Novel medicaments

Abstract: Novel compounds which interact with the histamine H3 receptor are defined. These compounds are particularly useful in the treatment of a variety of diseases or conditions in which histamine H3 interactions are beneficial. Thus, the compounds may find use, e.g., in the treatment of diseases of the central nervous system, the peripheral nervous system, the cardiovascular system, the pulmonary system, the gastrointestinal system and the endocrinological system. The novel compounds have a core consisting of a 6-membered aromatic ring containing at least one nitrogen atom and two carbon atoms in the ring and, at the remaining positions in the ring, there is either a carbon or a nitrogen atom.
NOVEL MEDICAMENTS

FIELD OF THIS INVENTION

The present invention relates to novel compounds, to the use of these compounds in pharmaceutical compositions, to pharmaceutical compositions comprising the compounds, and to methods of treatment employing these compounds or compositions. The present compounds show a high and selective binding affinity for the histamine H3 receptor, indicating histamine H3 receptor antagonistic, inverse agonistic or agonistic activity. As a result, the compounds are useful for the treatment of diseases or disorders related to the histamine H3 receptor.

BACKGROUND OF THIS INVENTION

The existence of the histamine H3 receptor has been known for several years and the receptor is of current interest for the development of new medicaments. Recently, the human histamine H3 receptor has been cloned. The histamine H3 receptor is a presynaptic autoreceptor located both in the central and the peripheral nervous system, the skin and in organs such as the lung, the intestine, probably the spleen and the gastrointestinal tract. Recent evidence suggests that the H3 receptor shows intrinsic, constitutive activity, in vitro as well as in vivo (i.e., it is active in the absence of an agonist). Compounds acting as inverse agonists can inhibit this activity. The histamine H3 receptor has been demonstrated to regulate the release of histamine and also of other neurotransmitters such as serotonin and acetylcholine.

A histamine H3 receptor antagonist or inverse agonist would therefore be expected to increase the release of these neurotransmitters in the brain. A histamine H3 receptor agonist, on the contrary, leads to an inhibition of the biosynthesis of histamine and an inhibition of the release of histamine and also of other neurotransmitters such as serotonin and acetylcholine.

These findings suggest that histamine H3 receptor agonists, inverse agonists and antagonists could be important mediators of neuronal activity. Accordingly, the histamine H3 receptor is an important target for new therapeutics.

In view of the art's interest in histamine H3 receptor agonists, inverse agonists and antagonists, novel compounds which interact with the histamine H3 receptor would be a highly desirable contribution to the art. Several publications disclose the preparation and use of histamine H3 agonists and antagonists. Most of these are imidazole derivatives. However, recently some imidazole-free ligands of the histamine H3 receptor have been described (see e.g. Linney et al., J. Med. Chem. 2000, 43, 2362-2370; US 6,316,475, WO 01/66534 and WO 01/74810).

WO 00/66578 claims certain 3- or 4-(imidazol-2-yl)pyridines being substituted in the
4 position of the imidazole ring. It is mentioned that mammals having a disease or condition mediated by NPY can be treated with such a compound.

Our earlier application, WO 2003/066604 (our internal ref.: 6447), claims certain piperazines being substituted in the 1 and 4 positions.

Our earlier application, WO 2005/009976 A1 (our internal ref.: 6739), claims certain 3-(4-isopropylpiperazin-1-yl)-6-phenylpyrazines being substituted in the para position of the phenyl ring. In the specification, no pharmacological data are given for the compounds prepared.

WO 2005/028438 claims certain piperidines being substituted in the 1 and 4 position.

The object of this invention is to overcome or ameliorate at least some of the disadvantages of the prior art. Hence, not all the objects mentioned below may be fully overcome or ameliorated. Further objects of this invention are mentioned below.

