This invention is directed to a series of pyrazoles, their preparation, pharmaceutical compositions containing these compounds, and their pharmaceutical use in the treatment of disease states capable of being modulated by the inhibition of p38 kinase and/or tumor necrosis factor (TNF).

P38 kinase is a widely expressed mitogen/stress-activated protein kinase that is activated via a complex phosphorylation cascade by inflammatory and other stimuli. It plays an important role in regulating the production of TNF-alpha and other proinflammatory cytokines such as IL-1beta.

Substantial evidence indicates that p38 regulates TNF-alpha release at the post-transcriptional level via regulatory elements that bind to the AU-rich 3'-untranslated region of the mRNA for TNF-alpha. As well as regulating inflammatory proteins, p38 also controls the expression of proteins that are involved in the transduction of pain responses in peripheral and central neurons. Thus, inhibitors of p38 kinase are useful for the treatment of inflammatory conditions associated with over-production of TNF-alpha and other pro-inflammatory cytokines as well as pain hypersensitivity.

Tumour necrosis factor (TNF) is an important pro-inflammatory cytokine which causes hemorrhagic necrosis of tumors and possesses other important biological activities. TNF is released by activated macrophages, activated T-lymphocytes, natural killer cells, mast cells and basophils, fibroblasts, endothelial cells and brain astrocytes among other cells.

The principal in vivo actions of TNF can be broadly classified as inflammatory and catabolic. It has been implicated as a mediator of endotoxic shock, inflammation of joints and of the airways, immune deficiency states, allograft rejection, and in the cachexia associated with malignant disease and some parasitic infections. In view of the association of high serum levels of TNF with poor prognosis in sepsis, graft versus host disease and adult respiratory distress syndrome, and its role in many other immunologic processes, this factor is regarded as an important mediator of general inflammation.

TNF primes or activates neutrophils, eosinophils, and endothelial cells to release tissue damaging mediators and increase the expression of adhesion molecules. In fibroblasts, TNF stimulates the production of collagenase, an enzyme implicated in the joint destruction in rheumatoid arthritis and other metalloproteinases. TNF also activates monocytes, macrophages and T-lymphocytes to cause the production of colony stimulating factors and other pro-inflammatory cytokines such IL-1, IL-6, IL-8 and GM-CSF, which in some cases mediate the end effects of TNF.
The ability of TNF to activate T-lymphocytes, monocytes, macrophages and related cells has been implicated in the progression of Human Immunodeficiency Virus (HIV) infection. In order for these cells to become infected with HIV and for HIV replication to take place the cells must be maintained in an activated state. Cytokines such as TNF have been shown to activate HIV replication in monocytes and macrophages. Features of endotoxemic shock such as fever, metabolic acidosis, hypotension and intravascular coagulation are thought to be mediated through the actions of TNF. The cachexia associated with certain disease states is mediated through indirect effects on protein catabolism. TNF also promotes bone resorption and acute phase protein synthesis.

TNF-alpha inhibits surfactant protein C gene transcription, which may contribute to abnormalities of surfactant homeostasis associated with pulmonary injury and infection, induces mucin hypersecretion and mediates the recruitment of neutrophils and eosinophils during airway inflammation. Although TNF-alpha inhibits collagen synthesis in fibroblasts, a number of studies point to it being pro-fibrotic in vivo. Thus, by inhibiting TNF-alpha production, the compounds of the invention are useful in suppressing the inflammation and airways remodelling that occurs in asthma.

TNF-alpha is present in high concentration in the sputum of chronic obstructive pulmonary disease (COPD) patients particularly during exacerbations. TNF-alpha induces the production of several inflammatory proteins, including chemokines and proteases, in epithelial cells and macrophages. Serum concentrations of TNF-alpha and stimulated TNF-alpha production from peripheral blood monocytes are increased in weight-losing COPD patients, suggesting that it may play a role in the cachexia of severe COPD. Thus, the compounds of the invention through inhibition of TNF-alpha are useful in reversing the skeletal wasting seen in COPD as well as reducing the airway inflammatory response in this disease.

TNF-alpha inhibits the ability of insulin to stimulate glucose uptake in adipose tissue. In obesity the overproduction of TNF is thought to cause an insulin-resistant state. Thus, by blocking TNF release the compounds of the invention are useful in the treatment of diabetes.

TNF-alpha can induce angiogenesis in normally avascular tissue, possibly through up-regulation of other pro-inflammatory cytokines, upregulation of adhesion molecules, stimulation of matrix metalloproteinase expression and increased prostaglandin production. Thus, inhibition of TNF-alpha release by compounds of the invention will have benefit in angiogenesis dependent diseases including arthritis, diabetic retinopathies and cancer.
Tumor necrosis factor (TNF) and other cytokines (e.g., interleukin-1) play an important role in the pathogenesis of atherosclerotic lesions of the coronary artery, the acute ischemic event associated with myocardial infarction, the progression of myocardiopathies or the loss of myocardial function in congestive heart failure. Thus by inhibiting TNF-alpha and other inflammatory cytokines, the compounds of the invention will be useful for the treatment of heart disease, including myocardial infarction, thrombosis, angina and acute coronary syndrome.

TNF-alpha plays an important role in neuronal death that occurs in neurodegenerative diseases. Furthermore, p38 is implicated in neuronal apoptosis. Thus, the compounds of the invention, through inhibition of TNF-alpha or suppression of neuronal apoptosis are useful in the treatment of diseases such as Alzheimer’s disease, Huntingdon’s disease and Parkinson’s disease as well as stroke.

