This application is related to U.S. patent application Ser. No. 13/311,402 (PROCUSA.091A), filed Dec. 5, 2011, now U.S. Pat. No. 8,915,239. All of the above applications are hereby incorporated by reference and should be considered a part of this specification.

BACKGROUND OF THE INVENTION

[0002] 1. Field of the Invention

[0003] Certain embodiments disclosed herein relate generally to a heating apparatus for use in a gas appliance particularly adapted for dual fuel use. The heating apparatus can be a part of, and can be used in or with many different appliances, including, but not limited to: heaters, boilers, dryers, washing machines, ovens, fireplaces, stoves, water heaters, barbecues, etc.

[0004] 2. Description of the Related Art

[0005] Many varieties of appliances, such as heaters, boilers, dryers, washing machines, ovens, fireplaces, stoves, and other heat-producing devices utilize pressurized, combustible fuels. Some such devices operate with liquid propane, while others operate with natural gas. However, such devices and certain components thereof have various limitations and disadvantages. Therefore, there exists a constant need for improvement in appliances and components to be used in appliances.

SUMMARY OF THE INVENTION

[0006] A heater assembly can be used with one of a first fuel type or a second fuel type different than the first. The heater assembly can include at least one pressure regulator, a housing, and an actuation member. The housing has a first fuel hook-up for connecting the first fuel type to the heater assembly, a second fuel hook-up for connecting the second fuel type to the heater assembly, and an internal valve. The actuation member can control the position of the internal valve based on whether the first or the second fuel hook-up is used or selected.

[0007] A heater assembly according to some embodiments can comprise a pressure regulator having a first position and a second position, a housing having first and second fuel hook-ups, and an actuation member. The first fuel hook-up can be for connecting a first fuel type to the heater assembly and the second hook-up can be for connecting a second fuel type to the heater assembly. The actuation member can have an end located within the second fuel hook-up and a first position and a second position. The actuation member can be configured such that connecting a fuel source to the heater assembly at the second fuel hook-up moves the actuation member from the first position to the second position which causes the pressure regulator to move from the first position to the second position. The pressure regulator in the second position can be configured to regulate a fuel flow of the second fuel type within a predetermined range.

[0008] The heater assembly can have a pressure regulator where the first position is configured to regulate a fuel flow of the first fuel type within a predetermined range different than the predetermined range for the second fuel type. Alternatively, the heater assembly can include a second pressure regulator configured to regulate a fuel flow of the first fuel type within a predetermined range different than the predetermined range for the second fuel type.

[0009] The actuation member can comprise a rod configured for linear advancement from the first position to the second position. The rod can extend along a longitudinal axis and have a plurality of longitudinal cross-sections of different shapes. A first section of the actuation member can be associated with the pressure regulator in the first position and a second section of the actuation member can be associated with the pressure regulator in the second position, the first section having a longitudinal cross-section of a different shape than the second section.

[0010] The heater assembly can further include additional valves that can also be controlled with the actuation member. The heater assembly can also include an additional actuation member.

[0011] In some embodiments, a heater assembly can comprise at least one pressure regulator, a housing, and a first actuation member. The housing can include a first fuel hook-up for connecting the first fuel type to the heater assembly, a second fuel hook-up for connecting the second fuel type to the heater assembly, a first inlet, a first outlet, a second outlet configured with an open position and a closed position, and a first valve configured to open and close the second outlet. The first actuation member can have an end located within the second fuel hook-up and a first position and a second position. The first actuation member can be configured such that connecting a fuel source to the heater assembly at the second fuel hook-up moves the actuation member from the first position to the second position which causes the first valve to open the second outlet, the second outlet being in fluid communication with the second fuel hook-up.

[0012] The first actuation member can be further configured such that connecting the fuel source to the heater assembly at the second fuel hook-up moves the first actuation member from the first position to the second position which causes the at least one pressure regulator to move from a first position to a second position, wherein the at least one pressure regulator in the second position is configured to regulate a fuel flow of the second fuel type within a predetermined range.

[0013] In some embodiments, a heater assembly can be configured for use with one of a first fuel type or a second fuel type different than the first. The heater assembly can comprise a housing, a first actuation member and a second actuation member. The housing can have a first fuel hook-up for connecting a first fuel type to the heater assembly, a second hook-up for connecting a second fuel type to the heater assembly, a first outlet in fluid communication with both the
The first actuation member can have an end located within the first fuel hook-up and having a first actuation member first position and a second position, the actuation member configured such that connecting a fuel source to the heater assembly at the first fuel hook-up moves the actuation member from the first actuation member first position to the second position. In the first actuation member first position, fuel flow through the first fuel hook-up and the second outlet is prevented. In the first actuation member second position, fuel flow through the first fuel hook-up and the second outlet is permitted. The second actuation member can have an end located within the second fuel hook-up and having a first position and a second position, the actuation member configured such that connecting a fuel source to the heater assembly at the second fuel hook-up moves the actuation member from the first position to the second position. In the second actuation member first position, fuel flow through the second fuel hook-up and the third outlet is prevented. In the second actuation member second position, fuel flow through the second fuel hook-up and the third outlet is permitted.

In some embodiments, the heater assembly may further comprise a first pressure regulator configured to regulate fuel flow of the first fuel type within a first predetermined range and a second pressure regulator configured to regulate a fuel flow of the second fuel type within a second predetermined range different from the first.

BRIEF DESCRIPTION OF THE DRAWINGS

These and other features, aspects and advantages are described below with reference to the drawings, which are intended to illustrate but not to limit the invention. In the drawings, like reference characters denote corresponding features consistently throughout similar embodiments.

FIG. 1 is a perspective cutaway view of a portion of one embodiment of a heater configured to operate using either a first fuel source or a second fuel source.

FIG. 2 is a perspective cutaway view of the heater of FIG. 1.

FIG. 3A is a perspective view of one embodiment of a heating source.

FIG. 3B is a perspective view of the partially disassembled heating source of FIG. 3A.

FIG. 3C is a front view of the heating source of FIG. 3A.

FIG. 3D is a cross-section of the heating source taken along line A-A of FIG. 3C.

FIG. 4 is a top view of the partially disassembled heating source of FIG. 3B.

FIG. 4A is a cross-section of a heating source taken along line A-A of FIG. 4.

FIGS. 4A1 and 4A2 show the heating source of FIG. 4A in two different positions.

FIGS. 4B1 and 4B2 are cross-sections of the heating source of FIG. 4A taken along line B-B in two different positions.

FIGS. 5A-C are schematic views of different embodiments of heating sources.

FIGS. 6A-B are schematic views of different embodiments of heating sources.

FIG. 7 is a perspective view of another embodiment of a partially disassembled heating source.

FIG. 8 is a front view of the heating source of FIG. 7.

FIG. 8A is a cross-sectional view of the heating source of FIG. 8 taken along line A-A.

FIG. 9 is a top view of the partially disassembled heating source of FIG. 7.

FIG. 9A is a cross-section of a heating source taken along line A-A of FIG. 9.

FIGS. 9A1 and 9A2 show the heating source of FIG. 9A in two different positions.

FIGS. 9B and 9C are cross-sections of the heating source of FIG. 9A taken along line C-C in two different positions.

FIGS. 10, 10A, and 10B illustrate perspective views of different embodiments of heating sources.

FIGS. 11A and 11B are cross-sections of a heating source in two different positions.

FIG. 12 is a cross-section of another heating source.

FIG. 13 is a cross-section of still another heating source.

FIG. 14 shows a perspective view of another embodiment of a heating source.

FIG. 15 is a cross-section of the heating source of FIG. 14.

FIG. 16 is a cross-section of the heating source of FIG. 14 showing the pressure regulators.

FIG. 17 is a cross-section of the heating source of FIG. 14 showing two valves.

FIG. 18 shows another embodiment of a heating source.

FIG. 19 is a cross-section of the heating source of FIG. 18.

FIG. 20A is a cross-section of the heating source of FIG. 18 showing the pressure regulator in a first position.

FIG. 20B is a cross-section of the heating source of FIG. 18 showing the pressure regulator in a second position.

FIG. 21A shows a cross-section of another embodiment of a heating source with the pressure regulator in a first position.

FIG. 21B is a cross-section of the heating source of FIG. 21A showing the pressure regulator in a second position.

FIG. 22 shows certain components of an embodiment of a heater.

FIG. 23 is a schematic diagram of the heater of FIG. 22.

FIGS. 24 and 24A show another embodiment of heating source.

