SMALL MOLECULE INHIBITORS OF KRAS G12C MUTANT

The present application claims the benefit of U.S. Provisional Application Nos. 62/926,879, filed October 28, 2019, and 63/030,014, filed May 26, 2020, the entirety of each of which is
5 incorporated by reference herein.

FIELD OF THE INVENTION

The present disclosure relates to certain heteroaryl compounds and pharmaceutically acceptable salts thereof that inhibit the G12C mutant of Kirsten rat sarcoma (KRAS) protein and
10 are expected to have utility as therapeutic agents, for example, for treatment of cancer. The present application also relates to pharmaceutical compounds containing such compounds as well as methods of using the compounds for treating cancer.

BACKGROUND OF THE INVENTION

15 RAS proteins are membrane-associated guanine nucleotide-binding proteins which function as molecular switches. RAS proteins function as components of signalling pathways transmitting signals from cell-surface receptors to regulate cellular proliferation, survival and differentiation. RAS proteins cycle between an inactive GDP-bound state and an active GTP-bound state.

20 The most notable members of the RAS subfamily are HRAS, KRAS and NRAS, mainly being implicated in many types of cancer. However, there are many other members including DIRAS1; DIRAS2; DIRAS3; ERAS; GEM; MRAS; KIRAS1; KIRAS2; NRAS; RALA; RALB; RAPIA; RAPIB; RAP2A; RAP2B; RAP2C; RASD1; RASD2; RASL10A; RASL10B; RASL11A; RASL11B; RASL12; REM1; REM2; RERG; RERGL; RRAD; RRAS and RRAS2.

25 Mutations in any one of the three main isoforms of RAS (HRAS, NRAS, or KRAS) genes are among the most common events in human tumorigenesis. KRAS mutations are detected in 25-30% of tumors. By comparison, the rates of oncogenic mutation occurring in the NRAS and HRAS family members are much lower (8% and 3% respectively).

30 Exchange of a glycine for a cysteine at residue 12 of RAS (the G12C mutation) results from a mutation commonly found in RAS genes. Large-scale cancer sequencing studies indicate that the G12C mutation appeared most frequently in lung, colorectal and pancreatic cancers. Histological analysis of seven cancer types indicated non-small cell lung cancer contributed the

most, 70-75%, to cancer cases having the KRAS G12C mutation. See Lindsay, C.R., *et al.*, *Br J Cancer* 121, 197–198 (2019).

Accordingly, while progress has been made in this field, there remains a need in the art for improved compounds and methods for treatment of cancer, for example, by inhibition of a mutant KRAS, HRAS or NRAS protein (*e.g.*, KRAS G12C). Embodiments of the present disclosure fulfill this need and provide further related advantages.

SUMMARY OF THE DISCLOSURE

The present disclosure provides compounds which modulate mutant KRAS, HRAS, and/or NRAS proteins and may be valuable pharmaceutically active compounds for the treatment of cancer. In some embodiments the disclosed compounds selectively inhibit the KRAS (G12C) protein. The compounds of Formula (I)

and their pharmaceutically acceptable salts, can modulate the activity of KRAS, HRAS and/or
15 NRAS activity and thereby effect the signaling pathway which regulates cell growth,
differentiation, and proliferation associated with oncological disorders. In certain embodiments,
the compounds of Formula (I) can inhibit the KRAS (G12C) protein. The disclosure furthermore
provides processes for preparing compounds of Formula (I), methods for using such compounds
to treat oncological disorders, and pharmaceutical compositions which comprise compounds of
20 Formula (I).

“Bicyclo- ring system” refers to two joined rings. The rings may be fused, i.e., share two adjacent atoms, or “spirocyclic”, i.e., share only a single atom.

“Cyanoalkyl” refers to an alkyl group substituted with a cyano group.

“Cycloalkyl” means a saturated cyclic hydrocarbon radical. In particular embodiments, the cycloalkyl group has 3-12 carbon atoms, forming 1-3 carbocyclic rings that are fused. Examples of cycloalkyl include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, adamantyl, and the like.

