The compounds provided are useful in the treatment, prevention, or amelioration of a disease or disorder related to RAF, including BRAF kinase, activity or one or more symptoms thereof.

BACKGROUND
[0003] Protein kinases (PKs) are enzymes that catalyze the phosphorylation of hydroxyl groups on tyrosine, serine or threonine residues of proteins. Protein kinases act primarily as growth factor receptors and play a central role in signal transduction pathways regulating a number of cellular functions, such as cell cycle, cell growth, cell differentiation and cell death.

[0004] One important signal transduction pathway is the mitogen-activated protein kinase (MAPK) pathway. The MAPK signaling pathway is responsible for the regulation of cell growth, differentiation, proliferation and survival and its dysregulation is implicated in a broad spectrum of cancer. (Hoshino, et al, Oncogene, 1999, 18, 813-822)

[0005] The MAPK signaling pathway is one of multiple signaling pathways activated by GTP-bound RAS. Initially, extracellular stimuli such as mitogens, hormones or neurotransmitters induce receptor tyrosine kinase dimerization leading to increased levels of GTP-bound RAS. Activated RAS recruits dimerized RAF kinase to the plasma membrane whereby RAF is activated by autophosphorylation or phosphorylation by other kinases. The activation of RAF initiates the phosphorylation cascade down the MEK/ERK pathway, in which activated RAF phosphorylates and activates MEK 1/2 which in turn phosphorylates and activates ERK (or extracellular signal-regulated kinase, also called p44/42 MAPK) which in
turn phosphorylates a number of targets including nuclear transcription factors that lead to changes in gene expression.

[0006] RAF is a family of serine/threonine kinases comprising three isoforms called ARAF, BRAF and CRAF (also called raf-1). BRAF is currently a cancer therapeutic target, as mutations in the BRAF gene are among the most common in cancer (Haluska, et al., Clin Cancer Res 2006, 12(7 Pt 2), 2301s-2307s; Ikediobi, et al., Mol. Cancer Ther. 2006 5(11), 2606-2612; Greenman, et al., Nature 2007 226(7132), 153-158). The majority of mutant BRAF have been found to exhibit elevated kinase activity as measured by levels of phosphorylated MEK or ERK found endogenously in COS cells (Wan et al. Cell 2004 116, 855-867). BRAF mutations have been identified in about 7% of all known cancers, including 27-70% of melanoma (Davies et al. Nature, 2002 417, 949-954), 42-50% of papillary thyroid carcinoma, 36-53% colorectal cancers, and 5-22% serous ovarian cancers and to a lesser extent in breast cancer, endometrial cancer, liver cancer, sarcoma, stomach cancer, Barret's adenocarcinoma, gliomas including ependymomas and lung cancer including 1-2% of non small cell lung cancer (See Davies et al. Nature, 2002, 417, 949-954; Garnett and Marais, Cancer Cell, 2004 6, 313-319; Ouyang et al. Clin Cancer Res 2006 12(6), 1785-1793; Melillo, et al., J. Clin. Invest. 2005, 115, 1068-1081; Wilhelm, et al., Nat. Rev. Drug Discov., 2006 5, 835-844; and Ji et al. Cancer Res 2007 67(10), 4933-4939). Over forty different missense mutations of BRAF have been identified, but among them, the V600E mutation, has been found to be the most predominant (Fecher, et al., J. Clin. Oncology 2007, 25(12), 1606-1620), accounting for nearly 90% of the mutations in melanoma and thyroid cancer and for a high proportion in colorectal cancer, which makes this mutation a particularly attractive target for molecular therapy. A study of the crystal structures of both wild type and V600 mutants suggests that substitution at the 600 position destabilizes the inactive conformation of the enzyme (Wan et al. op cit.). However, V600E mutation is comparatively rare in non-small cell lung cancer, which is more likely than not to be associated with non-V600E BRAF missense mutations (Brose et al. Cancer Res., 2002 62, 6997-7000). Other non-V600E BRAF missense mutations are also implicated in melanoma, breast cancer, lung cancer, colorectal cancer, liver cancer, ovarian cancer, leukemia including acute lymphoblastic leukemia (ALL), non-Hodgkin's lymphoma, Barret's adenocarcinoma, endometrial cancer, liver cancer, stomach cancer, thyroid cancer and endometrial cancer (Garnett and Marais, op. cit.).
In vivo efficacy has been demonstrated for BRAF inhibitors NVP-AAL881-NX (also AAL881) and NVP-L T613-AG-8 (LBT613) in mouse tumor xenograft models using human cell lines (See, Ouyang et al. op. cit.). Preclinical studies have also shown that BRAF inhibition by siRNA or by the small molecule RAF kinase inhibitor Sorafenib resulted in a decrease in tumor growth or metastases in animals (Sharma et al. Cancer Res., 2005, 65(6), 2412-2421; Sharma et al. Cancer Res., 2006, (66)16, 8200-8209). RAF inhibitors that have entered clinical trials include antisense oligonucleotides against CRAF such as ISIS 5132 and LErafAON and small molecule BRAF inhibitors such as BAY 43-9006 (Sorafenib), Raf-265 (formerly CHIR-265, Novartis), PLX-4032 ( Plexxikon) and XL281 (Exelixis).

Although most BRAF mutations are activating mutations, mutants having impaired kinase activity have been identified, and shown to stimulate ERK activity, presumably through recruitment of CRAF (Wan op cit.). Therefore, CRAF represents another target for the treatment of diseases associated with this particular subset of BRAF mutants.

Outside of cancer, the MAPK (Raf-Mek-Erk) signaling pathway could provide targets for inflammation and inflammatory diseases. The MAPK pathway is known to control cell survival and apoptosis of inflammatory cells such as basophils, macrophages, neutrophils and monocytes (See Dong et al., Annu. Rev. Immunol., 2002, 20, 55-72; Johnson, et al, Curr. Opin. Chem. Biol., 2005, 9, 325-331; R. Herrera and J. S. Sebott-Leopold, Trends Mol. Med., 2002, 8, S27-S3; and Kyriakis et al., Physiol. Rev., 2002, 81, 807-869). In the carrageenan-induced pleurisy rat model, it has been shown that the Erkl/2 inhibitor PD98059 inhibits eosinophilic proinflammatory cytokine release by increasing the rate of neutrophil apoptosis thereby decreasing the number of macrophage and neutrophils that perpetuate the inflammatory response (Sawatzky et al, Am J Pathol 2006, 168(1), 33-41). It is therefore possible that one downstream effect of inhibiting RAF might be the resolution of an inflammatory response and BRAF inhibitors could be useful for the treatment of inflammatory diseases or immune system disorders including inflammatory bowel disease, Crohn's disease, ulcerative colitis, systemic lupus erythematosus (SLE), rheumatoid arthritis, multiple sclerosis, thyroiditis, type 1 diabetes, sarcoidosis, psoriasis, allergic rhinitis, asthma, COPD (chronic obstructive pulmonary disease) (See Stanton et al. Dev. Biol. 2003 263,165-175, Hofrnan et al Curr. Drug Targets. Inflamm. Allergy 2004 2,1-9).
Given the multitude of diseases attributed to the dysregulation of MAPK signaling, there is an ever-existing need to provide novel classes of compounds that are useful as inhibitors of enzymes in the MAPK signaling pathway, as discussed herein.