FIG. 25 is a cross-section taken along line C-C of FIG. 24A.

FIG. 26 is a cross-section taken along line B-B of FIG. 24A.

FIG. 27 is the cross-section of FIG. 25 shown with a fitting.

FIG. 28 is the cross-section of FIG. 26 shown with a fitting.

FIG. 29 shows certain components of an embodiment of a heater.

FIG. 30 is a schematic diagram of the heater of FIG. 29.

FIGS. 31A and 31B show another embodiment of heating source.

FIG. 32 is a cross-section of the heating source of FIGS. 31A and 31B in a first position.

FIG. 33 is a cross-section of the heating source of FIGS. 31A and 31B in a second position.
DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENT

[0061] Many varieties of space heaters, fireplaces, stoves, ovens, boilers, fireplace inserts, gas logs, and other heat-producing devices employ combustible fuels, such as liquid propane and natural gas. These devices generally are designed to operate with a single fuel type at a specific pressure. For example, as one having skill in the art would appreciate, some gas heaters that are configured to be installed on a wall or a floor operate with natural gas at a pressure in a range from about 3 inches of water column to about 6 inches of water column, while others operate with liquid propane at a pressure in a range from about 8 inches of water column to about 12 inches of water column.

[0062] In many instances, the operability of such devices with only a single fuel source is disadvantageous for distributors, retailers, and/or consumers. For example, retail stores often try to predict the demand for natural gas units versus liquid propane units over a given season, and accordingly stock their shelves and/or warehouses with a percentage of each variety of device. Should such predictions prove incorrect, stores can be left with unsold units when the demand for one type of unit was less than expected, while some potential customers can be left waiting through shipping delays or even be turned away empty-handed when the demand for one type of unit was greater than expected. Either case can result in financial and other costs to the stores. Additionally, some consumers can be disappointed to discover that the styles or models of stoves, fireplaces or other device, with which they wish to improve their homes, are incompatible with the fuel sources with which their homes are serviced.

[0063] Certain advantageous embodiments disclosed herein reduce or eliminate these and other problems associated with devices having heating sources that operate with only a single type of fuel source. Furthermore, although certain of the embodiments described hereunder are presented in the context of vent-free heating systems, the apparatus and devices disclosed and enabled herein can benefit a wide variety of other applications and appliances.

[0064] FIG. 1 illustrates one embodiment of a heater 100. The heater 100 can be a vent-free infrared heater, a vent-free blue flame heater, or some other variety of heater, such as a direct vent heater. Some embodiments include boilers, stoves, dryers, fireplaces, gas logs, etc. Other configurations are also possible for the heater 100. In many embodiments, the heater 100 is configured to be mounted to a wall or a floor or to otherwise rest in a substantially static position. In other embodiments, the heater 100 is configured to move within a limited range. In still other embodiments, the heater 100 is portable.

[0065] The heater 100 can comprise a housing 200. The housing 200 can include metal or some other suitable material for providing structure to the heater 100 without melting or otherwise deforming in a heated environment. In the illustrated embodiment, the housing 200 comprises a window 220, one or more intake vents 240 and one or more outlet vents 260. Heated air and/or radiant energy can pass through the window 220. Air can flow into the heater 100 through the one or more intake vents 240 and heated air can flow out of the heater 100 through the outlet vents 260.

[0066] With reference to FIG. 2, in certain embodiments, the heater 100 includes a regulator 120. The regulator 120 can be coupled with an output line or intake line, conduit, or pipe 122. The intake pipe 122 can be coupled with a heater control valve 130, which, in some embodiments, includes a knob 132. As illustrated, the heater control valve 130 is coupled to a fuel supply pipe 124 and an oxygen depletion sensor (ODS) pipe 126, each of which can be coupled with a fluid flow controller 140. The fluid flow controller 140 can be coupled with a first nozzle line 141, a second nozzle line 142, a first ODS line 143, and a second ODS line 144. In some embodiments, the first and the second nozzle lines 141, 142 are coupled with a nozzle 160, and the first and the second ODS lines 143, 144 are coupled with an ODS 180. In some embodiments, the ODS comprises a thermocouple 182, which can be coupled with the heater control valve 130, and an igniter line 184, which can be coupled with an igniter switch 186. Each of the pipes 122, 124, and 126 and the lines 141-144 can define a fluid passageway or flow channel through which a fluid can move or flow.

[0067] In some embodiments, including the illustrated embodiment, the heater 100 comprises a burner 190. The ODS 180 can be mounted to the burner 190, as shown. The nozzle 160 can be positioned to discharge a fluid, which may be a gas, liquid, or combination thereof into the burner 190. For purposes of brevity, recitation of the term “gas or liquid” hereafter shall also include the possibility of a combination of a gas and a liquid. In addition, as used herein, the term “fluid” is a broad term used in its ordinary sense, and includes materials or substances capable of fluid flow, such as gases, liquids, and combinations thereof.

[0068] Where the heater 100 is a dual fuel heater, either a first or a second fluid is introduced into the heater 100 through the regulator 120. Still referring to FIG. 2, the first or the second fluid proceeds from the regulator 120 through the intake pipe 122 to the heater control valve 130. The heater control valve 130 can permit a portion of the first or the second fluid to flow into the fuel supply pipe 124 and permit another portion of the first or the second fluid to flow into the ODS pipe 126. From the heater control valve 130, the first or the second fluid can proceed to the fluid flow controller 140. In many embodiments, the fluid flow controller 140 is configured to channel the respective portions of the first fluid from the fuel supply pipe 124 to the first nozzle line 141 and from the ODS pipe 126 to the first ODS line 143 when the fluid flow controller 140 is in a first state, and is configured to channel the respective portions of the second fluid from the fuel supply pipe 124 to the second nozzle line 142 and from the ODS pipe 126 to the second ODS line 144 when the fluid flow controller 140 is in a second state.

[0069] In certain embodiments, when the fluid flow controller 140 is in the first state, a portion of the first fluid proceeds through the first nozzle line 141, through the nozzle 160 and is delivered to the burner 190, and a portion of the first fluid proceeds through the first ODS line 143 to the ODS 180. Similarly, when the fluid flow controller 140 is in the second state, a portion of the second fluid proceeds through the nozzle 160 and another portion proceeds to the ODS 180. As discussed in more detail below, other configurations are also possible.

[0070] A heating assembly or heating source 10 that can be used with the heater 100, or other gas appliances, will now be described. The heating source 10 can be configured such that the installer of the gas appliance can connect the assembly to one of two fuels, such as either a supply of natural gas (NG) or a supply of propane (LP) and the assembly will desirably operate in the standard mode (with respect to efficiency and flame size and color) for either gas.
Looking at FIGS. 3A-4B, a heating source 10 can comprise a fuel selector valve 3. The fuel selector valve 3 can be used for selecting between two different fuels and for setting certain parameters, such as one or more flow paths, and/or a setting on one or more pressure regulators based on the desired and selected fuel. The fuel selector valve 3 can have a fuel source configuration to direct a flow of a first fuel (such as NG) in a first path through the fuel selector valve 3 and a second mode configured to direct a flow of a second fuel (such as LP) in a second path through the fuel selector valve 3.

The fuel selector valve 3 can further comprise first and second fuel source connections or hook-ups 12, 14. The fuel selector valve 3 can connect to one of two different fuel sources, each fuel source having a different type of fuel therein. For example, one fuel source can be a cylinder of LP and another fuel source can be a NG fuel line in a house connected to a city gas line. The first and second fuel source connections 12, 14 can comprise any type of connection such as a threaded connection, a locking connection, an advance and twist type connection, etc.

An embodiment of a fuel selector valve 3 is shown in FIG. 3A with a housing 11 and a cover 20. The cover has been removed in FIG. 3B revealing some of the internal components of the illustrated embodiment. A pressure regulator 16 is positioned within the housing such that fluid entering the fuel selector valve 3 via either the first or second fuel source connection 12, 14 can be directed to the pressure regulator 16. FIG. 3D shows a cross-section of the selector valve 3 showing the flow path between the fuel source connections and the pressure regulator. Fuel from the pressure regulator 16 can then flow to the outlet 18, as can also be seen with reference to FIG. 3D. The fuel can then flow to various other components, such as a burner. In some embodiments, the fuel selector valve 3 has two separate pressure regulators such that each fuel source connection directs fuel to a specific pressure regulator which can then travel to the outlet.