“Fluoroalkyl” include mono-substituted as well as multiple fluoro-substituted alkyl groups, up to perfluoro substituted alkyl. For example, fluoromethyl, 1,1-difluoroethyl, trifluoromethyl or 1,1,1,2,2-pentafluorobutyl are included.

“Geminally substituted” refers to substitutions (e.g., functional groups) that are attached to the same atom in a molecule. For instance, 1,1-dichloroethane is an ethane molecule which is geminally substituted with two chlorine atoms.

The term “heteroalkylene” refers to optionally substituted alkylene radicals, which have one or more skeletal chain atoms selected from an atom other than carbon, e.g., oxygen, nitrogen, or sulfur, thereof. A numerical range, which refers to the chain length in total, may be given. For example, C₁-C₇ heteroalkylene has a chain length of 1 to 7 atoms. For example, a —OCH₂CH₂CH₂O- radical is referred to as a “C₅ heteroalkylene”, which includes two heteroatoms in the atom chain length description. Connections to the rest of the molecule are through terminal carbon, nitrogen, oxygen or sulfur atoms in the heteroalkylene chain (e.g., to ring atoms of CY and CZ). The heteroalkylene groups may be substituted. Unless otherwise stated in the specification, heteroalkylene groups may be substituted at carbon atoms in the radicals with one or more substituents which independently are oxo, fluoro, C₁-C₃ alkyl, C₁-C₃ fluoroalkyl, amino, hydroxy or two geminal or vicinal or hominal substitutions can combine with the carbon atoms to which they are substituted to form a C₃-C₆ cycloalkyl. In some embodiments, the heteroalkylene groups have 1-2 heteroatoms selected from nitrogen and oxygen atoms in the atom chain. In some embodiments, the heteroalkylene groups have 1 heteroatom selected from nitrogen and oxygen atoms in the atom chain.

“Heteroaryl” refers to aromatic monocyclic and bicyclic ring structures in which one or more atoms in the ring, the heteroatom(s), is an element other than carbon. Heteroatoms are typically O, S, or N atoms. Examples of heteroaromatic groups include pyridinyl, pyrimidinyl, pyrrolyl, pyridazinyl, isoxazolyl, thiazolyl, oxazolyl, indolyl, benzoxazolyl, benzothiazolyl, and imidazolyl.

“Halogen” or “halo” unless otherwise indicated, includes fluorine (fluoro), chlorine (chloro), bromine (bromo) and iodine (iodo). In one embodiment, halo is fluoro (-F) or chloro (-Cl).

“Hominally substituted” refers to substitutions or groups that are attached on a molecule in a 1,3-relationship. For instance, 1,3-dichloropropane $\text{ClCH}_2\text{CH}_2\text{CH}_2\text{Cl}$ is a propane molecule which is hominally substituted with two chlorine atoms.

“Hydroxyalkyl” includes mono-substituted as well as multiple hydroxy-substituted alkyl groups.

When any variable (*e.g.*, R^3 , R_Y , etc.) occurs more than one time in any constituent or in Formula (I) or other generic formulas herein, its definition on each occurrence is independent of its definition at every other occurrence. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds. In choosing compounds of the present disclosure, one of ordinary skill in the art will recognize that the various substituents, *i.e.*, R^3 , R_Y , etc., are to be chosen in conformity with well-known principles of chemical structure connectivity and stability. Unless expressly stated to the contrary, substitution by a named substituent is permitted on any atom in a ring (*e.g.*, aryl, a heteroaryl ring, or a saturated heterocycloalkyl ring) provided such ring substitution is chemically allowed and results in a stable compound. A “stable” compound is a compound which can be prepared and isolated and whose structure and properties remain or can be caused to remain essentially unchanged for a period of time sufficient to allow use of the compound for the purposes described herein (*e.g.*, therapeutic or prophylactic administration to a subject).