**PHARMACEUTICAL COMPOSITIONS**

The compounds of the invention may be administered alone or in combination with pharmaceutically acceptable carriers or excipients, in either single or multiple doses. The pharma-
ceutical compositions according to the invention may be formulated with pharmaceutically acceptable carriers or diluents as well as any other known adjuvants and excipients in accordance with conventional techniques, such as those disclosed in Remington: The Science and Practice of Pharmacy, 19th Edition, Gennaro, Ed., Mack Publishing Co., Easton, PA, 1995.

The pharmaceutical compositions may be specifically formulated for administration by any suitable route, such as the oral, rectal, nasal, pulmonary, topical (including buccal and sub-lingual), transdermal, intracisternal, intraperitoneal, vaginal or parenteral (including subcutaneous, intramuscular, intrathecal, intravenous and intradermal) route, the oral route being preferred. It will be appreciated that the preferred route will depend on the general condition and age of the subject to be treated, the nature of the condition to be treated and the active ingredient chosen.

Pharmaceutical compositions for oral administration include solid dosage forms such as capsules, tablets, dragees, pills, lozenges, powders and granules. Where appropriate, they can be prepared with coatings, such as enteric coatings, or they can be formulated so as to provide controlled release of the active ingredient, such as sustained or prolonged release according to methods well known in the art.

Liquid dosage forms for oral administration include solutions, emulsions, suspensions, syrups and elixirs.

Pharmaceutical compositions for parenteral administration include sterile aqueous and non-aqueous injectable solutions, dispersions, suspensions or emulsions as well as sterile powders to be reconstituted in sterile injectable solutions or dispersions prior to use. Depot injectable formulations are also to be understood as being within the scope of the present invention.

Other suitable administration forms include suppositories, sprays, ointments, creams, gels, inhalants, dermal patches, implants etc.

A typical oral dosage is in the range of from about 0.001 to about 100 mg/kg body weight per day, preferably from about 0.01 to about 50 mg/kg body weight per day, and more preferably from about 0.05 to about 10 mg/kg body weight per day, administered in one or more doses, such as from 1 to 3 doses. The exact dosage will depend upon the frequency and mode of administration, the sex, age, weight and general condition of the subject treated, the nature and severity of the condition treated and any concomitant diseases to be treated, and other factors evident to those skilled in the art.

The formulations may conveniently be presented in unit dosage form by methods known to those skilled in the art. A typical unit dosage form for oral administration one or more times per day, such as from 1 to 3 times per day, may contain from 0.05 to about 1000
mg, preferably from about 0.1 to about 500 mg, and more preferably from about 0.5 mg to about 200 mg of a compound (or a salt or other derivative thereof as set forth above), according to the invention.

For parenteral routes, such as intravenous, intrathecal, intramuscular and similar administration, typical doses are of the order of about half the dose employed for oral administration.

The compounds of this invention are generally utilized as the free substance or as a pharmaceutically acceptable salt thereof. One example is an acid addition salt of a compound having a free base functionality. When a compound of the formula I contains a free base functionality, such salts are prepared in a conventional manner by treating a solution or suspension of the free base form of the compound of formula I with a chemical equivalent (acid-base equivalent) of a pharmaceutically acceptable acid. Representative examples of relevant inorganic and organic acids are mentioned above. Physiologically acceptable salts of a compound of the invention having a hydroxy group include the anion of said compound in combination with a suitable cation, such as sodium or ammonium ion.

For parenteral administration, solutions of the novel compounds of the formula I in sterile aqueous solution, aqueous propylene glycol or sesame or peanut oil may be employed. Such aqueous solutions should be suitably buffered if necessary, and the liquid diluent first rendered isotonic with sufficient saline or glucose. The aqueous solutions are particularly suitable for intravenous, intramuscular, subcutaneous and intraperitoneal administration. The sterile aqueous media employed are all readily available by standard techniques known to those skilled in the art.

