ABSTRACT
The present invention relates to a method of treating a patient suffering from a disorder of the central nervous system associated with 5-HT_{1A} receptor subtype, comprising as an active ingredient a carbostyril derivative or a salt thereof represented by the formula (I):

\[
\text{I}
\]

wherein the carbon-carbon bond between 3- and 4-positions in the carbostyril skeleton is a single or a double bond.
METHOD OF TREATING BIPOLAR I AND II DISORDERS

This is a division of application Ser. No. 10/876, 605, filed Jun. 28, 2004, which is a division of application Ser. No. 10/055,915, filed Jan. 28, 2002, now U.S. Pat. No. 7,053,092, which claims benefit of U.S. Provisional Application No. 60/331,370, filed Jan. 29, 2001, all of which are incorporated herein by reference.

BACKGROUND OF THE INVENTION

The present invention relates to a method of treating a patient suffering from a disorder of the central nervous system associated with the 5-HT_{1A} receptor subtype. The active ingredient comprises a carbostyril derivative or a salt thereof.

Related Art

U.S. Pat. No. 5,006,528; European Patent No. 367,141 and Japanese Patent Kokai (Laid-open) 7-304,740 (1995) contain the same chemical structural formula as the carbostyril derivatives in the present invention, and their pharmacological properties are beneficial drug treatments for schizophrenia.

The carbostyril derivatives disclosed in European Patent No. 226,441 have the genus of the carbostyril derivatives in the present invention, and they are useful for the treatment of hypoxia.

In addition to the above, the carbostyril derivatives disclosed in U.S. Pat. No. 4,734,416; Canadian Patent No. 1,117,110; British Patent No. 2,017,701; German Patent Nos. 2,912,105 and 2,953,723; Japanese Patent Kokai (Laid-open) Nos. 54-130,587 (1979), 55-127,371 (1980) and 62-149,664 (1987) have the genus of the carbostyril derivatives in the present invention, and they have anhistaminic activities and central nervous controlling activities.

Furthermore, it is reported that aripiprazole possesses high affinity to dopamine D_{2} receptors and with moderate affinity to dopamine D_{3} and 5-HT_{1A} receptors (Masashi Sasa et al., CNS Drug Reviews, Vol. 3, No. 1, pp. 24-33).

However, it has not been reported that compounds in the present invention have agonistic activity at 5-HT_{1A} receptor subtype.

It has been reported that therapeutic interventions using 5-HT_{1A} receptor ligands may be useful drug treatments for alcohol abuse (Mark Kleven et al., European Journal of Pharmacology, Vol. 281, (1995) pp. 219-228).

It is also reported that 5-HT_{1A} agonist drugs may be useful for the treatment and/or prophylaxis of disorders associated with neuronal degeneration resulting from ischemic events in mammals (U.S. Pat. No. 5,162,375).

It is also reported that 5-HT_{1A} receptor hypersensitivity could be the biological basis for the increased frequency of migraine attack in stressful and anxious conditions (Massimo Leone et al., Neuro Report, Vol. 9, pp. 2605-2608 (1998)).

It has recently been reported that (-)-(R)-2-[4-[(3,4-dihydro-2H-1-benzopyran-2-yl)methyl][aminol]-butyl]-1,2-benzisothiazol-3(2H)-one 1,1-dioxide monohydrochloride (BAY-3702), a 5-HT_{1A} receptor agonist, has neuroprotective, anxiolytic- and antidepressant-like effects in animal models (Jean De Vry et al., European Journal of Pharmacology, Vol. 357, (1998), pp. 1-8).

Serotonin plays a role in several neurological and psychiatric disorders, including Alzheimer's disease, depression, nausea and vomiting, eating disorders, and migraine. (See Rasmussen et al., "Chapter 1. Recent Progress in Serotonin 5HT_{1A} Receptor Modulators", in Annual Reports in Medicinal Chemistry, Vol. 30, Section I, pp. 19, 1995, Academic Press, Inc.) WO 00/16777 discloses that a 5-HT_{1A} receptor agonist, buspirone is efficacious in treating a variety of symptoms associated with ADHD, and that combined use of a D_{2} receptor agonist and 5-HT_{1A} agonist provides effective treatments for ADHD and Parkinson's disease.

