Abstract:

Polymeric additives used with viscoelastic surfactants, fluids comprising such additives and viscoelastic surfactants, and associated methods of use, are provided. In one embodiment, the methods comprise: providing a treatment fluid that comprises an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, the amphiphilic polymer comprising a hydrophobic component, and a hydrophilic component comprising at least 15 monomer units; and introducing the treatment fluid into at least a portion of a subterranean formation.
POLYMERIC ADDITIVES FOR ENHANCEMENT OF TREATMENT FLUIDS COMPRISING VISCOELASTIC SURFACTANTS AND METHODS OF USE

CROSS REFERENCE TO RELATED APPLICATIONS

BACKGROUND

[0001] The present invention relates to methods and compositions that may be useful in treating subterranean formations, and more specifically, to polymeric additives used with viscoelastic surfactants, fluids comprising such additives and viscoelastic surfactants, and associated methods of use.

[0002] Viscosified treatment fluids may be used in a variety of subterranean treatments. As used herein, the term "treatment," or "treating," refers to any subterranean operation that uses a fluid in conjunction with a desired function and/or for a desired purpose. The term "treatment," or "treating," does not imply any particular action by the fluid. Examples of common subterranean treatments include, but are not limited to, drilling operations, pre-pad treatments, fracturing operations, perforation operations, preflush treatments, afterflush treatments, sand control treatments (e.g., gravel packing), acidizing treatments (e.g., matrix acidizing or fracture acidizing), diverting treatments, cementing treatments, and well bore clean-out treatments. For example, in certain fracturing treatments generally a treatment fluid (e.g., a fracturing fluid or a "pad fluid") is introduced into a well bore that penetrates a subterranean formation at a sufficient hydraulic pressure to create or enhance one or more pathways, or "fractures," in the subterranean formation. These cracks generally increase the permeability of that portion of the formation. The fluid may comprise particulates, often referred to as "proppant particulates," that are deposited in the resultant fractures. The proppant particulates are thought to help prevent the fractures from fully closing upon the release of the hydraulic pressure, forming conductive channels through which fluids may flow to a well bore penetrating the formation.

[0003] Treatment fluids are also utilized in sand control treatments, such as gravel packing. In "gravel-packing" treatments, a treatment fluid suspends particulates (commonly referred to as "gravel particulates"), and at least a portion of those particulates are then deposited in a desired area in a well bore, e.g., near unconsolidated or weakly consolidated formation zones, to form a "gravel pack," which is a grouping of particulates that are packed sufficiently close together so as to prevent the passage of certain materials through the gravel pack. This "gravel pack" may, inter alia, enhance sand control in the...
subterranean formation and/or prevent the flow of particulates from an unconsolidated portion of the subterranean formation (e.g., a propped fracture) into a well bore. One common type of gravel-packing operation involves placing a sand control screen in the well bore and packing the annulus between the screen and the well bore with the gravel particulates of a specific size designed to prevent the passage of formation sand. The gravel particulates act, *inter alia*, to prevent the formation sand from occluding the screen or migrating with the produced hydrocarbons, and the screen acts, *inter alia*, to prevent the particulates from entering the well bore. The gravel particulates also may be coated with certain types of materials, including resins, tackifying agents, and the like. Once the gravel pack is substantially in place, the viscosity of the treatment fluid may be reduced to allow it to be recovered. In some situations, fracturing and gravel-packing treatments are combined into a single treatment (commonly referred to as "FRAC PAC™" operations). In such "FRAC PAC™" operations, the treatments are generally completed with a gravel pack screen assembly in place with the hydraulic fracturing treatment being pumped through the annular space between the casing and screen. In this situation, the hydraulic fracturing treatment ends in a screen-out condition, creating an annular gravel pack between the screen and casing. In other cases, the fracturing treatment may be performed prior to installing the screen and placing a gravel pack.

[0004] Maintaining sufficient viscosity in treatment fluids may be important for a number of reasons. Viscosity is desirable in drilling operations since treatment fluids with higher viscosity can, among other things, transport solids, such as drill cuttings, more readily. Maintaining sufficient viscosity is important in fracturing treatments for particulate transport, as well as to create or enhance fracture width. Particulate transport is also important in sand control treatments, such as gravel packing. Maintaining sufficient viscosity may be important to control and/or reduce leak-off into the formation, improve the ability to divert another fluid in the formation, and/or reduce pumping requirements by reducing friction in the well bore. At the same time, while maintaining sufficient viscosity of a treatment fluid often is desirable, it also may be desirable to maintain the viscosity of the treatment fluid in such a way that the viscosity may be reduced at a particular time, *inter alia*, for subsequent recovery of the fluid from the formation.

[0005] To provide the desired viscosity, polymeric gelling agents commonly are added to the treatment fluids. The term "gelling agent" is defined herein to include any substance that is capable of increasing the viscosity of a fluid, for example, by forming a gel.
Examples of commonly used polymeric gelling agents include, but are not limited to guar gums and derivatives thereof, cellulose derivatives, biopolymers, and the like. The use of polymeric gelling agents, however, may be problematic. For instance, these polymeric gelling agents may leave an undesirable gel residue in the subterranean formation after use, which can impact permeability. As a result, costly remedial operations may be required to clean up the fracture face and proppant pack. Foamed treatment fluids and emulsion-based treatment fluids have been employed to minimize residual damage, but increased expense and complexity often have resulted.