Suitable pharmaceutical carriers include inert solid diluents or fillers, sterile aqueous solution and various organic solvents. Examples of solid carriers are lactose, terra alba, sucrose, cyclodextrin, talc, gelatine, agar, pectin, acacia, magnesium stearate, stearic acid or lower alkyl ethers of cellulose. Examples of liquid carriers are syrup, peanut oil, olive oil, phospholipids, fatty acids, fatty acid amines, polyoxyethylene or water. Similarly, the carrier or diluent may include any sustained release material known in the art, such as glyceryl monostearate or glyceryl distearate, alone or mixed with a wax. The pharmaceutical compositions formed by combining the novel compounds of the formula I and the pharmaceutically acceptable carriers are then readily administered in a variety of dosage forms suitable for the disclosed routes of administration. The formulations may conveniently be presented in unit dosage form by methods known in the art of pharmacy.

Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules or tablets, each containing a predetermined
amount of the active ingredient, and which may include a suitable excipient. These formulations may be in the form of powder or granules, as a solution or suspension in an aqueous or non-aqueous liquid, or as an oil-in-water or water-in-oil liquid emulsion.

If a solid carrier is used for oral administration, the preparation may be tabletted, placed in a hard gelatine capsule in powder or pellet form or it can be in the form of a troche or lozenge. The amount of solid carrier may vary widely, but will usually be from about 25 mg to about 1 g. If a liquid carrier is used, the preparation may be in the form of a syrup, emulsion, soft gelatine capsule or sterile injectable liquid, such as an aqueous or non-aqueous liquid suspension or solution.

A typical tablet, which may be prepared by conventional tablettting techniques, may in the core contain 5.0 mg of a compound of the invention, 67.8 mg of lactosum Ph. Eur., 3.14 mg of cellulose, microcrystalline (Avicel), 1.0 mg of Amberlite® IRP88 (i.e., Polacrillin potassium NF, tablet disintegrant, Rohm and Haas) and magnesii stearas Ph. Eur. q.s. with a coating of approximately 9 mg of hydroxypropyl methylcellulose and approximately 0.9 mg of Mywacett 9-40 T (being acylated monoglyceride used as plasticizer for film coating).

If desired, the pharmaceutical composition of this invention may comprise the compound of the formula I in combination with one or more further pharmacologically active substances, e.g., substances chosen among those described in the foregoing.

Briefly, the compounds of this invention can be prepared in a manner known per se or analogous with known processes.

TESTS

The ability of the compounds to interact with the histamine H3 receptor can be determined by the following in vitro binding assay.

Binding assay

The human H3 receptor is cloned by PCR and subcloned into the pcDNA3 expression vector. Cells stably expressing the H3 receptor are generated by transfecting the H3-expression vectors into HEK 293 cells and using G418 to select for H3 clones. The human H3-HEK 293 clones are cultured in DMEM (GIBCO-BRL) with glutamax, 10% foetal calf serum, 1% penicillin/streptavidin and 1 mg/ml G 4 1 8 at 37 °C and 5% CO₂. Before harvesting, the confluent cells are rinsed with phosphate buffered saline (hereinafter designated PBS) and incubated with Versene (proteinase, GIBCO-BRL) for approximately 5 minutes. The cells are flushed with PBS and DMEM and the cell suspension collected in a tube and centrifuged for 5-10 minutes at 1500 rpm in a Heraeus Sepatech Megafuge 1.0. The pellet is resuspended in 10-20 volumes Hepes buffer (20 mM Hepes, 5 mM MgCl₂, pH
7.1 (KOH)) and homogenized for 10-20 seconds using an Ultra-Turrax homogenizer. The homogenate is centrifuged for 30 minutes at 23,000 g. The pellet is resuspended in 5-10 ml Hepes buffer, homogenized 5-10 seconds with the Ultra-Turrax and centrifuged for 10 minutes at 23,000 g. Following this centrifugation step, the membrane pellet is resuspended in 2-4 ml Hepes buffer, homogenized with a syringe or Teflon homogenizer, and the protein concentration determined. The membranes are diluted to a protein concentration of 1-5 mg/ml in Hepes buffer, aliquoted and kept at -80 °C until use.

