ABSTRACT

The invention concerns novel pyrazole derivatives comprising at least a cationic group Z, Z being selected among the quaternized aliphatic chains, aliphatic chains comprising at least a saturated quaternized cycle, and aliphatic chains comprising at least an unsaturated quaternized cycle, their use as oxidation base for dyeing keratin fibres, dyeing compositions containing them, and dyeing methods using them.

**NOVEL CATIONIC OXIDATION BASES, THEIR USE FOR THE
OXIDATION DYEING OF KERATIN FIBRES, DYE COMPOSITIONS
AND DYEING PROCESSES**

The invention relates to novel pyrazole
5 derivatives containing at least one cationic group Z, Z
being chosen from quaternized aliphatic chains,
aliphatic chains containing at least one quaternized
saturated ring and aliphatic chains containing at least
one quaternized unsaturated ring, to their use as
10 oxidation base for the oxidation dyeing of keratin
fibres, to dye compositions containing them and to
oxidation dyeing processes using them.

It is known practice to dye keratin fibres,
and in particular human hair, with dye compositions
15 containing oxidation dye precursors, in particular
ortho- or para-phenylenediamines, ortho- or para-
aminophenols and heterocyclic compounds such as
diaminopyrazole derivatives, which are generally
referred to as oxidation bases. The oxidation dye
20 precursors, or oxidation bases, are colourless or
weakly coloured compounds which, when combined with
oxidizing products, can give rise to coloured compounds
and dyes by a process of oxidative condensation.

It is also known that the shades obtained
25 with these oxidation bases can be varied by combining
them with couplers or coloration modifiers, the latter
being chosen in particular from aromatic meta-diamines,

meta-aminophenols, meta-diphenols and certain heterocyclic compounds.

The variety of molecules used as oxidation bases and couplers makes it possible to obtain a wide
5 range of colours.

The so-called "permanent" coloration obtained by means of these oxidation dyes must moreover satisfy a certain number of requirements. Thus, it must have no toxicological drawbacks and it must allow shades of the
10 desired strength to be obtained and have good resistance to external agents (light, bad weather, washing, permanent-waving, perspiration and friction).

The dyes must also allow white hairs to be covered, and, lastly, they must be as unselective as
15 possible, i.e. they must allow the smallest possible differences in coloration to be produced over the entire length of the same keratin fibre, which may indeed be differently sensitized (i.e. damaged) between its tip and its root.

20 Now, the Applicant has just discovered, entirely surprisingly and unexpectedly, that novel pyrazole derivatives of formula (I) defined below, containing at least one cationic group Z, Z being chosen from quaternized aliphatic chains, aliphatic
25 chains containing at least one quaternized saturated ring and aliphatic chains containing at least one quaternized unsaturated ring, are not only suitable for use as oxidation base, but also allow dye compositions

to be obtained which lead to strong colorations, in a wide range of colours, and which have excellent properties of resistance to the various treatments to which keratin fibres may be subjected.

5 These discoveries form the basis of the present invention.

As mentioned above, the colorations obtained
20 with the oxidation dye composition containing one or more compounds of formula (I) in accordance with the invention are strong and produce a wide range of colours. They moreover have excellent properties of resistance to the action of various external agents
25 (light, bad weather, washing, permanent-waving, perspiration, friction). These properties are particularly noteworthy, in particular as regards the

 When the compounds of formula (I) are such that they contain an OH group on one of the positions 3
15 or 5, α of a nitrogen atom, there is a tautomeric equilibrium which may be represented, for example, by the following scheme:

and the addition salts thereof with an acid or with a base, and the possible tautomeric forms thereof.

25 Among these compounds of formula (I) that are preferred more particularly are:

- [3-(4-amino-2,5-dimethyl-2H-pyrazol-3-ylamino)propyl]-trimethylammonium chloride;

- [3-(4-amino-2,5-dimethyl-2H-pyrazol-3-ylamino)propyl]-(2-hydroxyethyl)dimethylammonium chloride;

- 10 1-methyl-3H-imidazol-1-ium chloride;

and the addition salts thereof with an acid or with a base, and the possible tautomeric forms thereof.

The compounds of formula (I) in accordance with the invention may be readily obtained according to methods that are well known in the prior art:

- either by reducing the corresponding cationic nitro or nitroso compounds. In this case, the reduction to the corresponding primary aromatic amine is carried out according to conventional methods (J. Lehmann in Houben-Weyl, "Methoden der Organischen Chemie", Volume IV/1c: Reduction I pages 491 to 537, 1980).

