Title: LUBRICANTS FOR WATER-BASED DRILLING FLUIDS

Abstract:
Embodiments are directed to a lubricant package for water based drilling fluids. The lubricant package includes water, a polyethylene glycol, and a lubricating agent. The lubricating agent includes triethanolamine, or a C12-C14 alcohol ethoxylate, or a combination of triethanolamine and C12-C14 alcohol ethoxylate. The weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 1:2 to 2:1. Embodiments are also directed to a water-based drilling fluid composition including an aqueous base fluid, one or more additives, and the lubricant package for water based drilling fluids.

LUBRICANTS FOR WATER-BASED DRILLING FLUIDS

CROSS REFERENCES TO RELATED APPLICATIONS

TECHNICAL FIELD

[0002] Embodiments of the present disclosure generally relate to drilling fluids, lubricants for drilling fluids, and methods for using drilling fluids containing lubricants. More specifically, embodiments of the present disclosure relate to lubricants for water based drilling fluids used for drilling oil wells and to water based drilling fluid compositions comprising the lubricants.

BACKGROUND

[0003] Oil and gas hydrocarbons are naturally occurring in some subterranean formations. During drilling operations, a drilling fluid, which may also be referred to as drilling mud, is circulated through the wellbore to cool the drill bit, to convey rock cuttings to the surface, or to support the wellbore against collapse of the wellbore and against intrusion of fluids from the formation, among other purposes. Additionally, friction between the drill string and piping and the wellbore during the drilling operations generates heat and leads to fatigue and wear on the drilling equipment. The water or oil in the drilling fluid may providing a lubricating functionality to reduce the coefficient of friction and thereby friction between the drilling equipment and wellbore.

[0004] However, there is an ongoing need for drilling fluids and drilling fluid lubricating additives, and specifically water-based drilling fluids and lubricating additives, which provide improved lubrication between the drilling equipment and wellbore during drilling operations.
SUMMARY

[0005] Embodiments of the present disclosure are directed to lubricant packages for water-based drilling fluids and associated drilling fluid compositions comprising the lubricant package.

[0006] According to one or more embodiments, a lubricant package for water based drilling fluids includes water, a polyethylene glycol, and a lubricating agent. The lubricating agent includes triethanolamine, or a C_{12}-C_{14} alcohol ethoxylate, or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate. Further, the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 1:2 to 2:1.

[0007] According to another aspect, a water-based drilling fluid composition includes an aqueous base fluid, one or more additives, and a lubricant package. The additives are chosen from an emulsifier, a weighting material, a fluid-loss control additive, a viscosifier, and an alkali compound. The lubricant package includes water, a polyethylene glycol, and a lubricating agent. The lubricating agent includes triethanolamine, or a C_{12}-C_{14} alcohol ethoxylate, or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate. Further, the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 1:2 to 2:1.

[0008] Additional features and advantages of the described embodiments will be set forth in the detailed description which follows, and in part will be readily apparent to those skilled in the art from that description or recognized by practicing the described embodiments, including the detailed description which follows and the claims.

DETAILED DESCRIPTION

[0009] Drill strings for drilling subterranean wells include a drill bit and drill collars to weight the drill bit. To drill a subterranean well the drill string is inserted into a predrilled hole and is rotated to cause the drill bit to cut into the rock at the bottom of the hole. The drilling operation produces rock fragments. To remove the rock fragments from the bottom of the wellbore, a drilling fluid or a drilling fluid composition is pumped down through the drill string to the drill bit. Common categories of drilling fluids include drilling muds, packer fluids, drill-in fluids, and completion fluids. Generically, drilling fluids serve a number of functions, and with specific types of drilling fluids may specialize in a particular function or functions. The
drilling fluid cools the drill bit, provides lubrication, and lifts the rock fragments known as cuttings away from the drill bit. The drilling fluid carries the cuttings upwards as the drilling fluid is recirculated back to the surface. At the surface, the cuttings are removed from the drilling fluid through a secondary operation, and the drilling fluid is recirculated back down the drill string to the bottom of the wellbore for collection of further cuttings.

[0010] Embodiments of the present disclosure are directed to lubricant packages for water-based drilling fluids and additionally to water-based drilling fluid compositions incorporating the lubricant package. The lubricant package is a combination of water, a polyethylene glycol, and a lubricating agent. The lubricating agent may comprise triethanolamine, a C_{12}-C_{14} alcohol ethoxylate, or a combination of triethanolamine and a C_{12}-C_{14} alcohol ethoxylate. The weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 1:2 to 2:1.

[0011] The lubricant package includes water. In one or more embodiments, the lubricant package comprises 70 weight percent (wt.% to 98 wt.% water. In various embodiments, the lubricant package comprises 70 wt.% to 95 wt.% water, 75 wt.% to 98 wt.% water, 75 wt.% to 95 wt.% water, 80 wt.% to 95 wt.% water, 80 wt.% to 95 wt.% water, 85 wt.% to 98 wt.% water, or 85 wt.% to 95 wt.% water.