5-HT_{1A} agonists are effective in the treatment of cognitive impairment in Alzheimer's disease, Parkinson's disease or senile dementia. U.S. Pat. No. 5,824,680 discloses that a 5-HT_{1A} agonist, ipsapirone, is effective in treating Alzheimer's disease by improving memory. U.S. Pat. No. 4,687,772 describes that a 5-HT_{1A} partial agonist, buspirone, is useful for improving short term memory in patients in need of treatment. WO 93/04681 discloses that use of 5-HT_{1A} partial agonists have been used for the treatment or prevention of cognitive disorders associated with Alzheimer's disease, Parkinson's disease or senile dementia.

5-HT_{1A} agonists are also effective in the treatment of depression. U.S. Pat. No. 4,771,053 describes that a 5-HT_{1A} receptor partial agonist, gepirone, is useful in alleviation of certain primary depressive disorders, such as severe depression, endogenous depression, major depression with melancholia, and atypical depression. WO 01/52855 discloses that the combined use of the 5-HT_{1A} receptor partial agonist gepirone with an antidepressant can effectively treat depression.

The 5-HT_{1A} receptor partial agonist buspirone alleviates motor disorders such as neuroleptic induced parkinsonism and extrapyramidal symptoms. These observations are disclosed in U.S. Pat. No. 4,438,119. Furthermore 5-HT_{1A} agonists reverse neuroleptic-induced catalepsy in rodents, which mimic movement impairments observed in Parkinson's disease (Mark J. Millan, Journal of Pharmacology and Experimental Therapeutics, 2000, Vol. 295, p853-861). Thus, aripiprazole can be used to manage psychosis in geriatric patients, Alzheimer's disease, Parkinson's disease.
or senile dementia, since it possesses potent, partial agonistic activities at D2 and 5-HT1a receptors. In addition, these patients may not experience extrapyramidal symptoms due to this property of aripiprazole.

[0021] Heretofore, schizophrenia is understood to be caused by hyperactivity in the brain dopaminergic system. For this reason, some drugs were developed with strong dopaminergic receptor blocking activity. These typical antipsychotic drugs are effective in the treatments for the positive symptoms of schizophrenia, which include hallucinations, delusions and the like. During the last decade, a variety of atypical anti-psychotic drugs have been developed, which include clozapine, risperidone, olanzapine, quetiapine. These drugs have less extrapyramidal side effects, and have other activities in addition to their DA-receptor blocking activities. In contrast to typical anti-psychotic drugs, such as chlorpromazine, haloperidol, etc., it is reported that atypical antipsychotic drugs are more effective against the negative symptoms and cognitive impairments associated with schizophrenia than typical antipsychotic drugs, and atypical antipsychotic drugs also have less extrapyramidal side effects (S. Miyamoto, G. E. Duncan, R. B. Mallman and J. A. Lieberman: Current Opinion in CPNS Investigational Drugs, Vol. 2, pp. 25, (2000)). However, even though antipsychotic drugs provide a suitable pharmacotherapy for schizophrenia, certain patients are resistant to the antipsychotic therapies of these drugs. These patients may either not respond or may become refractory (i.e. may feel more anxious, depressed or cognitive dysfunction) in response to antipsychotic therapy. These treatment-resistant patients pose a problem for how a physician may provide an appropriate therapy.

[0022] At present, a number of treatment-resistant and treatment-refractory schizophrenic patients display symptoms that do not respond adequately to a variety of known effective classes and doses of typical or atypical antipsychotic drugs. Furthermore, these patients may also be inervate schizophrenia or chronic schizophrenics who are often repeatedly admitted to and discharged from hospitals (R. R. Conely and R. W. Buchanan: Schizophr. Bull., Vol. 23, pp. 663, (1997)).