The fuel selector valve 3 can be configured to select one or more flow paths through the fuel selector valve 3 and/or to set a parameter of the fuel selector valve. For example, the fuel selector valve 3 can include one or more valves, where the position of the valve can determine one or more flow paths through the fuel selector valve 3, such as a fluid exit or entry pathway. As another example, the fuel selector valve 3 can control certain parameters of the pressure regulator 16.

With reference to FIGS. 4-4A, it can be seen that the fuel selector valve 3 can include one or more actuation members 22, 24. The actuation members 22, 24 can be used for many purposes such as to select one or more flow paths through the fuel selector valve 3 and/or to set a parameter of the fuel selector valve. The one or more actuation members can be provided in the fuel selector valve 3 in many ways. As shown, the actuation members are spring loaded rods that can be advanced in a linear motion. An actuation member can be one or more of a linkage, a rod, an electric or mechanical button, a pin, a slider, a gear, a cam, etc.

As shown, the actuation member 22 has an end 26 positioned within the first fuel source connection 12. A connector 30 can be attached to the first fuel source connection 12 by advancing the connector into the first fuel source connection 12. This can force the actuation member 26 into the housing of the fuel selector valve 3. This force then counteracts a spring force provided by a spring 32 to open a valve 34.

FIG. 4A1 shows the open valve 34 with the connector 30 attached to the first fuel source connection 12. The connector 30 can be part of a fuel source to provide fuel to the heater assembly 10. With the valve 34 in the open position, fuel from the fuel source can flow through the connector 30 and into the fuel selector valve 3. In particular, as shown, fuel can flow into the first fuel source connection 12, then to the pressure regulator 16 and finally out of the fuel selector valve 3 by way of outlet 18 (FIGS. 3A-3B).

Alternatively, the connector 30 can be connected to the second fuel source connection 14. This can open the valve 36 by pressing on the end 28 of the second actuation member 24. Fuel can then flow from the fuel source through the connector 30 into the fuel source connection 14. The fuel can then flow to the pressure regulator 16 and out through outlet 18.

The presence of two valves 34, 36, one at each fuel source connection 12, 14, can prevent fuel from exiting the fuel selector valve 3 undesirably, as well as preventing other undesirable materials from entering the fuel selector valve 3. In some embodiments, the fuel selector valve can utilize a cap or plug to block the unused fuel source connection. This may be in addition to or instead of one or more valves at the fuel source connections. For example, in some embodiments the actuation member 24 does not include a valve at the fuel source connection 14.

In addition to or instead of providing a valve 36 at the inlet or fuel source connection 14, the actuation member 24 can be in a position to control a parameter of the pressure regulator 16. Referring back to FIGS. 3B and 4, it can be seen that an arm 38 extends between the actuation member 24 and the pressure regulator 16. The actuation member 24 can act on the arm, determining the position of the arm 38. This position can be seen by comparing the position of the arm 38 in FIGS. 4A1 and 4A2, as well as FIGS 4B1 and 4B2. The position of the arm 38 can then determine the height (H1, H2) of the spring 40 within the pressure regulator. That is, the length of the spring is constant, the height H1 of the spring when the diaphragm is in a first position shown in FIG. 4B1 is greater than the height H2 of the spring when the spring is in the position shown in FIG. 4B2. As shown, the arm 38 contacts a cap 41 that is connected to the spring 40. The height of the spring 40 can be a factor in determining the force required to move the diaphragm 42. The spring height can be used to preset the pressure settings of the pressure regulator. Thus, the spring can be tensioned to regulate the pressure of the incoming fuel depending on whether the first or second fuel source is utilized.

In another embodiment, the actuation member contacts the pressure regulator 16 directly, such as at the cap 41, without the assistance of an arm or other device to set the regulating pressure of the pressure regulator.

The pressure regulator 16 can be set to a first position as shown in FIG. 4B1. The initial position can allow for flow control of the first fuel at an initial predetermined pressure or pressure range. The initial predetermined pressure or pressure range is lower than the second predetermined pressure or pressure range based on the second position as shown in FIG. 4B2. For example, the predetermined selected pressure can depend on the particular fuel used, and may desirably provide for safe and efficient fuel combustion and reduce, mitigate, or minimize undesirable emissions and pollution. In some embodiments, the first pressure can be set to be within the range of about 3 inches of water column to...
about 6 inches of water column, including all values and sub-ranges therebetween. In some embodiments, the threshold or flow-terminating pressure is about 3 inches of water column, about 4 inches of water column, about 5 inches of water column, or about 6 inches of water column.

[0083] In some embodiments, the second pressure can be set to be within the range of about 8 inches of water column to about 12 inches of water column, including all values and sub-ranges therebetween. In some embodiments, the second threshold or flow-terminating pressure is about equal to 8 inches of water column, about 9 inches of water column, about 10 inches of water column, about 11 inches of water column, or about 12 inches of water column.

[0084] When natural gas is the first fuel and propane is the second fuel, the first pressure, pressure range and threshold pressure are less than the second pressure, pressure range and threshold pressure. Stated differently, in some embodiments, when natural gas is the first fuel and propane is the second fuel, the second pressure, pressure range and threshold pressure are greater than the first pressure, pressure range and threshold pressure.

[0085] The pressure regulator 16 can function in a similar manner to that discussed in U.S. application Ser. No. 11/443,484, filed May 30, 2006, now U.S. Pat. No. 7,607,426, incorporated herein by reference and made a part of this specification; with particular reference to the discussion on pressure regulators at columns 3-9 and FIGS. 3-7 of the issued patent.

[0086] The pressure settings can be further adjusted by tensioning of a screw or other device 41 that allows for flow control of the fuel at a predetermined pressure or pressure range and selectively maintains an orifice open so that the fuel can flow through spring-loaded valve or valve assembly of the pressure regulator. If the pressure exceeds a threshold pressure, a plunger seat 43 can be pushed towards a seal ring 45 to seal off the orifice, thereby closing the pressure regulator.

[0087] The fuel selector valve 3 can permit the flow of fuel from one or more pressure regulators, through the fuel selector valve 3 and into additional components. The additional components can be, for example, the heater control valve 130, the fluid flow controller 140, the nozzle 160, etc. In some embodiments, the additional components can comprise a control valve which comprises at least one of a manual valve, a thermostat valve, an AC solenoid, a DC solenoid and a flame adjustment motor. In various embodiments, the additional components may or may not comprise part of the heating source 10. The additional components can be configured to use the fuel, such as for combustion, and/or to direct one or more lines of fuel to other uses or areas of the heater 100 or other appliance.

[0088] Returning now to FIGS. 4A1-4132, the functioning of the arm 38 and the actuation member 24 will be described in more detail. The actuation member 24 can have a varying or undulating surface that engages the arm 38. The arm 38 can move with the varying surface thereby changing the position of the arm 38. The arm 38 can be made from a resilient flexible material, such as metal or plastic, but can also be rigid. The arm as shown is a flexible material that can be moved and bent between positions with a resiliency to return to an unbent or less bent position. In other embodiments, the arm can be a linkage, a pinned rotating arm, a member suspended between the actuation member and the pressure regulator, etc. The arm 38 can be elongate, have spring qualities, be biased upwards, be a bent metal arm or beam, etc.
fuel source connection 12 can allow fuel flow through the initial configuration of the pressure regulator and can open the first valve at one of the outlets. Selecting the second fuel source connection 14 can move the pressure regulator 16 to its secondary configuration and open the second valve at the other of the outlets.

FICG. SC illustrates a fuel selector valve having two valves 48, 50. In addition to setting the pressure regulator, selecting the fuel source connection can also determine how the fuel flows through the valves 48, 50. For example, one selection can allow the fuel to follow the upward arrows, while the other selection can allow the fuel to follow the downward arrows. In addition, the fuel selector valve can also direct the fuel out of the fuel selector valve after the pressure regulator 16, and then receive the fuel again. The fuel can be directed to other components 52 that then direct the fuel, or some of the fuel back to the fuel selector valve. It should be understood that the fuel selector valve show in FIG. SB can also include other components 52 between the pressure regulator 16 and the valve 48. The heating source can include the fuel selector valve and one or more of the other components.

The other component 52 can preferably be a control valve. In some embodiments, the control valve can comprise at least one of a manual valve, a thermostat valve, an AC solenoid, a DC solenoid and a flame adjustment motor. For example the control valve 52 can include two solenoids. Each solenoid can control the flow of fuel to one of the valves 48, 50. The valves can then direct fuel to additional components such as a pilot light or oxygen depletion sensor and to a nozzle. In some embodiments, each line leaving the valve can be configured to direct a particular type of fuel to a component configured specific to that type of fuel. For example, one valve may have two lines with each line connected to a different nozzle. The two nozzles can each have a different sized orifice and/or air hole and each can be configured for a particular fuel type.