[0012] The lubricant package includes polyethylene glycol. The polyethylene glycol provides a lubrication and friction reducing functionality as well as a freezing point depression functionality. Specifically, addition of polyethylene glycol to a water-based drilling fluid as a component of the lubricant package results in the coefficient of friction of the lubricant package independent of the remaining components of the lubricant package. Additionally, the polyethylene glycol reduces the freezing point of the lubricant package as well as the entire water-based drilling fluid when includes in the disclosed embodiments of a water-based drilling fluid.

[0013] In various embodiments, the polyethylene glycol includes polyethylene glycols having a distribution of molecular weights. In one or more embodiments, the polyethylene glycol comprises an average molecular weight of 250 to 700 grams per mole (g/mol). The polyethylene glycol may also comprise an average molecular weight of 500 to 700 g/mol, 525 to 700 g/mol, 525 to 675 g/mol, 525 to 650 g/mol, 525 to 625 g/mol, 525 to 600 g/mol, 550 to 700
g/mol, 550 to 675 g/mol, 550 to 650 g/mol, 550 to 625 g/mol, 550 to 600 g/mol, 575 to 700 g/mol, 575 to 675 g/mol, 575 to 650 g/mol, 575 to 625 g/mol, 575 to 600 g/mol, 590 to 610 g/mol, or approximately 600 g/mol. In further embodiments, the polyethylene glycol comprises an average molecular weight of 250 to 350 g/mol, 250 to 325 g/mol, 250 to 300 g/mol, 275 to 350 g/mol, 275 to 325 g/mol, 275 to 300 g/mol, 290 to 310 g/mol, or approximately 300 g/mol.

[0014] In one or more embodiments, the polyethylene glycol is a polyethylene glycol having a freezing point from 12 °C to 17 °C.

[0015] In one or more embodiments, the polyethylene glycol is a polyethylene glycol having a flash point greater than 220 °C. An elevated flash point of the polyethylene glycol allows the resulting drilling fluid to be utilized in high temperature and pressure conditions.

[0016] In one or more embodiments, the lubricant package includes triethanolamine. Triethanolamine has the formula N(CH₂CH₂OH)₃. The triethanolamine may provide an alkaline buffer functionality to the drilling fluid.

[0017] In one or more embodiments, the lubricant package comprises a C₁₂-C₁₄ alcohol ethoxylate. The C₁₂-C₁₄ alcohol ethoxylate may have Formula (I):

\[ R(OCH₂CH₂)_nOH \]  

Formula (I)

In Formula (I), R is a saturated or unsaturated, linear or branched hydrocarbyl group having from 8 to 18 carbon atoms. In embodiments, R is a saturated or unsaturated, linear or branched hydrocarbyl group having 13 carbon atoms. In embodiments, \( R = -(CH₂)ₘ(CH₃)CHCH₃ \) where \( m \) is from 9 to 11. In some embodiments, \( m \) is 9, 10, or 11. Further, in embodiments, \( n \) is from 3 to 13 including 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, and 13 individually.

[0018] In some embodiments, the alcohol ethoxylate compound includes compounds having the chemical formula \( C_{13}H_{27}-(OCH₂CH₂)ₙ-OH \). In one or more embodiments, owing to the reactions by which alcohol ethoxylates are prepared, the alcohol ethoxylate comprising the compound of the chemical formula \( C_{13}H_{27}-(OCH₂CH₂)ₙ-OH \) may include small amounts, for example less than 5 wt.%, less than 1 wt.%, less than 0.1 wt.% or less than 0.01 wt.%, of one or more other alcohol ethoxylates having the formula \( R-(OCH₂CH₂)ₙ-OH \) in which “n” is an
integer greater than or less than 8, in a range of 3 to 13. In embodiments, the alcohol ethoxylate is a condensate of synthetic branched isostearic acid alcohol with eight moles of ethylene oxide. The alcohol ethoxylate may have the chemical formula CH₃CH(CH₃)(CH₂)₁₀-(OCH₂CH₂)₈-OH.

[0019] In one or more embodiments, the alcohol ethoxylate may have a hydroxyl value of 98 to 104 mg KOH/g. The hydroxyl value may be measured in accordance with SKIM/QAD-SOP-209, which is incorporated here by reference in its entirety.

[0020] In one or more embodiments, the alcohol ethoxylate may have a hydrophilic-lipophilic balance (HLB) of 8 to 16. The HLB may be measured according to a standard technique, such as Griffin’s method which states \( HLB = 20 \times \frac{M_h}{M} \) where \( M_h \) is the molecular mass of the hydrophilic portion of the molecule and \( M \) is the molecular mass of the whole molecule. The resulting HLB value gives a result on a scale of from 0 to 20 in which a value of 0 indicates to a completely hydrophobic/lipophilic molecule and a value of 20 corresponds to a completely hydrophilic/lipophobic molecule. Generally, a molecule having an HLB of less than 10 is lipid-soluble (and thus water-insoluble) and a molecule having an HLB of greater than 10 is water-soluble (and thus lipid-insoluble). In various embodiments, the alcohol ethoxylate may have a hydrophilic-lipophilic balance of 9 to 15, 10 to 14.5, 11 to 14, 12 to 13.5, 12.5 to 13 or approximately 12.75.

