(54) Title: 7-AZAINDOLE INHIBITORS OF CRAC

(57) Abstract: Disclosed are compounds of Formula (I), useful for treatment of autoimmune and inflammatory diseases associated with IL-2 inhibition via modulation of calcium release-activated calcium (CRAC) channels. Also disclosed are methods of making and using the compounds for treatment of diseases associated with CRAC channels.

7-AZAINDOLE INHIBITORS OF CRAC

FIELD OF THE INVENTION

This invention pertains to compounds useful for treatment of autoimmune and inflammatory diseases associated with IL-2 inhibition via modulation of calcium release-activated calcium channels.

5

BACKGROUND OF THE INVENTION

The cytokine interleukin 2 (IL-2) is a T-cell mitogen important for T-cell proliferation and as a B cell growth factor. Because of its effects on T cells and B cells, IL-2 is recognized as an important regulator of immune responses. IL-2 is involved in inflammation, tumor progression and hematopoiesis, and IL-2 affects the production of other cytokines such as TNA alpha, TNF beta, IFN gamma. Inhibition of IL-2 production thus is relevant to immunosuppression therapies and treatment of inflammatory and immune disorders.

T-cell antigen binding in inflammatory events leads to T-cell initiated calcium influx by calcium release-activated calcium channels (CRAC). IL-2 secretion by T-cells occurs in response to calcium ion influx. Modulation of CRAC thus provides a mechanism for control of production of IL-2 and other cytokines associated with inflammation. CRAC inhibition has been recognized as a potential route to therapies for rheumatoid arthritis, asthma, allergic reactions and other inflammatory conditions (see, *e.g.*, Chang et al, Acta Pharmacologica Sinica (2006) Vol. 7, 813-820), and CRAC inhibitors have been shown to prevent antigen-induced airway eosinophilia and late phase asthmatic responses via Th2 cytokine inhibition in animal models (Yoshino et al, Eur. J. Pharm. (2007) Vol. 560(2), 225-233). There is, accordingly, a need for CRAC inhibitors.

- 5 "Treating" or "treatment" of a disease state includes:
preventing the disease state, i.e. causing the clinical symptoms of the disease state not to develop in a subject that may be exposed to or predisposed to the disease state, but does not yet experience or display symptoms of the disease state:
- 10 inhibiting the disease state, i.e., arresting the development of the disease state or its clinical symptoms, or

relieving the disease state, i.e., causing temporary or permanent regression of the disease state or its clinical symptoms.

15

- The terms "treating", "contacting" and "reacting" when referring to a chemical reaction means adding or mixing two or more reagents under appropriate conditions to produce the indicated and/or the desired product. It should be appreciated that the reaction which produces the indicated and/or the desired product may not necessarily result directly from the combination of
- 20 two reagents which were initially added, i.e., there may be one or more intermediates which are produced in the mixture which ultimately leads to the formation of the indicated and/or the desired product.

- 25 Beilstein Institute computerized system for the generation of IUPAC systematic nomenclature. Chemical structures shown herein were prepared using ISIS® version 2.2. Any open valency appearing on a carbon, oxygen sulfur or nitrogen atom in the structures herein indicates the presence of a hydrogen atom unless indicated otherwise. Where a nitrogen-containing heteroaryl ring is shown with an open valency on a nitrogen atom, and variables such as R^a, R^b or R^c are
- 30 shown on the heteroaryl ring, such variables may be bound or joined to the open valency nitrogen. Where a chiral center exists in a structure but no specific stereochemistry is shown for the chiral center, both enantiomers associated with the chiral center are encompassed by the structure. Where a structure shown herein may exist in multiple tautomeric forms, all such

-8-

tautomers are encompassed by the structure. The atoms represented in the structures herein are intended to encompass all naturally occurring isotopes of such atoms. Thus, for example, the hydrogen atoms represented herein are meant to include deuterium and tritium, and the carbon atoms are meant to include C^{13} and C^{14} isotopes.

Unless specified to the contrary, the reactions described herein preferably are conducted under an inert atmosphere at atmospheric pressure at a reaction temperature range of from about -78 °C to about 150 °C, more preferably from about 0 °C to about 125 °C, and most preferably and conveniently at about room (or ambient) temperature, e.g., about 20 °C.

Scheme 1

As shown in Scheme 1, halogen substituted heterocyclic amines of type i can be reacted under Sonogashira coupling conditions with an appropriate terminal alkyne to give the alkyne substituted heterocyclic amine ii, where R = aryl, heteroaryl, cycloalkyl, heterocycloalkyl, or alkyl. Conversion of alkynyl amine ii, in the presence of base or a transition metal catalyst, then

gives 2-substituted-5-halo-4-azaindole of type iii. Suzuki coupling of indole iii with an appropriate boronic acid or ester then gives 2-substituted-5-aryl-4-azaindole iv.