Aliquots of the membrane suspension are incubated for 60 minutes at 25 °C with 30 pM [125I]-iodoproxifan, a known compound with high affinity for the H3 receptor, and the test compound at various concentrations. The incubation is stopped by dilution with ice-cold medium, followed by rapid filtration through Whatman GF/B filters pretreated for 1 hour with 0.5% polyethyleneimine. The radioactivity retained on the filters is counted using a Cobra II auto gamma counter. The radioactivity of the filters is indirectly proportional to the binding affinity of the tested compound. The results are analysed by nonlinear regression analysis.

When tested, the present compounds of the formula (I) generally show a high binding affinity to the histamine H3 receptor.

Preferably, the compounds according to the invention have an IC50 value as determined by one or more of the assays of less than 10 µM, more preferred of less than 1 µM, and even more preferred of less than 500 nM, such as of less than 100 nM.

20 **Functional assay I**

The ability of the compounds to interact with the histamine H3 receptor as agonists, inverse agonists and/or antagonists, is determined by an in vitro functional assay utilizing membranes from HEK 293 cells expressing the human H3 receptors.

The H3 receptor is cloned by PCR and subcloned into the pcDNA3 expression vector.

Cells stably expressing the H3 receptor are generated by transfecting the H3-expression vectors into HEK 293 cells and using G418 to select for H3 clones. The human H3-HEK 293 clones are cultured in DMEM with glutamax, 10% foetal calf serum, 1% penicillin/streptavidin and 1 mg/ml G 418 at 37 °C and 5% CO2.

The H3 receptor expressing cells are washed once with PBS and harvested using versene (GIBCO-BRL). PBS is added and the cells are centrifuged for 5 minutes at 188 g. The cell pellet is resuspended in stimulation buffer to a concentration of 1 x 10⁶ cells/ml. cAMP accumulation is measured using the Flash Plate® cAMP assay (NEN™ Life Science Products). The assay is generally performed as described by the manufacturer. Briefly, 50 µl cell suspension is added to each well of the Flashplate which also contained 25 µl 40 µM...
isoprenaline, to stimulate cAMP generation, and 25 µl of test compound (either agonists or inverse agonists alone, or agonist and antagonist in combination). The assay can be run in "agonist-mode" which means that the test compound is added, in increasing concentration, on its own, to the cells, and cAMP is measured. If cAMP goes up, it is an inverse agonist; if cAMP does not change, it is a neutral antagonist, and if cAMP goes down, it is an agonist.

The assay can also be run in the "antagonist-mode" which means that a test compound is added, in increasing concentrations, together with increasing concentrations of a known H3 agonist (e.g. RAMHA). If the compound is an antagonist, increasing concentrations of it cause a right-ward shift in the H3-agonist's dose-response curves. The final volume in each well is 100 µl. Test compounds are dissolved in DMSO and diluted in water. The mixture is shaken for 5 minutes, and allowed to stand for 25 minutes at room temperature. The reaction is stopped with 100 µl "Detection Mix" per well. The plates are then sealed with plastic, shaken for 30 minutes, allowed to stand overnight, and finally the radioactivity is counted in the Cobra II auto gamma topcounter. EC_{50} values are calculated by non-linear regression analysis of dose response curves (6 points minimum) using GraphPad Prism. K_b values are calculated by Schild plot analysis.

Preferably, the antagonists and agonists according to the invention have an IC_{50}/EC_{50} value of less than 10 µM, more preferred of less than 1 µM, and even more preferred of less than 500 nM, such as of less than 100 nM.

