ABSTRACT

An automated consumable ordering system and method obtains an information handling system purchaser's preferences for ordering consumables used by devices of an information handling system ordered for manufacture and loads the consumable ordering preferences on a consumable ordering module of the information handling system during manufacture. Consumable usage by the information handling system is tracked to a predetermined level at which the module orders consumables automatically from the manufacturer. The order is placed with a message that uses a service tag number associated with the information handling system. The manufacturer determines account information for charging the order from the service tag. The module updates account information by directing the user of the information handling system to perform updates through a secure Internet connection with the manufacturer or other secure established connection.

METHOD AND SYSTEM FOR INFORMATION HANDLING SYSTEM CONSUMABLES AUTOMATED ORDERING

BACKGROUND OF THE INVENTION

[0001] 1. Field of the Invention

[0002] The present invention relates in general to the field of information handling system consumables, and more particularly to a method and system for automated ordering of information handling system consumables.

[0003] 2. Description of the Related Art

[0004] As the value and use of information continues to increase, individuals and businesses seek additional ways to process and store information. One option available to users is information handling systems. An information handling system generally processes, compiles, stores, and/or communicates information or data for business, personal, or other purposes thereby allowing users to take advantage of the value of the information. Because technology and information handling needs and requirements vary between different users or applications, information handling systems may also vary regarding what information is handled, how the information is handled, how much information is processed, stored, or communicated, and how quickly and efficiently the information may be processed, stored, or communicated. The variations in information handling systems allow for information handling systems to be general or configured for a specific user or specific use such as financial transaction processing, airline reservations, enterprise data storage, or global communications. In addition, information handling systems may include a variety of hardware and software components that may be configured to process, store, and communicate information and may include one or more computer systems, data storage systems, and networking systems.

[0005] Information handling systems often operate with incorporated and peripheral devices that use consumable items. For instance, printers print information from information handling systems on consumable paper by using consumable ink. As another example, storage disk drives store information on consumable storage disks, such as floppy and compact disks. Information handling system users typically must replenish consumable item inventories as the consumable items are used by information handling system devices. For instance, information handling system users typically make periodic purchases of consumable items such as printer ink, paper and storage disks. If a user fails to purchase consumable items before the user's inventory is depleted, the information handling system typically loses the functionality associated with the consumable item until the user replenishes the consumable item inventory.

[0006] One difficulty with the use of information handling systems is that a number of various consumables are typically used by different devices so that an information handling system user has difficulty tracking consumable inventory and maintaining sufficient inventory to avoid depletion of a given consumable. For instance, an inkjet printer may use one of several types of inkjet cartridges depending on the printer model and the frequency of different types of print jobs, such as color versus black and white printing. If the user fails to purchase extra inkjet cartridges, then the printer becomes essentially useless once the installed cartridges are depleted. Even if the user remembers to purchase additional inkjet cartridges before the on-hand inventory is depleted, the user must find a source to purchase the proper model of inkjet cartridge. For an information handling system user, this means one or more trips to one or more different stores to restock consumable inventories as the inventories are depleted. Failure to purchase consumables in a timely manner or failure to purchase correct consumables may render an information handling system functionally unusable.

SUMMARY OF THE INVENTION

[0007] Therefore a need has arisen for a method and system which automatically orders information handling system consumables before the inventory for the consumables is depleted.

[0008] A further need exists for a method and system which orders consumables from a single source with reduced risk of ordering of incorrect consumables and reduced risk of improper disclosure of payment information for the consumables.

[0009] In accordance with the present invention, a method and system are provided which substantially reduce the disadvantages and problems associated with previous methods and systems for purchasing information handling system consumables. A module installed on an information handling system automatically orders consumables at predetermined inventory levels for consumable-using devices associated with the information handling system.

[0010] More specifically, when a purchaser orders an information handling system from a manufacturer, a consumable preference set-up module accepts purchaser preferences for ordering consumables used by devices of the information handling system. The purchaser preferences are incorporated in a consumable auto-order module of the manufactured information handling system along with a service tag number that identifies the purchased information handling system. The information handling system is shipped to the purchaser and consumable usage of consumable-using devices is tracked by a consumable-usage tracking module. Once consumable usage depletes consumable inventory below a predetermined level for consumables identified by the purchaser's consumable preferences, the consumable auto-order module sends an order for additional consumables to the manufacturer with the information handling system service tag number. A consumable order module at the manufacturer associates the service tag number with an account number and arranges to send the ordered consumables to an account address associated with the service tag number. The consumable auto-order module then updates the consumable inventory for the ordered consumables and tracks consumable use for the updated inventory level.