Scheme 2

As shown in Scheme 2, 3-nitro-picoline v, can be converted to the nitropyridine substituted acetophenone vii via the intermediacy of alcohol vi. Dual reduction and cyclization then gives 4-
 10 aza-indole viii, which can be converted to 2,5-diaryl-4-azaindole ix by means of a Suzuki coupling with an appropriate boronic acid or ester.

-16-

Scheme 3

- 5 As shown in Scheme 3, 2,6-dichloro-3-nitropyridine **v**, can be transformed to 4-aza-oxindole **xii** in two steps via malonate **xi**. Conversion of oxindole **xii** to triflate **xvi** can be accomplished by addition and selective removal of an intermediate carbonate as reflected in structures **xiv** and **xv**. Sequential Suzuki couplings on triflate **xvi** with the appropriate boronic acids or esters then provides carbonate protected indole **xviii**. Compounds such as these can then be converted to
- 10 2,5-diaryl-4-azaindole **ix** under basic conditions.

-17-

Scheme 4

- 5 As shown in Scheme 4, 2,5-diaryl-7-azaindole **xxvii** can be produced in a manner similar to that shown in Scheme 3 substituting bromo oxindole **xxi**. This material can be prepared in two steps from 7-azaindole via the intermediacy tribromo oxindole **xx**.

Scheme 5

10

- 15 As shown in Scheme 5, carbonate protected 5-bromo-7-azaindole **xxv** from Scheme 4 can also be converted to boronic ester **xxviii**. Suzuki coupling with aryl halides or triflates then provides access to 2,5-diaryl-7-azaindole **xxvii**.

-18-

Scheme 6

5 As shown in Scheme 6, 5-bromo-2-chloro-3-methylpyridine xxix can be reacted with an appropriate benzonitrile and base to provide 5-bromo-7-azaindole xxx. This indole xxx can then be converted to 2,5-diaryl-7-azaindole xxvii by means of a Suzuki coupling with an appropriate boronic acid or ester.

10

Scheme 7

As shown in Scheme 7, 5-bromo-7-azaindole xxx from Scheme 6 can also be converted to boronic ester xxxi. Suzuki coupling with aryl halides or triflates then provides access to 2,5-diaryl-7-azaindole xxvii.

-19-

Scheme 8

As shown in Scheme 8, pyrimidine xxxii can be brominated to xxxiii and transformed to 4,6-diazaindole xxxv using a Sonogashira/base-mediated cyclization strategy. Suzuki coupling with an appropriate boronic acid or ester then provides access to the 2,5-diaryl-4,6-diazaindole xxxv.

Scheme 9

As shown in Scheme 9, 2-amino-3,5-dibromopyrazine can be transformed in a manner similar to that shown in Scheme 8 to provide 2,5-diaryl-4,7-diazaindole xl.

Many variations on the procedure of the above Schemes are possible and will suggest themselves to those skilled in the art. Specific details for producing compounds of the invention are described in the Examples section below.

Utility

The compounds of the invention are usable for the treatment of a wide range of inflammatory diseases and conditions such as arthritis, including but not limited to, rheumatoid arthritis, spondyloarthropathies, gouty arthritis, osteoarthritis, systemic lupus erythematosus and juvenile arthritis, osteoarthritis, gouty arthritis and other arthritic conditions. The subject compounds
5 would be useful for the treatment of pulmonary disorders or lung inflammation, including adult respiratory distress syndrome, pulmonary sarcoidosis, asthma, silicosis, and chronic pulmonary inflammatory disease.

Further, compounds of the invention are useful for treating respiratory disorders, including
10 chronic obstructive pulmonary disorder (COPD), asthma, bronchospasm, and the like.

Administration and Pharmaceutical Composition

The invention includes pharmaceutical compositions comprising at least one compound of the present invention, or an individual isomer, racemic or non-racemic mixture of isomers or a
15 pharmaceutically acceptable salt or solvate thereof, together with at least one pharmaceutically acceptable carrier, and optionally other therapeutic and/or prophylactic ingredients.

In general, the compounds of the invention will be administered in a therapeutically effective amount by any of the accepted modes of administration for agents that serve similar utilities.

