These derivatives are useful as antimicrobial agents which are effective against a number of human and veterinary pathogens, including gram positive bacteria such as multiply-resistant staphylococci,
streptococci, and enterococci, such as methicillin-resistant
Staphylococcus aureus or vancomycin-resistant Enterococcus faecium.

2. **Description of the Prior Art**

The literature contains a limited number of isoxazolinones used as
pre-emergence herbicides. For example in U.S. Patent 4,065,463, 2-
methyl-4-(trifluoromethyl-m-tolyl)-3-isoxazolin-5-one and 2-methyl-4-
(chloro-m-tolyl)-3-isoxazolin-5-one are disclosed as being useful in
preventing the growth of weeds which have a deleterious effect on crop
production.

![Chemical Structure 1](image1)

U.S. Patent 4,000,155 discloses the related compound 1,2-
dimethyl-4-(trifluoromethyl-m-tolyl)-3-pyrazolin-5-one for the same utility.

![Chemical Structure 2](image2)

The applicant is not aware of any literature which discloses the use
of these compounds as broad spectrum anti-bacterial agents. A different
ring system is disclosed in WO 98/07708, which discusses the use of
isoxazoline derivatives as anti-bacterial agents,

Oxazolidinones II shown below are a well known class of orally active antibacterial agents. The prior art contains numerous references to these compounds where Y and Z can include a wide variety of substituents. Specific substituted oxazolidinones are discussed in U.S. Patent Nos. 4,705,799 and 5,523,403 (substituted phenyl 2-oxazolidinones), U.S. Patent Nos. 4,948,801; 5,254,577; and 5,130,316 (arylbenzene oxazolidinyl compounds), and European Patent Applications 0,697,412; 0,694,544; 0694,543; and 0,693,491 (5 to 9-membered heteroaryl substituted oxazolidinones).

Additionally, certain compounds containing a substituted furanone ring have been reported to possess antibiotic activity. WO 97/14690 discloses

where T is hydroxy or NHC(O)C₁₋₄ alkyl, M and L are each independently hydrogen or fluoro, G and H are each independently hydrogen or methyl, K-J is of the formula C=CH, CHCH₂ or C(OH)CH₂, I is O, SO, SO₂ or a substituted nitrogen, and Q-R is CH₂-CH₂ or CH=CH₂. Other substituted furanones are discussed in U.S. Patent 5,708,169, WO 97/43280 and WO 97/10235.

The compounds of this invention are novel and represent a new class of antibacterial agents. They are distinct from both the previously reported oxazolidinone and isoxazoline antibiotics since they incorporate the isoxazolinone ring system. They differ from the prior art isoxazolinone herbicides since the ring nitrogen must be substituted with an amide moiety as defined above.

The compounds of formula I are antibacterial agents useful in the treatment of infections in humans and other animals caused by a variety of bacteria, particularly methicillin-resistant \textit{Staphylococcus aureus} and vancomycin-resistant \textit{Enterococcus faecium}.

Also included in the invention are processes for preparing the compounds of formula I and pharmaceutical compositions containing said compounds in combination with pharmaceutically acceptable carriers or diluents.

Some specific preferred embodiments of the present invention are listed in the table below.
The compounds of the present invention can be made by the methods summarized below.

It will be apparent to those skilled in the art that the procedures described herein are representative in nature and that alternative procedures are feasible.

Isoxazolinones 5 of the present invention are preferably prepared via the sequence outlined in Scheme 1. Aryl acetic acids 1 are either commercially available or prepared by one of many well known methods in the chemical literature including but not limited to the sequence shown in Scheme 2 or 3. Isoxazolinone 3 is prepared by methods described by Marchesini [J. Org. Chem. 1984, 49, p. 4287-4290]. Reaction of 1 with sodium hydride and ethyl formate provides 2 which is in turn reacted with hydroxylamine yielding 3. Treatment of 3 with mild base, preferably potassium carbonate, in an appropriate solvent, preferably dichloromethane or N, N-dimethylformamide followed by addition of 4 (prepared by methods described by Barnes et al in US Patent 5, 284, 863) provides isoxazolinone 5.