[0021] The lubricant package comprises a combination of water, the polyethylene glycol, and the lubricating agent. The lubricating agent may comprise triethanolamine, or a C₁₂-C₁₄ alcohol ethoxylate, or triethanolamine and a C₁₂-C₁₄ alcohol ethoxylate. The individual components of the lubricant package may be formulated in various ratios to accentuate various properties. In one or more embodiments, the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 1:2 to 2:1. In various embodiments, the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is 5:9 to 9:5, 4:7 to 7:4, 3:5 to 5:3, or 2:3 to 3:2. Further, in embodiments, the weight ratio of the alcohol ethoxylate to the triethanolamine in the lubricating agent is from 0:1 to 1:0, 10:1 to 1:10, 5:1 to 1:5, 3:1 to 1:3, 2:1 to 1:2, or approximately 1:1.

[0022] The lubricant package increases lubricity and decreases friction between the drill string and the wellbore during drilling operations. A reduction in the coefficient of friction of
the lubricant package, and similarly a water-based drilling fluid containing the lubricant package, provides a reduction in friction experienced between the drill string and the wellbore. In embodiments, the lubricant package has a coefficient of friction less than 20. In various further embodiments, the lubricant package has a coefficient of friction less than 19, less than 18, less than 17, less than 16, less than 15, or less than 14. The coefficient of friction may be measured in accordance with a standard lubricity coefficient test. Specifically, a lubricity testing device as commonly used by those in the drilling fluid industry may be utilized, for example, a lubricity tester from OFI Testing Equipment, Inc (OFITE), Houston, TX. In testing, the lubricant package is positioned between a hardened steel block and rotating ring. A 150 inch-pounds (in-lb) of force is applied between the hardened steel block and rotating ring while the rotating ring spins at 60 rotations per minute (RPM). The 150 in-lb of force is equivalent to 5,000 to 10,000 PSI pressure on the lubricant package. The lubricity testing device then provides a value for the coefficient of friction for the lubricant package based on internal calculations of the lubricity testing device.

[0023] The lubricant package may be added to a water-based drilling fluid to generate a water-based drilling fluid composition which includes embodiments of the lubricant package. An example water-based drilling fluid composition incorporating the lubricant package comprises an aqueous base fluid, one or more additives including emulsifiers, weighting material, fluid-loss control additives, viscosifiers, or alkali compounds, and a lubricant package as previously described, including polyethylene glycol and one or more of triethanolamine and a C_{12-C_{14}} alcohol ethoxylate.

[0024] In one or more embodiments the aqueous base fluid may include water or a combination of oil and water. An aqueous base fluid may be any suitable fluid such as water or a solution containing both water and one or more organic or inorganic compounds dissolved in the water or otherwise completely miscible with the water. The water in the aqueous base fluid may include one or more of fresh water, well water, filtered water, distilled water, sea water, salt water, produced water, formation brine, other type of water, or combinations of waters. The water-based drilling fluid compositions comprising oil in the aqueous base fluid may have a natural oil, a synthetic oil, or a combination thereof.

[0025] The water-based drilling fluid composition may have an amount of the aqueous base fluid sufficient to allow the water-based drilling fluid composition to be circulated to the drill bit
at the bottom of a wellbore and back to the surface. In embodiments, the water-based drilling fluid composition may include from 20 wt.% to 99 wt.% base fluid based on the total weight of the water-based drilling fluid composition. For example, the water-based drilling fluid composition may have from 20 wt.% to 80 wt.%, from 20 wt.% to 70 wt.%, from 20 wt.% to 60 wt.%, from 20 wt.% to 50 wt.%, from 20 wt.% to 40 wt.%, from 23 wt.% to 99 wt.%, from 23 wt.% to 80 wt.%, from 23 wt.% to 70 wt.%, from 23 wt.% to 60 wt.%, from 23 wt.% to 50 wt.%, from 23 wt.% to 40 wt.%, from 24 wt.% to 99 wt.%, from 24 wt.% to 80 wt.%, from 24 wt.% to 70 wt.%, from 24 wt.% to 60 wt.%, from 24 wt.% to 50 wt.%, from 24 wt.% to 40 wt.%, from 25 wt.% to 99 wt.%, from 25 wt.% to 80 wt.%, from 25 wt.% to 70 wt.%, from 25 wt.% to 60 wt.%, from 25 wt.% to 50 wt.%, or from 25 wt.% to 40 wt.% aqueous base fluid based on the total weight of the water-based drilling fluid composition. Said another way, the drilling fluids may include from 5 pounds per barrel (lb/bbl) to 850 lb/bbl, 25 lb/bbl to 750 lb/bbl, 50 lb/bbl to 600 lb/bbl, or 75 lb/bbl to 350 lb/bbl of base fluid.