"Heteroaralkyl" refers to a radical of the formula -R\textsubscript{a}R\textsubscript{f} where R\textsubscript{a} is an alkyl radical as defined above and R\textsubscript{f} is a heteroaryl radical as defined herein. The alkyl radical and the heteroaryl radical may be optionally substituted as defined herein.

"IC\textsubscript{50}" refers to an amount, concentration or dosage of a particular test compound that achieves a 50% inhibition of a maximal response, such as cell growth or proliferation measured via any the in vitro or cell based assay described herein.

Unless stated otherwise specifically described in the specification, it is understood that the substitution can occur on any atom of the alkyl, alkenyl, alkynyl, cycloalkyl, heterocyclyl, aryl or heteroaryl group.

"Oxo" refers to =0.

Pharmaceutically acceptable salts include, but are not limited to, amine salts, such as but not limited to N,N'-dibenzylethlenediamine, chloroprocaine,
choline, ammonia, diethanolamine and other hydroxyalkylamines, ethylenediamine,
N-methylglucamine, procaine, N-benzylphenethylamine,
1-p-nα-chlorobenzyl-2-pyrrolidin-r-ylmethyl- benzimidazole, diethylamine and other
alkylamines, piperazine and tris(hydroxymethyl)aminomethane; alkali metal salts,

of organic acids, such as but not limited to acetates, lactates, malates, tartrates,
citrates, ascorbates, succinates, butyrates, valerates and fumarates.

As used herein and unless otherwise indicated, the term "hydrate" means a compound provided herein or a salt thereof, that further includes a
stoichiometric or non-stoichiometric amount of water bound by non-covalent
intermolecular forces.

As used herein and unless otherwise indicated, the term "solvate" means a solvate formed from the association of one or more solvent molecules to a
compound provided herein. The term "solvate" includes hydrates (e.g., mono-
hydrate, dihydrate, trihydrate, tetrahydrate and the like).

"Sulfide" refers to the radical having the formula -SR wherein R is an
alkyl or haloalkyl group. An "optionally substituted sulfide" refers to the radical
having the formula -SR wherein R is an optionally substituted alkyl as defined herein.

As used herein, "substantially pure" means sufficiently homogeneous
to appear free of readily detectable impurities as determined by standard methods of
analysis, such as thin layer chromatography (TLC), gel electrophoresis, high
performance liquid chromatography (HPLC) and mass spectrometry (MS), used by
those of skill in the art to assess such purity, or sufficiently pure such that further
purification would not detectably alter the physical and chemical properties, such as
enzymatic and biological activities, of the substance. Methods for purification of the
compounds to produce substantially chemically pure compounds are known to those
of skill in the art. A substantially chemically pure compound may, however, be a
mixture of stereoisomers. In such instances, further purification might increase the
specific activity of the compound.
[0082] Unless specifically stated otherwise, where a compound may assume alternative tautomeric, regioisomeric and/or stereoisomeric forms, all alternative isomers are intended to be encompassed within the scope of the claimed subject matter. For example, where a compound is described as having one of two tautomeric forms, it is intended that the both tautomers be encompassed herein.

[0083] Thus, the compounds provided herein may be enantiomerically pure, or be stereoisomeric or diastereomeric mixtures. In the case of amino acid residues, such residues may be of either the L- or D-form. The configuration for naturally occurring amino acid residues is generally L. When not specified the residue is the L form. As used herein, the term "amino acid" refers to α-amino acids which are racemic, or of either the D- or L-configuration. The designation "d" preceding an amino acid designation (e.g., dAla, dSer, dVal, etc.) refers to the D-isomer of the amino acid. The designation "dl" preceding an amino acid designation (e.g., dlPip) refers to a mixture of the L- and D-isomers of the amino acid. It is to be understood that the chiral centers of the compounds provided herein may undergo epimerization in vivo. As such, one of skill in the art will recognize that administration of a compound in its (R) form is equivalent, for compounds that undergo epimerization in vivo, to administration of the compound in its (S) form.

[0084] It is to be understood that the compounds provided herein may contain chiral centers. Such chiral centers may be of either the (R) or (S) configuration, or may be a mixture thereof.

[0085] Optically active (+) and (-), (R)- and (S)-, or (D)- and (L)-isomers may be prepared using chiral synths or chiral reagents, or resolved using conventional techniques, such as reverse phase HPLC.

[0086] As used herein, the term "enantiomerically pure" or "pure enantiomer" denotes that the compound comprises more than 75% by weight, more than 80% by weight, more than 85% by weight, more than 90% by weight, more than 91% by weight, more than 92% by weight, more than 93% by weight, more than 94% by weight, more than 95% by weight, more than 96% by weight, more than 97% by weight, more than 98% by weight, more than 98.5% by weight, more than 99% by weight, more than 99.2% by weight, more than 99.5% by weight, more than 99.6% by weight, more than 99.7% by weight, more than 99.8% by weight or more than 99.9% by weight, of the desired enantiomer.
[0087] Where the number of any given substituent is not specified (e.g., haloalkyl), there may be one or more substituents present. For example, "haloalkyl" may include one or more of the same or different halogens.

[0088] In the description herein, if there is any discrepancy between a chemical name and chemical structure, the structure preferably controls. As used herein, "isotopic composition" refers to the amount of each isotope present for a given atom, and "natural isotopic composition" refers to the naturally occurring isotopic composition or abundance for a given atom. Atoms containing their natural isotopic composition may also be referred to herein as "non-enriched" atoms. Unless otherwise designated, the atoms of the compounds recited herein are meant to represent any stable isotope of that atom. For example, unless otherwise stated, when a position is designated specifically as "H" or "hydrogen", the position is understood to have hydrogen at its natural isotopic composition.

As used herein, "isotopically enriched" refers to an atom having an isotopic composition other than the natural isotopic composition of that atom. "Isotopically enriched" may also refer to a compound containing at least one atom having an isotopic composition other than the natural isotopic composition of that atom.

As used herein, "isotopic enrichment" refers to the percentage of incorporation of an amount of a specific isotope at a given atom in a molecule in the place of that atom's natural isotopic abundance. For example, deuterium enrichment of 1% at a given position means that 1% of the molecules in a given sample contain deuterium at the specified position. Because the naturally occurring distribution of deuterium is about 0.0156%, deuterium enrichment at any position in a compound synthesized using non-enriched starting materials is about 0.0156%. The isotopic enrichment of the compounds provided herein can be determined using conventional analytical methods known to one of ordinary skill in the art, including mass spectrometry and nuclear magnetic resonance spectroscopy.