[0023] Symptoms of patients corresponding to treatment-resistant and treatment-refractory schizophrenics involve not only the positive symptoms, but also the negative symptoms and emotional disorders, as well as cognitive impairments (i.e., cognitive dysfunction or cognitive disturbances) (K. Akiyama and S. Watanabe: Jpn. J. Clin. Psychopharmacol., Vol. 3, pp. 423, (2000)).

[0026] The 5-HT1a receptor has been demonstrated to play a role in the therapeutic efficacy of clozapine against treatment-resistant schizophrenia and cognitive impairments. This relation ship was revealed by a binding experiment using human the 5-HT1a receptors (S. L. Mason and G. P. Reynolds: Eur. J. Pharmacol., Vol. 221, pp. 397, (1992)). Further, in accordance with progress in molecular pharmacology, it is clearly understood that 5-HT1a receptor agonistic activity or 5-HT1a receptor partial agonistic activity plays an important role in treatment-resistant schizophrenia and cognitive impairments (A. Newman-Tuncredi, C. Chaput, L. Verriele and M. J. Millan: Neuropharmacology, Vol. 35, pp. 119, (1996)). Additionally, it was reported that the number of 5-HT1a receptor is increased in the prefrontal cortex of chronic schizophrenics who were classified treatment-resistant. This observation was explained by a compensatory process where by the manifestation of severe symptoms of chronic schizophrenia are a result of impaired neuronal function mediated by hypofunctional 5-HT1a receptors (T. Hashimoto, N. Kitamura, Y. Kajimoto, Y. Shirai, O. Shirakawa, T. Mita, N. Nishino and C. Tanaka: Psychopharmacology, Vol. 112, pp. S35, (1993)). Therefore, a lowering in neuronal transmission mediated through 5-HT1a receptors is expected in treatment-resistant schizophrenics. Thus the clinical efficacy of clozapine may be related to its partial agonist efficacy at the 5-HT1a receptors (A. Newman-Tuncredi, C. Chaput, L. Verriele and M. J. Millan: Neuropharmacology, Vol. 35, pp. 119, (1996)). 5-HT1a receptor agonistic activity may be related to the clinical effects of clozapine, and this hypothesis is supported by a positron emission tomography study in primates which showed that clozapine interacts with brain 5-HT1a receptors at a therapeutically effective dose (Y. H. Chou, C. Halklin and L. Farde: Int. J. Neuropsychopharmacol., Vol. 4 (Suppl. 3), pp. S130, (2000)). Furthermore tandospirone, which is known as a selective 5-HT1a receptor agonist, improved cognitive impairments in chronic schizophrenic patients (T. Sumiyoshi, M. Matsui, I. Yamashita, S. Nohara, T. Uehara, M. Kurachi and H. Y. Meltzer: J. Clin. Pharmacol., Vol. 20, pp. 386, (2000)). While, in animal tests, all reports do not always suggest that 5-HT1a receptor agonist activity may be related to cognitive impairment, however, 8-OH-DPAT (8-hydroxy-2-(di-n-propylamino)tetrinal), which is known as a selective 5-HT1a receptor agonist, improves learning and memory impairments induced by scopolamine known as a muscarinic receptor antagonist, suggesting a relationship

[0028] In contrast to reports that clozapine was moderately effective against treatment-resistant schizophrenia, risperidone and olanzapine were not consistently superior to typical antipsychotic drugs in their effectiveness against treatment-resistant schizophrenia. Thus, risperidone and olanzapine bind with lower affinity to human 5-HT\textsubscript{1A} receptors (S. Miyamoto, G. E. Duncan, R. B. Mailman and J. A. Lieberman: Current Opinion in CNS Investigation Drugs, Vol. 2, pp. 25, (2000)), and as such these drugs can not clearly perform activities through human 5-HT\textsubscript{1A} receptors at clinical effective doses.