Turning now to FIGS. 6A and 6B, additional embodiments of heating sources are shown. The heating source of FIG. 6A is very similar to that shown in FIG. 5C. One difference is that the fuel selector valve of FIG. 6A includes two pressure regulators 16. The pressure regulators 16 are each configured to direct fuel to a particular pressure or pressure range. As there is only one line leading to each pressure regulator, the pressure regulators 16 are each configured to control pressure according to a different pressure setting. The fuel selector valve 16 can be configured to direct the fuel to be delivered by the pressure regulators 16 to each of the fuel sources 12, 14. In FIGS. 5A and 5C, each of the fuel source connections 12, 14 or both can determine and/or change a path through the fuel selector valve. For example, each of valves 48 and 50 can comprise one valve or two valves as described above.

FIG. 6B shows another embodiment where the control valve 52 returns the flow of fuel to the fuel selector valve. One flow of fuel is directed to valve 48 and one flow passes through the fuel selector valve but the flow does not have separate paths dependent on the fuel type.

In each of the embodiments shown in FIGS. 5A-6B, the fuel selector valve may also include valves in or near the fuel source connections 12, 14. This can help to control the flow of fuel into the fuel selector valve as has been previously discussed.

Turning now to FIGS. 7-9C, another embodiment of heating source 10 is shown. It will be understood that parts of this heating source can function in a similar manner to the heating source shown and described with reference to FIGS. 3A-4B2. Thus, similar reference numbers are used. For example, the pressure regulator 16 functions in the same way in both illustrated embodiments. In addition, the embodiment of FIGS. 7-9C is conceptually similar to the schematic diagram shown and described with reference to FIG. 5C.

Looking to FIG. 7, it can be seen that a control valve 52 having two solenoids 54, 56 is connected to the side of the fuel selector valve 3. The fuel selector valve 3 also includes two valves 48, 50. FIGS. 8 and 8A show the fuel selector valve 3 in relation to the control valve 52. A fluid, such as fuel, can flow from one of the fuel source connections 12, 14, flows through the pressure regulator 16 to the control valve 52. The fluid flow will first encounter the first solenoid 54. The first solenoid 54 has a valve 58 that can control flow past the first solenoid 54. When the valve 58 is open, fluid can flow to both the second solenoid 56 and to the valve 48. The second solenoid 56 also has a valve 60 which can open or close to control fluid flow to the valve 50. In some embodiments, the valve 48 directs fuel to a pilot light or oxygen depletion sensor and the valve 50 directs fuel to a nozzle at a burner. Thus, it may be desirable to direct fuel to be ignited at the pilot light first, before directing fuel to the burner. The control valve 52 can also control the amount of fuel flowing to the burner. In some embodiments, the control valve can also include a manual valve that allows for manual as well as, or instead of, automatic control by an electric valve, such as the two solenoids shown.

As discussed, selecting one of the first and second fuel source connections 12, 14 can determine the flow path through the heating source. In particular, the actuation member 24 can move the valves 48 and 50 from an initial position to a secondary position in a manner similar to that described above with reference to the pressure regulator.

The fuel selector valve 3 can be used for selecting between two different fuels and for setting certain parameters, such as one or more flow paths, and/or a setting on one or more pressure regulators based on the desired and selected fuel. The fuel selector valve 3 can have a first mode configured to direct a flow of a first fuel (such as NG) in a first path through the fuel selector valve 3 and a second mode configured to direct a flow of a second fuel (such as LP) in a second path through the fuel selector valve 3. The fuel selector valve 3 can further comprise first and second fuel source connections 12, 14, and hook-ups 12, 14. The fuel selector valve 3 can connect to one of two different fuel sources, each fuel source having a different type of fuel therein.

A pressure regulator 16 is positioned within the housing such that fluid entering the fuel selector valve 3 via either the first or second fuel source connection 12, 14 can be directed to the pressure regulator 16. Fuel from the pressure regulator 16 can then flow to the control valve 52 as discussed above. In some embodiments, the fuel selector valve 3 has two separate pressure regulators such that each fuel source connection directs fuel to a specific pressure regulator.

The fuel selector valve 3 can be configured to select one or more flow paths through the fuel selector valve 3 and/or to set a parameter of the fuel selector valve. For example, the fuel selector valve 3 may include two valves 48, 50, where the position of the valve can determine a flow path through the fuel selector valve 3. The fuel selector valve 3 can also control certain parameters of the pressure regulator 16.

With reference to FIGS. 9-9A2, it can be seen that the fuel selector valve 3 can include one or more actuation
members 22, 24. The actuation members 22, 24 can be used for many purposes such as to select one or more flow paths through the fuel selector valve 3 and/or to set a parameter of the fuel selector valve. As shown, the actuation members are spring loaded rods that can be advanced in a linear motion.

The illustrated actuation member 22 has an end 26 positioned within the first fuel source connection 12. A connector 30 can be attached to the first fuel source connection 12 by advancing the connector into the first fuel source connection 12. This can force the actuation member end 26 into the housing of the fuel selector valve 3. This force then counteracts a spring force provided by a spring 32 to open a valve 34.

FIG. 9A1 shows the open valve 34 with the connector 30 attached to the first fuel source connection 12. The connector 30 can be part of a fuel source to provide fuel to the heater assembly 10. With the valve 34 in the open position, fuel from the fuel source can flow into the first fuel source connection 12, to the pressure regulator 16, then to the control valve 52 and then to one or both of the valves 48, 50 before finally leaving the fuel selector valve 3.

Alternatively, the connector 30 can be connected to the second fuel source connection 14 as shown in FIG. 9A2. This can open the valve 36 by pressing on the end 28 of the second actuation member 24. Fuel can then flow from the fuel source through the connector 30 into the fuel selector valve 3 and through the fuel selector valve 3 in the same manner as mentioned above.

The presence of two valves 34, 36, one at each fuel source connection 12, 14, can prevent fuel from exiting the fuel selector valve 3 undesirably, as well as preventing other undesirable materials from entering the fuel selector valve 3. In some embodiments, the fuel selector valve can utilize a cap or plug to block the unused fuel source connection. This may be in addition to or instead of one or more valves at the fuel source connections. For example, in some embodiments the actuation member 24 does not include a valve at the fuel source connection 14.

In addition to, or instead of, providing a valve 36 at the inlet or fuel source connection 14, the actuation member 24 can be in a position to control a parameter of the pressure regulator 16, such as by an arm 38 that extends between the actuation member 24 and the pressure regulator 16. The actuation member 24 can act on the arm, determining the position of the arm 38. The position of the arm 38 can then determine the height of the spring 40 within the pressure regulator. The height of the spring 40 can be a factor in determining the force required to move the diaphragm 42. The spring height can be used to set the pressure of the fluid flowing through the pressure regulator.

In addition to controlling the pressure regulator, the actuation member 24 can also control one or more valves, including valves 48, 50. The actuation member 24 can have a varying or undulating surface that engages the arms 38 as shown in FIGS. 9A1-9A2. The arms 38 can move with the varying surface thereby changing the position of the arms 38.

The actuation member 24 can include flat spots or sections with a diameter different than adjacent sections. As can be seen, the actuation member includes flat portions 44 with transition portions 46 that extend between the initial outer diameter of the cylindrical rod and the flat portions 44. Alternatively, the portion 44 can have a smaller diameter than the initial outer diameter of the rod. The rod can extend along a longitudinal axis and have a plurality of longitudinal cross-sections of different shapes. The actuation member 24 can be a type of cam and can also be shapes, besides cylindrical, and can have a surface that varies to provide different heights to the arms 38 for engaging the arms.

Looking now to FIGS. 9B and 9C, an embodiment of a valve 48 is shown. The valve 50 can function in a similar manner to that as will be described with reference to valve 48. The valves can also function in other ways as will be understood by one of skill in the art.

Valve 48 is shown having a valve body 62 that can control the fluid flow path and whether the flow exits the valve 48 through one of two outlets 70, 72. The valve body 62 can be seated against one of two different ledges 64, 66 surrounding an opening to either open or close the pathway 71, 73 to the respective outlet 70, 72. Fluid can enter the valve, such as from the control valve 52 as indicated by the dotted line. The position of the valve body 62 within the valve 48 can then determine whether the fluid exits via the first outlet 70 or the second outlet 72.