The discussion herein relates to disease states associated with TNF including those disease states related to the production of TNF itself, and disease states associated with other cytokines, such as, but not limited to IL-1 or IL-6, that are modulated by association with TNF. For example, a IL-1 associated disease state, where IL-1 production or action is exacerbated or secreted in response to TNF, would therefore be considered a disease state associated with TNF. TNF-alpha and TNF-beta are also herein referred to collectively as "TNF" unless specifically delineated otherwise, since there is a close structural homology between TNF-alpha (cachectin) and TNF-beta (lymphotoxin) and each of them has a capacity to induce similar biological responses and bind to the same cellular receptor.

We have now found a novel group of pyrazoles which have valuable pharmaceutical properties, in particular the ability to regulate proteins that mediate cellular activity, for example p38 kinase and TNF.
Thus, in one aspect, the present invention is directed to compounds of Formula (I)

Some of the compounds of the present invention are basic, and such compounds are useful in the form of the free base or in the form of a pharmaceutically acceptable acid addition salt thereof.

Acid addition salts are a more convenient form for use; and in practice, use of the salt form inherently amounts to use of the free base form. The acids which can be used to prepare the acid addition salts include preferably those which produce, when combined with the free base, pharmaceutically acceptable salts, that is, salts whose anions are non-toxic to the patient in
pharmaceutical doses of the salts, so that the beneficial inhibitory effects inherent in the free base are not vitiated by side effects ascribable to the anions. Although pharmaceutically acceptable salts of said basic compounds are preferred, all acid addition salts are useful as sources of the free base form even if the particular salt, per se, is desired only as an intermediate product as, for example, when the salt is formed only for purposes of purification, and identification, or when it is used as intermediate in preparing a pharmaceutically acceptable salt by ion exchange procedures. Pharmaceutically acceptable salts within the scope of the invention include those derived from mineral acids and organic acids, and include hydrohalides, e.g., hydrochlorides and hydrobromides, sulfates, phosphates, nitrates, sulfamates, acetates, citrates, lactates, tartrates, malonates, oxalates, salicylates, propionates, succinates, fumarates, maleates, methylene-bis-b-hydroxynaphthoates, gentisates, isethionates, di-p-toluoyltartrates, methane-sulfonates, ethanesulfonates, benzenesulfonates, p-toluenesulfonates, cyclohexylsulfamates and quinates.

Where the compound of the invention is substituted with an acidic moiety, base addition salts may be formed and are simply a more convenient form for use; and in practice, use of the salt form inherently amounts to use of the free acid form. The bases which can be used to prepare the base addition salts include preferably those which produce, when combined with the free acid, pharmaceutically acceptable salts, that is, salts whose cations are non-toxic to the patient in pharmaceutical doses of the salts, so that the beneficial inhibitory effects inherent in the free base are not vitiated by side effects ascribable to the cations. Pharmaceutically acceptable salts, including those derived from alkali and alkaline earth metal salts, within the scope of the invention include those derived from the following bases: sodium hydride, sodium hydroxide, potassium hydroxide, calcium hydroxide, aluminium hydroxide, lithium hydroxide, magnesium hydroxide, zinc hydroxide, ammonia, ethylenediamine, N-methyl-glucamine, lysine, arginine, ornithine, choline, N,N'-dibenzylethylenediamine, chloroprocaine, diethanolamine, procaine, N-benzylphenethylamine, diethylamine, piperazine, tris(hydroxymethyl)aminomethane, tetramethy lammonium hydroxide, and the like.

As well as being useful in themselves as active compounds, salts of compounds of the invention are useful for the purposes of purification of the compounds, for example by exploitation of the solubility differences between the salts and the parent compounds, side products and/or starting materials by techniques well known to those skilled in the art.

It will be appreciated that compounds of the present invention may contain asymmetric centers. These asymmetric centers may independently be in either the R or S configuration. It will
also be appreciated that compounds of formula (I) in which \[ \text{is an ethylene bridge} \] can exist in either the exo- or endo- configuration. It will be apparent to those skilled in the art that certain compounds of the invention may also exhibit geometrical isomerism. It is to be understood that the present invention includes individual geometrical isomers and stereoisomers and mixtures thereof, including racemic mixtures, of compounds of Formula (I) hereinabove. Such isomers can be separated from their mixtures, by the application or adaptation of known methods, for example chromatographic techniques and recrystallisation techniques, or they are separately prepared from the appropriate isomers of their intermediates. Additionally, in situations where tautomers of the compounds of Formula (I) are possible, the present invention is intended to include all tautomeric forms of the compounds.

The compounds of present invention and the intermediates and starting materials used in their preparation are named in accordance with IUPAC rules of nomenclature in which the characteristic groups have decreasing priority for citation as the principle group as follows: acids, esters, amides, etc. Alternatively, the compounds are named by AutoNom 4.0 (Beilstein Information Systems, Inc.). [For example, a compound of formula (I) wherein R1 is p-tolyl, R2 is tert-butyl, X is -C(O)-, A is 1-(2,4-dimethoxy-benzoyl)-piperidin-4-yl and the urea moiety is attached to position 4 of the substituted phenyl moiety; that is, a compound having the following structure:
is named 1-(5-tert-butyl-2-p-tolyl-2H-pyrazol-3-yl)-3-{3-[1-(2,4-dimethoxy-benzoyl)-piperidin-4-ylmethyl]-phenyl}-urea. However, it is understood that, for a particular compound referred to by both a structural formula and a nomenclature name, if the structural formula and the nomenclature name are inconsistent with each other, the structural formula takes the precedence over the nomenclature name.