The methods that are preferred according to the invention involve metals such as Zn, Sn or Fe in acidic medium, for instance aqueous hydrochloric acid or aqueous acetic acid in the presence or absence of a co-solvent such as methanol, ethanol or tetrahydrofuran. Catalytic hydrogenation is a reduction method that is preferred according to the invention.

This catalytic hydrogenation uses metals such as palladium, platinum or nickel. It is even more particularly preferred to use palladium-on-charcoal or Raney nickel, or alternatively oxides such as PtO_2 in solvents such as methanol, ethanol, tetrahydrofuran or ethyl acetate, in the presence or absence of an acid, for example acetic acid. These catalytic reductions may also be carried out with formic acid in the presence of a trialkylamine such as triethylamine or with an ammonium formate instead of hydrogen gas (S. Ram, R.E. Ehrenkauf, *Synthesis*, 1988, 91).

- or by reducing the corresponding cationic azo compounds (reductive cleavage). The reduction to the corresponding primary aromatic amine is carried out according to conventional methods (J. Lehmann in Houben-Weyl, "Methoden der Organischen Chemie", Volume IV/1c: Reduction I pages 551 to 553, 1980; E.C. Taylor & Coll., *J. Amer. Chem. Soc.*, 80, 421, 1958).

This reduction step (production of a primary aromatic amine) which gives the synthesized compound its nature as an oxidizable compound (oxidation base), which may or may not be followed by a salification, is generally, for convenience, the final step of the synthesis.

This reduction can take place earlier in the sequence of reactions leading to the preparation of the

compounds of formula (I), and according to well-known processes it is then necessary to "protect" the primary amine created (for example by an acetylation, benzenesulphonation, etc. step), then carry out the
5 desired substitution(s) or modification(s) (including quaternization) and end by "deprotecting" (generally in acidic medium) the amine function.

When the synthesis is complete, the compounds of formula (I) in accordance with the invention can, if
10 necessary, be recovered by methods which are well known in the state of the art, such as crystallization or distillation.

Another subject of the invention is the use of the compounds of formula (I) in accordance with the
15 invention as oxidation bases for the oxidation dyeing of keratin fibres, and in of particular human keratin fibres such as the hair.

The invention also relates to a composition for the oxidation dyeing of keratin fibres, and in
20 particular of human keratin fibres such as the hair, characterized in that it comprises, as an oxidation base, in a medium which is suitable for dyeing, at least one compound of formula (I) in accordance with the invention.

25 The compound(s) of formula (I) in accordance with the invention preferably represent(s) from 0.0005 to 12% by weight approximately relative to the total weight of the dye composition, and even more preferably

from 0.005 to 6% by weight approximately relative to this weight.

The medium which is suitable for dyeing (or the support) generally consists of water or a mixture of water and at least one organic solvent to dissolve the compounds which would not be sufficiently soluble in water. As organic solvent, mention may be made, for example, of C₁-C₄ lower alkanols, such as ethanol and isopropanol; glycerol; glycols and glycol ethers such as 2-butoxyethanol, propylene glycol, propylene glycol monomethyl ether, diethylene glycol monoethyl ether and monomethyl ether, as well as aromatic alcohols such as benzyl alcohol or phenoxyethanol, similar products and mixtures thereof.

The solvents can be present in proportions preferably of between 1 and 40% by weight approximately relative to the total weight of the dye composition, and even more preferably between 5 and 30% by weight approximately.

The pH of the dye composition in accordance with the invention is generally between 3 and 12 approximately, and preferably between 5 and 11 approximately. It can be adjusted to the desired value using acidifying or basifying agents commonly used to dye keratin fibres.

Among the acidifying agents which may be mentioned, for example, are inorganic or organic acids such as hydrochloric acid, orthophosphoric acid,

sulphuric acid, carboxylic acids such as acetic acid, tartaric acid, citric acid and lactic acid, and sulphononic acids.

Among the basifying agents which can be mentioned, for example, are aqueous ammonia, alkaline carbonates, alkanolamines such as mono-, di- and triethanolamine and derivatives thereof, sodium hydroxide, potassium hydroxide and the compounds of formula (V) below:

10

15

15 by weight approximately relative to the total weight of
the dye composition, and even more preferably from

weight.