[0026] In embodiments, the water-based drilling fluid composition may include a weighting material. In some embodiments, the weighting material may be a particulate solid having a specific gravity (SG) sufficient to increase the density of the drilling fluid composition by a certain amount without adding excessive weighting material such that the drilling fluid composition cannot be circulated through the wellbore. The weighting material may have a specific gravity (SG) of from 2 grams per cubic centimeter (g/cm³) to 6 g/cm³. Examples of weighting materials include, but are not limited to, barite (minimum SG of 4.20 g/cm³), hematite (minimum SG of 5.05 g/cm³), calcium carbonate (minimum SG of 2.7-2.8 g/cm³), siderite (minimum SG of 3.8 g/cm³), ilmenite (minimum SG of 4.6 g/cm³), other weighting materials, or any combination of these weighting materials. Some example drilling fluid compositions may include barite as the solid.

[0027] The water-based drilling fluid composition may include an amount of weighting material sufficient to increase the density of the drilling fluid composition to allow the drilling fluid composition to support the wellbore and prevent fluids in downhole formations from flowing into the wellbore. In embodiments, the water-based drilling fluid composition may include from 1 wt.% to 80 wt.% weighting material based on the total weight of the water-based drilling fluid composition. In some embodiments, the water-based drilling fluid composition may include from 1 wt.% to 75 wt.%, from 1 wt.% to 74 wt.%, from 1 wt.% to 73 wt.%, from
1 wt.% to 70 wt.%, from 1 wt.% to 60 wt.%, from 20 wt.% to 80 wt.%, from 20 wt.% to 75 wt.%, from 20 wt.% to 74 wt.%, from 20 wt.% to 73 wt.%, from 20 wt.% to 70 wt.%, from 20 wt.% to 60 wt.%, from 50 wt.% to 80 wt.%, from 50 wt.% to 75 wt.%, from 50 wt.% to 74 wt.%, from 50 wt.% to 73 wt.%, from 50 wt.% to 70 wt.%, from 50 wt.% to 60 wt.%, from 60 wt.% to 80 wt.%, or from 60 wt.% to 75 wt.% weighting material, based on the total weight of the water-based drilling fluid composition. Said another way, the drilling fluids may include from 5 ppb to 850 ppb, 50 ppb to 750 ppb, 150 ppb to 700 ppb, or 200 ppb to 650 ppb of weighting material.

[0028] The drilling fluid composition may have a density of from 60 pounds of mass per cubic foot (lbm/ft$^3$) to 155 lbm/ft$^3$, from 60 lbm/ft$^3$ to 130 lbm/ft$^3$, from 60 lbm/ft$^3$ to 120 lbm/ft$^3$, from 70 lbm/ft$^3$ to 140 lbm/ft$^3$, from 70 lbm/ft$^3$ to 125 lbm/ft$^3$, from 70 lbm/ft$^3$ to 110 lbm/ft$^3$, from 80 lbm/ft$^3$ to 120 lbm/ft$^3$, from 80 lbm/ft$^3$ to 110 lbm/ft$^3$, or from 80 lbm/ft$^3$ to 100 lbm/ft$^3$, where 1 lbm/ft$^3$ is approximately 16.02 kilograms per cubic meter ($kg/m^3$). In some embodiments, the drilling fluid composition may have a density that is approximately equal to 90 lbm/ft$^3$ (1,442 kg/m$^3$), alternatively commonly referenced as 90 pcf.

[0029] The water-based drilling fluid composition may include at least one solid-phase component. Examples of solid-phase components in the water-based drilling fluid compositions may include, but are not limited to, the weighting materials, starch, soda ash, bentonite, lime, sodium sulfite, other solid-phase component, or combinations of these solid-phase components. All of the solid-phase components together make up a total solids content of the water-based drilling fluid composition. In some embodiments, the water-based drilling fluid composition may have a total solids content of equal to or greater than 50 wt.% based on the total weight of the water-based drilling fluid composition. Alternatively, in other embodiments, the water-based drilling fluid composition may have a solids content of equal to or greater than 60 wt.% based on the total weight of the water-based drilling fluid composition.

[0030] The water-based drilling fluid compositions may optionally include one or a plurality of additives to enhance the properties and characteristics of the water-based drilling fluid composition. Examples of the additives include, but are not limited to, emulsifiers, fluid-loss control additives, viscosifiers (viscosity control agents), alkali compounds, or combinations of these. The water-based drilling fluid composition may also optionally include pH buffers, electrolytes, glycols, glycerols, dispersion aids, corrosion inhibitors, defoamers, and other
additives or combinations of additives. In embodiments, the water-based drilling fluid composition may optionally include a viscosifier to impart non-Newtonian fluid rheology to the water-based drilling fluid composition to facilitate lifting and conveying rock cuttings to the surface of the wellbore. Examples of viscosifiers may include, but are not limited to, xanthan gum polymer (XC polymer), bentonite, polyacrylamide, polyanionic cellulose, or combinations of these viscosifiers. In some embodiments, the water-based drilling fluid composition may optionally include xanthan gum polymer, which is a polysaccharide secreted by the bacteria Xanthomonas Campestris (XC). An example water-based drilling fluid composition may optionally include from 0.03 to 1 lb/bbl of a xanthan gum polymer. Unless otherwise stated, the weight percent of an additive in the water-based drilling fluid composition is based on the total weight of the water-based drilling fluid composition. In some embodiments, the water-based drilling fluid composition may optionally include from 0.03 to 1 lb/bbl bentonite. The water-based drilling fluid composition may optionally include other suitable viscosifiers without deviating from the scope of the present subject matter.