The valve body 62 can have a spring 32 to bias the valve body towards a first position as shown in FIG. 9B. In the first position, the outlet 72 is open and outlet 70 is closed, thus fluid will flow through flow path 73. In the second position shown in FIG. 9C, the outlet 72 is closed and the outlet 70 is open, thus fluid will flow through flow path 71. The valve body 62 can be made of one or more materials. The valve body 62 may include a solid core with a rubber or other elastic material to form the valve seat with the respective first or second ledge 64, 66.

The valve body 62 can also engage the arm 38 so that the position of the valve body 62 is controlled by the actuation member 24. As mentioned with respect to the pressure regulator, in some embodiments, the actuation member 24 can contact the valve body directly, without the use of an arm 38. Also, the arm 38 can take any form to allow the actuation member to control the position of the valve body within the valve 48.

The valve 48 can also include a diaphragm 68. The diaphragm 68 can be different from the diaphragm 42 in the pressure regulator (FIGS. 4B1 and 4B2) in that the diaphragm 68 is generally not used for pressure regulation. The diaphragm 68 can be a sheet of a flexible material anchored at its periphery that is most often round in shape. It can serve as a flexible barrier that allows the valve to be actuated from the outside, while sealing the valve body 62 and keeping the contents, namely the fuel, within the fuel selector valve.

FIG. 10 illustrates a perspective view of the heating source 10 where both the first valve 48 and the second valve 50 have two outlets and function in similar manners. Thus, the heating source 10, valve 48 and valve 50 can all function in the same or a similar manner as that described with respect to FIGS. 7-9C. FIGS. 10A and 10B show heating sources where the first valve 48 is different from the second valve 50. The valve 48 can be the same or similar to that described above and the valve 50 can be the same or similar to the valves described in more detail below. Further, in some embodiments the heating source can include only one valve. The heating source may still include one or more outlets at the area that does not include a valve.

FIGS. 11A and 11B show an embodiment of a valve 50 in cross-section. As one example, the illustrated valve 50 could be used in the heating source of FIG. 10A. The valve 50 has two channels or flow paths 78, 80 and a valve body 62 that is positioned to open and close only one of the flow paths 80. Thus, the flow path 78 remains open so that when fuel is...
flowing from the control valve 52 to the valve 50, it will flow through flow path 78 and it may also flow through flow path 80. FIG. 11A shows the valve 50 with the valve body 62' spaced away from the ledge 66 so that the valve and the flow path 80 are open. FIG. 11B shows the valve body 62 seated at the ledge 66 so that the valve and the flow path 80 are closed. The flow path 78 remains open in both figures. There is also only one outlet 74 so both flow paths pass through the outlet 74.

[0121] FIG. 12 shows the valve 50 of FIG. 11A with a nozzle assembly 76 positioned within the outlet 74. The nozzle assembly 76 has a center orifice 82 and an outer orifice 84. The flow path 78 is in fluid communication with the center orifice 82 and the flow path 80 is in fluid communication with the outer orifice 84. The orifices can be single orifices, or a plurality of orifices. For example, the nozzle can have a single center orifice 82 and a plurality of orifices that surround the center orifice to make up the outer orifice 84.

[0122] FIG. 13 illustrates another embodiment of the fuel selector valve which is conceptually similar to the schematic diagram shown and described with reference to FIG. 6A. The fuel selector valve can have a valve 48 and then a separate flow path 86. Thus, a control valve 52 can return two flows of fuel to the fuel selector valve, one of which is to the valve 48 and one to the flow path 86. The fuel in the flow path 86 can flow through the fuel selector valve without being controlled by having a valve 50 or without being directed downstream separate paths dependent on the fuel type. The fuel is simply directed out of the fuel selector valve.

[0123] Turning now to FIGS. 14-17, another embodiment of a heating source is shown which is conceptually similar to the schematic diagram shown and described with reference to FIG. 6A. As can best be seen in FIG. 15, both the first actuation member 22' and the second actuation member 24' are used to control valves at the inlets, but also the valves at the outlets of the fuel selector valve. In addition, the fuel selector valve includes two pressure regulators 16', 16" as can be seen in FIG. 16. The two pressure regulators 16', 16" can be preset to a particular pressure or pressure range and each of the fuel source connections 12, 14 can direct fluid flow to a specific pressure regulator. Thus, the pressure regulators do not need to be changeable between two different pressures as discussed previously.

[0124] The pressure settings of each pressure regulator 16', 16" can be independently adjusted by tensioning of a screw or other device 41 that allows for flow-control of the fuel at a predetermined pressure or pressure range and selectively maintains an orifice open so that the fuel can flow through spring-loaded valve or valve assembly of the pressure regulator. If the pressure exceeds a threshold pressure, a plunger seat 43 can be pushed towards a seal ring 45 to seal off the orifice, thereby closing the pressure regulator.

[0125] Turning now to FIG. 17, one example of a valve 48' is shown. The valve 48' can comprise two separate valves that are each separately controllable by either the first actuation member 22 or the second actuation member 24'. The selection of the fuel source connection can determine which valve is opened. For example, selecting the first fuel source connection 12 and advancing the first actuation member 22 can allow fuel flow through a preset pressure regulator 16' and can move the first valve body 62' to the open position to allow flow through the outlet 70. Selecting the second fuel source connection 14 and advancing the second actuation member 24' can allow fuel flow through a preset pressure regulator 16' and can move the second valve body 62" to the open position to allow flow through the outlet 72. It is anticipated that only one of the fuel source connections will be selected, though it is possible that in certain configurations, both fuel source connections could be in use.

[0126] The fuel selector valve may also include valves in or near the fuel source connections 12, 14. This can help to control the flow of fuel into the fuel selector valve as has been previously discussed.

[0127] As before, it will be understood that the valve 50 can be similar to valve 48' or can have a different configuration. For example, the valve 50 may have one or two outlets and it may include a nozzle in the one outlet.

[0128] Turning now to FIGS. 18-20B, another embodiment of a heating source is illustrated. This heating source is similar in many regards to that discussed below with reference to FIGS. 3A-4B. The heating source can include a fuel selector valve 3 configured for selecting between two different fuels and for setting certain parameters, such as one or more flow paths, and/or a setting on one or more pressure regulators based on the desired and selected fuel. The fuel selector valve 3 can include first and second fuel source connections or hook-ups 12, 14. Each fuel selector valve 3 can connect to one of two different fuel sources through the hook-ups 12, 14, each fuel source having a different type of fuel therein.

[0129] A pressure regulator 16 is positioned within the housing such that fluid entering the fuel selector valve 3 via the first or second fuel source connection 12, 14 can be directed to the pressure regulator 16. FIG. 19 shows a cross-section of the selector valve 3 showing the flow path from the fuel source connections to the pressure regulator. Fuel from the pressure regulator 16 can then flow to the outlet 18. The fuel can then flow to various other components, such as a burner.

[0130] With continued reference to FIG. 19, it can be seen that the fuel selector valve 3 can include one or more actuation members 22, 24. The actuation members 22, 24 can be used for many purposes such as to select one or more flow paths through the fuel selector valve 3 and/or to set a parameter of the fuel selector valve. The one or more actuation members can be provided in the fuel selector valve 3 in many ways. As shown, the actuation members are spring loaded rods that can be advanced in a linear motion. An actuation member can be one or more of a linkage, a rod, an electric or mechanical button, a pin, a slider, a gear, a cam, etc.

[0131] As shown, the actuation member 22 has an end 26 positioned within the first fuel source connection 12. A connector 30 can be attached to the first fuel source connection 12 by advancing the connector into the first fuel source connection 12. This can force the actuation member end 26 into the housing of the fuel selector valve 3. This force then counteracts a spring force provided by a spring 32 to open a valve 34. Actuation member 24 can function in a similar manner. The presence of two valves 34, 36, one at each fuel source connection 12, 14, can prevent fuel from exiting the fuel selector valve 3 undesirably, as well as preventing the undesirable materials from entering the fuel selector valve 3.

[0132] In addition to or instead of providing a valve 36 at the inlet or fuel source connection 14, the actuation member 24 can be in a position to control a parameter of the pressure regulator 16. Referring to FIGS. 20A and 20B, it can be seen that an arm 30 can be positioned between an end 80 of the actuation member 24 and the pressure regulator 16. The actuation member 24 can act on the arm, determining the
position of the arm 90. This position can be seen by comparing 
the position of the arm 90 in FIGS. 20A and 20B.