### Functional assay II

The ability of the compounds to bind and interact with the human H3 receptor as agonists, inverse agonists and/or antagonists, is determined by a functional assay, named [{\textsuperscript{[35]S}}]GTP\gammaS assay. The assay measures the activation of G proteins by catalyzing the exchange of guanosine 5'-diphosphate (hereinafter designated GDP) by guanosine 5'-triphosphate (hereinafter designated GTP) at the \( \alpha \)-subunit. The GTP-bounded G proteins dissociate into two subunits, \( \mathrm{G}^\mathrm{GTP} \) and \( \mathrm{G}^\mathrm{GDP} \), which in turn regulate intracellular enzymes and ion channels. GTP is rapidly hydrolysed by the \( \alpha \)-subunit (GTPases) and the G protein is deactivated and ready for a new GTP exchange cycle. To study the function of ligand induced G protein coupled receptor (GPCR) activation by an increase in guanine nucleotide exchange at the G proteins, the binding of [{\textsuperscript{35}S]}guanosine-5'-O-(3-thio) triphosphate (hereinafter designated [{\textsuperscript{35}S}}GTP \gamma S), a non-hydrolysed analogue of GTP, is determined. This process can be monitored \textit{in vitro} by incubating cell membranes containing the G protein coupled receptor H3 with GDP and [{\textsuperscript{35}S}}GTP\gammaS. Cell membranes are obtained from CHO cells stably expressing the human H3 receptor. The cells are washed twice in PBS,
harvested with PBS + 1 mM EDTA, pH 7.4 and centrifuged at 1000 rpm for 5 minutes. The cell pellet is homogenized in 10 ml ice-cold Hepes buffer (20 mM Hepes, 10 mM EDTA, pH 7.4 (NaOH)) using an Ultra-Turrax homogenizer for 30 seconds and centrifuged for 15 minutes at 20,000 rpm. Following this centrifugation step, the membrane pellet is resuspended in 10 ml ice-cold Hepes buffer (20 mM Hepes, 0.1 mM EDTA, pH 7.4 (NaOH)) and homogenized as describe above. This procedure is repeated twice except for the last homogenization step, the protein concentration is determined and membranes are diluted to a protein concentration at 2 mg/ml, aliquoted and kept at -80 °C until use.

In order to study the presence and the potency of an inverse agonist/antagonist, the H3-receptor agonist ligand R-α-methyl histamine (hereinafter designated RAMHA) is added. The ability of the test compound to counteract the effect of RAMHA is measured. When studying the effect of an agonist, RAMHA is not added to the assay medium. The test compound is diluted in the assay buffer (20 mM HEPES, 120 mM NaCl, 10 mM MgCl₂ pH 7.4 (NaOH)) at various concentrations followed by addition of 10³ nM RAMHA (only in the case where an inverse agonist/antagonist is examined), 3 μM GDP, 2.5 μg membranes, 0.5 mg SPA beads and 0.1 nM [³⁵S] GTPγS and incubated for 2 hours by slightly shaking at room temperature. The plates are centrifuged at 1500 rpm for 10 minutes and the radioactivity is measured using a Top-counter. The results are analyzed by non linear regression and the IC₅₀ value is determined.

RAMHA and other H3 agonists stimulate the binding of [³⁵S] GTPγS to membranes expressing the H3 receptor. In the antagonist/inverse agonist test, the ability of increasing amounts of test compound to inhibit the increased [³⁵S] GTPγS binding by 10³ M RAMHA is measured as a decrease in radioactivity signal. The IC₅₀ value determined for an antagonist is the ability of this compound to inhibit the effect of 10³ M RAMHA by 50%. In the agonist test, the ability of increasing amounts of test compound is measured as an increase in radioactivity signal. The EC₅₀ value determined for an agonist, is the ability of this compound to increase the signal by 50% of the maximal signal that is obtained by 10⁻⁵ M RAMHA.

Preferably, the antagonists and agonists according to the invention have an IC₅₀/EC₅₀ value of less than 10 μM, more preferred of less than 1 μM, and even more preferred of less than 500 nM, such as of less than 100 nM.