[0089] "Anti-cancer agents" refers to anti-metabolites (e.g., 5-fluoro-uracil, methotrexate, fludarabine), antimicrotubule agents (e.g., vinca alkaloids such as vincristine, vinblastine; taxanes such as paclitaxel, docetaxel), alkylating agents (e.g., cyclophosphamide, melphalan, carmustine, nitrosoureas such as bischloroethylnitrosurea and hydroxyurea), platinum agents (e.g. cisplatin, carboplatin, oxaliplatin, JM-216 or satraplatin, CI-973), anthracyclines (e.g., doxrubicin, daunorubicin), antitumor antibiotics (e.g., mitomycin, idarubicin,
adriamycin, daunomycin), topoisomerase inhibitors (e.g., etoposide, camptothecins), anti-angiogenesis agents (e.g. Sutent® and Bevacizumab) or any other cytotoxic agents, (estramustine phosphate, prednimustine), hormones or hormone agonists, antagonists, partial agonists or partial antagonists, kinase inhibitors, and radiation treatment.

"Anti-inflammatory agents" refers to matrix metalloproteinase inhibitors, inhibitors of pro-inflammatory cytokines (e.g., anti-TNF molecules, TNF soluble receptors, and IL1) non-steroidal anti-inflammatory drugs (NSAIDs) such as prostaglandin synthase inhibitors (e.g., choline magnesium salicylate, salicylsalicylic acid), COX-I or COX-2 inhibitors), or glucocorticoid receptor agonists such as corticosteroids, methylprednisone, prednisone, or cortisone.

As used herein, the abbreviations for any protective groups, amino acids and other compounds, are, unless indicated otherwise, in accord with their common usage, recognized abbreviations, or the IUPAC-IUB Commission on Biochemical Nomenclature (see, Biochem. 1972, 11:942-944).

[00537] Isotopic enrichment of a drug can be used, for example, to (1) reduce or eliminate unwanted metabolites, (2) increase the half-life of the parent drug, (3) decrease the number of doses needed to achieve a desired effect, (4) decrease the amount of a dose necessary to achieve a desired effect, (5) increase the formation of active metabolites, if any are formed, and/or (6) decrease the production of deleterious metabolites in specific tissues and/or create a more effective drug and/or a safer drug for combination therapy, whether the combination therapy is intentional or not.

[00538] Replacement of an atom for one of its isotopes often will result in a change in the reaction rate of a chemical reaction. This phenomenon is known as the Kinetic Isotope Effect ("KIE"). For example, if a C-H bond is broken during a rate-determining step in a chemical reaction \textit{i.e.} the step with the highest transition state...

[00539] Tritium ("T") is a radioactive isotope of hydrogen, used in research, fusion reactors, neutron generators and radiopharmaceuticals. Tritium is a hydrogen atom that has 2 neutrons in the nucleus and has an atomic weight close to 3. It occurs naturally in the environment in very low concentrations, most commonly found as T2O. Tritium decays slowly (half-life = 12.3 years) and emits a low energy beta particle that cannot penetrate the outer layer of human skin. Internal exposure is the main hazard associated with this isotope, yet it must be ingested in large amounts to pose a significant health risk. As compared with deuterium, a lesser amount of tritium must be consumed before it reaches a hazardous level. Substitution of tritium ("T") for hydrogen results in yet a stronger bond than deuterium and gives numerically larger isotope effects. Similarly, substitution of isotopes for other elements, including, but not limited to, 13C or 14C for carbon, 33S, 34S, or 36S for sulfur, 15N for nitrogen, and 17O or 18O for oxygen, will provide a similar kinetic isotope effects.

[00540] In another embodiment, provided herein are methods of using the disclosed compounds and compositions, or pharmaceutically acceptable salts, solvates, or hydrates thereof, for the local or systemic treatment or prophylaxis of human and veterinary diseases, disorders and conditions modulated or otherwise affected mediated via RAF kinase, including BRAF kinase, activity.

C. FORMULATION OF PHARMACEUTICAL COMPOSITIONS

[00541] Provided herein are pharmaceutical compositions comprising a compound provided herein, e.g., a compound of Formula I, as an active ingredient, or a pharmaceutically acceptable salt, solvate or hydrate thereof; in combination with a pharmaceutically acceptable vehicle, carrier, diluent, or excipient, or a mixture thereof.

[00542] The compound provided herein may be administered alone, or in combination with one or more other compounds provided herein. The pharmaceutical compositions that comprise a compound provided herein, e.g., a compound of Formula I, can be formulated in various dosage forms for oral, parenteral, and topical
administration. The pharmaceutical compositions can also be formulated as modified release dosage forms, including delayed-, extended-, prolonged-, sustained-, pulsatile-, controlled-, accelerated- and fast-, targeted-, programmed-release, and gastric retention dosage forms. These dosage forms can be prepared according to conventional methods and techniques known to those skilled in the art (see, Remington: The Science and Practice of Pharmacy, supra; Modified-Release Drug Deliver Technology, Rathbone et al., Eds., Drugs and the Pharmaceutical Science, Marcel Dekker, Inc.: New York, NY, 2003; Vol. 126).

[00543] In one embodiment, the pharmaceutical compositions are provided in a dosage form for oral administration, which comprise a compound provided herein, e.g., a compound of Formula I, or a pharmaceutically acceptable salt, solvate or hydrate thereof; and one or more pharmaceutically acceptable excipients or carriers.

[00544] In another embodiment, the pharmaceutical compositions are provided in a dosage form for parenteral administration, which comprise a compound provided herein, e.g., a compound of Formula I, or a pharmaceutically acceptable salt, solvate or hydrate thereof; and one or more pharmaceutically acceptable excipients or carriers.

[00545] In yet another embodiment, the pharmaceutical compositions are provided in a dosage form for topical administration, which comprise a compound provided herein, e.g., a compound of Formula I, or a pharmaceutically acceptable salt, solvate or hydrate thereof; and one or more pharmaceutically acceptable excipients or carriers.

[00546] The pharmaceutical compositions provided herein can be provided in a unit-dosage form or multiple-dosage form. A unit-dosage form, as used herein, refers to physically discrete a unit suitable for administration to a human and animal subject, and packaged individually as is known in the art. Each unit-dose contains a predetermined quantity of an active ingredient(s) sufficient to produce the desired therapeutic effect, in association with the required pharmaceutical carriers or excipients. Examples of a unit-dosage form include an ampoule, syringe, and individually packaged tablet and capsule. A unit-dosage form may be administered in fractions or multiples thereof. A multiple-dosage form is a plurality of identical unit-dosage forms packaged in a single container to be administered in segregated unit-dosage form. Examples of a multiple-dosage form include a vial, bottle of tablets or capsules, or bottle of pints or gallons. The pharmaceutical compositions provided
herein can be administered at once, or multiple times at intervals of time. It is understood that the precise dosage and duration of treatment may vary with the age, weight, and condition of the patient being treated, and may be determined empirically using known testing protocols or by extrapolation from in vivo or in vitro test or diagnostic data. It is further understood that for any particular individual, specific dosage regimens should be adjusted over time according to the individual need and the professional judgment of the person administering or supervising the administration of the formulations.