[0006] To combat perceived problems associated with polymeric gelling agents, some surfactants have been used as gelling agents. It is well understood that, when mixed with an aqueous fluid in a concentration above the critical micelle concentration, the molecules (or ions) of surfactants may associate to form micelles. The term "micelle" is defined to include any structure that minimizes the contact between the lyophobic ("solvent-repelling") portion of a surfactant molecule and the solvent, for example, by aggregating the surfactant molecules into structures such as spheres, cylinders, or sheets, wherein the lyophobic portions are on the interior of the aggregate structure and the lyophilic ("solvent-attracting") portions are on the exterior of the structure. These micelles may function, among other purposes, to stabilize emulsions, break emulsions, stabilize a foam, change the wettability of a surface, solubilize certain materials, and/or reduce surface tension. When used as a gelling agent, the molecules (or ions) of the surfactants used associate to form micelles of a certain micellar structure (e.g., rodlike, wormlike, vesicles, etc., which are referred to herein as "viscosifying micelles") that, under certain conditions (e.g., concentration, ionic strength of the fluid, etc.) are capable of, inter alia, imparting increased viscosity to a particular fluid and/or forming a gel. Certain viscosifying micelles may impart increased viscosity to a fluid such that the fluid exhibits viscoelastic behavior (e.g., shear thinning properties) due, at least in part, to the association of the surfactant molecules contained therein. As used herein, the term "viscoelastic surfactant fluid" refers to fluids that exhibit or are capable of exhibiting viscoelastic behavior due, at least in part, to the association of surfactant molecules contained therein to form viscosifying micelles.

[0007] However, the use of surfactants as gelling agents may be problematic in several respects. In certain applications, large quantities of viscoelastic surfactants may be required to impart the desired rheological properties to a fluid. Certain viscoelastic
surfactants may be less soluble in certain fluids, which may impair the ability of those surfactants to form viscosifying micelles. Viscoelastic surfactant fluids also may be unstable at high temperatures and/or in high salt concentrations due to, among other things, the tendency of high salt concentrations to "screen out" electrostatic interactions between viscosifying micelles.

SUMMARY

[0008] The present invention relates to methods and compositions that may be useful in treating subterranean formations, and more specifically, to polymeric additives used with viscoelastic surfactants, fluids comprising such additives and viscoelastic surfactants, and associated methods of use.

[0009] In one aspect, the present invention provides a method comprising: providing a treatment fluid that comprises an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, the amphiphilic polymer comprising a hydrophobic component, and a hydrophilic component comprising at least 15 monomer units; and introducing the treatment fluid into at least a portion of a subterranean formation.

[0010] In another aspect, the present invention provides a method comprising: providing a treatment fluid that comprises an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, the amphiphilic polymer comprising an alkyl ethoxylate, wherein the treatment fluid does not comprise a substantial amount of a zwitterionic surfactant; and introducing the treatment fluid into at least a portion of a subterranean formation.

[0011] In another aspect, the present invention provides a method comprising: providing a treatment fluid that comprises an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, wherein the treatment fluid does not comprise a substantial amount of a zwitterionic surfactant and the amphiphilic polymer comprises: a hydrophobic component selected from the group consisting of: an alkyl group, a polybutadiene group, a polyisoprene group, a polystyrene group, a polyoxystyrene group, any derivative thereof, and any combination thereof; and a hydrophilic component selected from the group consisting of: a polyethylene oxide group; a polyacrylic acid group; a polyethylene oxide group; a dimethylacrylamide group, an n-isopropylacrylamide group, a polyvinylpyrrolidone group, a polyethyleneimine group, any derivative thereof, and any combination thereof; and introducing the treatment fluid into at least a portion of a subterranean formation.
In another aspect, the present invention provides a method comprising:
providing an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, the
amphiphilic polymer comprising a hydrophobic component, and a hydrophilic component
comprising at least 15 monomer units; and mixing the aqueous base fluid, the viscoelastic
surfactant, and the amphiphilic polymer together to form a treatment fluid.

In another aspect, the present invention provides a treatment fluid comprising:
an aqueous base fluid, a viscoelastic surfactant; and an amphiphilic polymer that
comprises a hydrophobic component, and a hydrophilic component comprising at least 15
monomer units.

In another aspect, the present invention provides a subterranean
treatment additive comprising: a viscoelastic surfactant; and an amphiphilic polymer that
comprises a hydrophobic component, and a hydrophilic component comprising at least 15
monomer units.

In another aspect, the invention provides a treatment fluid comprising
an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, the amphiphilic
polymer comprising an alkyl ethoxylate, wherein the treatment fluid does not comprise a
substantial amount of a zwitterionic surfactant.

In another aspect the invention provides a treatment fluid comprising
an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, wherein the
treatment fluid does not comprise a substantial amount of a zwitterionic surfactant and the
amphiphilic polymer comprises: a hydrophobic component selected from the group consisting
of: an alkyl group, a polybutadiene group, a polyisoprene group, a polystyrene group, a
polyoxystyrene group, any derivative thereof, and any combination thereof; and a hydrophilic
component selected from the group consisting of: a polyethylene oxide group; a polyacrylic
acid group, a polyethylacetae group, a dimethylacrylamide group, an n-isopropylacrylamide
group, a polyvinylpyrrolidone group, a polyethyleneimine group, any derivative thereof, and
any combination thereof.

The features and advantages of the present invention will be readily
apparent to those skilled in the art. While numerous changes may be made by those skilled in
the art, such changes are within the scope of the invention.