[0011] The present invention provides a number of important technical advantages. One example of an important technical advantage is that consumables are ordered automatically for an information handling system without a need for intervention by a user. Consumable usage is automatically tracked and monitored for a predetermined inventory level so that additional consumables are ordered and delivered before depletion of an on-hand inventory. Automatic ordering of consumables ensures that the information handling system user will receive replenishments of consumables before losing system functionality without having to track consumable usage or inventory. Further, automated tracking of consumable usage ensures that ordered consumables match the consumables used by information handling system consumable-using devices.
Another example of an important technical advantage of the present invention is that consumables are automatically ordered based on a purchased information handling system configuration without sending personal account payment information over public networks. For instance, upon purchase of an information handling system, the purchaser inputs consumable order preferences that determine the type of consumables ordered and the account information for payment of the consumables. Once the information handling system is delivered to the purchaser, a module installed during manufacture of the information handling system orders consumables by reference to a service tag number, thus limiting the need for sending of payment information for the ordered consumables.

BRIEF DESCRIPTION OF THE DRAWINGS

The present invention may be better understood, and its numerous objects, features and advantages made apparent to those skilled in the art by referencing the accompanying drawings. The use of the same reference number throughout the several figures designates a like or similar element.

FIG. 1 depicts a block diagram of an automatic consumable ordering system for information handling system consumables; and

FIG. 2 depicts a flow diagram of a process for automated ordering of consumables used by an information handling system.

DETAILED DESCRIPTION

Automated ordering of information handling system consumables improves usability by ensuring that consumables are re-stocked without user intervention before a lack of a consumable makes an information handling system function or device unusable. The present invention provides effective automatic tracking and ordering of consumables by including consumable ordering preferences during manufacture of an information handling system. For purposes of this application, an information handling system may include any instrumentality or aggregate of instrumentality operable to compute, classify, process, transmit, receive, retrieve, originate, switch, store, display, manifest, detect, record, reproduce, handle, or utilize any form of information, intelligence, or data for business, scientific, control, or other purposes. For example, an information handling system may be a personal computer, a network storage device, or any other suitable device and may vary in size, shape, performance, functionality, and price. The information handling system may include random access memory (RAM), one or more processing resources such as a central processing unit (CPU) or hardware or software control logic, ROM, and/or other types of nonvolatile memory. Additional components of the information handling system may include one or more disk drives, one or more network ports for communicating with external devices as well as various input and output (I/O) devices, such as a keyboard, a mouse, and a video display. The information handling system may also include one or more buses operable to transmit communications between the various hardware components.

Referring now to FIG. 1, a block diagram depicts an automatic consumable ordering system 10 for consumables used by an information handling system 12. Information handling system 12 is manufactured with one or more consumable-using devices 14. For instance, in one embodiment, consumable-using device 14 is an ink jet printer that uses consumable ink jet cartridges and ink jet paper, such as for printing color pictures. Alternatively, consumable-using device 14 is a laser printer that uses consumable laser printer toner cartridges and drums and regular printing paper. In another embodiment, consumable-using device 14 is a disk storage device that stores information on consumable media, such as disks used by CD-ROM, CD-RW or DVD compact disk drives, floppy disks or storage tapes for ZIP drives.

A consumable auto-order module 16 is loaded on an information handling system 12 automatically places orders for consumables used by consumable-using device 14. Consumable auto-order module 16 compares desired levels of consumable inventory established from consumable preferences with actual levels of consumable inventory determined by a consumable usage tracking module 18. When a consumable inventory level reaches a predetermined level, consumable auto-order module 16 places an order for that consumable through a consumable ordering module 20. For instance, for a printer consumable-using device 14, consumable auto-order module 16 sets an order threshold for ink and places an order for additional ink based on ink levels measured by the printer. When consumable usage tracking module 18 detects an ink level of the order threshold, consumable auto-order module 16 sends a message to the manufacturer of the information handling system with consumable message 20 through a network 22, such as the Internet, and orders additional printer ink. The message sent by consumer message system 20 identifies the desired consumable and ordering source with a service tag number so that account information, such as a credit card account number, is not sent through insecure communications. A service tag number is typically an alphanumeric identification number that is assigned by the manufacturer.

Orders for consumables are received by an information handling system order engine 24 operated directly or indirectly by the information handling system manufacturer. A consumable order module 26 looks up account information for received consumable orders with a service tag account database 28 by finding the account information associated with the service tag of a consumable order message. Consumable order module 26 places an order for the consumable to be shipped to the site of information handling system 12 by using the account information without any need for intervention by the user or information handling system 12. The use of the service tag to fill the consumable order makes the process anonymous to anyone who intercepts a consumable order message since no personal or payment information is transferred to accomplish the sale. In the event that the user of information handling system 12 desires direct interaction with the consumable ordering process, consumer auto-order module 16 directs communication with a consumable preference set-up module through a secure interface, such as a secure Internet interface with a browser of information handling system 12. For instance, the user is able to update account information through consumable preference set-up module 30 so that subsequent messages with the service tag will place consumable orders according to the updated account information.