The term “substituted” shall be deemed to include multiple degrees of substitution by a named substituent. Where multiple substituent moieties are disclosed or claimed, the substituted compound can be independently substituted by one or more of the disclosed or claimed substituent moieties, singly or plurally. By independently substituted, it is meant that the (two or more) substituents can be the same or different.

“Vicinally substituted” refers to substitutions or groups that are attached to the adjacent atoms in a molecule. For instance, 1,2-dichloroethane is an ethane molecule which is vicinally substituted with two chlorine atoms.

Unless expressly depicted or described otherwise, variables depicted in a structural formula with a “floating” bond, such as R^3 or R_Y in Formula (I), are permitted on any available carbon atom in the ring to which the variable is attached. When a moiety is noted as being “optionally substituted” in Formula (I) or any embodiment thereof, it means that Formula (I) or

the embodiment thereof encompasses compounds that contain the noted substituent (or substituents) on the moiety and also compounds that do not contain the noted substituent (or substituents) on the moiety.

The wavy line , as used herein, indicates a point of attachment to the rest of the compound.

Compounds of Formula (I) may contain one or more asymmetric centers and can thus occur as racemates and racemic mixtures, single enantiomers, diastereoisomeric mixtures and individual diastereoisomers. Centers of asymmetry that are present in the compounds of Formula (I) can all independently of one another have S configuration or R configuration. The compounds of this disclosure include all possible enantiomers and diastereomers and mixtures of two or more stereoisomers, for example, mixtures of enantiomers and/or diastereomers, in all ratios. Thus, enantiomers are a subject of the disclosure in enantiomerically pure form, both as levorotatory and as dextrorotatory antipodes, in the form of racemates and in the form of mixtures of the two enantiomers in all ratios. In the case of a cis/trans isomerism, the disclosure includes both the cis form and the trans form as well as mixtures of these forms in all ratios. The present disclosure is meant to comprehend all such stereoisomeric forms of the compounds of Formula (I). Where a structural formula or chemical name specifies a particular configuration at a stereocenter, the enantiomer or stereoisomer of the compound resulting from that specified stereocenter is intended. Where a structural formula of the compounds of Formula (I) indicates a straight line at a chiral center, the structural formula includes both the S and R stereoisomers associated with the chiral center and mixtures thereof.

Compounds of Formula (I) may be separated into their individual diastereoisomers by, for example, fractional crystallization from a suitable solvent, for example, methanol or ethyl acetate or a mixture thereof, or via chiral chromatography using an optically active stationary phase. Absolute stereochemistry may be determined by X-ray crystallography of crystalline products or crystalline intermediates which are derivatized, if necessary, with a reagent containing an asymmetric center of known absolute configuration. Vibrational circular dichroism (VCD) may also be used to determine the absolute stereochemistry. Alternatively, any stereoisomer or isomers of a compound of Formula (I) may be obtained by stereospecific synthesis using optically pure starting materials or reagents of known absolute configuration.

If desired, racemic mixtures of the compounds may be separated so that the individual enantiomers are isolated. The separation can be carried out by methods well known in the art, such as the coupling of a racemic mixture of compounds to an enantiomerically pure compound

to form a diastereoisomeric mixture, followed by separation of the individual diastereoisomers by standard methods, such as fractional crystallization or chromatography. The coupling reaction is often the formation of salts using an enantiomerically pure acid or base. The diasteromeric derivatives may then be converted to the pure enantiomers by cleavage of the added chiral residue. The racemic mixture of the compounds can also be separated directly by chromatographic methods utilizing chiral stationary phases, which methods are well known in the art.

For compounds of Formula (I) described herein which contain olefinic double bonds, unless specified otherwise, they are meant to include both E and Z geometric isomers.

Some of the compounds described herein may exist as tautomers which have different points of attachment of hydrogen accompanied by one or more double bond shifts. For example, a ketone and its enol form are keto-enol tautomers. The individual tautomers as well as mixtures thereof are encompassed with compounds of Formula I of the present disclosure.