[0031] The water-based drilling fluid composition may optionally include at least one pH adjuster. In embodiments, the water-based drilling fluid composition may optionally include at least one alkali compound. Examples of alkali compounds may include, but are not limited to, lime (calcium hydroxide or calcium oxide), soda ash (sodium carbonate), sodium hydroxide, potassium hydroxide, other strong base, or combinations of these alkali compounds. The alkali compounds may react with gases, such as CO₂ or H₂S for example, encountered by the drilling fluid composition during drilling operations to prevent the gases from hydrolyzing components of the water-based drilling fluid composition. Some example water-based drilling fluid compositions may optionally include from 0.33 to 10 lb/bbl of soda ash. Other example water-based drilling fluid compositions may optionally include from 0.3 to 10 lb/bbl of lime. In embodiments, the water-based drilling fluid composition may have a pH of from 7 to 12, from 7 to 10.5, from 7 to 10, from 9 to 12, from 9 to 10.5, from 9 to 10, from 9.5 to 12, from 9.5 to 10.5, from 9.5 to 10, from 7.5 to 9, from 7.5 to 9.5, or from 10 to 12. In some embodiments, the water-based drilling fluid composition may have a pH of from 9 to 10.5.

[0032] The water-based drilling fluid composition may optionally include at least one emulsifier. In one or more embodiments, the drilling fluid composition may include from 7 ppb to 25 ppb of emulsifier, from 8 ppb to 20 ppb of emulsifier, or from 9 ppb to 15 ppb of
emulsifier. In one or more embodiments, the emulsifier may be an invert emulsifier and oil-wetting agent for synthetic based drilling fluid systems such as LE SUPERMUL™ commercially available from Halliburton Energy Services, Inc.

[0033] The water-based drilling fluid composition may optionally include at least one fluid-loss control additive. The drilling fluid composition may include from 1 ppb to 10 ppb of fluid-loss control additive, from 1 ppb to 5 ppb of fluid-loss control additive, from 1.5 ppb to 8 ppb of fluid-loss control additive, or from 1.5 ppb to 2.5 ppb of fluid-loss control additive. In one or more embodiments, the fluid-loss additive may be a polyaninoic cellulose. The fluid-loss additive may additionally or alternatively be a modified starch, a xanthan gum, or 2-acrylamido-2-methyl propane sulfonic acid (AMPS).

[0034] In embodiments, the water-based drilling fluid composition also provides a cooling and lubrication functionality for cooling and lubrication of the bit and drill string utilized in boring operations. Embodiments of the lubricant package and water-based drilling fluids comprising the lubricant package are formulated to provide improved lubrication functionality for lubrication of the bit and drill string utilized in boring operations. The lubricant package imparts enhanced lubricity to the water-based drilling fluid composition thereby providing increased lubrication and reduced friction between the drill string, pipe, and wellbore during drilling operations. The synergistic effect of both the polyethylene glycol and triethanolamine or the polyethylene glycol and alcohol ethoxylate imparts the enhanced lubrication and friction reduction. Without wishing to be bound by theory it is believed there is a hydrophilic interaction between the head groups of the polyethylene glycol-triethanolamine and polyethylene glycol-alcohol ethoxylate to impart the enhanced lubrication and friction reduction.

EXAMPLES

[0035] The following examples illustrate one or more additional features of the present disclosure. It should be understood that these examples are not intended to limit the scope of the disclosure or the appended claims in any manner.

[0036] In the following examples, lubricating fluids with varying amounts of water, polyethylene glycol, and lubricating agent were prepared. The polyethylene glycol, the lubricating agent, and both the freezing point depressant and lubricating agent were tested in
combination with water. The testing included combinations of water, polyethylene glycol, and lubricating agent encompassed by embodiments of the lubricant package previously described. The physical characteristics of the polyethylene glycols used in the lubricating fluids are provided in Tables 1 and 2. The physical characteristics of the alcohol ethoxylate are provided in Table 3. The coefficients of friction of the various tested lubricating fluids are described in Table 4.

Example 3 (Comparative)

*Water and Triethanolamine*

[0039] A lubricating fluid formulated from 250 mL of water and 15 g of triethanolamine was prepared as an Example 3 for comparison with embodiments of the lubricant package. The constituents of Example 3 were simultaneously mixed for 5 minutes to prepare Example 3. Details of the physical properties of the triethanolamine are provided in Table 3.

Example 4 (Comparative)

*Water and Alcohol Ethoxylate*

[0040] A lubricating fluid formulated from 250 mL of water and 15 g of an alcohol ethoxylate was formulated as an Example 4 for comparison with embodiments of the lubricant package. The constituents of Example 4 were simultaneously mixed for 5 minutes to prepare Example 4. Details of the physical properties of the alcohol ethoxylate are provided in Table 4. Specifically, the alcohol ethoxylate was a C_{13} alcohol ethoxylate and more specifically had the chemical formula CH₃CH(CH₃)(CH₂)₁₀–(OCH₂CH₂)₈–OH.