20 Suitable dosage ranges are typically 1-500 mg daily, preferably 1-100 mg daily, and most preferably 1-30 mg daily, depending upon numerous factors such as the severity of the disease to be treated, the age and relative health of the subject, the potency of the compound used, the route and form of administration, the indication towards which the administration is directed, and the preferences and experience of the medical practitioner involved. One of ordinary skill in the art
25 of treating such diseases will be able, without undue experimentation and in reliance upon personal knowledge and the disclosure of this Application, to ascertain a therapeutically effective amount of the compounds of the present invention for a given disease.

Compounds of the invention may be administered as pharmaceutical formulations including
30 those suitable for oral (including buccal and sub-lingual), rectal, nasal, topical, pulmonary, vaginal, or parenteral (including intramuscular, intraarterial, intrathecal, subcutaneous and intravenous) administration or in a form suitable for administration by inhalation or insufflation.

The preferred manner of administration is generally oral using a convenient daily dosage regimen which can be adjusted according to the degree of affliction.

A compound or compounds of the invention, together with one or more conventional adjuvants, carriers, or diluents, may be placed into the form of pharmaceutical compositions and unit dosages. The pharmaceutical compositions and unit dosage forms may be comprised of conventional ingredients in conventional proportions, with or without additional active compounds or principles, and the unit dosage forms may contain any suitable effective amount of the active ingredient commensurate with the intended daily dosage range to be employed.

The pharmaceutical compositions may be employed as solids, such as tablets or filled capsules, semisolids, powders, sustained release formulations, or liquids such as solutions, suspensions, emulsions, elixirs, or filled capsules for oral use; or in the form of suppositories for rectal or vaginal administration; or in the form of sterile injectable solutions for parenteral use.

Formulations containing about one (1) milligram of active ingredient or, more broadly, about 0.01 to about one hundred (100) milligrams, per tablet, are accordingly suitable representative unit dosage forms.

The compounds of the invention may be formulated in a wide variety of oral administration dosage forms. The pharmaceutical compositions and dosage forms may comprise a compound or compounds of the present invention or pharmaceutically acceptable salts thereof as the active component. The pharmaceutically acceptable carriers may be either solid or liquid. Solid form preparations include powders, tablets, pills, capsules, cachets, suppositories, and dispersible granules. A solid carrier may be one or more substances which may also act as diluents, flavoring agents, solubilizers, lubricants, suspending agents, binders, preservatives, tablet disintegrating agents, or an encapsulating material. In powders, the carrier generally is a finely divided solid which is a mixture with the finely divided active component. In tablets, the active component generally is mixed with the carrier having the necessary binding capacity in suitable proportions and compacted in the shape and size desired. The powders and tablets preferably contain from about one (1) to about seventy (70) percent of the active compound. Suitable carriers include but are not limited to magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatine, tragacanth, methylcellulose, sodium carboxymethylcellulose, a low melting wax, cocoa butter, and the like. The term "preparation" is intended to include the formulation of the active compound with encapsulating material as

carrier, providing a capsule in which the active component, with or without carriers, is surrounded by a carrier, which is in association with it. Similarly, cachets and lozenges are included. Tablets, powders, capsules, pills, cachets, and lozenges may be as solid forms suitable for oral administration.

5

Other forms suitable for oral administration include liquid form preparations including emulsions, syrups, elixirs, aqueous solutions, aqueous suspensions, or solid form preparations which are intended to be converted shortly before use to liquid form preparations. Emulsions may be prepared in solutions, for example, in aqueous propylene glycol solutions or may contain
10 emulsifying agents, for example, such as lecithin, sorbitan monooleate, or acacia. Aqueous solutions can be prepared by dissolving the active component in water and adding suitable colorants, flavors, stabilizers, and thickening agents. Aqueous suspensions can be prepared by dispersing the finely divided active component in water with viscous material, such as natural or synthetic gums, resins, methylcellulose, sodium carboxymethylcellulose, and other well known
15 suspending agents. Solid form preparations include solutions, suspensions, and emulsions, and may contain, in addition to the active component, colorants, flavors, stabilizers, buffers, artificial and natural sweeteners, dispersants, thickeners, solubilizing agents, and the like.

The compounds of the invention may be formulated for parenteral administration (e.g., by
20 injection, for example bolus injection or continuous infusion) and may be presented in unit dose form in ampoules, pre-filled syringes, small volume infusion or in multi-dose containers with an added preservative. The compositions may take such forms as suspensions, solutions, or emulsions in oily or aqueous vehicles, for example solutions in aqueous polyethylene glycol. Examples of oily or nonaqueous carriers, diluents, solvents or vehicles include propylene glycol,
25 polyethylene glycol, vegetable oils (e.g., olive oil), and injectable organic esters (e.g., ethyl oleate), and may contain formulatory agents such as preserving, wetting, emulsifying or suspending, stabilizing and/or dispersing agents. Alternatively, the active ingredient may be in powder form, obtained by aseptic isolation of sterile solid or by lyophilization from solution for constitution before use with a suitable vehicle, e.g., sterile, pyrogen-free water.