[0030] As explained above, 5-HT\textsubscript{1A} receptor agonistic activity is important for improving treatment-resistant schizophrenia or cognitive impairment caused by treatment-resistant schizophrenia. Clozapine is effective against treatment-resistant schizophrenia, however, its use is limited due to its severe side-effect of producing agranulocytosis which requires patients to undergo periodical blood tests. Under these circumstances, the development of a safe anti-psychotic drug with potent, full or partial agonist activity at 5-HT\textsubscript{1A} receptors is earnestly desired.

[0031] The carboxystyryl compound in the present invention binds with high affinity and displays a potent, partial agonist activity at the 5-HT\textsubscript{1A} receptors and it has higher intrinsic activity (about 68%) as compared with that of clozapine. Therefore, the compound in the present invention has a 5-HT\textsubscript{1A} receptor agonistic activity that is more potent than the agonistic activity of clozapine. Thus, the present carboxystyryl compound may represent a more potent and highly safe drug for curing treatment-resistant schizophrenia, cognitive impairments caused by treatment-resistant schizophrenia, invertebrate schizophrenia, cognitive impairments caused by invertebrate schizophrenia, chronic schizophrenia, cognitive impairments caused by chronic schizophrenia and the like, as compared with other currently available pharmacological treatments. That is, the compound in the present invention may prove to be a potent and safer drug therapy for treatment-resistant schizophrenia, cognitive impairments caused by treatment-resistant schizophrenia, invertebrate schizophrenia, cognitive impairments caused by invertebrate schizophrenia, chronic schizophrenia, or cognitive impairments caused by chronic schizophrenia, etc., which fail to respond adequately to currently available antipsychotic drugs such as chlorpromazine, haloperidol, sulpiride, fluphenazine, perphenazine, thioridazine, pimozide, zotepine, risperidone, olanzapine, quetiapine, amisulpride, etc.

[0032] In particular, the carboxystyryl compound in the present invention may be a potent and highly safe drug therapy against treatment-resistant schizophrenia, cognitive impairments caused by treatment-resistant schizophrenia, invertebrate schizophrenia, cognitive impairments caused by invertebrate schizophrenia, chronic schizophrenia or cognitive impairments caused by chronic schizophrenia, etc. which fail to respond adequately to both of 1 to 3 typical antipsychotic drugs selected from the group consisting of chlorpromazine, haloperidol and perphenazine, and one atypical antipsychotic drug selected from the group consisting of risperidone, olanzapine, quetiapine and amisulpride.

[0033] Moreover, the compound in the present invention may be a potent and highly safe drug therapy against treatment-resistant schizophrenia, cognitive impairments caused by treatment-resistant schizophrenia, invertebrate schizophrenia, cognitive impairment caused by invertebrate schizophrenia, chronic schizophrenia or cognitive impairment caused by chronic schizophrenia, etc. which fail to respond adequately to both of 2 typical antipsychotic drugs selected from the group consisting of chlorpromazine, haloperidol and perphenazine, and one atypical antipsychotic drug selected from the group consisting of risperidone, olanzapine, quetiapine and amisulpride.

[0034] Moreover, the compound in the present invention may be a potent and highly safe drug therapy against treatment-resistant schizophrenia, cognitive impairments caused by treatment-resistant schizophrenia, invertebrate schizophrenia, cognitive impairments caused by invertebrate schizophrenia, chronic schizophrenia, or cognitive impairment caused by chronic schizophrenia, etc. which fail to respond adequately to both of 1 to 2 typical antipsychotic drugs selected from the group consisting of chlorpromazine and haloperidol, and one atypical antipsychotic drug selected from the group consisting of risperidone, olanzapine, quetiapine and amisulpride.