[00547] In one embodiment, the therapeutically effective dose is from about 0.1 mg to about 2,000 mg per day of a compound provided herein. The pharmaceutical compositions therefore should provide a dosage of from about 0.1 mg to about 2000 mg of the compound. In certain embodiments, pharmaceutical dosage unit forms are prepared to provide from about 1 mg to about 2000 mg, from about 10 mg to about 1000 mg, from about 20 mg to about 500 mg or from about 25 mg to about 250 mg of the essential active ingredient or a combination of essential ingredients per dosage unit form. In certain embodiments, the pharmaceutical dosage unit forms are prepared to provide about 10 mg, 20 mg, 25 mg, 50 mg, 100 mg, 250 mg, 500 mg, 1000 mg or 2000 mg of the essential active ingredient.

**Oral Administration**

[00548] The pharmaceutical compositions provided herein can be provided in solid, semisolid, or liquid dosage forms for oral administration. As used herein, oral administration also includes buccal, lingual, and sublingual administration. Suitable oral dosage forms include, but are not limited to, tablets, fastmelts, chewable tablets, capsules, pills, troches, lozenges, pastilles, cachets, pellets, medicated chewing gum, bulk powders, effervescent or non-effervescent powders or granules, solutions, emulsions, suspensions, wafers, sprinkles, elixirs, and syrups. In addition to the active ingredient(s), the pharmaceutical compositions can contain one or more pharmacologically acceptable carriers or excipients, including, but not limited to, binders, fillers, diluents, disintegrants, wetting agents, lubricants, glidants, coloring agents, dye-migration inhibitors, sweetening agents, and flavoring agents.

[00549] Binders or granulators impart cohesiveness to a tablet to ensure the tablet remaining intact after compression. Suitable binders or granulators include, but are not limited to, starches, such as corn starch, potato starch, and pre-gelatinized
starch (e.g., STARCH 1500); gelatin; sugars, such as sucrose, glucose, dextrose, molasses, and lactose; natural and synthetic gums, such as acacia, alginic acid, alginites, extract of Irish moss, panwar gum, ghatti gum, mucilage of isabgol husks, carboxymethylcellulose, methylcellulose, polyvinylpyrrolidone (PVP), Veegum, larch arabogalactan, powdered tragacanth, and guar gum; celluloses, such as ethyl cellulose, cellulose acetate, carboxymethyl cellulose calcium, sodium carboxymethyl cellulose, methyl cellulose, hydroxyethylcellulose. Coloring agents include any of the approved, certified, water soluble FD&C dyes, and water insoluble FD&C dyes suspended on alumina hydrate, and color lakes and mixtures thereof. A color lake is the combination by adsorption of a water-soluble dye to a hydrous oxide of a heavy metal, resulting in an insoluble form of the dye. Enteric-coated tablets are compressed tablets coated with substances that resist the action of stomach acid but dissolve or disintegrate in the intestine, thus protecting the active ingredients from the acidic environment of the stomach. Enteric-coatings include, but are not limited to, fatty acids, fats, phenyl salicylate, waxes, shellac, ammoniated shellac, and cellulose acetate phthalates. Sugar-coated tablets are compressed tablets surrounded by a sugar coating, which may be beneficial in covering up objectionable tastes or odors and in protecting the tablets from oxidation. Film-coated tablets are compressed tablets that are covered with a thin layer or film of a water-soluble material. Film coatings include, but are not limited to, hydroxyethylcellulose, sodium carboxymethylcellulose, polyethylene glycol 4000, and cellulose acetate phthalate. The pharmaceutical compositions provided herein in a modified release dosage form can be prepared by methods known to those skilled in the art, including direct compression, dry or wet granulation followed by compression, melt-granulation followed by compression.

2. Osmotic Controlled Release Devices

The pharmaceutical compositions provided herein in a modified release dosage form can be fabricated using an osmotic controlled release device, including one-chamber system, two-chamber system, asymmetric membrane technology (AMT), and extruding core system (ECS). In general, such devices have at least two components: (a) the core which contains the active ingredient(s); and (b) a semipermeable membrane with at least one delivery port, which encapsulates the core. The semipermeable membrane controls the influx of water to the core from an
aqueous environment of use so as to cause drug release by extrusion through the
delivery port(s).

[00600] In addition to the active ingredient(s), the core of the osmotic device
optionally includes an osmotic agent, which creates a driving force for transport of
water from the environment of use into the core of the device. One class of osmotic
agents water-swellable hydrophilic polymers, which are also referred to as
"osmopolymers" and "hydrogels," including, but not limited to, hydrophilic vinyl and
acrylic polymers, polysaccharides such as calcium alginate, polyethylene oxide
(PEO), polyethylene glycol (PEG), polypropylene glycol (PPG), poly(2-hydroxyethyl
methacrylate), poly(acrylic) acid, poly(methacrylic) acid, polyvinylpyrrolidone
(PVP), crosslinked PVP, polyvinyl alcohol (PVA), PVA/PVP copolymers, PVA/PVP
copolymers with hydrophobic monomers such as methyl methacrylate and vinyl
acetate, hydrophilic polyurethanes containing large PEO blocks, sodium
croscarmellose, carrageenan, hydroxyethyl cellulose (HEC), hydroxypropyl cellulose
(HPC), hydroxypropyl methyl cellulose (HPMC), carboxymethyl cellulose (CMC)
and carboxyethyl, cellulose (CEC), sodium alginate, polycarbophil, gelatin, xanthan
gum, and sodium starch glycolate.

[00601] The other class of osmotic agents is osmogens, which are capable of
imbibing water to affect an osmotic pressure gradient across the barrier of the
surrounding coating. Suitable osmogens include, but are not limited to, inorganic
salts, such as magnesium sulfate, magnesium chloride, calcium chloride, sodium
chloride, lithium chloride, potassium sulfate, potassium phosphates, sodium
carbonate, sodium sulfite, lithium sulfate, potassium chloride, and sodium sulfate;
sugars, such as dextrose, fructose, glucose, inositol, lactose, maltose, mannitol,
raffinose, sorbitol, sucrose, trehalose, and xylitol.; organic acids, such as ascorbic
acid, benzoic acid, fumaric acid, citric acid, maleic acid, sebacic acid, sorbic acid,
adipic acid, edetic acid, glutamic acid, p-toluenesulfonic acid, succinic acid, and
tartaric acid; urea; and mixtures thereof.

[00602] Osmotic agents of different dissolution rates can be employed to
influence how rapidly the active ingredient(s) is initially delivered from the dosage
form. For example, amorphous sugars, such as MANNOGEM™ EZ (SPI Pharma,
Lewes, DE) can be used to provide faster delivery during the first couple of hours to
promptly produce the desired therapeutic effect, and gradually and continually release
of the remaining amount to maintain the desired level of therapeutic or prophylactic

149
effect over an extended period of time. In this case, the active ingredient(s) is released at such a rate to replace the amount of the active ingredient metabolized and excreted.

The core can also include a wide variety of other excipients and carriers as described herein to enhance the performance of the dosage form or to promote stability or processing.