[0133] A secondary spring 92 is operated together 
connected to the arm 90. The secondary spring 92 can assist 
the main regulator spring 40 to set a desired regulation pressure. 
For example, the secondary spring 92 can have an engaged 
position (FIG. 20A) and an unengaged position (FIG. 20B) 
which correspond with a first and second position of the 
pressure regulator. When the arm is moved upwards, the 
spring 92 engages the valve 43 (FIG. 20A) and pushes the 
valve, as well as, the diaphragm 42 upwards. This also can 
adjust the height of the main spring 40. This can decrease the 
pressure required to cause flow through the pressure regulator 
16. It will be understood that the arm and/or spring can be 
used in other ways to decrease or increase the pressure setting 
of the pressure regulator. For example, the secondary spring 
92 can be connected to the valve 43 in both positions, and 
the actuation member can be used to adjust the height of the 
spring.

[0134] In the embodiment of FIG. 20A, the secondary 
spring 92 is engaged with the valve 43 and the inlet 14 is 
closed. Though not shown, a fitting 30 can be advanced into 
the inlet 12 to utilize the illustrated configuration of the pres-
sure regulator. Fuel can flow from a fuel source, though inlet 
12 and through the pressure regulator with the secondary 
spring 92 engaged with the valve 43.

[0135] FIG. 20B shows a fitting 30 within inlet 14. In this 
position, the secondary spring 92 is disengaged from the 
valve. Thus, the valve 43 and diaphragm 42 will return to their 
initial at rest position until fuel begins to flow, acting on the 
diaphragm and flowing through the pressure regulator and out 
the outlet 18.

[0136] FIGS. 21A and 21B show a variation of the heating 
source of FIGS. 20A and 20B. In this embodiment, when the 
fitting 30 is positioned within the inlet 12 and not the inlet 
14, the secondary spring 92 is in the unengaged position (FIG. 
21A). Then, when the fitting 30 is within the inlet 14, the 
secondary spring 92 is in the engaged position (FIG. 21B).

[0137] Turning now to FIGS. 22 and 23, another embodi-
ment of a heater assembly 100 is illustrated. In some embodi-
ments, the heater assembly 100 can include a fuel selector 
valve 3. The fuel selector valve 3 can receive a first fuel or a 
second fuel. In some embodiments, the first fuel may be liquid 
propane gas (LPG). In some embodiments, the second fuel may 
be natural gas (NG). The fuel selector valve 3 includes a fuel 
source connection 12 and a fuel source connection 14. The 
the fuel selector valve 3 can receive LP at fuel source connection 
12. The fuel selector valve 3 can receive NG at fuel source 
connection 14.

[0138] In some embodiments, the fuel selector valve 3 can 
direct fuel to a control valve 130. The control valve can 
include at least one of a manual valve, a thermostat valve, an 
AC solenoid, a DC solenoid and a flame adjustment motor. 
The control valve 130 can direct fuel back to the fuel selector 
valve 3 and/or to a nozzle assembly 160. In some embodi-
ments the nozzle assembly 160 can be part of the fuel selector 
valve 3. The nozzle assembly 160 can be similar to the various 
embodiments that described in U.S. patent application Ser. 
No. 13/310,664 filed Dec. 2, 2011 and published as U.S. 
2012/0255536, the entire contents of which are incorpo-rated 
by reference herein and are to be considered a part of the 
specification. FIGS. 23-240, 28A-343, 39A-440, and their 
accompanying descriptions are but some examples of nozzle 
assemblies from U.S. 2012/0255536.

[0139] An air shutter 170 can be positioned around the 
nozzle assembly 160 and have an opening and a cover. An air 
shutter can be used to introduce air into the flow of fuel prior 
to combustion. The amount of air that is needed to be intro-
duced depends on the type of fuel used. For example, propane 
gas needs more air than natural gas to produce a flame of the 
same size. It will be understood that an air shutter can be used 
with any of the embodiments discussed herein.

[0140] The fuel selector valve 3 can also direct fuel to an 
oxidation depletion sensor (ODS) 180. In some embodiments, 
the fuel selector valve 3 can be coupled with ODS lines 143 
and 144. As shown, the ODS 180 has a thermocouple 182 
coupled to the control valve 130, and an igniter line 184 
coupled with an igniter 186. In some embodiments, the ODS 
180 can be mounted to the main burner 190.

[0141] As also shown in FIG. 22, in some embodiments the 
heater can be a hybrid heating apparatus and can include an 
electric heating element 105. The electric heating element 
105 and heater can be similar to that described in U.S. patent 
application Ser. No. 13/310,649 filed Dec. 2, 2011 and 
published as U.S. 2012/0145693, the entire contents of which 
are incorporated by reference herein and are to be considered 
a part of the specification.

[0142] Referring now to FIGS. 24-24A, another embodi-
ment of a fuel selector valve 3 will be described. The fuel 
selector valve 3 as illustrated includes two pressure regulators 
16, one for each different fuel type to a dual fuel heater. Each 
of the pressure regulators can have a spring loaded valve 
connected to a diaphragm. The fluid pressure acting on the 
diaphragm can move the valve allowing more or less fluid to 
flow through the pressure regulator depending on the ori-
entation of the valve with respect to a valve seat which are 
generally positioned within the flow passage through the 
pressure regulator.

[0143] Among other features, the heating assembly 100 can 
be used to select between two different fuels and to set certain 
parameters, such as one or more flowpaths, and/or a setting on 
one or more pressure regulators based on the desired and 
selected fuel. The heating assembly 100 can have a first mode 
coupled to direct a flow of a first fuel (such as LP) in a first 
path through the heating assembly 100 and a second mode 
coupled to direct a flow of a second fuel (such as NG) in a 
second path through the heating assembly 100.

[0144] The fuel selector valve 3 can be used to select 
between two different fuels and to set certain parameters, 
such as one or more flowpaths, and/or a setting on one or more 
pressure regulators based on the desired and selected fuel. 
The fuel selector valve 3 can have a first mode configured to 
direct a flow of a first fuel (such as LPG) in a first path 
through the fuel selector valve 3 and a second mode configured 
to direct a flow of a second fuel (such as NG) on a second 
path through the fuel selector valve 3. The fuel selector valve 
3 can also include one or more actuation members as has been 
previously described with respect to previous embodiments. 
In some embodiments, the fuel selector valve 3 can be 
configured such that inlets of the valve are only open when they 
are connected to a source of fuel, as described in more detail 
below.

[0145] FIG. 24 illustrates an external view of a fuel selector 
valve 3 that can have a first inlet 12 and a second inlet 14. Both 
inlets can have an actuation member with an end that can at 
least partially enter the inlet and close or substantially close 
the inlet. For example, as illustrated in FIG. 25, the first inlet 
12 can have a first actuation member 22 with an end that
blocks the inlet. Similarly, the second inlet 14 can have a second actuation member 24 with an end that blocks the inlet.

As described with respect to various embodiments above, the actuation members can have sealing sections 34, 36 that can seat against respective ledges to close or substantially close their respective inlets 12, 14. Thus, the first actuation member 22 can have a first position in which the sealing section 34 of the first actuation member seats against the first ledge. Similarly, the second actuation member 24 can have a first position in which the sealing section 36 of the second actuation member seats against the second ledge. Each actuation member preferably has a biasing member, such as a spring 32 that biases the actuation member toward the first position.

As described in various embodiments above, when a fitting for a source of fuel connects to one of the inlets, it can move the actuation member into a second position that allows fluid to flow through the inlet. FIG. 27 illustrates a fitting 30 of a source of fuel connected to the first inlet 12. Each of the inlets is shown fluidly connected to a pressure regulator 16 and to the outlet 18.

As with some pressure regulators described above, the pressure settings of each pressure regulator 16 can be independently adjusted by tensioning of a screw or other device that allows for flow control of the fuel at a predetermined pressure or pressure range (which can correspond to a height of a spring) and selectively maintains an orifice open so that the fuel can flow through a spring-loaded valve or valve assembly of the pressure regulator. If the pressure exceeds a threshold pressure, a plunger seat can be pushed towards a seal ring to seal off the orifice, thereby closing the pressure regulator. In some embodiments, a fuel selector valve 3 can include two inlets with respective inlet valves as well as dedicated pressure regulators that can direct fluid flow to an outlet. Other embodiments may have additional features.