The oxidation dye compositions in accordance
20 with the invention can also contain at least one
coupler and/or at least one direct dye, in particular
in order to modify the shades or to enrich them with
glints.

The couplers which can be used in the
25 oxidation dye compositions in accordance with the
invention can be chosen from the couplers used
conventionally in oxidation dyeing and among which
mention may be made in particular of meta-

phenylenediamines, meta-aminophenols, meta-diphenols and heterocyclic couplers such as, for example, indole derivatives, indolene derivatives, pyridine derivatives and pyrazolones, and the addition salts thereof with an
 5 acid.

These couplers are chosen more particularly from 2-methyl-5-aminophenol, 5-N-(•-hydroxyethyl)amino-2-methylphenol, 3-aminophenol, 1,3-dihydroxybenzene, 1,3-dihydroxy-2-methylbenzene, 4-chloro-1,3-dihydroxy-

addition salts with a base which may be used in the context of the invention (compounds of formula (I)) are in particular those obtained with sodium hydroxide, potassium hydroxide, aqueous ammonia or amines.

5 The dye composition in accordance with the invention can also contain various adjuvants conventionally used in compositions for dyeing the hair, such as anionic, cationic, nonionic, amphoteric or zwitterionic surfactants or mixtures thereof,
10 anionic, cationic, nonionic, amphoteric or zwitterionic polymers or mixtures thereof, inorganic or organic thickeners, antioxidants, penetration agents, sequestering agents, fragrances, buffers, dispersing agents, conditioners such as, for example, silicones,
15 film-forming agents, preserving agents and opacifiers.

Needless to say, a person skilled in the art will take care to select this or these optional additional compounds such that the advantageous properties intrinsically associated with the oxidation
20 dye composition in accordance with the invention are not, or are not substantially, adversely affected by the addition(s) envisaged.

The dye composition according to the invention can be in various forms, such as in the form
25 of liquids, creams or gels or in any other form which is suitable for dyeing keratin fibres, and in particular human hair.

The invention also relates to a process for dyeing keratin fibres, and in particular human keratin fibres such as the hair, using the dye composition as defined above.

5 According to this process, at least one dye composition as defined above is applied to the fibres, the colour being developed at acidic, neutral or alkaline pH using an oxidizing agent which is added to the dye composition just at the time of use, or which
10 is present in an oxidizing composition which is applied simultaneously or sequentially in a separate manner.

 According to a preferred embodiment of the dyeing process of the invention, the dye composition described above is preferably mixed, at the time of
15 use, with an oxidizing composition containing, in a medium which is suitable for dyeing, at least one oxidizing agent present in an amount which is sufficient to develop a coloration. The mixture obtained is then applied to the keratin fibres and is
20 left in place for 3 to 50 minutes approximately, preferably 5 to 30 minutes approximately, after which the fibres are rinsed, washed with shampoo, rinsed again and dried.

 The oxidizing agent can be chosen from the
25 oxidizing agents conventionally used for the oxidation dyeing of keratin fibres, and among which mention may be made of hydrogen peroxide, urea peroxide, alkali metal bromates and persalts such as perborates and

persulphates, and enzymes such as peroxidases, laccases, tyrosinases and oxidoreductases, among which mention may be made in particular of pyranose oxidases, glucose oxidases, glycerol oxidases, lactate oxidases, pyruvate oxidases and uricases.

The pH of the oxidizing composition containing the oxidizing agent as defined above is such that, after mixing with the dye composition, the pH of the resultant composition applied to the keratin fibres preferably varies between 3 and 12 approximately, and even more preferably between 5 and 11. It is adjusted to the desired value using acidifying or basifying agents commonly used to dye keratin fibres and as defined above.

The oxidizing composition as defined above can also contain various adjuvants conventionally used in compositions for dyeing the hair and as defined above.

The composition which is finally applied to the keratin fibres can be in various forms, such as in the form of liquids, creams or gels or any other form which is suitable for dyeing keratin fibres, and in particular human hair.

Another subject of the invention is a multi-compartment dyeing device or "kit" or any other multi-compartment packaging system, a first compartment of which contains the dye composition as defined above and a second compartment of which contains the oxidizing

composition as defined above. These devices can be equipped with a means for delivering the desired mixture onto the hair, such as the devices described in patent FR 2,586,913 in the name of the Applicant.

5 The examples which follow are intended to illustrate the invention without, however, limiting its scope.