Materials useful in forming the semipermeable membrane include various grades of acrylics, vinyls, ethers, polyamides, polyesters, and cellulosic derivatives that are water-permeable and water-insoluble at physiologically relevant pHs, or are susceptible to being rendered water-insoluble by chemical alteration, such as crosslinking. Examples of suitable polymers useful in forming the coating, include plasticized, unplasticized, and reinforced cellulose acetate (CA), cellulose diacetate, cellulose triacetate, CA propionate, cellulose nitrate, cellulose acetate butyrate (CAB), CA ethyl carbamate, CAP, CA methyl carbamate, CA succinate, cellulose acetate trimellitate (CAT), CA dimethylaminoacetate, CA ethyl carbonate, CA chloroacetate, CA ethyl oxalate, CA methyl sulfonate, CA butyl sulfonate, CA p-toluene sulfonate, agar acetate, amylose triacetate, beta glucan acetate, beta glucan triacetate, acetaldehyde dimethyl acetate, triacetate of locust bean gum, hydroxylated ethylene-vinylacetate, EC, PEG, PPG, PEG/PPG copolymers, PVP, HEC, HPC, CMC, CMEC, HPMC, HPMCP, HPMCAS, HPMCAT, poly(acrylic) acids and esters and poly(methacrylic) acids and esters and copolymers thereof, starch, dextran, dextrin, chitosan, collagen, gelatin, polyalkenes, polyethers, polysulfones, polyethersulfones, polystyrenes, polyvinyl halides, polyvinyl esters and ethers, natural waxes, and synthetic waxes.

Semipermeable membrane can also be a hydrophobic microporous membrane, wherein the pores are substantially filled with a gas and are not wetted by the aqueous medium but are permeable to water vapor, as disclosed in U.S. Pat. No. 5,798,119. Such hydrophobic but water-vapor permeable membrane are typically composed of hydrophobic polymers such as polyalkenes, polyethylene, polypropylene, polytetrafluoroethylene, polyacrylic acid derivatives, polyethers, polysulfones, polyethersulfones, polystyrenes, polyvinyl halides, polyvinylidene fluoride, polyvinyl esters and ethers, natural waxes, and synthetic waxes.

The delivery port(s) on the semipermeable membrane can be formed post-coating by mechanical or laser drilling. Delivery port(s) can also be formed in
situ by erosion of a plug of water-soluble material or by rupture of a thinner portion of the membrane over an indentation in the core. In addition, delivery ports can be formed during coating process, as in the case of asymmetric membrane coatings of the type disclosed in U.S. Pat. Nos. 5,612,059 and 5,698,220.

[00607] The total amount of the active ingredient(s) released and the release rate can substantially by modulated via the thickness and porosity of the semipermeable membrane, the composition of the core, and the number, size, and position of the delivery ports.

[00608] The pharmaceutical compositions in an osmotic controlled-release dosage form can further comprise additional conventional excipients or carriers as described herein to promote performance or processing of the formulation.

[00609] The osmotic controlled-release dosage forms can be prepared according to conventional methods and techniques known to those skilled in the art (see, Remington: The Science and Practice of Pharmacy, supra; Santus and Baker, J. Controlled Release 1995, 35, 1-21; Verma et al., Drug Development and Industrial Pharmacy 2000, 26, 695-708; Verma et al., J Controlled Release 2002, 79, 7-27).

[00612] The pharmaceutical compositions provided herein in a modified release dosage form can be fabricated as a multiparticulate controlled release device, which comprises a multiplicity of particles, granules, or pellets, ranging from about 10 µm to about 3 mm, about 50 µm to about 2.5 mm, or from about 100 µm to about
1 mm in diameter. Such multiparticulates can be made by the processes known to those skilled in the art, including wet-and dry-granulation, extrusion/spheronization, roller-compaction, melt-congealing, and by spray-coating seed cores. See, for example, *Multiparticle Oral Drug Delivery*; Marcel Dekker: 1994; and *Pharmaceutical Pelletization Technology*; Marcel Dekker: 1989.

[00613] Other excipients or carriers as described herein can be blended with the pharmaceutical compositions to aid in processing and forming the multiparticulates. The resulting particles can themselves constitute the multiparticulate device or can be coated by various film-forming materials, such as enteric polymers, water-swellable, and water-soluble polymers. The multiparticulates can be further processed as a capsule or a tablet.

G. PREPARATION OF THE COMPOUNDS

[00628] Starting materials in the synthesis examples provided herein are either available from commercial sources or via literature procedures (e.g., March Advanced...
Organic Chemistry: Reactions, Mechanisms, and Structure, (1992) 4th Ed.; Wiley Interscience, New York). All commercially available compounds were used without further purification unless otherwise indicated. CDCl₃ (99.8% D, Cambridge Isotope Laboratories) was used in all experiments as indicated. Proton (¹H) nuclear magnetic resonance (NMR) spectra were recorded on a Bruker Avance 300 MHz NMR spectrometer. Significant peaks are tabulated and typically include: number of protons, and multiplicity (s, singlet; d, double; t, triplet; q, quartet; m, multiplet; br s, broad singlet). Chemical shifts are reported as parts per million (δ) relative to tetramethylsilane. Low resolution mass spectra (MS) were obtained as electrospray ionization (ESI) mass spectra, which were recorded on a Shimadzu HPLC/MS instrument using reverse-phase conditions (acetonitrile/water, 0.05% acetic acid). Preparative HPLC was performed using Varian HPLC systems and Phenomenex columns. Flash chromatography was performed using Merck Silica Gel 60 (230-400 mesh) following standard protocol (Still et al. (1978) J. Org. Chem. 43:2923).

[00629] It is understood that in the following description, combinations of substituents and/or variables of the depicted formulae are permissible only if such contributions result in stable compounds under standard conditions.

[00630] It will also be appreciated by those skilled in the art that in the process described below the functional groups of intermediate compounds may need to be protected by suitable protecting groups. Such functional groups include hydroxy, amino, mercapto and carboxylic acid. Suitable protecting groups for hydroxy include trialkylsilyl or diarylalkylsilyl (e.g., t-butyldimethylsilyl, t-butyldiphenylsilyl or trimethylsilyl), tetrahydropyranyle, benzyl, and the like. Suitable protecting groups for amino, amidino and guanidino include t-butoxy carbonyl, benzyl oxy carbonyl, and the like. Suitable protecting groups for mercapto include -C(O)-R (where R is alkyl, aryl or aralkyl), /?-methoxy benzyl, trityl and the like. Suitable protecting groups for carboxylic acid include alkyl, aryl or aralkyl esters.

[00631] Protecting groups may be added or removed in accordance with standard techniques, which are well-known to those skilled in the art and as described herein. The use of protecting groups is described in detail in Green, T.W. and P.G.M. Wutz, Protective Groups in Organic Synthesis (1991), 2nd Ed., Wiley-Interscience.

[00632] One of ordinary skill in the art would easily ascertain which choices for each substituent are possible for the reaction conditions of each Scheme. Moreover,
the substituents are selected from components as indicated in the specification heretofore, and may be attached to starting materials, intermediates, and/or final products according to schemes known to those of ordinary skill in the art.

Also it will be apparent that the compounds provided herein could exist as one or more isomers, that is E/Z isomers, enantiomers and/or diastereomers.