Example 5

*Water, Triethanolamine, and Polyethylene Glycol (MW 600)*

[0041] A lubricant package in accordance with embodiments of this disclosure formulated from 250 mL of water, 15 g of triethanolamine, and 15 g of polyethylene glycol (MW 600) was prepared as an Example 5. The constituents of Example 5 were simultaneously mixed for 5 minutes to prepare Example 5.

Example 6

*Water, Alcohol Ethoxylate, and Polyethylene Glycol (MW 600)*

[0042] A lubricant package in accordance with embodiments of this disclosure formulated from 250 mL of water, 15 g of CH₃CH(CH₃)(CH₂)₁₀–(OCH₂CH₂)₈–OH alcohol ethoxylate, and 15 g of polyethylene glycol (MW 600) was prepared as an Example 6. The constituents of Example 6 were simultaneously mixed for 5 minutes to prepare Example 6.

[0043] The lubricating fluids of Examples 1-4 (Comparative Examples) and Examples 5-6 were evaluated to determine the coefficient of friction for each sample. A lubricity testing device as commonly used by those in the drilling fluid industry was utilized to determine the coefficient of friction for each sample. Specifically, a lubricity tester from OFI Testing Equipment, Inc (OFITE), Houston, TX was utilized. In testing, each lubricating fluids of Comparative Examples 1-4 and Inventive Examples 1-2 were individually positioned between a hardened steel block and rotating ring. A force of 150 inch-pounds (in-lb) was applied between the hardened steel block and the rotating ring while the rotating ring spun at 60 rotations per minute (RPM). The lubricity testing device recorded the force required to spin the rotating ring and based on internal calculations the lubricity testing device provided a coefficient of friction value for each of Examples 1-4 (Comparative) and Examples 5-6. The results of these measurements for the lubricating fluids of Examples 1-4 (Comparative) and Examples 5-6 are provided in Table 5. Table 4 also includes a calculated reduction in the coefficient of friction compared to a pure water sample.

</tbody>
</table>

As shown in Table 5, the lubricant package of Example 5, which included the triethanolamine and polyethylene glycol, resulted in an over 54% reduction in the coefficient of friction compared to just the base water. Similarly, the lubricant package of Example 6, which included the C_{13} alcohol ethoxylate and polyethylene glycol, resulted in an over 63% reduction in the coefficient of friction compared to just the base water. The synergistic effect of the C_{13}
alcohol ethoxylate and polyethylene glycol or triethanolamine and polyethylene glycol in combination in reducing the coefficient of friction compared to the components of the lubricating fluid in isolation is evident. Specifically, the polyethylene glycol (MW 600) in isolation only had a 14.69% reduction in the coefficient of friction compared to just the base water, the triethanolamine in isolation only had a 4.83% reduction in the coefficient of friction compared to just the base water, and the C_{13} alcohol ethoxylate in isolation only had a 35.26% reduction in the coefficient of friction compared to just the base water. An 18.81% reduction when the polyethylene glycol (600 MW) and triethanolamine are used in combination would be expected based on the combination of a 14.69% and 4.83% reduction; however, the much greater 54.47% reduction is noted. Similarly, a 44.77% reduction when the polyethylene glycol (600 MW) and C_{13} alcohol ethoxylate are used in combination would be expected based on the combination of a 14.69% and 35.26% reduction; however, the much greater 63.13% reduction is noted.

[0045] It should be understood that the various aspects of the method of making BTX compounds including benzene, toluene, and xylene, and the composite zeolite catalyst utilized in the same are described and such aspects may be utilized in conjunction with various other aspects.

[0046] In a first aspect, the disclosure provides a lubricant package for water based drilling fluids. The lubricant package includes water, a polyethylene glycol, and a lubricating agent. The lubricating agent comprises triethanolamine, or a C_{12}-C_{14} alcohol ethoxylate, or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate. The weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 1:2 to 2:1.

[0047] In a second aspect, the disclosure provides the lubricant package of the first aspect, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and an average molecular weight of 500 to 700 grams/mole.

[0048] In a third aspect, the disclosure provides the lubricant package of the first aspect, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and with an average molecular weight of 590 to 610 grams/mole.
[0049] In a fourth aspect, the disclosure provides the lubricant package of the first aspect, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and an average molecular weight of 250 to 350 grams/mole.

[0050] In a fifth aspect, the disclosure provides the lubricant package of any of the first through fourth aspects, in which the polyethylene glycol is a polyethylene glycol having a freezing point from 12 °C to 17 °C.

[0051] In a sixth aspect, the disclosure provides the lubricant package of any of the first through fifth aspects, in which the polyethylene glycol is a polyethylene glycol having a flash point greater than 220 °C.

[0052] In a seventh aspect, the disclosure provides the lubricant package of any of the first through sixth aspects, in which the lubricating agent comprises triethanolamine or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate.

[0053] In an eighth aspect, the disclosure provides the lubricant package of any of the first through sixth aspects, in which the lubricating agent comprises C_{12}-C_{14} alcohol ethoxylate or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate.

[0054] In a ninth aspect, the disclosure provides the lubricant package of any of the first through eighth aspects, in which the C_{12}-C_{14} alcohol ethoxylate is a C_{13} alcohol ethoxylate.