An alternative way to prepare aryl acetic esters 1 of the present invention is shown in Scheme 2. Treatment of triflate 6 (prepared from methyl 4-hydroxyphenyl acetate by methods known by those skilled in the art) with an \(N, N\)-dialkylamine in the manner described by Buchwald [Tet. Lett., 1997, 38, p. 6363-6366] produces esters exemplified by 7. Aryl-bromides, -iodides, and -chlorides are also suitable as replacements for triflate 6 in Scheme 2. The \(N, N\)-dialkylamines used in Scheme 2 are either commercially available or are synthesized by literature procedures. Literature preparations of many cyclic \(N, N\)-dialkylamines have been detailed by Gadwood (WO 97/10223) and others are well known to those skilled in the art.

**Scheme 2**

Another alternative to prepare aryl acetic esters 1 of the present invention is shown in Scheme 3. Treatment of 8 with a mild base, preferably potassium carbonate, and a primary or secondary amine or thiolate, in a suitable solvent, preferably acetonitrile or \(N, N\)-dimethylformamide, at a temperature between 25°C and 100°C provides 9. Compound 8 is commercially available. Compound 9 is converted to 11 or 12 by methods described by Gravestock (World Patent 97/14690). This sequence is also known to those skilled in the art as the Willgerodt reaction. Conversion of 11 to 12 can also be accomplished by various methods known in the chemical literature including but not limited to treatment with acid in hot alcohol.
Scheme 3

Sulfides and sulfoxides 14 and 16 are prepared by treating sulfides 13 and 15, respectively with an oxidizing agent such as m-chloroperoxybenzoic acid or osmium tetroxide by methods known by those skilled in the art and exemplified by Barbachyn [J. Med. Chem., 1996, 39, 680-685].
An alternative method of preparing compound 18 of the present invention is shown in Scheme 5. Treatment of 17 with an appropriate organostannane provides 18. This method is known by those skilled in the art as the Stille cross-coupling reaction.
Preparation of 21, 22, 23, and 24 of the present invention is described in Scheme 6. Treatment of 19 with trifluoroacetic acid provides 20. Compound 20 is treated with an acid chloride, chloroformate, sulfonyl halide, or isocyanate in the presence of triethylamine by methods well known in the chemical literature to provide 21, 22, 23, and 24, respectively.
The triazole-substituted compounds 27 and 28 are prepared by cyclization of the azide 25 with acetylenes 26 (Scheme 7). This is a
standard 3+2 cycloaddition which is well documented in the chemical literature. The acetylenes 26 are either commercially available or prepared by literature procedures. For example, cyanoacetylene is prepared according to Murahashi [J. Chem. Soc. Jap., 1956, 77, 1689].

The cyclization reaction was usually carried out in a suitable solvent such as DMF, at a temperature between 25°C and 80°C. Other suitable solvents include but are not limited to DMSO, NMP, and DMA. The two cyclization adducts 27 and 28 were separated using preparative HPLC or by triturating with a suitable solvent such as ethyl acetate. Other suitable solvents for trituration include but are not limited to methanol, ethanol, diethyl ether, and acetone.

The azidophenylisoxazolinone 25 is reduced to aminophenylisoxazolinone 29 via one of the many well known methods in the chemical literature including but not limited to the treatment with stannous chloride in a suitable solvent such as a 2:1 combination of ethyl acetate and methanol. Treatment of aminophenylisoxazolinones 29 with 2,5-dimethoxytetrahydrofurans 30 in acetic acid provide pyrrole-substituted isoxazolinones 31 (Scheme 8). Subsequent conversions of
the pyrrole (R = CHO) are also possible, for instance the corresponding oxime can be prepared by refluxing with 50% aqueous hydroxylamine in methanol.

\]

N-thioacetates 33 may be prepared from the corresponding N-acetates 32 using a variety of well-known literature methods, for instance by refluxing in benzene with Lawesson's reagent. Other solvents such as toluene and xylene are also suitable.

It will be understood that where the substituent groups used in the above reactions contain certain reaction-sensitive functional groups which
might result in undesirable side-reactions, such groups may be protected by conventional protecting groups known to those skilled in the art. Suitable protecting groups and methods for their removal are illustrated, for example, in *Protective Groups in Organic Synthesis*, Theodora W. Greene (John Wiley & Sons, 1991). It is intended that such "protected" intermediates and end-products are included within the scope of the present disclosure and claims.