The compounds of the invention are p38 kinase inhibitors that inhibit the release of TNFα from mononuclear phagocytes and therefore have useful pharmacological activity. Accordingly, they are incorporated into pharmaceutical compositions and used in the treatment of patients suffering from certain medical disorders. The present invention thus provides, according to a further aspect, compounds of the invention and compositions containing compounds of the invention for use in therapy.

Compounds within the scope of the present invention are inhibitors of the generation of tumour necrosis factor (TNF), especially TNF-alpha, according to tests described in the literature and described in vitro and in vivo procedures hereinafter, and which tests results are believed to correlate to pharmacological activity in humans and other mammals. Thus, in a further embodiment, the present invention provides compounds of the invention and compositions containing compounds of the invention for use in the treatment of a patient suffering from, or subject to, conditions which can be ameliorated by the administration of an inhibitor of TNF, especially of TNF-alpha. For example, compounds of the present invention are useful in the treatment of joint inflammation, including arthritis, rheumatoid arthritis and other arthritic conditions such as rheumatoid spondylitis, gouty arthritis, traumatic arthritis, rubella arthritis, psoriatic arthritis and osteoarthritis. Additionally, the compounds are useful in the treatment of acute synovitis, Lupus erythematosis, tuberculosis, atherosclerosis, acute coronary syndrome, myocardial infarction, stroke, muscle degeneration, cachexia, Reiter's syndrome, endotoxaemia, sepsis, septic shock, endotoxic shock, gram negative sepsis, gout, toxic shock syndrome, chronic pulmonary inflammatory diseases including asthma, adult respiratory distress syndrome, COPD, silicosis, pulmonary sarcoidosis, bone resorption diseases, osteoporosis, restenosis, heart failure and myocardial ischaemic syndromes, cardiac and renal reperfusion injury, thrombosis, glomerulonephritis, graft vs. host reaction, allograft rejection,
Alzheimer's disease, Huntingdon's disease, Parkinson's disease and leprosy. Furthermore, the compounds are useful in the treatment of infections such as viral infections, for example HIV, cytomegalovirus (CMV), influenza, adenovirus and the Herpes group of viruses, parasitic infections, for example malaria such as cerebral malaria, and yeast and fungal infections, for example fungal meningitis; fever and myalgias due to infection; AIDS; AIDS related complex (ARC); cachexia secondary to infection or malignancy; cachexia secondary to acquired immune deficiency syndrome (AIDS) or to cancer, keloid and scar tissue formation, pyresis, diabetes, diabetic retinopathies, cancer and inflammatory bowel diseases such as Crohn's disease and ulcerative colitis; eczema; contact dermitis; psoriasis; sunburn and conjunctivitis. The compounds are also useful in the treatment of pain.

Compounds of the invention are also useful in the treatment of diseases of, or injury to, the brain in which over-production of TNF-alpha has been implicated, such as multiple sclerosis, Alzheimers disease, trauma, stroke and other ischaemic conditions.

Compounds of the invention may also be useful in inhibiting diseases associated with over-production of other pro-inflammatory cytokines, IL-1, IL-6 and IL-8.

Compounds of the invention are also useful in the treatment of inflammatory and neuropathic pain.

A special embodiment of the therapeutic methods of the present invention is the treating of respiratory diseases including asthma and chronic obstructive pulmonary disease (COPD).

Another special embodiment of the therapeutic methods of the present invention is the treating of joint inflammation.

According to a further feature of the invention there is provided a method for the treatment of a human or animal patient suffering from, or subject to, conditions which can be ameliorated by the administration of an inhibitor of TNF, especially TNF-alpha, for example conditions as hereinbefore described, which comprises the administration to the patient of an effective amount of compound of the invention or a composition containing a compound of the invention. "Effective amount" is meant to describe an amount of compound of the present invention effective in inhibiting TNF and thus producing the desired therapeutic effect.
References herein to treatment should be understood to include prophylactic therapy as well as treatment of established conditions.

The present invention also includes within its scope pharmaceutical compositions comprising at least one of the compounds of the invention in association with a pharmaceutically acceptable carrier or excipient.

Compounds of the invention may be administered by any suitable means. In practice compounds of the present invention may generally be administered parenterally, topically, rectally, orally or by inhalation, especially by the oral route.

Compositions according to the invention may be prepared according to the customary methods, using one or more pharmaceutically acceptable adjuvants or excipients. The adjuvants comprise, inter alia, diluents, sterile aqueous media and the various non-toxic organic solvents. The compositions may be presented in the form of tablets, pills, granules, powders, aqueous solutions or suspensions, injectable solutions, elixirs or syrups, and can contain one or more agents chosen from the group comprising sweeteners, flavorings, colorings, or stabilizers in order to obtain pharmaceutically acceptable preparations. The choice of vehicle and the content of active substance in the vehicle are generally determined in accordance with the solubility and chemical properties of the active compound, the particular mode of administration and the provisions to be observed in pharmaceutical practice. For example, excipients such as lactose, sodium citrate, calcium carbonate, dicalcium phosphate and disintegrating agents such as starch, alginic acids and certain complex silicates combined with lubricants such as magnesium stearate, sodium lauryl sulfate and talc may be used for preparing tablets. To prepare a capsule, it is advantageous to use lactose and high molecular weight polyethylene glycols. When aqueous suspensions are used they can contain emulsifying agents or agents which facilitate suspension. Diluents such as sucrose, ethanol, polyethylene glycol, propylene glycol, glycerol and chloroform or mixtures thereof may also be used.