Turning now to FIGS. 26 and 28, it can be seen that the illustrated fuel selector valve 3 can provide additional control of a fluid flow through an additional valve system. As shown in FIG. 22, the fuel selector valve 3 can both direct fluid to the control valve 130 and receive a flow of fluid from the control valve. As shown, the control valve 130 directs the fluid flow for the oxygen depletion sensor (ODS) to the fuel selector valve 3. It will be understood that other embodiments can receive both the ODS fluid flow, as well as the nozzle fluid flow, or just the fluid flow for the nozzle. In addition, the fuel selector valve 3 can direct fluid flow to other components in addition to and/or instead of the control valve 130.

As best seen in FIG. 28, the actuators 22, 24 can each be operatively coupled to a valve member 112, 114 that can open the flow path to either the second outlet 96 or the third outlet 98. Thus, fluid received at the third inlet 94 can be discharged to either the second outlet 96 or the third outlet 98. In this way, the fuel selector valve 3 can direct fuel to desired location, such as a burner nozzle or ODS nozzle specific for a particular type of fuel.

The actuation members 22, 24 are shown as have three separate movable members. For example, actuation member 22 has a first valve 26, a moveable member 102 and a second valve 112. This second valve 112 of actuation member 22 is also the third valve of the system. Actuation member 24 is shown with a first valve 28, a moveable member 104 and a second valve 114. In the overall system, these valves are also called the second valve 28 and the fourth valve 112. One benefit of having two or more independently moveable members is that having two or more separate members can allow each member to properly seat to the respective valve to prevent leakage. Though it will be understood that one, two, or more members could be used. It can also be seen that a number of springs 32 and o-rings, 106 can be used to bias the members to their initial positions and to prevent leakage.

FIG. 28 shows a fitting in the first inlet 12. The fitting has advanced the actuation member 22. Thus, the valve 26 has been moved backwards opening the valve seat 34 to allow fluid flow to the pressure regulator 16 and then to the outlet 18 along a first flow path. The second flow path between the inlet 14 and outlet 18 is closed. Fluid can also be received in the second inlet 94. The actuation member 22 has been advanced so that the moveable member 102 has also been advanced. Moveable member 102 is operatively coupled to valve member 26 through a spring 32 positioned between them. The moveable member 102 can contact the third valve member 112, opening a valve seat 108 to allow fluid flow out of the outlet 96. This can be done along a third flow path.

A fourth flow path is closed as the actuation member 24 has not been advanced. Thus, the second moveable member 104 has also not been advanced. The second moveable member 104 is operatively coupled to valve member 28 through a spring 32 positioned between them. The second moveable member 104 can contact the fourth valve member 114. As it has not been advanced, the valve seat 110 remains closed, preventing fluid flow between third inlet 94 and third outlet 96. It will be understood that connecting a fitting in the inlet 14 can open the second and fourth flow paths.

In some embodiments, a fuel selector valve 3 similar to that described with respect to FIGS. 24-28, can have a single pressure regulator, or no pressure regulators. In addition, in some embodiments, the fuel selector valve 3 can have separate outlets fluidly connected to each inlet and/or fuel hook-up.

Turning now to FIGS. 29 and 30, another embodiment of a heater assembly 100 is illustrated. In some embodiments, the heater assembly 100 can include a fuel selector valve 3. The fuel selector valve 3 can receive a first fuel or a second fuel. The fuel selector valve 3 can include a fuel source connection 12 and a fuel source connection 14. The fuel selector valve 3 can receive a LP source at fuel source connection 12 and a NG source at fuel source connection 14.

In some embodiments, the fuel selector valve 3 can direct fuel to a control valve 130. The control valve can include at least one of a manual valve, a thermostat valve, an AC solenoid, a DC solenoid and a flame adjustment motor. The control valve 130 can direct fuel back to the fuel selector valve 3 and/or to a nozzle assembly 160. In some embodiments the nozzle assembly 160 can be part of the fuel selector valve 3. As shown, the control valve 130 directs fuel flow to both the fuel selector valve 3 and to the nozzle assembly 160. The fuel selector valve 3 can then selectively direct an additional flow of fuel to the nozzle assembly 160.

The fuel selector valve 3 can also direct fuel to an oxygen depletion sensor (ODS) 180. In some embodiments, the fuel selector valve 3 can be coupled with ODS lines 143 and 144. As shown, the ODS 180 has a thermocouple 182 coupled to the control valve 130, and an igniter line 184 coupled with an igniter 186. In some embodiments, the ODS 180 can be mounted to the main burner 190.

As also shown in FIG. 29, in some embodiments the heater can be a hybrid heating apparatus and can include an
electric heating element 105. The electric heating element 105 and heater can be similar to that described in U.S. patent application Ser. No. 13/310,649 filed Dec. 2, 2011 and published as U.S. 2012/0145693, the entire contents of which are incorporated by reference herein and are to be considered a part of the specification.

[0159] Referring now to FIGS. 31A and 31B, another embodiment of a fuel selector valve 3 will be described. The fuel selector valve 3 can be used to select between two different fuels and to set certain parameters, such as one or more flowpaths, and/or a setting on one or more pressure regulators based on the desired and selected fuel. The fuel selector valve 3 can have a first mode configured to direct a flow of a first fuel (such as LP gas) on a first path through the fuel selector valve 3 and a second mode configured to direct a flow of a second fuel (such as natural gas) on a second path through the fuel selector valve 3. The fuel selector valve 3 can also include one or more actuation members as has been previously described with respect to previous embodiments. In some embodiments, the fuel selector valve 3 can be configured such that inlets of the valve are only open when they are connected to a source of fuel, as described in more detail below.

[0160] FIG. 32 illustrates a cross section of the fuel selector valve 3. The fuel selector valve has a first inlet 12 and a second inlet 14. Both inlets can have an actuation member with an end that can at least partially enter the inlet and close or substantially close the inlet. For example, as illustrated in FIG. 32, the first inlet 12 can have a first actuation member 22 with an end that blocks the inlet. Similarly, the second inlet 14 can have a second actuation member 24 with an end that blocks the inlet. As shown, a fitting 30 is positioned within the inlet 12.

[0161] As described with respect to various embodiments above, the actuation members can have sealing sections 34, 36 that can seat against respective ledges to close or substantially close their respective inlets 12, 14. Thus, the first actuation member 22 can have a first position in which the sealing section 34 of the first actuation member seats against the first ledge. Similarly, the second actuation member 24 can have a first position in which the sealing section 36 of the second actuation member seats against the second ledge. Each actuation member preferably has a biasing member, such as a spring 32 that biases the actuation member toward the first position.

[0162] As described in various embodiments above, when a fitting for a source of fuel connects to one of the inlets, it can move the actuation member into a second position that allows fluid to flow through the inlet. FIG. 32 illustrates a fitting 30 of a source of fuel connected to the first inlet 12. The inlets are also fluidly connected to a single pressure regulator 16 and to the outlet 18.

[0163] The fuel selector valve 3 as illustrated includes a pressure regulator 16 that can function in a manner similar to that described with respect to FIGS. 20A-21B. The pressure regulator can have a spring loaded valve connected to a diaphragm. A secondary spring 92 can be operatively connected to an arm 90. The secondary spring 92 can assist the main regulator spring 40 to set a desired regulation pressure. For example, the secondary spring 92 can have an unengaged position (FIG. 32) and an engaged position (FIG. 33) which correspond with a first and second position of the pressure regulator 16.

[0164] The arm 90 can be coupled to the actuation member 24 through a slot 116 and tongue. When the actuation member 24 is advanced, the arm 90 can be forced to move towards the pressure regulator. Moving towards the pressure regulator 16 can cause the secondary spring 92 to engage the valve 43 (FIG. 33) and push the valve, as well as, the diaphragm 42 upwards. This also can adjust the height of the main spring 40. This can decrease the pressure required to cause flow through the pressure regulator 16. It will be understood that the arm and/or spring can be used in other ways to decrease or increase the pressure setting of the pressure regulator. For example, the secondary spring 92 can be connected to the valve 43 in both positions, and the actuation member can be used to adjust the height of the spring.

[0165] In the embodiment of FIG. 32, the secondary spring 92 is not engaged with the valve 43 and the inlet 14 is closed. A fitting 30 is shown within the inlet 12 to utilize the illustrated configuration of the pressure regulator. Fuel can flow from a fuel source, though inlet 12 and through the pressure regulator to the outlet 18.

[0166] FIG. 33 shows a fitting 30 within inlet 14. In this position, the secondary spring 92 is engaged with the valve 43. Thus, the valve 43 and diaphragm 42 are advanced from their initial state. When fuel flows into the inlet 14, it will flow to the diaphragm 42 and pressure regulator 16, flow through the pressure regulator and out the outlet 18.