Some of the compounds described herein may exist as atropisomers when the rotational energy barrier around a single bond is sufficiently high to prevent free rotation at a given temperature, thus allowing isolation of individual conformers with distinct properties. A typical example of stable atropisomers are exemplified by intermediates Int-4d-1 and Int-4d-2 (described below), which can be resolved by supercritical fluid chromatography separation. The individual atropisomers as well as mixtures thereof are encompassed with compounds of Formula I of the present disclosure. When resolved, individual atropisomers can be designated by established conventions such as those specified by the International Union of Pure Applied Chemistry (IUPAC) 2013 Recommendations.

In the compounds of Formula (I), the atoms may exhibit their natural isotopic abundances, or one or more of the atoms may be artificially enriched in a particular isotope having the same atomic number, but an atomic mass or mass number different from the atomic mass or mass number predominantly found in nature. The present disclosure as described and claimed herein is meant to include all suitable isotopic variations of the compounds of Formula (I) and embodiments thereof. For example, different isotopic forms of hydrogen (H) include protium (^1H) and deuterium (^2H , also denoted herein as D). Protium is the predominant hydrogen isotope found in nature. Enriching for deuterium may afford certain therapeutic advantages, such as increasing *in vivo* half-life or reducing dosage requirements or may provide a compound useful as a standard for characterization of biological samples. Isotopically-enriched compounds of Formula (I), can be prepared without undue experimentation by conventional techniques well

known to those skilled in the art or by processes analogous to those described in the Schemes and Examples herein using appropriate isotopically-enriched reagents and/or intermediates.

The term “pharmaceutically acceptable salts” refers to salts prepared from pharmaceutically acceptable non-toxic bases or acids. When the compound of the present disclosure is acidic, its corresponding salt can be conveniently prepared from pharmaceutically acceptable non-toxic bases, including inorganic bases and organic bases. Salts derived from such inorganic bases include aluminum, ammonium, calcium, copper (ic and ous), ferric, ferrous, lithium, magnesium, manganese (ic and ous), potassium, sodium, zinc and the like salts.

When the compound of the present disclosure is basic, its corresponding salt can be conveniently prepared from pharmaceutically acceptable non-toxic inorganic and organic acids. Such acids include, for example, acetic, benzenesulfonic, benzoic, camphorsulfonic, citric, ethanesulfonic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, pamoic, pantothenic, phosphoric, succinic, sulfuric, tartaric, p-toluenesulfonic acid and the like. Preferred are citric, hydrobromic, hydrochloric, maleic, phosphoric, sulfuric, and tartaric acids. If the compounds of Formula (I) simultaneously contain acidic and basic groups in the molecule, the disclosure also includes, in addition to the salt forms mentioned, inner salts or betaines (zwitterions). Salts can be obtained from the compounds of Formula (I) by customary methods which are known to the person skilled in the art, for example, by combination with an organic or inorganic acid or base in a solvent or dispersant, or by anion exchange or cation exchange from other salts. The present disclosure also includes all salts of the compounds of Formula (I) which, owing to low physiological compatibility, are not directly suitable for use in pharmaceuticals but which can be

used, for example, as intermediates for chemical reactions or for the preparation of pharmaceutically acceptable salts.

Furthermore, compounds of the present disclosure may exist in amorphous form and/or one or more crystalline forms, and as such all amorphous and crystalline forms and mixtures thereof of the compounds of Formula (I), including the Examples, are intended to be included within the scope of the present disclosure. In addition, some of the compounds of the instant disclosure may form solvates with water (*i.e.*, a hydrate) or common organic solvents such as but not limited to ethyl acetate. Such solvates and hydrates, particularly the pharmaceutically acceptable solvates and hydrates, of the instant compounds are likewise encompassed within the scope of this disclosure, along with un-solvated and anhydrous forms.

Any pharmaceutically acceptable pro-drug modification of a compound of this disclosure which results in conversion in vivo to a compound within the scope of this disclosure is also within the scope of this disclosure.

The present disclosure also relates to processes for the preparation of the compounds of Formula (I) which are described in the following and by which the compounds of the disclosure are obtainable.