[0055] In a tenth aspect, the disclosure provides the lubricant package of any of the first through ninth aspects, in which the alcohol ethoxylate is a condensate of synthetic branched isotridecyl alcohol with three to thirteen moles of ethylene oxide.

[0056] In an eleventh aspect, the disclosure provides the lubricant package of any of the first through tenth aspects, in which the alcohol ethoxylate is a condensate of synthetic branched isotridecyl alcohol with eight moles of ethylene oxide.

[0057] In a twelfth aspect, the disclosure provides the lubricant package of any of the first through eleventh aspects, in which the alcohol ethoxylate has the chemical formula CH_3CH(CH_3)(CH_2)_{10-}(OCH_2CH_2)_8-OH.
[0058] In a thirteenth aspect, the disclosure provides the lubricant package of any of the first through twelfth aspects, in which the lubricant package comprises a C\textsubscript{12}-C\textsubscript{14} alcohol ethoxylate having a hydroxyl value of 98-104 mg KOH/g measured according to SKIMS/QAD-SOP-209.

[0059] In a fourteenth aspect, the disclosure provides the lubricant package of any of the first through thirteenth aspects, in which the lubricant package comprises a C\textsubscript{12}-C\textsubscript{14} alcohol ethoxylate having a hydrophilic-lipophilic balance of 8 to 16.

[0060] In a fifteenth aspect, the disclosure provides the lubricant package of any of the first through thirteenth aspects, in which the lubricant package comprises a C\textsubscript{12}-C\textsubscript{14} alcohol ethoxylate having a hydrophilic-lipophilic balance of 12.5 to 13.0.

[0061] In a sixteenth aspect, the disclosure provides the lubricant package of any of the first through fifteenth aspects, in which the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 2:3 to 3:2.

[0062] In a seventeenth aspect, the disclosure provides the lubricant package of any of the first through sixteenth aspects, in which the lubricant package comprises 70 wt.% to 98 wt.% water.

[0063] In an eighteenth aspect, the disclosure provides the lubricant package of any of the first through seventeenth aspects, in which the lubricant package comprises 85 wt.% to 95 wt.% water.

[0064] In a nineteenth aspect, the disclosure provides the lubricant package of any of the first through eighteenth aspects, in which the lubricant package has a coefficient of friction less than 20.

[0065] In a twentieth aspect, the disclosure provides the lubricant package of any of the first through eighteenth aspects, in which the lubricant package has a coefficient of friction less than 18.
[0066] In a twenty-first aspect, the disclosure provides the lubricant package of any of the first through eighteenth aspects, in which the lubricant package has a coefficient of friction less than 14.

[0067] In a twenty-second aspect, the disclosure provides a water-based drilling fluid composition. The water-based drilling fluid composition comprises an aqueous base fluid, one or more additives chosen from a weighting material, a fluid-loss control additive, a viscosifier, and an alkali compound, and a lubricant package. The lubricant package comprises water, a polyethylene glycol, a lubricating agent. The lubricating agent comprises triethanolamine, or a C_{12}-C_{14} alcohol ethoxylate, or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate. The weight ratio of the polyethylene glycol to the lubricating agent is from 1:2 to 2:1.

[0068] In a twenty-third aspect, the disclosure provides the drilling fluid of the twenty-second aspect, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and an average molecular weight of 500 to 700 grams/mole.

[0069] In a twenty-fourth aspect, the disclosure provides the drilling fluid of the twenty-second aspect, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and with an average molecular weight of 590 to 610 grams/mole.

[0070] In a twenty-fifth aspect, the disclosure provides the drilling fluid of the twenty-second aspect, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and an average molecular weight of 250 to 350 grams/mole.

[0071] In a twenty-sixth aspect, the disclosure provides the drilling fluid of any of the twenty-second through twenty-fifth aspects, in which the polyethylene glycol is a polyethylene glycol having a freezing point from 12 °C to 17 °C.

[0072] In a twenty-seventh aspect, the disclosure provides the drilling fluid of any of the twenty-second through twenty-sixth aspects, in which the polyethylene glycol is a polyethylene glycol having a flash point greater than 220 °C.
[0073] In a twenty-eighth aspect, the disclosure provides the drilling fluid of any of the twenty-second through twenty-seventh aspects, in which the lubricating agent comprises triethanolamine or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate.

[0074] In a twenty-ninth aspect, the disclosure provides the drilling fluid of any of the twenty-second through twenty-seventh aspects, in which the lubricating agent comprises C_{12}-C_{14} alcohol ethoxylate or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate.

[0075] In a thirtieth aspect, the disclosure provides the drilling fluid of any of the twenty-second through twenty-ninth aspects, in which the C_{12}-C_{14} alcohol ethoxylate is a C_{13} alcohol ethoxylate.

[0076] In a thirty-first aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirtieth aspects, in which the alcohol ethoxylate is a condensate of synthetic branched isotridecyl alcohol with three to thirteen moles of ethylene oxide.

[0077] In a thirty-second aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-first aspects, in which the alcohol ethoxylate is a condensate of synthetic branched isotridecyl alcohol with eight moles of ethylene oxide.