BRIEF DESCRIPTION OF THE DRAWINGS
[0018] These drawings illustrate certain aspects of some of the embodiments of the present invention, and should not be used to limit or define the invention.

[0019] FIGURES 1-8 illustrate data regarding the zero-shear viscosity of certain viscoelastic surfactant fluids, including certain embodiments of the treatment fluids of the present invention.

**DESCRIPTION OF PREFERRED EMBODIMENTS**

[0020] The present invention relates to methods and compositions that may be useful in treating subterranean formations, and more specifically, to polymeric additives used with viscoelastic surfactants, fluids comprising such additives and viscoelastic surfactants, and associated methods of use.

[0021] The fluids and additives of the present invention generally comprise a viscoelastic surfactant and an amphiphilic polymer that comprises a hydrophobic component and a hydrophilic component. The term "viscoelastic surfactant" is defined herein to include any surfactant that imparts or is capable of imparting viscoelastic behavior to a fluid due, at least in part, to the association of surfactant molecules to form viscosifying micelles.

[0022] Among the many potential advantages of the present invention, the methods and compositions of the present invention may, among other things, enhance the viscoelasticity, stability, and/or other rheological properties of viscoelastic surfactant fluids, particularly at high temperatures and/or in brines or other high salinity conditions (greater than about 0.5 M). The methods of the present invention also may enhance the solubility of certain viscoelastic surfactants in a fluid, which may enhance the viscoelasticity, stability, and/or other rheological properties of the resulting viscoelastic surfactant fluid. Moreover, the methods and compositions of the present invention may facilitate the achievement of desired rheological properties in a fluid while utilizing lower concentrations of viscoelastic surfactant. In certain embodiments, the fluids of the present invention may further comprise "transient polymer networks," which refers to inter- and intramolecularly associative systems (*i.e.*, networks) of the amphiphilic polymer(s) that form associations via, *e.g.*, physical crosslinks, Van der Waals forces and/or electrostatic interactions, and impart elastic and suspension properties within a fluid. It is believed that, in such embodiments, the hydrophobic components of the amphiphilic polymer(s) may become incorporated into viscosifying micelles, and thus may act as a type of crosslinker. These transient polymer networks, the polymers that may be used to form them, and the rheological properties they
may impart are further described in co-pending U.S. Patent Application Serial No. 12/551,334, filed on August 31, 2009, entitled "Treatment Fluids Comprising Transient Polymer Networks," the entire disclosure of which is incorporated herein by reference for all purposes.

[0023] The viscoelastic surfactants used in the present invention may comprise any viscoelastic surfactant known in the art, any derivative thereof, or any combination thereof. These viscoelastic surfactants may be cationic, anionic, nonionic or amphoteric in nature. The viscoelastic surfactants may comprise any number of different compounds, including methyl ester sulfonates (e.g., as described in U.S. Patent Application Numbers 11/058,660, 11/058,475, 11/058,612, and 11/058,611, filed February 15, 2005, the relevant disclosures of which are incorporated herein by reference), hydrolyzed keratin (e.g., as described in United States Patent No. 6,547,871, the relevant disclosure of which is incorporated herein by reference), sulfosuccinates, taurates, amine oxides, ethoxylated amides, alkoxylated fatty acids, alkoxylated alcohols (e.g., lauryl alcohol ethoxylate, ethoxylated nonyl phenol), ethoxylated fatty amines, ethoxylated alkyl amines (e.g., cocoalkylamine ethoxylate), betaines, modified betaines, alkylamidobetaines (e.g., cocoamidopropyl betaine), quaternary ammonium compounds (e.g., trimethyltallowammonium chloride, trimethylcocoammonium chloride), derivatives thereof, and combinations thereof. The term "derivative" is defined herein to include any compound that is made from one of the listed compounds, for example, by replacing one atom in the listed compound with another atom or group of atoms, rearranging two or more atoms in the listed compound, ionizing the listed compounds, or creating a salt of the listed compound.

[0024] Suitable viscoelastic surfactants may comprise mixtures of several different compounds, including but not limited to: mixtures of an ammonium salt of an alkyl ether sulfate, a cocoamidopropyl betaine surfactant, a cocoamidopropyl dimethylamine oxide surfactant, sodium chloride, and water; mixtures of an ammonium salt of an alkyl ether sulfate surfactant, a cocoamidopropyl hydroxysultaine surfactant, a cocoamidopropyl dimethylamine oxide surfactant, sodium chloride, and water; mixtures of an ethoxylated alcohol ether sulfate surfactant, an alkyl or alkene amidopropyl betaine surfactant, and an alkyl or alkene dimethylamine oxide surfactant; aqueous solutions of an alpha-olefinic sulfonate surfactant and a betaine surfactant; and combinations thereof. Examples of suitable mixtures of an ethoxylated alcohol ether sulfate surfactant, an alkyl or alkene amidopropyl betaine surfactant,
and an alkyl or alkene dimethylamine oxide surfactant are described in United States Patent No. 6,063,738, the relevant disclosure of which is incorporated herein by reference. Examples of suitable aqueous solutions of an alpha-olefinic sulfonate surfactant and a betaine surfactant are described in United States Patent No. 5,879,699, the relevant disclosure of which is incorporated herein by reference. Suitable viscoelastic surfactants also may comprise "catanionic" surfactant systems, which comprise paired oppositely-charged surfactants that act as counterions to each other and may form wormlike micelles. Examples of such catanionic surfactant systems include, but are not limited to sodium oleate (NaO)/octyl trimethylammonium chloride (C₈TAC) systems, stearyl trimethylammonium chloride (C₁₂TACVcaprylic acid sodium salt (NaCap) systems, and cetyl trimethylammonium tosylate (CTAT)/sodium dodecylbenzenesulfonate (SDBS) systems.