For parenteral administration, emulsions, suspensions or solutions of the products according to the invention in vegetable oil, for example sesame oil, groundnut oil or olive oil, or aqueous-organic solutions such as water and propylene glycol, injectable organic esters such as ethyl oleate, as well as sterile aqueous solutions of the pharmaceutically acceptable salts, are used. The solutions of the salts of the products according to the invention are especially useful for administration by intramuscular or subcutaneous injection. The aqueous solutions, also comprising solutions of the salts in pure distilled water, may be used for intravenous administration with the
proviso that their pH is suitably adjusted, that they are judiciously buffered and rendered isotonic with a sufficient quantity of glucose or sodium chloride and that they are sterilized by heating, irradiation or microfiltration.

For topical administration, gels (water or alcohol based), creams or ointments containing compounds of the invention may be used. Compounds of the invention may also be incorporated in a gel or matrix base for application in a patch, which would allow a controlled release of compound through the transdermal barrier.

For administration by inhalation compounds of the invention may be dissolved or suspended in a suitable carrier for use in a nebulizer or a suspension or solution aerosol, or may be absorbed or adsorbed onto a suitable solid carrier for use in a dry powder inhaler.

Solid compositions for rectal administration include suppositories formulated in accordance with known methods and containing at least one compound of the invention.

The percentage of active ingredient in the compositions of the invention may be varied, it being necessary that it should constitute a proportion such that a suitable dosage shall be obtained. Obviously, several unit dosage forms may be administered at about the same time. The dose employed will be determined by the physician, and depends upon the desired therapeutic effect, the route of administration and the duration of the treatment, and the condition of the patient. In the adult, the doses are generally from about 0.001 to about 50, preferably about 0.001 to about 5, mg/kg body weight per day by inhalation, from about 0.01 to about 100, preferably 0.1 to 70, more especially 0.5 to 10, mg/kg body weight per day by oral administration, and from about 0.001 to about 10, preferably 0.01 to 1, mg/kg body weight per day by intravenous administration. In each particular case, the doses will be determined in accordance with the factors distinctive to the subject to be treated, such as age, weight, general state of health and other characteristics which can influence the efficacy of the medicinal product.

The compounds according to the invention may be administered as frequently as necessary in order to obtain the desired therapeutic effect. Some patients may respond rapidly to a higher or lower dose and may find much weaker maintenance doses adequate. For other patients, it may be necessary to have long-term treatments at the rate of 1 to 4 doses per day, in accordance with the physiological requirements of each particular patient. Generally, the active product may be administered orally 1
to 4 times per day. Of course, for some patients, it will be necessary to prescribe not more than one or two doses per day.

Compounds of the invention may be prepared by the application or adaptation of known methods, by which is meant methods used heretofore or described in the literature, for example those described by R.C. Larock in Comprehensive Organic Transformations, VCH publishers, 1989.

In the reactions described hereinafter it may be necessary to protect reactive functional groups, for example hydroxy, amino, imino, thio or carboxy groups, where these are desired in the final product, to avoid their unwanted participation in the reactions. Conventional protecting groups may be used in accordance with standard practice, for examples see T.W. Greene and P. G. M. Wuts, Protecting Groups in Organic Synthesis, 3rd edition, John Wiley & Sons, Inc., 1999. Suitable amine protecting groups include sulfonyl (e.g., tosyl), acyl (e.g., benzylxycarbonyl or t-butoxycarbonyl) and arylalkyl (e.g., benzyl), which may be removed by hydrolysis or hydrogenolysis as appropriate. Other suitable amine protecting groups include trifluoroacetyl [-C(=O)CF₃] which may be removed by base catalysed hydrolysis, or a solid phase resin bound benzyl group, such as a Merrifield resin bound 2,6-dimethoxybenzyl group (EIIman linker) or a 2,6-dimethoxy-4-[2-(polystyrylmethoxy)ethoxy]benzyl, which may be removed by acid catalysed hydrolysis, for example with trifluoroacetic acid.

Mass Spectra (MS) were recorded using a Micromass LCT mass spectrophotometer. The method was positive electrospray ionization, scanning mass m/z from 100 to 1000. Liquid chromatography was performed on an Agilent 1100 HPLC; stationary phase: phenomenex Synergi 2U Hydro-RP 20 X 4.0mm column, mobile phase: A = 0.1% formic acid (FA) in water, B = 0.1% FA in acetonitrile. Flow is 1 mL/minute. Gradient is 10% B to 90% B in 3 minutes and 90% B to 100% B in 2 minutes.

Nuclear Magnetic Resonance Spectra (NMR) were recorded using VAST-NMR conditions (VAST = Versatile Automatic Sample Transportation) on a Varian Unity Inova 600 mhz NMR spectrophotometer. Spectral width is 15987 hz with 40,000 data points for digitizing. Relaxation delay was 2.0 seconds, with 128 transients in 7 minutes 28 seconds of acquisition time. Linear predication and solvent subtraction were applied for post-acquisition data processing. The samples were dissolved in (CD$_3$)$_2$SO and transferred into the NMR probe via a Gilson-215 liquid handler. One 1mL (CD$_3$)$_2$SO rinse was performed for each sample change.