Compounds of formula (I) may be generally prepared as depicted in the following schemes, unless otherwise noted, the various substituents are as defined elsewhere herein.

Activated quinazoline derivatives having one or more R₁ substituents (where each R₁ substitutent may or may not differ from the other R₁ substitutent(s)) are either commercially available or may be prepared according to Scheme 1. Activated quinazoline may be synthesized starting from anthranilic esters (Ic, where R is alkyl) which are either commercially available, or are prepared from benzoic ester derivatives (Ia, where R is alkyl), which undergoes classical nitration to yield the 2-nitro benzoic ester derivative (Ib) which is followed by separation from any undesired regioisomers by crystallization or chromatography. For the reduction step, the 2-nitro intermediate in a suitable solvent such as water, C₁ - C₄ alcohol, ethyl acetate or N,N-dimethylformamide, may be reacted with reducing agents such as hydrogen gas in the presence of noble metal catalyst, sodium dithionite, tin chloride, tin or iron metal in the presence of acid, and the like, to yield the anthranilic ester intermediate (Ic).
There are many synthetic routes known to one skilled in the art that may be used to prepare the 4-hydroxy quinazoline derivative (I). One route that may be used is the condensation of a suitable anthranilic ester derivative with formamide or a suitable formamide derivative such as formamidine hydrochloride in a suitable solvent such as ethanol at a temperature from 100°C to 130°C, normally in the presence of an acid such as acetic acid (See, for example, Ballard et al. Bioorganic & Medicinal Chemistry Letters 2006, 16, 1633-1637) to yield I. Following isolation, the intermediate 4-hydroxyquinazoline derivative may be treated with an activating agent such as a phosphoric oxytrihalide or an aryl- or alkylsulfonyl halide to produce the activated quinazoline intermediate (I) (See, for example, Takase et al. J. Med. Chem. 1994, 37, 2106-2111).

[00638] Phenyleneamine derivatives (2) may be prepared according to Scheme 2 by reaction of corresponding activated quinazoline derivatives (I) with the unprotected meta-hydroxy- (X = O) or meta-mercapto (X = S) aniline (2a) in a suitable solvent such as tetrahydrofuran or N,N-dimethylformamide at a temperature from 40°C to 85°C, with formation (preferably preformation) of the oxa or sulfanion with a base such as sodium hydride or cesium carbonate.

Scheme 2:
Alternatively, as will be apparent to one skilled in the art, the free amino group of 2a in Scheme 2 may be introduced in the form of an appropriate precursor, for example nitro or protected amino, followed by liberation of the free amine by nitro reduction or amine deprotection, respectively, to furnish 2b.

Diaryl ureas having the Formula I may be prepared according to Scheme 3 by the reaction of a phenyleneamine derivative (2b) (which may be prepared as described in Scheme 2), with an activated arylcarbamic acid derivative (3b, where Ar can be aryl or heteroaryl, which may be prepared as described below), where Z is a leaving group such as halo or optionally substituted phenoxy, for example.

Scheme 3:

![Scheme 3 diagram]

Alternatively, diaryl ureas having the Formula I may be prepared according to Scheme 4 when $R^5 = \text{H}$. Phenyleneamine (2b) is treated with an aryl isocyanate (4b, where Ar can be aryl or heteroaryl) in a suitable solvent such as tetrahydrofuran at a temperature from $25^\circ\text{C}$ to $60^\circ\text{C}$, optionally in the presence of a base.

Scheme 4:

![Scheme 4 diagram]

Alternatively, compounds having the Formula I may be prepared according to scheme 5 by the reaction of a hydroxy- ($X = \text{O}$) or mercapto- ($X = \text{S}$) substituted diaryl urea (5a, where Ar can be aryl or heteroaryl, which may be prepared as described below), with an activated quinazoline derivative (Ie, where $Y$ is a leaving group such as halo, aryl- or alkylsulfonate, which may be prepared as
described in Scheme 1), in a suitable solvent such as tetrahydrofuran at a temperature from 40 °C to 80 °C, normally in the presence of a base such as sodium hydride or cesium carbonate.

Scheme 5:

In certain embodiments, R¹ substituents of diaryl ureas having the Formula I, prepared as shown in Schemes 3, 4 and 5, may be further modified. For example, R¹ containing a haloalkyl moiety may be transformed to, for example, an aminoalkyl, alkoxyalkyl or thioalkyl, by treatment with, respectively, amines, alkoxides or thiolates. Alternatively, R¹ containing a carboxylic acid or carboxylic ester group may be transformed to the corresponding amides, amidines, alcohol, aldehydes, ketones, and aldehyde or ketone derivatives including oximes, hydrazones and the like. Where R¹ contains a hydroxy group, the hydroxy group may be derivatized to form the corresponding ester (by acylation), corresponding carbamate (by carbamylation), corresponding imidate and the like.

Arylcarbamoyl derivatives may be prepared as in Scheme 6 by treatment of corresponding aryl amines (6a, R⁵ = H) with a reagent such as an aryl chloroformate in a solvent such as tetrahydrofuran or dichloromethane in the presence of a base such as potassium carbonate at a temperature from 25 °C to 60 °C to give the corresponding aryl carbamate (6b or 3b, where Z may be, for example, phenoxy). When R⁵ ≠ H, phosgene, trichloromethyl chloroformate, or bis-trichloromethyl carbonate may be used to prepare arylcarbamoyl chloride variants (6c where Hal is halogen, or 3b, where Z may be, for example, halo).
Scheme 7 shows the preparation of isocyanate derivatives (4b) which are prepared by treatment of corresponding primary aryl amines (7a) (where Ar may be aryl or heteroaryl) with phosgene, trichloromethyl chloroformate, or bis-trichloromethyl carbonate in a solvent such as toluene in the presence of a base such as triethylamine at a temperature from 25 °C to 110 °C to give the corresponding isocyanate (4b) (where Ar may be aryl or heteroaryl).

Scheme 7:

[00646] Aryl amine derivatives (7a), wherein Ar is a 5-membered heteroaromatic ring, may be prepared by condensation of appropriate fragments and precursors by methods well known in the art and described in texts such as Gilchrist, T.L., *Heterocyclic Chemistry* (1992), 2nd Ed., Longman Scientific & Technical and John Wiley & Sons. Scheme 8 shows one example where Ar is 5-substituted-3-aminoisoxazole, whereby an appropriate 3-oxonitrile (8a) is treated with hydroxylamine under appropriate conditions of pH and temperature which is described, for example, in Takase et al. *Heterocycles* 1991 32(6), 1153-1 158, to afford the desired aryl amine product (8b). This method is particularly applicable for cases in which the atom of R^10^ directly attached to the aromatic ring is highly substituted, for example, is an α,α-dialkyl substituent (See Takase et al. *Heterocycles* 1991 32(6), 1153-1 158).