[0025] Examples of commercially-available viscoelastic surfactants suitable for use in the present invention may include, but are not limited to, Mirataine BET-O 30™ (an oleamidopropyl betaine surfactant available from Rhodia Inc., Cranbury, New Jersey), Aromox APA-T (amine oxide surfactant available from Akzo Nobel Chemicals, Chicago, Illinois), Ethoquad 0/12 PG™ (a fatty amine ethoxylate quat surfactant available from Akzo Nobel Chemicals, Chicago, Illinois), Ethomeen T/12™ (a fatty amine ethoxylate surfactant available from Akzo Nobel Chemicals, Chicago, Illinois), Ethomeen S/12™ (a fatty amine ethoxylate surfactant available from Akzo Nobel Chemicals, Chicago, Illinois), and Rewoteric AM TEG™ (a tallow dihydroxyethyl betaine amphoteric surfactant available from Degussa Corp., Parsippany, New Jersey).

[0026] The viscoelastic surfactant should be present in a fluid of the present invention in an amount sufficient to impart the desired viscosity (e.g., sufficient viscosity to divert flow, reduce fluid loss, suspend particulates, etc.) to the fluid. In certain embodiments, the viscoelastic surfactant may be present in the fluid in an amount in the range of from about 0.1% to about 20% by weight of the fluid. In certain embodiments, the viscoelastic surfactant may be present in an amount in the range of from about 0.5% to about 10% by weight of the fluid. In certain embodiments, the viscoelastic surfactant may be present in an amount in the range of from about 0.5% to about 3% by weight of the fluid.

[0027] The amphiphilic polymer(s) used in the present invention may comprise a variety of polymers known in the art that comprise a hydrophobic component and a hydrophilic component. For example, the amphiphilic polymer(s) may comprise a
hydrophobic component, and a hydrophilic component comprising at least 15 monomer units. In certain embodiments, the hydrophilic component may be larger and, for example, have at least 20 monomer units. In certain embodiments, the hydrophilic component may be larger and, for example, have at least 50 monomer units. Examples of hydrophobic components that may be suitable for use include, but are not limited to alkyl groups, polybutadiene, polyisoprene, polystyrene, polyoxystyrene, any derivatives thereof, and any combinations thereof. Examples of hydrophilic components that may be suitable for use include, but are not limited to polyethylene oxide (PEO), polyacrylic acid (PAA), polyethylaceate, dimethylacrylamide (DMA), n-isopropylacrylamide (NIPAM), polyvinylpyrrolidone (PVP), polyethyleneimine (PEI), any derivatives thereof, and any combinations thereof. Examples of amphiphilic polymers that may be suitable for use include, but are not limited to polybutadiene-PEO, polystyrene-PEO, polystyrene-polyacrylic acid, polyoxystyrene-PEO, polystyrene-polyethylacetate, any derivatives thereof, and any combinations thereof. Other examples of amphiphilic polymers that may be suitable for use in the present invention include those that comprise units based on one or more of the following: acrylamides, vinyl alcohols, vinylpyrrolidones, vinylpyridines, acrylates, polyacrylamides, polyvinyl alcohols, polyvinylpyrrolidones, polyvinylpyridines, polycrylates, polybutylene succinate, polybutylene succinate-co-adipate, polyhydroxybutyrate-valerate, polyhydroxybutyrate-covalerate, polycaprolactones, polyester amides, polyethylene terephthalates, sulfonated polyethylene terephthalate, polyethylene oxides, polyethylenes, polypropylene, aliphatic aromatic copolyester, polyacrylic acids, polysaccharides (such as dextran or cellulose), chitins, chitosans, proteins, aliphatic polyesters, polylactic acids, poly(glycolides), poly(ε-caprolactones), poly(hydroxy ester ethers), poly(hydroxybutyrates), poly(anhydrides), polycarbonates, poly(orthoesters), poly(amino acids), poly(ethylene oxides), poly(propylene oxides), poly(phosphazenes), polyester amides, polyamides, polystyrenes, any derivative thereof, any copolymer, homopolymer, or terpolymer, or any blend thereof. In certain embodiments, the amphiphilic polymer may comprise a compound selected from the group consisting of hydroxyethyl acrylate, acrylamide and hydroxyethyl methacrylate.

[0028] In certain embodiments, the amphiphilic polymer(s) may comprise one or more alkyl ethoxylates. In certain embodiments, the alkyl ethoxylate may comprise an alkyl group, and an ethoxylate group having at least 15 oxyethylene units. In certain embodiments, the hydrophilic component may be larger and, for example, have at least 20
oxyethylene units. In certain embodiments, the hydrophilic component may be larger and, for example, have at least 50 oxyethylene units. Commercially available sources of such amphiphilic polymers that may be suitable for use in the present invention include, but are not limited to, certain detergents available under the tradename BRIJ\textsuperscript{®}, such as BRIJ\textsuperscript{®}-30 (comprises polyethylene glycol dodecyl ether), BRIJ\textsuperscript{®}-35 (comprises polyoxyethyleneglycol dodecyl ether), BRIJ\textsuperscript{®}-58 (comprises polyethylene glycol hexadecyl ether), BRIJ\textsuperscript{®}-97 (comprises polyoxyethylene (10) oleyl ether), BRIJ\textsuperscript{®}-98 (comprises polyoxyethylene (20) oleyl ether), and BRIJ\textsuperscript{®}-700 (comprises polyoxyethylene (100) stearyl ether). Other commercially available sources of such amphiphilic polymers that may be suitable for use in the present invention include, certain detergents available under the tradename IGEPAL\textsuperscript{®}.