Some of the desired end-products of formula I contain an amine. In these cases, the final product may be recovered in the form of a pharmaceutically acceptable acid addition salt, e.g. by addition of the appropriate acid such as HCl, HI or methane-sulfonic acid to the amine.

It will be appreciated that certain products within the scope of formula I may have substituent groups which can result in formation of optical isomers. It is intended that the present invention include within its scope all such optical isomers as well as epimeric mixtures thereof, i.e. R- or S- or racemic forms.

The compounds of the invention are useful because they possess pharmacological activities in animals, including particularly mammals and most particularly, humans. The novel isoxazolinone derivatives of general formula I, or pharmaceutically acceptable salts or prodrugs thereof, are potent antibiotics active against gram-positive bacteria. While they may be used, for example, as animal feed additives for promotion of growth, as preservatives for food, as bactericides in industrial applications, for example in water-based paint and in the white water of paper mills to inhibit the growth of harmful bacteria, and as disinfectants for destroying or inhibiting the growth of harmful bacteria on medical and dental equipment, they are especially useful in the treatment
of bacterial infections in humans and other animals caused by the gram-
positive bacteria sensitive to the new derivatives.

The pharmaceutically active compounds of this invention may be
used alone or formulated as pharmaceutical compositions comprising, in
addition to the active isoxazolinone ingredient, a pharmaceutically
acceptable carrier or diluent. The compounds may be administered by a
variety of means, for example, orally, topically or parenterally (intravenous
or intramuscular injection). The pharmaceutical compositions may be in
solid form such as capsules, tablets, powders, etc. or in liquid form such
as solutions, suspensions or emulsions. Compositions for injection may
be prepared in unit dose form in ampules or in multidose containers and
may contain additives such as suspending, stabilizing and dispersing
agents. The compositions may be in ready-to-use form or in powder form
for reconstitution at the time of delivery with a suitable vehicle such as
sterile water.

Thus, according to another aspect of the invention, there is
provided a method of treating a bacterial infection which comprises
administering a therapeutically effective amount of the compound to a
host, particularly a mammalian host and most particularly a human
patient. The use of the compounds of the present invention as
pharmaceuticals and the use of the compounds of the invention in the
manufacture of a medicament for the treatment of bacterial infections are
also provided.

The dosage to be administered depends, to a large extent, on the
particular compound being used, the particular composition formulated,
the route of administration, the nature and condition of the host and the
particular situs and organism being treated. Selection of the particular
preferred dosage and route of application, then, is left to the discretion of
the physician or veterinarian. In general, however, the compounds may be administered parenterally or orally to mammalian hosts in an amount of from about 25 mg/day to about 2 g/day.

The preparations of pyrazoles substituted compounds are outlined in Scheme 10. Compound 29 was diazotized and then reduced to form hydrazine hydrochloride salt 34 via one of the many well known methods in the chemical literature including but not limited to the treatment with sodium nitrite and stannous chloride. Treatment of 34 with ethoxycarbonylmalondialdehyde, cyanomalondialdehyde [prepared according to Bertz, S.H., Dabbagh, G. and Cotte, P. in J. Org. Chem, 1982, 47, p. 2216.] or malondialdehyde [prepared according to Martinez, A.M., Cushmac, G.E., Rocek, J. in J. Amer. Chem. Soc, 1975, 97, p. 6502] in the presence of sodium bicarbonate at room temperature provides compound 35.

In Vitro Activity

Samples of the compounds prepared below in Examples 1 - 97 after solution in water and dilution with Nutrient Broth were found to exhibit the following ranges of Minimum Inhibitory Concentrations (MIC) versus the indicated microorganisms as determined by tube dilution. The MICs were determined using a broth micro dilution assay in accordance with that recommended by the National Committee for Clinical Laboratory Standards (NCCLS). Mueller-Hinton medium was used except for Streptococci which was tested in Todd Hewitt broth. The final bacterial inoculate contained approximately 5 x 10^5 cfu/ml and the plates were incubated at 35°C for 18 hours in ambient air (Streptococci in 5% CO2). The MIC was defined as the lowest drug concentration that prevented visible growth.