A mixture of the ester (1eq) and 20% Pd(OH)₂ (1eq by wt, 20% over charcoal) in ethyl alcohol (100 mL) is hydrogenated in a Parr apparatus overnight. The reaction is filtered through celite and evaporated to dryness. The residue is chromatographed on silica gel using 5% ethyl acetate/methylene chloride to yield the ester.

To a stirring solution of the ester (1eq) in methanol (15mL/g) is added 1N aqueous NaOH (1.5eq) and the reaction is stirred at room temperature for 3 days. The solvent is removed by rotoevaporation and the residue is partitioned between water and ethyl acetate. The mixture is cooled to 0°C and carefully acidified with 1N aqueous HCl to approximately pH 2. The two layers are
separated and the organic layer is washed with water, brine and dried over magnesium sulfate. The solution is filtered and concentrated in vacuo to yield the desired acid.

To a solution of acid (1.75 eq) in THF (12 mL/g) at room temp is added TEA (0.8 mL, 5.8 mmol) followed by DPPA (1 eq). The mixture is refluxed for 1 hour and the 3-amino-4-tert-butyl-2-tolylpyrazole (1.2 eq) is added and the reaction is refluxed overnight. The reaction is cooled and partitioned between ether-aqueous NH₄Cl, and the organic layer is washed with brine, then dried over MgSO₄, filtered and evaporated. The residue is chromatographed on silica gel using DCM/heptane (9:1) to yield the BOC-protected urea. The BOC-protected urea (1 eq) is dissolved in methylene chloride (5 mL/g) under nitrogen at 0°C and 4N HCL in dioxane (4 mL/g) is added. After 10 minutes the cooling bath is removed and the reaction is stirred for overnight at room temperature. The solution is concentrated to give exo 1-[4-(8-aza-bicyclo[3.2.1]oct-3-ylmethy1)-phenyl]-3-(5-tert-butyl-2-p-tolyl-2H-pyrazol-3-yl)-urea dihydrochloride, Intermediate 16.

1-(5-tert-butyl-2-p-tolyl-2H-pyrazol-3-yl)-3-[2-8-(2,4-dimethoxy-benzoyl)-8-aza-bicyclo[3.2.1]oct-3-ylmethyl]-phenyl]-urea, Compound A1643.

To a stirring solution of tropinone (10g, 72mmol) into 350mL DCE at 0°C was added 1-chloroethyl chloroformate (11.6mL, 108mmol). The reaction mixture was then heated to reflux and stirred for 16 hours. Upon completion (TLC), volatiles were removed in vacuo and the dark brown residue was washed with ether and filtered. The filtrate was concentrated under reduced pressure and the product formed a brown oil (Yield: 12.65g, 54.7mmol). The brown oil was dissolved in 100mL MeOH and set to reflux for 2 hours. Upon completion (TLC), the methanol was removed in vacuo and the residue was dissolved in ether. Solid particulates were filtered, and the ether was removed under reduced pressure and 8-aza-bicyclo[3.2.1]octan-3-one hydrochloride formed as a beige solid (Yield: 5.0g, 40mmol). The product was used without any further purification.

A mixture of 8-Aza-bicyclo[3.2.1]octan-3-one hydrochloride (2.5g, 20mmol), TEA (4.2mL, 30mmol) and DMAP (cat.) in DCM (60mL) was cooled to 0°C and benzyl chloroformate (4.3mL, 30mmol) was added and stirred for 30 minutes, then the reaction was allowed to stir at room temperature for overnight. The reaction was extracted with saturated ammonium chloride, brine and dried over magnesium sulfate. The organic layer was concentrated and purified on silica gel using heptane/ethyl acetate (7:3) to give 2.62 grams of CBZ-protected 8-Aza-bicyclo[3.2.1]octan-3-one.

To a solution of benzylphosphonium bromide (10.5g, 24.3mmol) in THF (65mL) was added at room temperature potassium t-butoxide (1M in THF, 24.3mL, 24.3mmol). The reaction was stirred
for 30 minutes and the CBZ-protected 8-Aza-bicyclo[3.2.1]octan-3-one (3.5g, 13.4mmol) in THF was added and the reaction was refluxed for 48 hours. The mixture was extracted with saturated ammonium chloride, brine and dried over magnesium sulfate. The organic was concentrated and the residue was taken up in ether and the solid that formed was filtered and the filtrate was concentrated to a oil. This was purified on silica gel using DCM to obtain 3.77 grams of product as a light yellow oil. The oil (1.93g, 5.8mmol) was dissolved in ethanol (30mL) and Pd/C (20%, 500mg) was added and the reaction was hydrogenated at 50 PSI. The mixture was shaken over night and filtered through celite and concentrated. The residue was purified on silica gel using DCM/MeOH/NH₄OH (90:10:1) to give 1 gram of 4-benzylnortropane. LCMS Mr=202, Rf=2.914 minutes.