[0078] In a thirty-third aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-second aspects, in which the alcohol ethoxylate has the chemical formula CH_{3}CH(CH_{3})(CH_{2})_{10}-(OCH_{2}CH_{2})_{8}-OH.

[0079] In a thirty-fourth aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-third aspects, in which the drilling fluid comprises a C_{12}-C_{14} alcohol ethoxylate having a hydroxyl value of 98-104 mg KOH/g measured according to SKIMS/QAD-SOP-209.

[0080] In a thirty-fifth aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-fourth aspects, in which the drilling fluid comprises a C_{12}-C_{14} alcohol ethoxylate having a hydrophilic-lipophilic balance of 8 to 16.
[0081] In a thirty-sixth aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-fifth aspects, in which the drilling fluid comprises a C_{12}-C_{14} alcohol ethoxylate having a hydrophilic-lipophilic balance of 12.5 to 13.0.

[0082] In a thirty-seventh aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-sixth aspects, in which the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 2:3 to 3:2.

[0083] In a thirty-eighth aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-seventh aspects, in which the lubricant package comprises 70 wt.% to 98 wt.% water.

[0084] In a thirty-ninth aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-eighth aspects, in which the lubricant package comprises 85 wt.% to 95 wt.% water.

[0085] In a fortieth aspect, the disclosure provides the drilling fluid of any of the twenty-second through thirty-ninth aspects, in which the lubricant package has a coefficient of friction less than 20.

[0086] It should be understood that any two quantitative values assigned to a property may constitute a range of that property, and all combinations of ranges formed from all stated quantitative values of a given property are contemplated in this disclosure.

[0087] Having described the subject matter of the present disclosure in detail and by reference to specific embodiments, it should be apparent to those skilled in the art that various modifications and variations can be made to the described embodiments without departing from the spirit and scope of the claimed subject matter. Thus it is intended that the specification cover the modifications and variations of the various described embodiments.
AMENDED CLAIMS
received by the International Bureau on 01 June 2018 (01.06.2018)

1. A lubricant package for water based drilling fluids, the lubricant package comprising:
   water;
   a polyethylene glycol; and
   a lubricating agent comprising a C_{12}-C_{14} alcohol ethoxylate or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate,
in which the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 1:2 to 2:1.

2. The lubricant package of claim 1, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and an average molecular weight of 500 to 700 grams/mole.

3. The lubricant package of claim 1, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and an average molecular weight of 250 to 350 grams/mole.

4. The lubricant package of claim 1, in which the lubricating agent comprises a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate.

5. The lubricant package of claim 1, in which the C_{12}-C_{14} alcohol ethoxylate is a C_{13} alcohol ethoxylate.

6. The lubricant package of claim 1, in which the alcohol ethoxylate is a condensate of synthetic branched isotredecyl alcohol with three to thirteen moles of ethylene oxide.

7. The lubricant package of claim 1, in which the alcohol ethoxylate is a condensate of synthetic branched isotredecyl alcohol with eight moles of ethylene oxide.

8. The lubricant package of any of claim 1, in which the alcohol ethoxylate has the chemical formula CH_3CH(CH_3)(CH_2)_{10}-(OCH_2CH_2)_8-OH.
9. The lubricant package of claim 1, comprising a C_{12}-C_{14} alcohol ethoxylate having a hydroxyl value of 98-104 mg KOH/g measured according to SKIMS/QAD-SOP-209.

10. The lubricant package of claim 1, comprising a C_{12}-C_{14} alcohol ethoxylate having a hydrophilic-lipophilic balance of 8 to 16.

11. The lubricant package of claim 1, in which the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 2:3 to 3:2.

12. The lubricant package of claim 1, in which the lubricant package comprises 70 wt.% to 98 wt.% water.

13. The lubricant package of claim 1, in which the lubricant package has a coefficient of friction less than 20.

14. A water-based drilling fluid composition comprising:
   an aqueous base fluid;
   one or more additives chosen from a weighting material, a fluid-loss control additive, a viscosifier, and an alkali compound; and
   a lubricant package comprising:
   water;
   a polyethylene glycol; and
   a lubricating agent comprising triethanolamine, or a C_{12}-C_{14} alcohol ethoxylate, or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate,
   in which the weight ratio of the polyethylene glycol to the lubricating agent is from 1:2 to 2:1.

15. The water-based drilling fluid composition of claim 14, in which the polyethylene glycol comprises polyethylene glycols having a distribution of molecular weights and with an average molecular weight of 590 to 610 grams/mole.

16. The water-based drilling fluid composition of claim 14, in which the lubricating agent comprises triethanolamine or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate.
17. The water-based drilling fluid composition of claim 14, in which the lubricating agent comprises C_{12}-C_{14} alcohol ethoxylate or a combination of triethanolamine and C_{12}-C_{14} alcohol ethoxylate.

18. The water-based drilling fluid composition of claim 14, in which the alcohol ethoxylate is a condensate of synthetic branched isopridecyl alcohol with eight moles of ethylene oxide.

19. The water-based drilling fluid composition of claim 14, in which the weight ratio of the polyethylene glycol to the lubricating agent in the lubricant package is from 2:3 to 3:2.