[0029] The amphiphilic polymer should be present in a fluid of the present invention in an amount sufficient to impart the desired viscosity (e.g., sufficient viscosity to divert flow, reduce fluid loss, suspend particulates, etc.) to the fluid. In certain embodiments, the amphiphilic polymer may be present in the fluid in an amount in the range of from about 1 mol % to about 5 mol % based on the amount of the viscoelastic surfactant. In certain embodiments, the amphiphilic polymer may be present in the fluid in an amount in the range of from about 1 mol % to about 3 mol % based on the amount of the viscoelastic surfactant, in some instances, the presence of excessive amounts of amphiphilic polymer may reduce the stability of the viscoelastic surfactant fluid (e.g., may reduce the viscosity of the fluid). A person of skill in the art, with the benefit of this disclosure, will recognize the amount of amphiphilic polymer that may produce these effects in a particular application of the present invention, and determine when they should be avoided or employed. For example, certain embodiments of the present invention may comprise adding sufficient amounts of the amphiphilic polymer to reduce the viscosity of the fluid, among other purposes, to permit the fluid to leak off into a subterranean formation.

[0030] The fluids of the present invention generally comprise an aqueous base fluid. Suitable aqueous base fluids may comprise, among other things, fresh water, saltwater (e.g., water containing one or more salts dissolved therein), brine, seawater, and/or any combination thereof. Generally, the water may be from any source, provided that it does not contain components that might adversely affect the stability and/or performance of the fluids of the present invention. In certain embodiments, the density of the aqueous base fluid can be adjusted, among other purposes, to provide additional particle transport and suspension in the
fluids of the present invention and/or to facilitate dissolving the viscoelastic surfactant into the aqueous base fluid. In certain embodiments, the pH of the aqueous base fluid may be adjusted (e.g., by a buffer or other pH adjusting agent), among other purposes, to reduce the viscosity of the fluid (e.g., activate a breaker or other additive). In these embodiments, the pH may be adjusted to a specific level, which may depend on, among other factors, the type(s) of viscoelastic surfactant(s), amphiphilic polymers, salts, and other additives included in the fluid. One of ordinary skill in the art, with the benefit of this disclosure, will recognize when such density and/or pH adjustments are appropriate.

[0031] The fluids used in methods of the present invention optionally may comprise any number of additional additives, including, but not limited to, salts, cosurfactants, acids, additional fluid loss control additives, gas, nitrogen, carbon dioxide, surface modifying agents, tackifying agents, foamers, corrosion inhibitors, scale inhibitors, catalysts, clay control agents, biocides, friction reducers, antifoam agents, bridging agents, dispersants, flocculants, \( \text{H}_2\text{S} \) scavengers, \( \text{CO}_2 \) scavengers, oxygen scavengers, lubricants, viscosifiers, breakers, weighting agents, relative permeability modifiers, resins, particulate materials (e.g., proppant particulates), wetting agents, coating enhancement agents, and the like. In certain embodiments, the fluids and additives of the present invention may not comprise a substantial amount of a zwitterionic surfactant. A person skilled in the art, with the benefit of this disclosure, will recognize the types of additives that may be included in the fluids of the present invention for a particular application.

[0032] For example, the fluids of the present invention optionally may comprise one or more salts. The salts may be organic or inorganic. Examples of suitable organic salts include but are not limited to aromatic sulfonates and carboxylates (such as p-toluene sulfonate, naphthalene sulfonate), hydroxynaphthalene carboxylates, salicylate, phthalate, chlorobenzoic acid, salicylic acid, phthalic acid, 5-hydroxy-1-naphthoic acid, 6-hydroxy-1-naphthoic acid, 7-hydroxy-1-naphthoic acid, 1-hydroxy-2-naphthoic acid, 3-hydroxy-2-naphthoic acid, 5-hydroxy-2-naphthoic acid, 7-hydroxy-2-naphthoic acid, 1,3-dihydroxy-2-naphthoic acid, 3,4-dichlorobenzoate, trimethylammonium hydrochloride and tetramethylammonium chloride. Examples of suitable inorganic salts include water-soluble potassium, sodium, and ammonium salts, (such as sodium chloride, potassium chloride, and ammonium chloride), calcium chloride, calcium bromide, magnesium chloride and zinc halide salts. Examples of viscoelastic surfactant fluids comprising salts suitable for use in the
The present invention are described in U.S. Patent Application Serial No. 10/800,478, the relevant disclosure of which is incorporated herein by reference. Any combination of the salts listed above also may be included in the fluids of the present invention.

[0033] The optional salt may be present in any practicable amount. In certain embodiments, the salt may be present in an amount in the range of from about 0.1% to about 30% by weight of the fluid. In certain embodiments, the salt may be present in an amount in the range of from about 0.1% to about 10% by weight of the fluid. The type(s) and amount of salts suitable in a particular application of the present invention may depend upon a variety of factors, such as the type(s) of viscoelastic surfactant(s) present in the fluid, the composition of the aqueous-base fluid, the temperature of the fluid and/or the region of desired use, and the like. In certain embodiments of the present invention, the aqueous base fluid may comprise a brine that already includes a certain amount of salt. In these embodiments, additional salts may not be desired, or it may be desirable to remove salt from or add further salt to the brine in the preparation and/or use of a fluid of the present invention. A person of ordinary skill, with the benefit of this disclosure, will recognize when to include a salt in a particular application of the present invention, as well as the appropriate type and amount of salts to include.