To a solution of 4-benzylnortropane (494mg, 2.46mmol) in TFA (1.84mL) was added ammonium nitrate (207mg, 2.58mmol) at 0°C. The mixture was then allowed to come to room temperature and stir overnight, then the mixture was concentrated and partitioned between water and ethyl acetate. The organic layer was dried over magnesium sulfate, concentrated and purified on silica gel (90/10/1 DCM/MeOH, NH₄OH) to give a mixture of 2-nitro- and 4-nitro substituted 4-benzylnortropane trifluoroacetamide (127mg, 0.37mmol). The trifluoroacetamide group was removed by dissolving it in methanol/water (5 mL, 1:1) followed by the addition of potassium carbonate (102mg, 0.75mmol) and stirring overnight at room temperature. The reaction was concentrated and partitioned between water and ethyl acetate, then the organic layer was extracted with saturated ammonium chloride. Product was in both layers and they were combined and concentrated to dryness. The residue was taken into methanol and the solids were removed and the methanol layer was concentrated to give 90 mg of product as a mixture of 4-nitro- and 2-nitrobenzylnortropane.

The reaction was stirred overnight at room temperature. The reaction was extracted with saturated ammonium chloride and dried over magnesium sulfate. The solution was concentrated and purified on silica gel column (95/5/1 DCM/MeOH, NH₄OH) to give 108 mg of product as a mixture. This product (108mg) was dissolved in methanol (10mL) and 10% Pd/C (300mg) was added followed by the addition of NaBH₄ (100mg). After 60 minutes the reaction was concentrated to dryness. General Procedure for Amide formation

The following procedure is used for preparation of certain amides of the present invention, i.e., where X of Formulas (I) to (VI) is -C(O)-.

Weigh 0.125mmol of tetrafluorophenol resin (PL-TFP 009) into fritted polypropylene syringe tubes. Add 1mL N,N-dimethylformamide (DMF) to swell the resin. Add 0.250mmol of both an appropriate carboxylic acid and N,N'-diisopropylcarbodiimide (DIC). Cap and shake on a platform shaker overnight at room temperature. Using a luer lock vacuum box, aspirate reaction liquor and wash 3x each with DMF and tetrahydrofuran (THF), and alternate dichloromethane (DCM) and methanol washes 3x, followed by one DCM and two DMF washes. Add 1mL DMF and 0.075mmol of one of the amine intermediates selected from Intermediates 3 to 8 or 11 to 16 to the acid-loaded resin.
Cap and shake on a platform shaker overnight at 50°C. Collect the reaction liquor, rinse twice with DCM, collecting both rinses. Add 1% triethylamine (TEA) in DCM, cap and shake approx. 1 hour at room temperature on a platform shaker. Collect this wash and add to the original collection. Dry in a Genevac centrifugal evaporator.

**Sulfonamide formation**

The following procedure is used for preparation of certain sulfonamides of the present invention, i.e., where X of Formulas (I) to (VI) is –S(O)₂–.

Weigh 0.125 mmol of tetrafluorophenol resin (PL-TFP 009) into fritted polypropylene syringe tubes. Add 1 mL DMF to swell the resin. Add 0.250 mmol of an appropriate sulfonyl chloride and 0.500 mmol of N,N-diisopropylethylamine. Cap and shake on a platform shaker overnight at room temperature. Using a luer lock vacuum box, aspirate reaction liquor and wash three times each with DMF and THF, and alternate DCM and methanol washes (three times), and follow with one DCM and two DMF washes. Add 1 mL DMF and 0.075 mmol of one of the amine intermediate selected from Intermediates 3 to 8 or 11 to 16 to the sulfone-loaded resin. Cap and shake on a platform shaker overnight at 50°C. Collect the reaction liquor, rinse twice with DCM, collecting both rinses. Add 1% triethylamine (TEA) in DCM, cap and shake approx. 1 hour at room temperature on a platform shaker. Collect this wash and add to the original collection. Dry in a Genevac centrifugal evaporator.

IN VITRO AND IN VIVO TEST PROCEDURES

1. Inhibitory effects of compounds against p38 in a novel cascade assay

The compounds of the disclosure were tested in an assay designed to identify compounds that interact preferentially with the inactive enzyme. In this novel ‘cascade’ assay, compound was incubated with inactive p38 prior to addition of MKK-6 (upstream activator), substrate (ATF-2) and ATP. Theoretically, compounds that interact with the inactive enzyme would be more selective and, perhaps, demonstrate improved safety margins compared with the ATP competitive compounds.

The homogeneous time resolved fluorescence method (HTRF) assay measured the phosphorylation of human activating transcription factor (ATF)-2 protein by p38 following activation by MKK-6 and was run in a 384 well plate format. Inactive N-terminal His6 tagged murine p38 (final concentration 20 nM) was incubated with compound (in 1% dimethyl sulphoxide, DMSO) for 30 minutes in kinase assay buffer (HEPES, pH 8.0, containing 0.15 M NaCl, 10 mM MgCl2, 2 mM dithiothreitol, 5% glycerol, 0.01% Triton X-100, 0.10% γ-globulins). MBP-tagged mouse MKK-6 (final concentration 50 nM), GST-tagged ATF-2 (final concentration 200 nM) and ATP (final concentration 50 μM) were then added and the incubation continued for 90 min. p38, MKK-6 and ATF-2 were prepared in the Protein Production Group, Aventis Pharmaceuticals. XL665 labeled anti-GST antibody (Cis Bio International) and cryptate labeled anti-phospho-ATF2 antibody (Cis Bio International) were then added to generate the specific signal proportional to the phosphorylation of the substrate. The close proximity of XL665 labeled anti-GST antibody/phosphorylated GST-ATF2 complex and the cryptate labeled anti-phospho-ATF2 antibody results in a fluorescence transfer from cryptate to XL665. The resulting fluorescence signal was then read on a LJJL Acquest set at multimethod mode using a fluorescence filter set (Ex = 360 nm, Em = 615/665 nm) with UV dichroic mirror (Integration time: 300000μs). The results are reported as IC50 values. Compounds were tested over the concentration range of 3x10^-10M to 3x10^-5M.

