Mechanism for hanging a gate at an adjustable height on a support

- (57) A trough-shaped rail (11) with a bottom and two flanks is provided on the support (3) and/or on the gate (1). The fixing element (8) for fixing the hinge (2, 4, 5) on the rail is on a sliding piece (10) which is slidable vertically in the rail (11), the flanks of the rail being clamped between parts (15) of said fixing element (8) and parts (14) of the sliding piece (10) when the fixing element (8) is bolted down on the sliding piece (10). In order to centre the fixing element (8) relative to the rail (11), and in order to counteract twisting or horizontal displacement of the fixing element (8) relative to the rail (11), at least the clamped parts of the flanks (13) each form an angle of inclination with the bottom of the rail (11), and said parts (15) of the fixing element (8) and said parts (14) of the sliding piece (10) in the fitted state each likewise form virtually the same angle of inclination with the bottom of the rail.

**ANNEX TO THE EUROPEAN SEARCH REPORT
ON EUROPEAN PATENT APPLICATION NO.**

EP 04 10 5458

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report.
The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