Scheme 8:
Scheme 9 shows an example for the case where Ar is 3-substituted-5-aminoisoxazole, whereby an appropriate 3-oxonitrile 9a is treated with hydroxylamine under appropriate conditions of pH and temperature, as described again in Takase et al. *Heterocycles* 1991 32(6), 1153-1158, to afford the desired aryl amine product (9b). This method is particularly applicable for cases in which the atom of R^{10} directly attached to the aromatic ring is not highly substituted, for example, is not an \( \alpha, \alpha \)-dialkyl substituent (See Eddington et al. *Eur. J. Med. Chem.* 2002 37, 635-648), or when R^{10} contains one or more highly electron-withdrawing groups, eg, fluorine, or under special conditions of pH and solvent, such as ethanol and water mixture as described in EP 0220947.

**Scheme 9:**

![Scheme 9](image)

**00648** Scheme 10 shows an example for the case where Ar is a 2,5-disubstituted-3-aminopyrazole, whereby an appropriate 3-oxonitrile (10a) is treated with a monosubstituted hydrazine under appropriate conditions of pH and temperature to afford the desired aryl amine product (10b).

**Scheme 10:**

![Scheme 10](image)

**00649** Depending on R^{10}, in order to influence the yield and regiochemical outcome of the condensation reaction, 3-oxonitrile (10a) may be productively
replaced in the foregoing schemes by oxo-protected derivatives of (10a), such as an enol ether derivative (10c, R = lower alkyl or substituted silyl) or a ketal derivative (10d, R = lower alkyl or taken together, an alkylene derivative to form a ketal ring). These derivatives are prepared from 3-oxonitrile under standard conditions, for example as described in Chan et al. Synthesis 1983 203-205.

![Chemical Structures](image)

**Scheme 11** illustrates preparation of the requisite 3-oxonitriles (10a) by reaction of an R₁₀-containing carboxylic ester (11a) with an alkali metal salt of acetonitrile (11b) (See, for example, US 4,728,743).

The aqueous layer was separated, acidified to pH 2 with aqueous 2N hydrochloric acid and extracted with diethyl ether (2 x 100 mL). The combined ether layers were dried over MgSO₄, then concentrated under reduced pressure to afford 4-methyl-3-oxopentanenitrile as a yellow oil (2.71 g, 78%) which was used in the next step without further purification. ¹H NMR (300 MHz, CDCl₃) δ 3.53 (s, 2H), 2.81 (septet, J = 6 Hz, 1H), 1.21 (d, J = 6 Hz, 6H).

Example 133A Step 1: In an oven dried flask equipped with a condenser and an Argon inlet, sodium hydride, 60% in mineral oil, (2.4 g, 61.10 mmol) was suspended in anhydrous tetrahydrofuran (26 mL). The suspension was refluxed under Argon and a mixture of anhydrous acetonitrile (3.2 mL, 61.10 mmol) and methylisobutyrate (4 g, 39.16 mmol) was added dropwise over fifty minutes. After the addition was complete, the mixture was heated at reflux overnight. After cooling to room temperature, the mixture was poured into water (150 mL). Diethyl ether (150 mL) was added and the two phases separated. The aqueous layer was acidified to pH = 1 with 10% aqueous hydrochloric acid and the organics extracted twice with diethyl ether (2 x 100 mL). The combined organic layers were dried (MgSO$_4$), filtered and concentrated under reduced pressure to afford 4-methyl-3-oxopentanenitrile (3.12 g, 72%) as a yellow oil, which was used directly in the next step without further purification. $^1$H NMR (300 MHz, CDCl$_3$) δ 3.54 (s, 2H), 2.86-2.77 (m, 1H), 1.19 (d, 6H).

Example 152A Step 1: In a round bottomed flask flushed with argon, a suspension of sodium hydride 60% in mineral oil (1.30 g, 34 mmoles) was rinsed twice with hexane, and suspended in 20 mL of dry THF. The solution was heated to 75°C, and ethyl difluoropropionate (3.00g, 22 mmoles) and acetonitrile (1.78 mL) in 5 ml of dry THF was added dropwise over 30 minutes. The temperature of the reaction was lowered to 65°C and stirred overnight. The mixture was then concentrated to an oil and partitioned between water and ether, and extracted twice to remove any mineral oil and other impurities. The aqueous layer was acidified to pH=1 with 10% HCl, and the solution extracted twice. These extracts were dried over magnesium sulfate, filtered and concentrated to a crude oil. The crude product was purified using silica gel chromatography using a gradient of 10-40% ethyl acetate/hexane to afford 4,4-difluoro-3-oxo-pentanenitrile \(1H(300 \text{ MHz}, \text{ CDCl}_3) \delta 3.95 \text{ (s, 2H)}, 1.86 \text{ (m, 3H)}\).

To this solution hydroxylamine sulfate (135 mg, 0.82 mmoles) was added in a single portion and stirred at room temperature for 15 minutes. The reaction was then heated to 80°C overnight. The suspension was cooled to 0 °C, 4,4,4-trifluoro-3-methoxybut-2-enenitrile (26 mmol) was added dropwise and the mixture allowed to slowly warm to room temperature. The mixture was then heated to 60 °C overnight. The solid was taken in ethanol (25 mL) and the solution acidified (pH = 1) with 37% aqueous hydrochloric acid. The resulting mixture was heated to 60 °C for 2h. Ethanol was removed under reduced pressure and the residue diluted with dichloromethane. A saturated solution of sodium bicarbonate was added (pH = 14) and the organic phase separated. The aqueous phase was back extracted three times with dichloromethane, the organics combined, dried (MgSO4) and concentrated under reduced pressure. The resulting crude material was purified by silica gel chromatography (dichloromethane/ethyl acetate 95:5) to isolate 3-(trifluoromethyl)isoxazol-5-amine (446 mg, 11%) along with 5-(trifluoromethyl)isoxazol-3-amine as a minor product. 1H NMR (300 MHz, CDCl3) δ 5.31 (s, 1H), 5.03 (bs, 2H).

The resulting oil was redissolved in diethyl ether (200 mL), washed with saturated sodium hydrogen carbonate solution (100 mL), separated, and dried over MgSO₄. Filtration followed by concentration in vacuo (keeping bath temperature below 30 °C) gave crude product. Crude product from both batches were combined to afford crude methyl 3,3,3-trifluoro-2,2-dimethylpropanoate (7.69 g) as a yellow oil which was taken on without further purification. ¹H NMR (300 MHz, CDCl₃) δ 3.86 (s, 3H), 1.40 (s, 6H).

Example 259A Step 2: Reaction was carried out in two separate batches, employing 3.85 g of methyl 3,3,3-trifluoro-2,2-dimethylpropanoate in each batch. To a stirred refluxing suspension of sodium hydride (1.41 g of a 60% dispersion in mineral oil, 35 mmol) in dry THF (30 mL) (under an argon atmosphere) was added a mixture of crude methyl 3,3,3-trifluoro-2,2-dimethylpropanoate (3.85 g) and dry acetonitrile (1.85 mL, 35 mmol), dropwise over the course of 45 mins. The resulting pale yellow suspension was heated at 70 °C for a further 15 h. After cooling to rt, both reaction batches were combined whenupon the solvent was removed in vacuo. The resulting orange foam was redissolved in water (200 mL) and washed with diethyl ether (2 x 200 mL), to remove residual mineral oil. The aqueous layer was separated, acidified to pH 2 with aqueous 2N hydrochloric acid and extracted with diethyl ether (3 x 200 mL). The combined ether layers were dried over MgSO₄, filtered, then concentrated under reduced pressure to afford 5,5,5-trifluoro-4,4-dimethyl-3-oxopentanenitrile as a yellow oil (4.27 g, 37% from 3,3,3-trifluoro-2,2-dimethylpropionic acid) which was used in the next step without further purification. ¹H NMR (300 MHz, CDCl₃) δ 3.77 (s, 2H), 1.43 (s, 6H).