30

The compounds of the invention may be formulated for topical administration to the epidermis as ointments, creams or lotions, or as a transdermal patch. Ointments and creams may, for example, be formulated with an aqueous or oily base with the addition of suitable thickening

and/or gelling agents. Lotions may be formulated with an aqueous or oily base and will in general also containing one or more emulsifying agents, stabilizing agents, dispersing agents, suspending agents, thickening agents, or coloring agents. Formulations suitable for topical administration in the mouth include lozenges comprising active agents in a flavored base, usually
5 sucrose and acacia or tragacanth; pastilles comprising the active ingredient in an inert base such as gelatine and glycerine or sucrose and acacia; and mouthwashes comprising the active ingredient in a suitable liquid carrier.

The compounds of the invention may be formulated for administration as suppositories. A low
10 melting wax, such as a mixture of fatty acid glycerides or cocoa butter is first melted and the active component is dispersed homogeneously, for example, by stirring. The molten homogeneous mixture is then poured into convenient sized molds, allowed to cool, and to solidify.

15 The compounds of the invention may be formulated for vaginal administration. Pessaries, tampons, creams, gels, pastes, foams or sprays containing in addition to the active ingredient such carriers as are known in the art to be appropriate.

The subject compounds may be formulated for nasal administration. The solutions or
20 suspensions are applied directly to the nasal cavity by conventional means, for example, with a dropper, pipette or spray. The formulations may be provided in a single or multidose form. In the latter case of a dropper or pipette, this may be achieved by the patient administering an appropriate, predetermined volume of the solution or suspension. In the case of a spray, this may be achieved for example by means of a metering atomizing spray pump.

25 The compounds of the invention may be formulated for aerosol administration, particularly to the respiratory tract and including intranasal administration. The compound will generally have a small particle size for example of the order of five (5) microns or less. Such a particle size may be obtained by means known in the art, for example by micronization. The active ingredient is
30 provided in a pressurized pack with a suitable propellant such as a chlorofluoro carbon (CFC), for example, dichlorodifluoromethane, trichlorofluoromethane, or dichlorotetrafluoroethane, or carbon dioxide or other suitable gas. The aerosol may conveniently also contain a surfactant such as lecithin. The dose of drug may be controlled by a metered valve. Alternatively the

active ingredients may be provided in a form of a dry powder, for example a powder mix of the compound in a suitable powder base such as lactose, starch, starch derivatives such as hydroxypropylmethyl cellulose and polyvinylpyrrolidone (PVP). The powder carrier will form a gel in the nasal cavity. The powder composition may be presented in unit dose form for example in capsules or cartridges of e.g., gelatine or blister packs from which the powder may be administered by means of an inhaler.

When desired, formulations can be prepared with enteric coatings adapted for sustained or controlled release administration of the active ingredient. For example, the compounds of the present invention can be formulated in transdermal or subcutaneous drug delivery devices. These delivery systems are advantageous when sustained release of the compound is necessary and when patient compliance with a treatment regimen is crucial. Compounds in transdermal delivery systems are frequently attached to an skin-adhesive solid support. The compound of interest can also be combined with a penetration enhancer, e.g., Azone (1-dodecylazacycloheptan-2-one). Sustained release delivery systems are inserted subcutaneously into the subdermal layer by surgery or injection. The subdermal implants encapsulate the compound in a lipid soluble membrane, e.g., silicone rubber, or a biodegradable polymer, e.g., polylactic acid.

The pharmaceutical preparations are preferably in unit dosage forms. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation, such as packeted tablets, capsules, and powders in vials or ampoules. Also, the unit dosage form can be a capsule, tablet, cachet, or lozenge itself, or it can be the appropriate number of any of these in packaged form.

Other suitable pharmaceutical carriers and their formulations are described in *Remington: The Science and Practice of Pharmacy* **1995**, edited by E. W. Martin, Mack Publishing Company, 19th edition, Easton, Pennsylvania. Representative pharmaceutical formulations containing a compound of the present invention are described below.

Unless otherwise stated, all temperatures including melting points (i.e., MP) are in degrees Celsius (°C). It should be appreciated that the reaction which produces the indicated and/or the desired product may not necessarily result directly from the combination of two reagents which were initially added, i.e., there may be one or more intermediates which are produced in the mixture which ultimately leads to the formation of the indicated and/or the desired product.