**Test of food intake inhibition**

In this type of test rats are acclimatized to the experimental environment for 1-2 weeks before the start of experiments. About 7-10 days before recording of food intake access to food is restricted to 5-7 hours per day. Water remains freely available. On the test day,
groups (n=10) of animals receive single administrations of histamine H3 receptor antagonists shortly before presentation of food. After this, food consumption is recorded for 3 h. Preferred compounds are those that produce a statistically significant reduction of 3-hour cumulated food intake. More preferred compounds are those that decrease 3-hour cumulated food intake with 10-20% and the most preferred compounds reduce 3-cumulated food intake with more than 20% without sedation of the animals.

**Test of body weight reduction**

This test is carried out in rats that have become obese due to over-consumption of dietary energy, i.e. a sustained positive energy balance. Animals are being exposed to the test compound for 7 days. Preferred compounds are those that produce a statistically significant decrease of body weight compared with control rats given vehicle. More preferred compounds are those that produce a weight reduction of at least 4%, compared with the vehicle control group, and the most preferred compounds are those that reduce body weight with more than 8% compared with vehicle control rats.

1-Cyclopropylmethyl-4-[5-(4-piperidin-1-ylmethylphenyl)pyridin-2-yl]piperazine, trifluoroacetate

Step 1:

4-[6-(4-Cyclopropylmethyl-piperazin-1-yl)-pyridin-3-yl]-benzonitrile

1-Cyclopropylmethyl-piperazine (13 g, 94 mmol) was mixed with 4-(6-cloro-pyridin-3-yl)-benzonitrile (5 g, 23 mmol). The mixture was heated at 140°C for 1.5 hours. The mixture was cooled to rt and purified by column chromatography (EtOAc : petrolether = 1:1) on silica gel to give 2.7 g (43%) of 4-[6-(4-cyclopropylmethyl-piperazin-1-yl)-pyridin-3-yl]-benzonitrile.

Step 2:

4-[6-(4-Cyclopropylmethyl-piperazin-1-yl)-pyridin-3-yl]-benzaldehyde

To a solution of 4-[6-(4-cyclopropylmethyl-piperazin-1-yl)-pyridin-3-yl]-benzonitrile (2.0 g, 6.3 mmol) dissolved in THF (40 ml,) was added DIBAL-H (25 ml, 1 N) at -40°C. The mixture was stirred 2 h at -40°C and then CH₃OH (15 ml), water (100 ml) and 1 N NaOH (15 ml) was added at - 40°C. The mixture was extracted with EtOAc (3 x 300 ml). The combined organic extracts were washed with water (3 x 50mL), dried (Na₂SO₄) and concentrated under reduced pressure to give 1.7 g (51%) of 4-[6-(4-cyclopropylmethyl-piperazin-1-yl)-pyridin-3-yl]-benzaldehyde.

Step 3:
To a solution of 4-[6-(4-cyclopropylmethyl-piperazin-1-yl)-pyridin-3-yl]-benzaldehyde (1.7 g, 3.18 mmol) dissolved in THF (15 ml) was added water (0.05 ml), piperidine (0.33 g, 3.8 mmol), acetic acid (0.01 ml) and NaCNBH₃ (400 mg, 6.4 mmol). The mixture was stirred overnight at 60°C and concentrated to give a crude product, which was further purified by HPLC Method F to give 540 mg (26%) of the title compound as a TFA salt.