[0034] In certain embodiments, the methods of the present invention generally comprise: providing an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer that comprises (a) a hydrophobic component comprising an alkyl group, and (b) a hydrophilic component comprising an ethoxylate having at least 20 oxyethylene units; and mixing the aqueous base fluid, the viscoelastic surfactant, and the amphiphilic polymer together to form a fluid of the present invention. The fluids of the present invention and/or any component thereof (e.g., the amphiphilic polymer) may be provided in any form that is suitable for the particular application of the present invention. In certain embodiments, the viscoelastic surfactant and/or amphiphilic polymer may be provided as a liquid and/or solid additive that is admixed or incorporated at any point prior to and/or during use of the fluid. For example, in certain embodiments, the amphiphilic polymer may be added to a fluid that is already present in a portion of a subterranean formation. The different components of the fluids of the present invention may be provided or incorporated together (e.g., in the same additive or fluid), or they may be provided or incorporated into a fluid as separate additives. Where they are provided or incorporated into a fluid separately, the different components may
be provided or incorporated simultaneously, or certain components may be provided or incorporated at some point in time before or after the other components are provided or incorporated. The fluids of the present invention and/or any component thereof may be prepared at a job site, or they may be prepared at a plant or facility prior to use, and may be stored for some period of time prior to use. In certain embodiments, the preparation of these fluids of the present invention may be done at the job site in a method characterized as being performed "on the fly." The term "on-the-fly" is used herein to include methods of combining two or more components wherein a flowing stream of one element is continuously introduced into flowing stream of another component so that the streams are combined and mixed while continuing to flow as a single stream as part of the on-going treatment. Such mixing can also be described as "real-time" mixing.

[0035] In certain embodiments, the methods of the present invention comprise: providing a treatment fluid that comprises an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer that comprises (a) a hydrophobic component comprising an alkyl group, and (b) a hydrophilic component comprising an ethoxylate having at least 15 oxyethylene units; and introducing the treatment fluid into at least a portion of a subterranean formation. In these methods, the treatment fluid (and/or the separate components thereof) may be introduced into a portion of a subterranean formation by any means known in the art.

[0036] The methods and treatment fluids of the present invention may be used during or in preparation for any subterranean operation wherein a fluid may be used. Suitable subterranean operations may include, but are not limited to, preflush treatments, afterflush treatments, drilling operations, hydraulic fracturing treatments, sand control treatments (e.g., gravel packing), acidizing treatments (e.g., matrix acidizing or fracture acidizing), "frac-pack" treatments, well bore clean-out treatments, and other operations where a treatment fluid of the present invention may be useful. For example, in certain embodiments, the present invention provides fluids that comprise an aqueous base fluid, a viscoelastic surfactant, an amphiphilic polymer that comprises (a) a hydrophobic component comprising an alkyl group, and (b) a hydrophilic component comprising an ethoxylate having at least 15 oxyethylene units, and, in certain embodiments, a plurality of proppant particulates. In certain embodiments, a treatment fluid of the present invention may be used in a method of fracturing a subterranean formation, wherein a treatment fluid of the present invention is introduced into the subterranean formation at or above a sufficient hydraulic pressure to create or enhance one or
more cracks, or "fractures," in the subterranean formation. "Enhancing" one or more fractures in a subterranean formation, as that term is used herein, is defined to include the extension or enlargement of one or more natural or previously created fractures in the subterranean formation. This may, among other things, form conductive channels in the subterranean formation through which fluids (e.g., oil, gas, etc.) may flow to a well bore penetrating the subterranean formation.

[0037] To facilitate a better understanding of the present invention, the following examples of certain aspects of some embodiments are given. In no way should the following examples be read to limit, or define, the entire scope of the invention.

EXAMPLES

EXAMPLE 1A

[0038] A fluid was prepared comprising a 1.5% by weight aqueous solution of a cetyl trimethylammonium tosylate (CTAT)/sodium dodecylbenzenesulfonate (SDBS) (97:3 weight ratio) surfactant system, and the zero-shear viscosity of the fluid was measured using an Physica MCR501 rheometer (manufactured by Anton Paar GmbH) at 70°F and ambient pressure. A certain amount of an amphiphilic polymer (BRIJ-35 or BRIJ-700) was then added to 3 different samples of that fluid, and the zero-shear viscosity of each fluid sample with the polymer added was measured at the same conditions. The types and amounts (by weight of the surfactant system) of amphiphilic polymer added to each fluid and the resulting viscosities are listed in Table 1 and depicted in Figure 1.

EXAMPLE 1B

[0039] A second fluid was prepared using the same surfactant system and concentration described in Example 1A in an aqueous 0.7M solution of sodium bromide (NaBr), and its zero-shear viscosity was measured. An amphiphilic polymer (BRIJ-700) was added to 2 different samples of that fluid (1 mol % and 3 mol % by weight of the surfactant system).
system, respectively), and the zero-shear viscosity of each fluid sample with the polymer added was measured. The resulting viscosities are listed in Table 2 and are depicted in Figure 2, along with the zero-shear viscosity of the initial fluid from Example 1A without polymer or sodium bromide for comparison.