Referring now to FIG. 2, a flow diagram depicts a process for using consumable preference set-up module 30 to establish consumable preferences when an information handling system is ordered from a manufacturer. The process starts at step 32 with the ordering of an information handling system from a manufacturer, such as through a secure Internet interface. At step 34, during the ordering of the information handling system, the purchaser inputs consumable auto-order preferences so that an auto order module is installed with the preferences during manufacture of the information handling system. For instance, consumable preference set-up module
determines the consumable-using devices purchased with the information handling system and the type of consumable goods the user may need. Consumable preference set-up module 30 then queries the purchaser to determine if auto-ordering of consumables is desired for one or more of the consumable-using devices. The account information for purchasing the consumables with auto-orders may be copied from the purchase of the information handling system or separately input by the purchaser. At step 36, the information handling system is built to include a consumable auto-order module populated with the initial consumable auto-order preferences and is shipped to the purchaser. In an alternative embodiment, consumable auto-order module 16 may query the user for initial consumable order preferences during initial power-up by a purchaser.

[0021] At step 38, consumable auto-order module 16 monitors consumable usage to detect consumable inventory levels below an order threshold. When a consumable order threshold is reached, at step 40 an automatic order of the consumable is initiated by sending a message to the manufacturer with the service tag of the information handling system. In one embodiment, the initiation of a consumable order occurs without customer intervention based on automated tracking of consumable usage. In an alternative embodiment, consumable orders are confirmed by the information handling system user before the order is sent to allow the user to alter the order or to order additional items. Alternatively, a confirmatory e-mail may be sent to the information handling system user after the order is automatically sent to and received by the manufacturer.

[0022] At step 42, the auto-consumable order is processed by the manufacturer to automatically purchase and send the identified consumable to the information handling system location. For instance, service tag information provided by a consumable auto-order message is correlated with account information to determine a credit card to charge for the order and an address to which the order is to be sent. At step 44, the consumable order is shipped to the account address associated with the service tag number. At step 46, the consumable inventory amount is updated to reflect shipped consumables. For instance, a message is sent to the information handling system associated with the service tag number indicating the shipment of the ordered consumables. Alternatively, the information handling system user is presented with a display query after the lapse of a shipment time to determine that the consumable has arrived, or the consumable-using device is monitored to detect the installation of additional consumables. Once the consumable inventory is updated to reflect the addition of ordered consumables, the process returns to step 38 to monitor consumable usage.

[0023] Although the present invention has been described in detail, it should be understood that various changes, substitutions and alterations can be made hereto without departing from the spirit and scope of the invention as defined by the appended claims.

1. An information handling system comprising:
   one or more consumable-using devices;
   a consumable usage tracking module interfaced with the consumable-using devices and operable to track consumable usage by the consumable-using devices; and
   a consumable auto-order module interfaced with the consumable usage tracking module and operable to automatically order consumables if consumable usage reaches a predetermined value by sending a tag number to a distal server through a network.

2. The information handling system of claim 1 wherein the consumable-using devices comprise a printer and the consumable comprises printer ink.

3. The information handling system of claim 2 wherein the consumable further comprises printer paper.

4. The information handling system of claim 1 wherein the consumable-using device comprises a disk drive and the consumable comprises compact disks.

5. The information handling system of claim 1 further comprising a messaging system interfaced with the consumable auto-order module, the messaging system operable to present a message on the information handling system when consumable automatic orders occur.

6. The information handling system of claim 1 wherein the consumable auto-order module is populated with consumable order information at manufacture of the information handling system.

7. The information handling system of claim 6 wherein the consumable order information comprises consumable preferences input by the purchaser of the information handling system.

8-16. (canceled)

17. A method for manufacturing an information handling system, the method comprising:
   accepting an order for an information handling system from a purchaser through the Internet, the information handling system having one or more consumable-using devices;
   presenting the purchaser with consumable preferences to select, the consumable preferences associated with the automatic ordering of consumables for the consumable-using devices; and
   loading a module on the ordered information handling system for automatic ordering of consumables according to the selected consumable preferences.

18. The method of claim 17 wherein the consumable preferences comprise account information for charging ordered consumables, the method further comprising:
   storing the account information with the information handling system manufacturer;
   associating the account information with an information handling system service tag; and
   providing the service tag to the module for use in communicating consumable orders to the manufacturer.

19. The method of claim 17 wherein the consumable using device comprises a printer and the module is operable to order printer ink.

20. The method of 17 wherein the consumable-using device comprises a disk storage drive and the module is operable to order storage disks.

21. The method of claim 17 wherein the consumable-using device comprises a printer and the module is operable to order paper.