**Example 170** (General Procedure L)

N-{3-[6-(4-Cyclopropylpiperazin-1-yl)pyridazin-3-yl]phenyl}acetamide

**Step 1:**

3-(4-Cyclopropyl-piperazin-1-yl)-6-(3-nitro-phenyl)-pyridazine

To a solution of 3-chloro-6-(3-nitro-phenyl)-pyridazine (10.0 g, 424 mmol) in n-BuOH (150 mL) was added 1-cyclopropyl-piperazine (8.55 g, 678 mmol) and NH$_4$Cl (2.27 g, 424 mmol) and the mixture was stirred for 48 h at 80°C. The solvent was removed under reduced pressure, and the residue was diluted with water. After alkalization with ammonia, the mixture was extracted with ethyl acetate. The extract was dried (Na$_2$SO$_4$) and concentrated to give 7.2 g of crude 3-(4-cyclopropyl-piperazin-1-yl)-6-(3-nitro-phenyl)-pyridazine.
Step 2:
3-[6-(4-Cyclopropyl-piperazin-1-yl)-pyridazin-3-yl]-phenylamine

A solution of 3-(4-cyclopropyl-piperazin-1-yl)-6-(3-nitro-phenyl)-pyridazine (3.60 g, 11 mmol) in ethanol (18 mL) was added to water (30 mL) and powdered Fe (1.86 g, 33 mmol). The mixture was stirred for 3 h at 80°C. The resulting mixture was filtered and the filtrate was extracted with CH₂Cl₂. The organic phase was washed with brine, dried (Na₂SO₄) and concentrated to give 2.32 g (71%) of 3-[6-(4-cyclopropyl-piperazin-1-yl)-pyridazin-3-yl]-phenylamine.

Step 3:
To a solution of 3-[6-(4-cyclopropyl-piperazin-1-yl)-pyridazin-3-yl]-phenylamine (400 mg, 1.36 mmol) in CH₂Cl₂ (25 mL) was added triethylamine (275 mg, 2.72 mmol). Then acetyl chloride (171 mg, 2.18 mmol) was added dropwise and the resulting mixture was stirred overnight at rt. The reaction was quenched with water (15 mL) and the phases were separated. The organic phase was washed with brine, dried (Na₂SO₄) and concentrated to give a crude product, which was recrystallized from MeOH. This afforded 201 mg (48%) of the title compound.

HPLC (Method D): tᵣ = 2.82 min (95%).

Step 1:

N-[3-(6-chloro-5-methyl-pyridazin-3-yl)-phenyl]-acetamide and N-[3-(6-chloro-4-methyl-pyridazin-3-yl)phenyl]acetamide

A solution of 3-acetamidophenylboronic acid (6.6 g, 37 mmol), 3,6-dichloro-4-methylpyridazine (5 g, 31 mmol) and Pd(PPh$_3$)$_4$ (3.5 g, 3 mmol) in DMF (180 ml, degassed) was stirred at rt for 1 h. Then sodium carbonate (12.3 g in 45 ml water, degassed) was added. The mixture was heated with stirring at 80°C overnight. The mixture was filtered and the filtrate was concentrated under reduced pressure. The residue was diluted with EtOAc (100 ml), washed with brine, dried over sodium sulfate and concentrated. The residue was purified by column chromatography on silica gel (EtOAc/petroleum ether = 1:1) to give 3 g (38%) of a mixture of N-[3-(6-chloro-5-methyl-pyridazin-3-yl)-phenyl]-acetamide and N-[3-(6-chloro-4-methyl-pyridazin-3-yl)-phenyl]-acetamide, which was used directly in the next step.

Step 2:

The mixture of isomers (1.5 g, 5.9 mmol) from the previous step and 1-isopropyl-piperazine (3.7 g, 28.5 mmol) was heated at 200°C under a nitrogen atmosphere for 1 h. The mixture
was cooled to rt and diluted with dichloromethane (30 ml). The mixture was washed with brine, dried (sodium sulfate) and concentrated to give a crude product, which was purified by preparative HPLC Method F to give 358 mg (11%) of N-[3-[6-(4-isopropyl-piperazin-1-yl)-4-methyl-pyridazin-3-yl]-phenyl]-acetamide and 195 mg (6%) of N-[3-[6-(4-isopropyl-piperazin-1-yl)-5-methyl-pyridazin-3-yl]-phenyl]-acetamide as the TFA salts.