In the following examples, all temperatures are given in degrees Centigrade. Melting points were determined on an electrothermal apparatus and are not corrected. Proton and carbon-13 nuclear magnetic resonance (¹H and ¹³C NMR) spectra were recorded on a Bruker AM-300 or a Varian Gemini 300 spectrometer. All spectra were determined in CDCl₃, DMSO-d₆, CD₃OD, or D₂O unless otherwise indicated. Splitting patterns are designated as follows: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; br, broad peak; dd, doublet of doublets; dt, doublet of triplets; and app d, apparent doublet, etc. Infrared spectra were determined on a Perkin-Elmer 1800 FT-IR spectrometer from 4000 cm⁻¹ to 400 cm⁻¹, calibrated to 1601 cm⁻¹ absorption of a polystyrene film, and are reported in reciprocal centimeters (cm⁻¹). Mass spectra were recorded on a Kratos MS-50 or a Finnegan 4500 instrument utilizing direct chemical ionization (DCI, isobutene), fast atom
bombardment (FAB), or electron ion spray (ESI). Ultraviolet spectra were determined on a Hewlett Packard 8452 diode array spectrophotometer in the solvent indicated.

Analytical thin-layer chromatography (TLC) was carried out on precoated silica gel plates (60F-254) and visualized using UV light, iodine vapors, and/or staining by heating with methanolic phosphomolybdic acid. Column chromatography, also referred to as flash chromatography, was performed in a glass column using finely divided silica gel at pressures somewhat above atmospheric pressure with the indicated solvents. Reversed-phase analytical thin-layer chromatography was carried out on precoated reverse phase plates and visualized using UV light or iodine vapors.

To a solution of 4-methylthiophenylacetic acid (1.0 g, 5.48 mmol) in 55 mL of ethanol was slowly added a catalytic amount of concentrated sulfuric acid. The mixture was stirred at room temperature overnight and then concentrated at reduced pressure. The residue was partitioned between methylene chloride and sodium bicarbonate. The organic layer was washed with brine, dried with magnesium sulfate, filtered, and concentrated to yield 1.1 g of a colorless oil (96%). $^1$H NMR (300MHz,
CDCl₃ δ 7.22 (s, 4 H), 4.15 (q, J=6 Hz, 2 H), 3.57 (s, 2 H), 2.47 (s, 3 H), 1.25 (t, J=6 Hz, 3 H).

To a solution of ethyl 4-methylthio-α-formyl-phenylacetate in 20 mL of methanol and 1 mL of water was added hydroxylamine hydrochloride (0.54 g, 7.8 mmol). The mixture was heated to reflux for 1 hour. The solvent was evaporated and the residue was triturated with water to afford a precipitate, which was then further triturated with ether to yield 0.48 g (two steps, 44%) of a pale yellow solid. ¹H NMR (300MHz, MeOH-d₄) δ 8.74 (s, 1 H), 7.66 (d, J=8 Hz, 2 H), 7.25 (d, J=8 Hz, 2 H), 2.46 (s, 3 H).

Ethyl 4-Azidophenylacetate

Following the general procedure of Marchesini (J. Org. Chem. 49, p. 4287-4290, 1984), sodium nitrite (38 g, 0.56 mol) was slowly added to a stirred and cooled (0°C) mixture of ethyl 4-aminophenylacetate (25 g, 0.14 mol) in 700 mL of TFA. After the addition was complete, the reaction was stirred at 0°C for another 0.5 hour and then sodium azide (27 g, 0.42 mol) was slowly added over a period of 0.5 hours. The mixture was stirred for another 2 hours at 0°C and then quenched with ice water and the product was extracted with EtOAc. The organic phase was washed with water, dried over magnesium sulfate, filtered, concentrated to yield 26.5 g (90%) of the title compound as a white solid. $^1$H NMR (300 MHz, DMSO-d$_6$) δ 7.31 (d, J = 8 Hz, 2 H), 7.07 (d, J = 7 Hz, 2 H), 4.07 (q, J = 7 Hz, 2 H), 3.66 (s, 2 H), 1.17 (t, J = 7 Hz, 3 H).