Example 259A Step 3: A mixture of 5,5,5-trifluoro-4,4-dimethyl-3-oxopentanenitrile (3 g, 16:76 mmol), hydroxylamine sulfate (3.30 g, 20.11 mmol) and sodium hydrogen carbonate (3.52 g, 41.90 mmol) in a mixture of 10% methanol in water (60 mL), was heated at 65 °C for 15 h. After cooling to rt, a further 30 mL of 10% methanol in water was added, and the mixture was divided into 9 x 10 mL batches. Each batch was adjusted to pH 1 with concentrated hydrochloric acid and each placed into a 20 mL volume microwave vial fitted with a stirrer bar. Example 400
Competition binding assay to determine binding constants (Kj) for interactions between compounds and RAF kinases

441
Competition binding assays used herein were developed, validated and performed as described in Fabian et al., Nature Biotechnology 2005, 25,329-336. Kinases were produced as fusions to T7 phage (See, Fabian et al. or WO04/015142) or alternatively, the kinases were expressed in HEK-293 cells and subsequently tagged with DNA for PCR detection (See, WO08/0053 10). For the binding assays, streptavidin-coated magnetic beads were treated with biotinylated affinity ligands for 30 min at room temperature to generate affinity resins. The liganded beads were blocked with excess biotin and washed with blocking buffer (SeaBlock (Pierce), 1 % BSA, 0.05 % Tween 20, 1 mM DTT) to remove unbound ligand and to reduce non-specific binding. Binding reactions were assembled by combining kinase, liganded affinity beads, and test compounds in 1 x binding buffer (20 % SeaBlock, 0.17x PBS, 0.05 % Tween 20, 6 mM DTT). Test compounds were prepared as 100 x stocks in DMSO and rapidly diluted into the aqueous environment. DMSO was added to control assays lacking a test compound. Primary screen interactions were performed in polypropylene 384-well plates in a final volume of 34 µL, while Kd determinations were performed in polystyrene 96-well plates in a final volume of 135 µL. The assay plates were incubated at room temperature with shaking for 1 hour, long enough for binding reactions to reach equilibrium, and the affinity beads were washed extensively with wash buffer (Ix PBS, 0.05 % Tween 20) to remove unbound protein. The beads were then resuspended in elution buffer (Ix PBS, 0.05 % Tween 20, 2 µM non-biotinylated affinity ligand) and incubated at room temperature with shaking for 30 min. The kinase concentration in the eluates was measured by quantitative PCR. Each kinase was tested individually against each compound. KdS were determined using eleven serial threefold dilutions. A selectivity score, which is a quantitative measure of selectivity of a compound against a panel of enzymes, may be calculated for a compound by dividing the number of enzymes for which a compound meets a set criteria, (for example, a binding constant of 100 nM or less), by the total number of enzymes tested. Table 1 provides a kinase selectivity score, S35, which was calculated for each compound by dividing the number of kinases for which a compound displayed inhibition of 65% or greater compared to negative control lacking inhibitors (DMSO only), divided by the 290 distinct kinases tested excluding mutant variants. (Note, for those compounds tested in a larger kinase panel, as indicated by an asterisk (*) next to the S35 score, the divisor is 321 (i.e. the larger panel contains 321 distinct kinases, excluding mutant variants.).
Example 401

MEK Phosphorylation ELISA

A MEK1 phosphorylation ELISA (Biosource, MEK1 [pSpS21 8/222] kit, Catalog # KHO0321) was used to measure the inhibition of MEK1 phosphorylation in the A375 human melanoma cell line in the presence of the compounds provided herein. The A375 cell line contains wild-type N-Ras but has a constitutively active BRAF carrying the V600E mutation. A total MEK ELISA was also run in parallel in order to measure the amount of both phosphorylated and unphosphorylated MEK1 (Biosource, tMEK kit, Catalog # KHO0291).

A375 cells (from American Type Culture Collection) were plated at 50,000 cells per well in DMEM (Mediatech) with 10% fetal bovine serum (Omega Scientific) into a 96 well plate and incubated overnight in a 37°C incubator with 10% CO2. The cells were then washed with PBS and the medium replaced with 0.5% FBS for incubation overnight. A solution of the test compound in DMSO was added to each well at varying concentrations, or alternatively, a solution of positive control (an internal compound previously determined to have an IC50 of less than 20 nM in this phospho-MEK assay), or negative control (DMSO) was added to the wells at varying concentrations. The cells were incubated with compound or control for two hours at 37°C. The compound solution was aspirated off and the cells washed with cold PBS. The cells were then lysed for 30 minutes in the cold with Cell Extraction Buffer containing Phosphatase Inhibitors (catalog # FNNOOl 1, Invitrogen) and protease inhibitors (catalog # 11873580001, Roche Applied Science). The plate was centrifuged for 30 minutes to pellet out the cell debris. The cleared lysates were transferred to a 96-well Nunc plate and the ELISA protocol described by the manufacturer in Catalog # KHO0321 or KHO0291 was followed. The reaction was read at 450 nM using an ELISA plate reader. The percent inhibition of MEK1 phosphorylation was determined for each compound at each concentration, and the concentration of the test compound necessary for inhibiting 50% of MEK1 phosphorylation (IC50) was calculated. The results are summarized in Table 1.
A375 cells (derived from a human melanoma cell line containing wild-
type N-Ras but which also has a constitutively active BRAF carrying the V600E
mutation obtained from ATCC), were plated at 10,000 cells per well into a 96 well
TC-treated plate in M3 medium (Mediatech Cell grow) containing 10% fetal bovine
serum (Omega-Scientific) and incubated overnight in a 37°C incubator under 10%
CO2. The following day, the medium was replaced with 0.5% FBS in M3 for
overnight incubation. At day three, a solution of the test compound in DMSO was
added to each well at varying concentrations, or alternatively, a solution of positive
control (an internal compound previously determined to have an IC₅₀ of less than 20
nM in the phospho-MEK assay) in DMSO, or negative control (DMSO) was added
to the wells at varying concentrations. The cells were incubated with compound or
control for 72 hours at 37°C under 10% CO2. Following incubation, Cell Titer Blue
reagent (Promega) was added to each well containing compounds or controls, and
then incubated for 3 hours at 37°C under 10% CO2. Proliferation was measured by
fluorescence with excitation at 560nm and emission at 590nm using SoftMax Pro.
The percent inhibition of proliferation was determined for each compound at each
concentration, and the concentration of the test compound necessary for inhibiting cell
proliferation by 50% (IC₅₀) was calculated. The results are summarized in Table 1.