The terms “therapeutically effective (or efficacious) amount” and similar descriptions such as “an amount efficacious for treatment” are intended to mean that amount of a compound of Formula (I) that will elicit the biological or medical response of a tissue, a system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician. In a preferred embodiment, the term “therapeutically effective amount” means an amount of a compound of Formula (I) that alleviates at least one clinical symptom in a human patient. The terms “prophylactically effective (or efficacious) amount” and similar descriptions such as “an amount efficacious for prevention” are intended to mean that amount of a compound of Formula (I) that will prevent or reduce the risk of occurrence of the biological or medical event that is sought to be prevented in a tissue, a system, animal or human by a researcher, veterinarian, medical doctor or other clinician.

Dosages of the Compounds of Formula (I)

The dosage regimen utilizing a compound of the instant disclosure is selected in accordance with a variety of factors including type, species, age, weight, sex and medical condition of the patient; the severity of the condition to be treated; the potency of the compound chosen to be administered; the route of administration; and the renal and hepatic function of the

patient. A consideration of these factors is well within the purview of the ordinarily skilled clinician for the purpose of determining the therapeutically effective or prophylactically effective dosage amount needed to prevent, counter, or arrest the progress of the condition. It is understood that a specific daily dosage amount can simultaneously be both a therapeutically effective amount, *e.g.*, for treatment of an oncological condition, and a prophylactically effective amount, *e.g.*, for prevention of an oncological condition.

Combination Therapies

One or more additional pharmacologically active agents may be administered in combination with a compound of Formula (I) (or a pharmaceutically acceptable salt thereof). An additional active agent (or agents) is intended to mean a pharmaceutically active agent (or agents) that is active in the body, including pro-drugs that convert to pharmaceutically active form after administration, which are different from the compound of Formula (I). The additional active agents also include free-acid, free-base and pharmaceutically acceptable salts of said additional active agents. Generally, any suitable additional active agent or agents, including chemotherapeutic agents or therapeutic antibodies, may be used in any combination with the compound of Formula (I) in a single dosage formulation (e.g., a fixed dose drug combination), or in one or more separate dosage formulations which allows for concurrent or sequential administration of the active agents (co-administration of the separate active agents) to subjects. In addition, the compounds of Formula (I) (or pharmaceutically acceptable salts thereof) can be administered in combination with radiation therapy, hormone therapy, surgery or immunotherapy.

The present application also provides methods for combination therapies in which the additional active agent is known to modulate other pathways, or other components of the same pathway, or even overlapping sets of target enzymes which are used in combination with a compound of Formula (I), or a pharmaceutically acceptable salt thereof. In one embodiment, such therapy includes, but is not limited to, the combination of one or more compounds of Formula (I) with chemotherapeutic agents, immunotherapeutic agents, hormonal and anti-hormonal agents, targeted therapy agents, and anti-angiogenesis agents, to provide a synergistic or additive therapeutic effect. In another embodiment, such therapy includes radiation treatment to provide a synergistic or additive therapeutic effect.

Examples of additional active agents (i.e., additional anti-cancer agents) include chemotherapeutic agents (e.g., cytotoxic agents), immunotherapeutic agents, hormonal and anti-hormonal agents, targeted therapy agents, and anti-angiogenesis agents. Many anti-cancer agents can be classified within one or more of these groups. While certain anti-cancer agents have been categorized within a specific group(s) or subgroup(s) herein, many of these agents can also be listed within one or more other group(s) or subgroup(s), as would be presently understood in the art. It is to be understood that the classification herein of a particular agent into a particular group is not intended to be limiting. DCM (1.1 mL) was added into the reaction vessel followed by dropwise addition of trifluoroacetic acid (411 µL, 5.37 mmol). The reaction mixture was stirred for 1 h at 24 °C. The product mixture was concentrated to dryness. The residue obtained was azeotroped once with toluene (5 mL). Preparation of 4-(4-((*tert*-butyldimethylsilyl)oxy)-3,3-difluorobutyl)-6-isopropylpyrimidin-5-amine (**Int-69d**)