2. **Inhibitory Effects of compounds on murine p38α in standard assay**

Compounds of the invention were tested in a conventional assay against pre-activated p38. Murine p38 enzyme activity was determined by measuring the incorporation of the γ-phosphate of ATP into ATF-2.

Human GST-tagged ATF-2 (50 μg/ml) was coated onto 96 well plates. Assay buffer (25mM Hepes buffer, pH 7.7 containing 25mM magnesium chloride, 2mM dithiothreitol, 1mM sodium orthovanadate and 100μM ATP) was then added to each well. Compounds were dissolved in DMSO (100 %) and added to the assay buffer to give a final DMSO concentration of 0.3 %. Murine p38 (CalBiochem Catalog # 506122; 40 ng/ml) was then added and the assay continued for 1 hour.

Phosphorylated ATF-2 was quantitated using a rabbit anti-human phospho (threonine 71)-specific ATF-2 primary antibody (Cell Signaling, Catalog # 9221B) followed by a sheep europium N\(^1\)-labelled anti-rabbit IgG secondary antibody (Perkin Elmer Life Sciences Catalog # AD0105) and addition of the Delfia enhancement solution (Perkin Elmer Life Sciences) resulting.

Fluorescence was measured using a Wallac Victor\(^2\) 1420 multi-label HTS counter (Perkin Elmer Life Sciences). The results are reported as IC\(_{50}\) values. Compounds were tested over the concentration range of 3\(\times\)10\(^{-10}\)M to 3\(\times\)10\(^{-5}\)M.

3. **Inhibitory Effects of compounds on LPS-induced TNF-alpha release in THP-1 cells**

The effects of compounds on TNF-alpha production by lipopolysaccharide (LPS)-stimulated Tamm-Horsfall protein (THP)-1 human monocytes were examined as follows.

3.1. **Preparation of THP-1 cells**

Undifferentiated THP-1 cells were maintained in RPMI 1640 with Glutamax I containing β-mercaptoethanol (50 μM) and foetal calf serum (FCS-10 %) at densities of about 1x 10\(^6\) cells per
ml. For incubations without and with test reagents, cells were seeded at the indicated densities under serum-deprived (1% FCS) conditions. Compounds were dissolved in dimethylsulfoxide (DMSO-100%) and incubated with the cells to give a final DMSO concentration of 0.3%. Control and untreated cell samples were incubated with DMSO (0.3%).

3.2. **Measurement of monocyte TNF-alpha release**

THP-1 cells (1x10⁶ cells/ml, total volume 150μl) in culture medium were incubated for 1 hour (5% CO₂, 37°C) with fresh medium containing compounds or vehicle (0.1 – 0.3% dimethylsulfoxide). LPS (20 μg/ml) was then added to the cells and the incubation continued for a further 18 hours. Cell supernatants were removed into 96 well plates for storage at -20°C.

TNF-alpha concentrations in cell supernatants were quantified by sandwich ELISA. Briefly, ELISA plates were coated overnight with 2μg/ml of mouse anti-human TNF-alpha antibody in bicarbonate buffer (pH 9.9). After washing the wells with wash buffer (0.05% (v/v) Tween in PBS) and blocking unoccupied sites (1% BSA in wash buffer), monocyte supernatant samples or human recombinant TNF-alpha standards were added into the corresponding wells of the ELISA plate at 1:10 dilution. Biotinylated rabbit polyclonal anti-human TNF-alpha antibody (3 μg/ml) was used as the second antibody and streptavidin-horseradish peroxidase was used as the detection antibody. The peroxidase substrate is 3,3′,5,5′-tetramethylbenzidine (TMB) in the presence of hydrogen peroxide.

TNFα concentrations in supernatants from control and LPS-stimulated monocyte incubations were calculated by interpolation from a standard (log/log) curve (0.125-16 ng/ml) fitted by Excel Fit using the Activity Base software. Compounds were tested within the concentration range of 1x10⁻⁹M to 1x10⁻⁶M.

3.3 **Results**

Compounds within the scope of the invention produce 50% inhibition in the LPS-induced TNF-alpha release in THP-1 cells assay at concentrations within the range 10 nanomolar to 50000 nanomolar. Preferred compounds within the scope of the invention produce 50% inhibition in the LPS-induced TNF-alpha release in THP-1 cells assay at concentrations within the range 10 nanomolar to 500 nanomolar. Especially preferred compounds within the scope of the invention produce 50% inhibition in the LPS-induced TNF-alpha release in THP-1 cells assay at concentrations within the range 10 nanomolar to 100 nanomolar.
4. **Inhibitory effects of compounds on LPS-induced TNF-alpha release in human whole blood**

Human Blood was collected from donors in heparinized vacutainer tubes and aliquotted into microtiter plates (125 µl/well). Compounds (50 µl) were incubated with the whole blood for 1 hour before lipopolysaccharide (LPS 10 ng/ml, 75 µl) was added and incubations (total volume 250 µl) continued for 5 h. At the end of the incubation, whole blood was removed and centrifuged at 2000 RPM for 5 minutes. Plasma TNF-alpha and IL-1-beta were measured by ELISA (Biosource kits) as recommended by the manufacturer. Values for TNF-alpha were calculated from a recombinant human TNF-alpha standard curve. The results are reported as IC_{50} values. Compounds were tested over the concentration range of 1x10^{-9}M to 1x10^{-5}M.