### Table 2

### EXAMPLE 1C

[0040] A third fluid was prepared using the same surfactant system and concentration described in Example 1A in an aqueous 1M solution of sodium bromide (NaBr). An amphiphilic polymer (BRIJ-700) was added to 2 different samples of that fluid (1 mol % and 3 mol % by weight of the surfactant system, respectively), and the zero-shear viscosity of each fluid sample with the polymer added was measured. The resulting viscosities are listed in Table 3 and are depicted in Figure 3, along with the zero-shear viscosity of the initial fluid from Example 1A without polymer or sodium bromide for comparison.

### EXAMPLE 1D

[0041] A fourth fluid was prepared using the same surfactant system and concentration described in Example 1A in an aqueous 2M solution of sodium bromide (NaBr). An amphiphilic polymer (BRIJ-700) was added the fluid (3 mol % by weight of the surfactant system), and the zero-shear viscosity of the fluid with the polymer added was measured. The resulting viscosities are listed in Table 4 and are depicted in Figure 4, along
with the zero-shear viscosity of the initial fluid from Example IA without any polymer or sodium bromide for comparison.

[0042] Thus, Examples IA-ID illustrate that the methods and additives of the present invention may enhance the rheology of certain viscoelastic surfactant fluids.

EXAMPLE 2A

[0043] A fluid was prepared comprising a 3% by weight aqueous solution of a cetyl trimethylammonium tosylate (CTAT)/sodium dodecylbenzenesulfonate (SDBS) (97:3 weight ratio) surfactant system, and the zero-shear viscosity of the fluid was measured using the same methods and parameters described in Example IA. An amphiphilic polymer (BRIJ-35 or BRIJ-700) was then added to 2 different samples of that fluid (1 mol % by weight of the surfactant system in each), and the zero-shear viscosity of each fluid sample with the polymer added was measured. The resulting viscosities are listed in Table 5 and depicted in Figure 5.

EXAMPLE 2B

[0044] A second fluid was prepared using the same surfactant system and concentration described in Example 2A in an aqueous 0.7M solution of sodium bromide (NaBr), and its zero-shear viscosity was measured. An amphiphilic polymer (BRIJ-700) was added to the fluid (1 mol % by weight of the surfactant system), and the zero-shear viscosity of the fluid with the polymer added was measured. The resulting viscosities are listed in Table 6 and are depicted in Figure 6, along with the zero-shear viscosity of the initial fluid from Example 2A without polymer or sodium bromide for comparison.
Thus, Examples 2A and 2B illustrate that the methods and additives of the present invention may enhance the rheology of certain viscoelastic surfactant fluids.

**EXAMPLE 3A**

[0046] A fluid was prepared comprising a 3% by weight aqueous solution of a sodium oleate (NaO)/octyl trimethylammonium chloride (C₈ TAC) (7:3 weight ratio) surfactant system, and the zero-shear viscosity of the fluid was measured using the same methods and parameters described in Example 1A. An amphiphilic polymer (BRIJ-30, BRIJ-35, or BRIJ-700) was then added to 3 different samples of that fluid (1 mol % by weight of the surfactant system in each), and the zero-shear viscosity of each fluid sample with the polymer added was measured. The resulting viscosities are listed in Table 7 and depicted in Figure 7.

</tbody>
</table>

**EXAMPLE 3B**

[0047] A second fluid was prepared using the same surfactant system and concentration described in Example 3A in an aqueous 0.15M solution of sodium bromide (NaBr), and its zero-shear viscosity was measured. An amphiphilic polymer (BRIJ-700) was added to the fluid (1 mol % by weight of the surfactant system), and further sodium bromide was added to bring the solution to a 0.2M NaBr concentration. The zero-shear viscosity of the fluid with the polymer and additional NaBr was measured. The resulting viscosities are
listed in Table 8 and are depicted in Figure 8, along with the zero-shear viscosity of the initial fluid from Example 3A without polymer or sodium bromide for comparison.

[0048] Thus, Examples 3A and 3B illustrate that the methods and additives of the present invention may enhance the rheology of certain viscoelastic surfactant fluids.

[0049] Therefore, the present invention is well adapted to attain the ends and advantages mentioned as well as those that are inherent therein. The particular embodiments disclosed above are illustrative only, as the present invention may be modified and practiced in different but equivalent manners apparent to those skilled in the art having the benefit of the teachings herein. Furthermore, no limitations are intended to the details of construction or design herein shown, other than as described in the claims below. It is therefore evident that the particular illustrative embodiments disclosed above may be altered or modified and all such variations are considered within the scope of the present invention. While compositions and methods are described in terms of "comprising," "containing," or "including" various components or steps, the compositions and methods can also "consist essentially of" or "consist of" the various components and steps. All numbers and ranges disclosed above may vary by some amount. Whenever a numerical range with a lower limit and an upper limit is disclosed, any number and any included range falling within the range is specifically disclosed. In particular, every range of values (of the form, "from about a to about b," or, equivalently, "from approximately a to b," or, equivalently, "from approximately a-b") disclosed herein is to be understood to set forth every number and range encompassed within the broader range of values. Also, the terms in the claims have their plain, ordinary meaning unless otherwise explicitly and clearly defined by the patentee. Moreover, the indefinite articles "a" or "an", as used in the claims, are defined herein to mean one or more than one of the element that it introduces. If there is any conflict in the usages of a word or term in this specification and one or more patent or other documents that may be incorporated herein by reference, the definitions that are consistent with this specification should be adopted.
CLAIMS:

1. A subterranean treatment additive comprising:
   a viscoelastic surfactant; and
   an amphiphilic polymer that comprises
   a hydrophobic component, and
   a hydrophilic component comprising at least 15 monomer units.