Step A: 4-chloro-6-(prop-1-en-2-yl)pyrimidin-5-amine (**Int-69a**)

- 5 Isopropenylboronic acid pinacol ester (6.88 mL, 36.6 mmol) was taken up in DME (81 mL) and added to a microwave vial containing 4,6-dichloropyrimidin-5-amine (5.00 g, 30.5 mmol). Cesium carbonate (29.8 g, 91.0 mmol) followed by water (20.3 mL) were added and argon was bubbled through the mixture. Bis(triphenylphosphine)palladium(II) dichloride (2.14 g, 3.05 mmol) was added and argon was bubbled through the mixture for 4 minutes. The mixture was then heated to $85\text{ }^\circ\text{C}$ for 3 h. Upon cooling to $24\text{ }^\circ\text{C}$, the mixture was diluted with ethyl acetate and saturated sodium bicarbonate aqueous solution. The organic layer was separated, dried over magnesium sulfate, filtered and concentrated under reduced pressure. Column chromatography was used for purification (0-20% ethyl acetate gradient in hexanes) to afford 4-chloro-6-(prop-1-en-2-yl)pyrimidin-5-amine (**Int-69a**). ^1H NMR (500 MHz, DMSO- d_6): δ 8.22 (s, 1H), 5.61 - 5.57 (m, 1H), 5.50 (s, 2H), 5.46 (t, $J = 1.1\text{ Hz}$, 1H), 2.07 (t, $J = 1.3\text{ Hz}$, 3H).

Step B: (*E*)-4-(4-(benzyloxy)-3,3-difluorobut-1-en-1-yl)-6-(prop-1-en-2-yl)pyrimidin-5-amine (**Int-69b**)

- 20 4-Chloro-6-(prop-1-en-2-yl)pyrimidin-5-amine (1.00 g, 5.90 mmol) and potassium (*E*)-4-(benzyloxy)-3,3-difluorobut-1-en-1-yltrifluoroborate (**Int-52d**, 1.97 g, 6.49 mmol) were placed in a vial and THF (13.8 mL) was added. Argon was bubbled through the mixture. Catacxiium A-Pd-G₃ (215 mg, 0.295 mmol), potassium phosphate tribasic (2.50 g, 11.8 mmol) and then water

(5.9 mL) were added and argon was bubbled through the mixture for five minutes. The reaction was then heated to 60 °C for 16 h. Upon cooling to 24 °C, the mixture was diluted with ethyl acetate and water. The organic layer was separated, dried over magnesium sulfate, filtered and concentrated under reduced pressure. The resulting mixture was purified by column chromatography (0-20% ethyl acetate gradient in hexanes) to afford (*E*)-4-(4-(benzyloxy)-3,3-difluorobut-1-en-1-yl)-6-(prop-1-en-2-yl)pyrimidin-5-amine (**Int-69b**). ¹H NMR (500 MHz, DMSO-*d*₆): δ 8.39 (s, 1H), 7.47 (dt, *J* = 15.3, 2.7 Hz, 1H), 7.43 - 7.22 (m, 5H), 6.95 (dt, *J* = 15.3, 12.3 Hz, 1H), 5.62 - 5.49 (m, 3H), 5.38 (t, *J* = 1.2 Hz, 1H), 4.64 (s, 2H), 3.93 (t, *J* = 13.3 Hz, 2H), 2.07 (d, *J* = 1.2 Hz, 3H).

Step C: 4-(4-(benzyloxy)-3,3-difluorobutyl)-6-isopropylpyrimidin-5-amine (**Int-69c**)

Pd/C (10 wt%, 29.0 mg, 0.273 mmol) was added and the flask was evacuated and then purged 5 times with hydrogen. The mixture was stirred for 16 h at 24 °C. The mixture was then filtered through CELITE and the filtrate was concentrated under reduced pressure. The resulting mixture containing 4-(4-(benzyloxy)-3,3-difluorobutyl)-6-isopropylpyrimidin-5-amine (**Int-69c**) was used in the subsequent reaction without further purification.