[0035] Moreover, the compound in the present invention may be a potent and highly safe drug therapy against treatment-resistant schizophrenia, cognitive impairments caused by treatment-resistant schizophrenia, invertebrate schizophrenia, cognitive impairment caused by invertebrate schizophrenia, chronic schizophrenia or cognitive impairment caused by chronic schizophrenia, etc. which fail to respond adequately to both of 2 typical antipsychotic drugs selected from the group consisting of chlorpromazine and haloperidol, and one atypical antipsychotic drug selected from the group consisting of risperidone, olanzapine, quetiapine and amisulpride.

SUMMARY OF THE INVENTION

[0036] It is an object of the present invention to provide a method of treating a patient suffering from a disorder of the central nervous system associated with the 5-HT\textsubscript{1A} receptor subtype.
As the 5-HT₆ receptor subtype agonist compound for use in accordance with the present invention, carbostyril derivatives represented by the following formula (1) are used:

![Chemical Structure](image)

wherein the carbon-carbon bond between 3- and 4-positions in the carbostyril skeleton is a single or a double bond.

The compounds of the forgoing general formula (1) are known compounds, which are disclosed in publication such as U.S. Pat. No. 5,006,528 or which can be readily prepared by the processes described in the above publication.

The carbostyril derivative represented by the formula (1) in the present invention can easily be converted into its acid-addition salt by reacting it with a pharmaceutically acceptable acid. Examples of such acid include inorganic acids, such as hydrochloric acid, sulfuric acid, phosphoric acid, hydrobromic acid and the like; organic acids, such as oxalic acid, maleic acid, fumaric acid, malic acid, tartaric acid, citric acid, benzoic acid and the like.

The solvent of solvates is a solvent conventionally used in recrystallization. Examples of solvates include hemihydrates, hydrates, and alcoholates, such as ethanolates, methanolates, isopropanolates and the like.

The desired compounds, prepared by the reactions mentioned above, can easily be isolated and purified by usual separation procedures such as solvent extraction, dilution, recrystallization, column chromatography, preparative thin layer chromatography and the like.

The potent, partial 5-HT₆ receptor agonist in the present invention is useful for various disorders of the central nervous system associated with the 5-HT₆ receptor subtype that induces bipolar disorders, such as bipolar I disorder with most recent hypomanic, manic, mixed, depressed or unspecified episode; bipolar II disorder with recurrent major depressive episodes with hypomanic episodes, and cyclothymic disorder; depression, such as endogenous depression, major depression, melancholia, and treatment-resistant depression; panic disorder; obsessive compulsive disorder (OCD); sleep disorders; sexual dysfunction; alcohol abuse and drug addiction; cognitive impairment; neurodegenerative diseases, such as Alzheimer’s disease, Parkinson’s disease and the like, cognitive impairments caused by neurodegenerative diseases such as Alzheimer’s disease, Parkinson’s disease and related disorders; emesis; motion sickness; obesity; migraine; autism; Down’s syndrome; attention-deficit hyperactivity disorder (ADHD); treatment-resistant, inveterate or chronic schizophrenia, (which fail to respond adequately to currently available antipsychotic drugs); cognitive impairments caused by treatment-resistant schizophrenia, inveterate schizophrenia or chronic schizophrenia and the like.

The dosage of these pharmaceutical preparations of the invention may be selected appropriately depending on the method of administration, the patient’s age, sex and other factors, severity of the disease and other factors. Generally, however, the daily dose of the active ingredient compound is preferably within the range of about 0.001 to about 50 mg per kilogram of body weight. It is desirable that the active ingredient compound be contained in each unit dosage form in an amount of about 0.001 to about 1,000 mg, particularly 0.01 to 100 mg, more particularly 0.1 to 50 mg, yet more particularly 1 mg to 20 mg.

Pharmacological Tests

1. Materials and Methods

1.1 Test Compound

7-[4-[4-(2,3-Dichlorophenyl)-1-piperazinyl]-butoxy]-3,4-dihydrocarbostyril (aripiprazole) was used as test compound.