[0167] As has been mentioned, the flow can then travel to a control valve 130 or to another component before returning to the fuel selector valve 3. Returning to FIGS. 31A and 31B, it can be seen that the fuel selector valve 3 has two inlets 94, 146 to receive additional fluid flow. From inlet 146, the fuel selector valve 3 can either permit or prevent flow to the outlet 148. From inlet 94, the fuel selector valve 3 can permit flow to either outlet 96 or outlet 98 (FIG. 31B). In some embodiments, the inlet 146 and outlet 148 can be configured to direct fluid to the nozzle and can be a nozzle flowpath inlet 146 and a nozzle flowpath outlet. In some embodiments, the inlet 94 and outlet 96, 98 can be configured to direct fluid to the oxygen depletion sensor (ODS) and can be an ODS flowpath inlet and first and second ODS flowpath outlets.

[0168] The flow between these inlets and outlets can be controlled through a third actuation member 118. Though in other embodiments, the actuation member 24 can be used. As shown, the inlet 14 has an actuation member 118 outside of the inlet 14. A spring 32 can be used to bias the actuation member 118 to a spaced away initial position. Inserting a fitting 30 can advance the actuation member 118, as can be seen by comparing FIGS. 32 and 33. As can best be seen in FIG. 31A, an elongated member 128 is connected to the actuation member 118 and a cross bar 134 is connected to the elongated member 128. In addition, two shafts 136, 150 are attached to the cross bar. Each of the shafts is connected to a valve 152, 138 that can control the flow of fuel between the respective inlets 146, 94 and outlets 148, 96, 98, for example for the nozzle and ODS.

[0169] FIG. 32 shows an initial position, where the valve 152 is closed preventing any flow between inlet 146 and outlet 148. Also, valve 138 is positioned to allow flow between inlet 94 and outlet 96, though the actual flow path can not be seen. If a fitting 30 is in the inlet 12, these initial positions will be used to control the flow of fluid through the fuel selector valve 3.

[0170] FIG. 33 shows a second position, where the fitting 30 has been inserted into the inlet 14. The fitting 30 has also caused the third actuation member 118 to advance, forcing the elongate member 128, cross bar 134, shafts 136, 150, and
valves 138, 152 to move. The valve 152 is now open, allowing flow between the inlet 146 and the outlet 148. Also, the inlet 94 is in communication with outlet 96, while the valve 138 is positioned to block flow to the outlet 98.

[0171] It will be understood that the third actuation member and/or a system that advances one or two valves can be done independent of the other features of the illustrated fuel selector valve. For example, a fuel selector valve can have the illustrated third actuator, though it may be the first and/or only actuator. In addition, the fuel selector valve may have two separate pressure regulators, or an adjustable pressure regulator that works in ways other than that illustrated in FIGS. 29-33.

[0172] Each of the fuel selector valves described herein can be used with a pilot light or oxygen depletion sensor, a nozzle, and a burner to form part of a heater or other gas appliance. The different configurations of valves and controls such as by the actuation members can allow the fuel selector valve to be used in different types of systems. For example, the fuel selector valve can be used in a dual fuel heater system with separate ODS and nozzles for each fuel. The fuel selector valve can also be used with nozzles and ODS that are pressure sensitive so that can be only one nozzle, one ODS, or one line leading to the various components from the fuel selector valve.

[0173] According to some embodiments, a heater assembly can be used with one of a first fuel type or a second fuel type different than the first. The heater assembly can include a pressure regulator having a first position and a second position and a housing having first and second fuel hook-ups. The first fuel hook-up can be used for connecting the first fuel type to the heater assembly and the second hook-up can be used for connecting the second fuel type to the heater assembly. An actuation member can be positioned such that one end is located within the second fuel hook-up. The actuation member can have a first position and a second position, such that connecting a fuel source to the heater assembly at the second fuel hook-up moves the actuation member from the first position to the second position. This can cause the pressure regulator to move from its first position to its second position. As has been discussed, the pressure regulator in the second position can be configured to regulate a fuel flow of the second fuel type within a predetermined range.

[0174] The heater assembly may also include one or more of a second pressure regulator, a second actuation member, and one or more arms extending between the respective actuation member and pressure regulator. The one or more arms can be configured to establish a compressible height of a pressure regulator spring within the pressure regulator.

[0175] A heater assembly can be used with one of a first fuel type or a second fuel type different than the first. The heater assembly can include at least one pressure regulator and a housing. The housing can comprise a first fuel hook-up for connecting the first fuel type to the heater assembly, and a second fuel hook-up for connecting the second fuel type to the heater assembly. The housing can also include a first inlet, a first outlet, a second outlet configured with an open position and a closed position, and a first valve configured to open and close the second outlet. A first actuation member having an end located within the second fuel hook-up and having a first position and a second position can be configured such that connecting a fuel source to the heater assembly at the second fuel hook-up moves the actuation member from the first position to the second position which causes the first valve to open the second outlet, the second outlet being in fluid communication with the second fuel hook-up.

[0176] The first actuation member can be further configured such that connecting the fuel source to the heater assembly at the second fuel hook-up moves the first actuation member from the first position to the second position which causes the at least one pressure regulator to move from a first position to a second position, wherein the at least one pressure regulator in the second position is configured to regulate a fuel flow of the second fuel type within a predetermined range.

[0177] The at least one pressure regulator can comprises first and second pressure regulators, the first pressure regulator being in fluid communication with the first fuel hook-up and the second pressure regulator being in fluid communication with the second fuel hook-up.

[0178] Similarly, the first valve can be configured to open and close both the first and second outlets or there can be a second valve configured to open and close the first outlet. The housing may include addition, inlets, outlets and valves. Also a second actuation member may be used positioned within the first fuel hook-up.

[0179] Although this invention has been disclosed in the context of certain preferred embodiments and examples, it will be understood by those skilled in the art that the present invention extends beyond the specifically disclosed embodiments to other alternative embodiments and/or uses of the invention and obvious modifications and equivalents thereof. In addition, while a number of variations of the invention have been shown and described in detail, other modifications, which are within the scope of this invention, will be readily apparent to those of skill in the art based upon this disclosure. It is also contemplated that various combinations or sub-combinations of the specific features and aspects of the embodiments may be made and still fall within the scope of the invention. Accordingly, it should be understood that various features and aspects of the disclosed embodiments can be combined with or substituted for one another in order to form varying modes of the disclosed invention. Thus, it is intended that the scope of the present invention herein disclosed should not be limited by the particular disclosed embodiments described above, but should be determined only by a fair reading of the claims that follow.

[0180] Similarly, this method of disclosure, is not to be interpreted as reflecting an intention that any claim require more features than are expressly recited in that claim. Rather, as the following claims reflect, inventive aspects lie in a combination of fewer than all features of any single foregoing disclosed embodiment. Thus, the claims following the Detailed Description are hereby expressly incorporated into this Detailed Description, with each claim standing on its own as a separate embodiment.

What is claimed is:

1. A heater assembly for use with one of a first fuel type or a second fuel type different than the first, the heater assembly comprising:
   a first pressure regulator configured to regulate a fuel flow of a first fuel type within a first predetermined range
   a second pressure regulator configured to regulate a fuel flow of a second fuel type within a second predetermined range different from the first;
   a housing comprising:
   a first fuel hook-up for connecting the first fuel type to the heater assembly, the first fuel hook-up configured to direct fuel flow to the first pressure regulator;
a second hook-up for connecting the second fuel type to the heater assembly, the second fuel hook-up configured to direct fuel flow to the second pressure regulator;
a first outlet in fluid communication with both the first and second pressure regulators;
a first inlet;
a second outlet; and
a third outlet;
a first actuation member having an end located within the first fuel hook-up and having a first actuation member first position and a second position, the actuation member configured such that connecting a fuel source to the heater assembly at the first fuel hook-up moves the actuation member from the first actuation member first position to the second position,
wherein in the first actuation member first position, fuel flow through the first fuel hook-up and the second outlet is prevented and in the first actuation member second position, fuel flow through the first fuel hook-up and the second outlet is permitted;
a second actuation member having an end located within the second fuel hook-up and having a first position and a second position, the actuation member configured such that connecting a fuel source to the heater assembly at the second fuel hook-up moves the actuation member from the first position to the second position,
wherein in the second actuation member first position, fuel flow through the second fuel hook-up and the third outlet is prevented and in the second actuation member second position, fuel flow through the second fuel hook-up and the third outlet is permitted.