Step D: 4-(4-((*tert*-butyldimethylsilyl)oxy)-3,3-difluorobutyl)-6-isopropylpyrimidin-5-amine (**Int-69d**)

Triethylamine (2.93 mL, 21.2 mmol) and *tert*-butyldimethylchlorosilane (638 mg, 4.23 mmol) were added into the reaction vessel. The resulting mixture was heated to 45 °C for 2 h. Upon cooling to room temperature, the product mixture was diluted with ethyl acetate (20 mL). The diluted product mixture was washed three times with saturated sodium bicarbonate aqueous solution (3 × 20 mL). The organic layer was dried over magnesium sulfate, filtered and concentrated under reduced pressure. The residue

obtained was purified by flash column chromatography with silica gel column, eluting with DCM initially, grading to 80% ethyl acetate:ethanol 3:1-DCM, linear gradient to afford 4-(4-((*tert*-butyldimethylsilyl)oxy)-3,3-difluorobutyl)-6-isopropylpyrimidin-5-amine (**Int-69d**). MS (ESI): m/z 360 $[M+H]^+$.

Step A: Int-97a

To a flask containing **Int-54b-1** (150 mg, 0.210 mmol) was added methanol (1.0 mL) and then potassium hydroxide (1.0 M in methanol, 0.63 mL, 0.63 mmol). The reaction vessel was sealed and the sealed reaction vessel was evacuated and backfilled with a balloon of nitrogen three times. The reaction mixture was heated to 40 °C for 16 hours. After 16 hours, the mixture was allowed to cool to room temperature and then quenched with saturated aqueous ammonium chloride (10 mL). The quenched product mixture was extracted three times with chloroform:isopropanol (3:1 mixture, 3 × 50 mL). The combined organic layers were dried over sodium sulfate, filtered and the filtrate was concentrated under reduced pressure to afford **Int-97a**. MS (ESI) m/z 519 [M+H]⁺.

Step B: Int-97b

A flask containing **Int-97a** (40 mg, 0.077 mmol) was evacuated and backfilled with a balloon of nitrogen three times. Acetonitrile (0.40 mL), *N*-ethyl-*N*-isopropylpropan-2-amine (21 µL, 0.12 mmol), and phosphoryl trichloride (9.0 µL, 0.10 mmol) were added to the reaction vessel and the resulting mixture was heated to 80 °C for 1 h. After 1 hour, the mixture was allowed to cool to room temperature and then was concentrated to dryness under reduced pressure. The resulting mixture was dissolved in acetonitrile (0.40 mL). *N*-Ethyl-*N*-isopropylpropan-2-amine (69 µL, 0.39 mmol) was added to the reaction mixture followed by the addition of tert-butyl (*S*)-3-methylpiperazine-1-carboxylate (23 mg, 0.12 mmol). The resulting mixture was stirred for 1 h at room temperature. The product mixture was then diluted with ethyl acetate (50 mL). The diluted product mixture was washed three times with saturated aqueous sodium bicarbonate (3 × 10 mL). The organic layer was dried over sodium sulfate, filtered and the filtrate was concentrated under reduced pressure. The residue obtained was purified by flash column chromatography (0-100% (3:1 ethyl acetate:ethanol) in dichloromethane) to afford **Int-97b**. MS (ESI) m/z 701 [M+H]⁺.

10 BIOLOGICAL ASSAYS:

Procedure for SOS-catalyzed nucleotide exchange assay

The SOS-catalyzed nucleotide exchange assay utilizes a preformed complex of recombinant biotinylated KRAS protein containing G12C/C51S/C80L/C118S mutations (183 amino acids; biotin on K10; leader sequence which is an AviTag; referred to as SEQ ID NO: 1 or
15 “Biotinylated KRAS G12C protein” hereafter), Bodipy-GDP, and Terbium-streptavidin. Compounds are added to this complex and then after incubation for 60 minutes, the mixture is treated with recombinant SOS protein and unlabeled GTP. Small molecule inhibitors stabilize the Bodipy-GDP complex whereas the untreated protein rapidly exchanges Bodipy-GDP for unlabeled GTP resulting in reduced TR-FRET signal.