1.2 Reference Compounds

Serotonin (5-HT) and WAY-100635 (N-[2-[4-(2-methoxyphenyl)-1-piperazinyl]ethyl]-N-(2-pyridinyl)-cyclohexanecarboxamide, a 5-HT₆ receptor antagonist, manufactured by RBI (Natick, Mass.) were used as reference compounds.

1.3 Vehicle

Dimethyl sulfoxide (DMSO) manufactured by Sigma Chemical Co. (St. Louis, Mo.) was used as vehicle.

1.4 Preparation of Test and Reference Compounds

Test compound was dissolved in 100% dimethyl sulfoxide (DMSO) to yield 100 μM stock solutions (final concentration of DMSO in all tubes containing test compound was 1%, v/v). All other reference compounds were prepared by the same method using double-distilled water rather than DMSO.

1.5 Experimental Procedure for the [³⁵S]GTP₇s Binding Assay

Test and reference compounds were studied in triplicate at 10 different concentrations (0.01, 0.1, 1, 5, 10, 50, 100, 1000, 10000 and 50000 nM) for their effects upon basal [³⁵S]GTP₇s binding to h5-HT₆ CHO cell membranes. Reactions were performed in 5 ml glass test tubes containing 8 μl of test/reference drug mixed with 792 μl of buffer (25 mM Tris HCl, 50 mM NaCl, 5 mM MgCl₂, 0.1 mM EGTA, pH 7.4) containing GDP (1 μM), [³⁵S]GTP₇s (0.1 nM) and h5-HT₆ CHO cell membranes (10 μg protein/reaction; NEN Life Science Products, Boston, Mass.; catalog # CRM035, lot #501-60024, GenBank # X13556). Reactions proceeded for 60 min at room temperature and were terminated by rapid filtration through Whatman GF/B filter paper, using a Brandel harvester and 4×3 ml
ice-cold buffer washes. $^{35}$S radio-activity bound to the filter paper was measured using liquid scintillation counting (1272 Clinigamma, LKB/Wallac).

[0055] 1.6 Experimental Procedure to Determine the Binding Affinity of Test compound (ariipiprazole) at the h5-HT$_{1_A}$ Receptor

[0056] Test compound was studied in triplicate at 10 different concentrations (0.01, 0.1, 1, 10, 50, 100, 500, 1000, 5000 and 10,000 nM) to determine its inhibition of $[^{35}]$SGTP$_S$ binding (1 nM; NEN Life Sciences; catalog # NET 929, lot #30160535, Specific Activity=124.9 Ci/mmol) binding to h5-HT$_{1_A}$ receptors in CHO cell membranes (15-20 μg protein; NEN Life Science Products, catalog # CRM035, lot #501- 60024). Membranes (396 μl) were incubated in 5 ml glass tubes containing (1H) 8-OH-DPAT (396 μl), test compound or vehicle (8 μl) and buffer A (50 mM Tris.HCl, 10 mM MgSO$_4$, 0.5 mM EDTA, 0.1% (w/v) ascorbic acid, pH=7.4). All assays proceeded for 60 min at room temperature and were terminated by rapid filtration through Whatman GF/B filter paper (presoaked in buffer B: 50 mM Tris.HCl, pH=7.4), using a Brandel harvester and 4x1 ml ice-cold washes with buffer B. Non-specific binding was determined in the presence of 10 μM (+) 8-OH-DPAT.