2. An additive according to claim 1, wherein the amphiphilic polymer comprises
   an alkyl ethoxylate comprising at least 15 oxyethylene units.

3. A treatment fluid comprising:
   an aqueous base fluid; and
   a subterranean treatment additive according to claim 1 or 2.

4. A treatment fluid according to claim 3, wherein the aqueous base fluid
   comprises at least one brine.

5. A treatment fluid according to claim 3 or 4, wherein the treatment fluid does
   not comprise a substantial amount of a zwitterionic surfactant.

6. A treatment fluid according to claim 3, 4 or 5, wherein the treatment fluid
   further comprises at least one salt.

7. A treatment fluid according to any one of claims 3 to 6, wherein the
   amphiphilic polymer is present in the treatment fluid in an amount of from about 1 mol %
   to about 5 mol % based on the amount of the viscoelastic surfactant.

8. A treatment fluid according to any one of claims 3 to 7, wherein the
   viscoelastic surfactant comprises at least one surfactant selected from the group consisting of:
   a methyl ester sulfonate, a hydrolyzed keratin, a sulfosuccininate, a taurate, an amine oxide, an
   ethoxylated amide, an alkoxylated fatty acid, an alkoxylated alcohol, an ethoxylated fatty
   amine, an ethoxylated alkyl amine, a betaine, a modified betaine, an alkylamidobetaine, a
   quaternary ammonium compound, any derivative thereof, and any combination thereof.

9. A treatment fluid according to any one of claims 3 to 8, wherein the
   viscoelastic surfactant comprises a catanionic surfactant system.

10. A treatment fluid according to any one of claims 3 to 9, wherein the
    viscoelastic surfactant is present in the treatment fluid in an amount of from about 0.1 % to
    about 20 % by weight of the treatment fluid.
11. A method of forming a treatment fluid as defined in any one of claims 3 to 10, comprising: mixing the aqueous base fluid, the viscoelastic surfactant, and the amphiphilic polymer together to form a treatment fluid.

12. A method comprising introducing a treatment fluid as defined in any one of claims 1 to 10 into at least a portion of a subterranean formation.

13. A method according to claim 12, wherein introducing the treatment fluid into at least a portion of a subterranean formation comprises introducing the treatment fluid into the subterranean formation at or above a pressure sufficient to create or enhance one or more cracks or fractures in at least a portion of the subterranean formation.

14. A method comprising:
   providing a treatment fluid that comprises an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, the amphiphilic polymer comprising an alkyl ethoxylate, wherein the treatment fluid does not comprise a substantial amount of a zwitterionic surfactant; and
   introducing the treatment fluid into at least a portion of a subterranean formation.

15. A method according to claim 14, wherein the alkyl ethoxylate comprises at least 15 oxyethylene units.

16. A method comprising:
   providing a treatment fluid that comprises an aqueous base fluid, a viscoelastic surfactant, and an amphiphilic polymer, wherein the treatment fluid does not comprise a substantial amount of a zwitterionic surfactant and the amphiphilic polymer comprises:
   a hydrophobic component selected from the group consisting of: an alkyl group, a polybutadiene group, a polyisoprene group, a polystyrene group, a polyoxystyrene group, any derivative thereof, and any combination thereof; and
   a hydrophilic component selected from the group consisting of: a polyethylene oxide group; a polyacrylic acid group, a polyethylacetate group, a dimethylacrylamide group, an n-isopropylacrylamide group, a polyvinylpyrrolidone group, a polyethyleneimine group, any derivative thereof, and any combination thereof; and
   introducing the treatment fluid into at least a portion of a subterranean formation.
17. A method according to claim 16, wherein the hydrophilic component comprises at least 15 monomeric units.

18. A method according to claim 14, 15, 16 or 17, wherein the aqueous base fluid comprises at least one brine.

Further documents are listed in the continuation of Box C. See patent family annex.

- Special categories of cited documents
  - "A" document defining the general state of the art which is not considered to be of particular relevance
  - "E" earlier document but published on or after the international filing date
  - "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  - "O" document referring to an oral disclosure, use exhibition or other means
  - "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "X" document of particular relevance the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance, the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
- "D" document member of the same patent family

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos because they relate to subject matter not required to be searched by this Authority, namely

2. Claims Nos because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically

3. Claims Nos because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a)

This International Searching Authority found multiple inventions in this international application, as follows:

- see additional sheet

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims

2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of additional fees

3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos

4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims, it is covered by claims Nos

**Remark on Protest**

- The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee
- The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation
- No protest accompanied the payment of additional search fees
This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-13

Claim 1 relates to a subterranean treatment additive comprising a viscoelastic surfactant and an amphiphilic polymer that comprises a hydrophobic component and a hydrophilic component comprising at least 15 monomer units.

2. claims: 14-18

Claim 14 relates to a method comprising providing a treatment fluid that comprises an aqueous base fluid, a viscoelastic surfactant and an amphiphilic polymer, the amphiphilic polymer comprising an alkyl ethoxylate, wherein the treatment fluid does not comprise a substantial amount of a zwitterionic surfactant, and introducing the treatment fluid into at least a portion of a subterranean formation.