20 Biotinylated KRAS G12C protein (SEQ ID NO: 1) is diluted to 2 μM in an EDTA buffer (20 mM HEPES, 150 mM sodium chloride, 10 mM EDTA, and 0.01% Tween) and incubated at room temperature for one hour. This mixture is then further diluted to 90nM in an assay buffer (20mM HEPES, 150mM sodium chloride, 10mM magnesium chloride, and 0.005% Tween) containing 15nM of Terbium-Streptavidin (Invitrogen, catalog# PV3577) and 900 nM of
25 Bodipy-GDP and incubated at room temperature for six hours. This solution is referred to as Biotinylated KRAS G12C mixture.

Each test compound (10 mM stock in DMSO) is diluted in DMSO to make a 10-point, 3-fold dilution series in a 384-well low dead volume microplate (Labcyte, catalog# LP-0200). Once titrations are made, 10 nL of the diluted compounds is acoustically dispensed into a 384-
30 well plate (Corning, catalog# 3820) using an Echo 550 (Labcyte).

Each well of the plate receives 3 μL Biotinylated KRAS G12C mixture that had been incubating for six hours and 3 μL of assay buffer using a BioRAPTR (Beckman Coulter) and is incubated at room temperature for 60 minutes. Each well then receives 3 μL of 240 nM

recombinant human SOS protein and 9 mM GTP (Sigma, G8877) in assay buffer and is incubated at room temperature for 60 minutes.

The time-resolved fluorescence resonance energy transfer signal of the plate is measured on an Envision (PerkinElmer) plate reader: Excitation filter = 340 nm; emission1 = 495 nm; emission2 = 520 nm; dichroic mirror = D400/D505; delay time=100 μ s. The signal of each well is determined as the ratio of the emission at 520 nm to that at 495 nm. Percent effect of each well is determined after normalization to control wells containing DMSO (no effect) or a saturating concentration of inhibitor (max effect). The apparent effect as a function of compound concentration is fit to a four parameter logistic equation.

10 **Procedure for cellular phospho-ERK assay**

NCI-H358 cells (ATCC® CRL-5807™) were cultured in T150 flask in growth medium (RPMI medium 1640-GlutaMAX™-I (ThermoFisher Scientific 61870) containing 10% fetal bovine serum (ThermoFisher Scientific 10091148)). The cells were harvested in growth medium after TrypLE (ThermoFisher scientific 12604021) digestion and were seeded in a 384-well collagen coated cell culture plate (Corning 356702) at a density of 15,000 cells/well, and incubated at 37°C, 5% CO₂ overnight. The compound dose-response titrations were prepared and appropriate amounts of compounds were dispensed in a 384-well intermediate plate using an Echo 550 liquid handler. RPMI medium 1640-GlutaMAX™-I were added to the intermediate plate and transferred to 384-well cell culture plate, which was incubated at 37°C, 5% CO₂ for 2 hours. After removal of medium from the plate, cells were lysed in lysis buffer from Alpha SureFire® Ultra™ Multiplex p-Erk and total Erk assay kit (PerkinElmer MPSU-PTERK) containing Halt™ Protease and Phosphatase inhibitor cocktail (ThermoFisher Scientific 78446) at room temperature with constant shaking at 300 rpm for 30 minutes. The cell lysates were then transferred to OptiPlate-384 plate (PerkinElmer 6005620) and the phosphorylation of Erk and total Erk levels were detected by Alpha SureFire Ultra Multiplex p-Erk kit (PerkinElmer MPSU-PTERK) following the manufacturer's protocol. Assay plates were read on an EnVision Multimode Plate Reader (PerkinElmer), and the ratio of p-Erk vs total Erk in each well was used as the final readout. Dose response curves were analyzed using a 4-parameter logistic model to calculate IC₅₀ values using spotfire software.