5. **Inhibitory effects of compounds on serum TNF-alpha levels in LPS-challenged rats**

5.1 **Treatment of animals and measurement of murine TNF-alpha**

Male Sprague Dawley rats [age 7-10 weeks, or 10-12 weeks (weight 150-200g) from Harlan, U.S.A.] in groups of 6 or more were dosed p.o. or i.v. with compounds (1.0 to 30 mg/kg, 0.5-8 hrs) suspended in 0.5% methylcellulose containing 0.2% Tween-80 (or a suitable vehicle for i.v. dosing). The animals were then challenged with a 40 µg/rat i.v. dose of LPS in 0.2 ml of 0.9% saline, usually 30 minutes after compound dosing. Ninety minutes after i.v. injection of LPS, each rat was anesthetized by isoflurane inhalation. Each rat was bled by cardiac puncture and terminated by cervical dislocation. The blood was allowed to clot, then centrifuged at 4000-5000 g for 5 minutes, and the serum taken for TNF-alpha analysis. TNF-alpha levels were measured using a commercially available rat TNF-alpha ELISA kit, purchased from R & D Systems (Cat. No. RTA00), as recommended by the manufacturer. Values for TNF-alpha were calculated from a recombinant rat TNF-alpha standard curve.

5.2 **Results**

Compounds within the scope of the invention inhibit TNF-alpha release in LPS challenged mice up to 90% at doses of 3mg/kg to 30mg/kg.

6. **Inhibitory effects of compounds on disease symptoms in rat type II collagen-induced arthritis (CIA)**

Bovine Nasal Type II Collagen (Elastin Products) was dissolved in 0.45 µm vacuum-filtered 0.01 M acetic acid and stirred at 4°C overnight for a final concentration of 2 mg/ml. 10 ml Incomplete Freund’s Adjuvant (Difco) was brought to 4°C in cold room. 10 ml collagen/acetic acid solution was
added drop-wise while mixing at low speed with PowerGen Homogenizer (Fisher). The resulting emulsion was mixed at high speed for one minute, allowed to return to 4°C, and mixed at high speed for one additional minute. Final collagen concentration is 1 mg/ml.

Female Lewis rats (Charles River) weighing 140 – 160 g were used. Fur at base of tail was shaved and the area swabbed with ethanol. Using 25G needle and glass syringe, 0.4 ml of collagen emulsion was injected intradermally at base of tail on Day 0 and again on Day 7.

Groups of at least 10 rats each were dosed orally with compounds typically suspended in 0.5% methylcellulose (Sigma)/0.2% Tween-80 (Acros Organics) vehicle twice daily from Day 6 through Day 21. Control groups were dosed either once daily with 3 mg/kg Leflunomide (Aventis) suspended in vehicle, or twice daily with 10 ml/kg vehicle only.

Ankle width, measured using digital calipers (Electronix Express), and individual body weights were recorded 2 – 3 times per week from Day 6 through Day 21. Blood plasma and/or serum was taken one hour after final dose on Day 21. Animals were then euthanized and their ankles/hindpaws were removed using a guillotine, weighed, and preserved in formalin for subsequent histological analysis. Compounds were tested at doses of 1-30 mg/kg (q.d. or b.i.d.).

7. **In Vitro Inhibitory Effects of Compounds on Human HSP27 Phosphorylation**

The effects of compounds on Heat Shock Protein (HSP)-27 phosphorylation in LPS stimulated THP-1 cells were examined as follows:

7.1 **Preparation of THP-1 cells**

THP-1 cells were maintained as described for the TNF-alpha assay (1.1.).

7.2 **Measurement of HSP27 Phosphorylation**

THP-1 cells (1x10⁶ cells/ml, total volume 1ml) in culture medium were incubated for one hour (5% CO₂, 37°C) with fresh medium containing compounds (0.0001 – 30 μM)or vehicle (0.1% DMSO). LPS (20 μl/ml) was then added to the cells (except the untreated cell sample) and the incubation continued for a further 20 minutes. Cells were collected, centrifuged and washed with ice-cold PBS buffer (free of Ca²⁺ and Mg²⁺). Cell lysates were prepared with 1x lysis buffer (Promega Catalog# E153A) for storage at -20°C.
HSP27 phosphorylation was determined by Western blot-enhanced chemi-luminescence (ECL-Amersham)). Briefly, cell lysates were electrophoresed on 12% Tris-glycine gels and transferred to nitrocellulose membranes. The membranes were then probed with primary rabbit antiphospho-HSP27 (ser82) antibody and secondary anti-rabbit antibody conjugated to horse radish peroxidase. After addition of the ECL detection reagent, the film was developed and the p-HSP27 immunoreactivity quantified by densitometry.

**INTERNATIONAL SEARCH REPORT**

**Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)**

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. X Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:
   
   Although claims 32–44 are directed to a method of treatment of the human body, the search has been carried out and based on the alleged effects of the compound.

2. [ ] Claims Nos.: because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:

3. [ ] Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1. [ ] As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the Invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- [ ] The additional search fees were accompanied by the applicant’s protest.
- [ ] No protest accompanied the payment of additional search fees.