[0057] 1.7 Parameters Determined

[0058] Serotonin (5-HT) is a full 5-HT$_{1_A}$ receptor agonist which stimulates increases in basal $[^{35}]$SGTP$_S$ binding to h5-HT$_{1_A}$ receptors in recombinant CHO cell membranes. Test compound was studied at 10 concentrations to determine their effects upon basal $[^{35}]$SGTP$_S$ binding relative to that produced by 10 μM 5-HT. The relative potency (EC$_{50}$, 95% confidence interval) and intrinsic agonist activity (% of Emax for 10 μM 5-HT) was calculated for each compound by computerized non-linear regression analysis of complete concentration-effect data. The binding affinity of test compound at the h5-HT$_{1_A}$ receptor was determined by its ability to prevent $[^{35}]$H) 8-OH-DPAT binding to CHO cell membranes that express this receptor. Non-linear regression analysis of the competition binding data was used to calculate an inhibition constant (IC$_{50}$, 95% confidence interval), which is the concentration of test compound that occupies half of the h5-HT$_{1_A}$ sites specifically bound by $[^{35}]$H) 8-OH-DPAT. The affinity of h5-HT$_{1_A}$ receptors for test compound (Ki, 95% confidence interval) was calculated by the equation, Ki=(IC$_{50}$)/(1+(Kd)[$[^{35}]$H] 8-OH-DPAT)/Kd), where the Kd for $[^{35}]$H) 8-OH-DPAT at h5-HT$_{1_A}$=0.69 nM (NEN Life Sciences). All estimates of drug binding affinity, potency and intrinsic efficacy at the h5-HT$_{1_A}$ receptor were calculated using GraphPad Prism version 3.00 for Windows (GraphPad Software, San Diego, Calif.).

2. Results

[0059] Test compound and 5-HT produced concentration-dependent increases above basal $[^{35}]$SGTP$_S$ binding. 1% DMSO tested alone had no effect upon basal or drug-induced $[^{35}]$SGTP$_S$ binding.

[0060] Test compound (EC$_{50}$=2.12 nM), 5-HT (EC$_{50}$=3.67 nM), potently stimulated, basal $[^{35}]$SGTP$_S$ binding. Potency and intrinsic agonist efficacy estimates were derived by non-linear regression analysis with correlation coefficients ($r^2$)>0.98 in each case (Table 1). Test compound exerted partial agonist efficacies in the 65-70% range. WAY-100635 produced no significant change (unpaired Student’s t-test) in basal $[^{35}]$SGTP$_S$ binding at all concentrations tested (Table 1). WAY-100635 did, however, completely inhibit the effects of 5-HT and test compound upon $[^{35}]$S GTP$_S$ binding to h5-HT$_{1_A}$ receptors in CHO cell membranes (Table 2). Tables 1 and 2 are shown below.

[0061] Test compound demonstrated high affinity binding to h5-HT$_{1_A}$ receptors in CHO cell membranes (IC$_{50}$=4.03 nM, 95% confidence interval=2.67 to 6.08 nM; Ki=1.65 nM, 95% confidence interval=1.09 to 2.48 nM).

1-8. (canceled)

9. A method of treating a patient suffering from a disorder of the central nervous system, selected from

(i) bipolar I disorder with most recent mixed, depressed or unspecified episode, and

(ii) bipolar II disorder with recurrent major depressive episodes with hypomanic episodes,

the method comprises:

administering to said patient a pharmaceutical composition comprising a therapeutically effective amount of a carbostyril compound of formula (I), or a pharmaceutically acceptable salt or solvate thereof, wherein said patient is a mammal:
wherein the carbostyril compound of formula (I) is both a partial D₂ receptor agonist and a partial 5-HT₁₄ receptor agonist facilitating treatment of both mania and depression of bipolar I and bipolar II disorders.

further wherein the compound of formula (I) is the only antipsychotic administered to said patient.

10. The method of claim 9, wherein the disorder is bipolar I disorder as defined in (i).

11. The method of claim 9, wherein the disorder is bipolar II disorder as defined in (ii).

12. The method according to claim 9, wherein the carbostyril compound is 7-\{4-[4-(2,3-dichlorophenyl)-1-piperazinyl]butoxy\}-3,4-dihydrocarbostyril.

13. The method according to claim 10, wherein the carbostyril compound is 7-\{4-[4-(2,3-dichlorophenyl)-1-piperazinyl]butoxy\}-3,4-dihydrocarbostyril.

14. The method according to claim 11, wherein the carbostyril compound is 7-\{4-[4-(2,3-dichlorophenyl)-1-piperazinyl]butoxy\}-3,4-dihydrocarbostyril.
