VIRAL POLYMERASE INHIBITORS

TECHNICAL FIELD OF THE INVENTION

The invention relates to inhibitors of RNA dependent RNA polymerases, particularly those viral polymerases within the Flaviviridae family, and more particularly the NS5B polymerase of HCV.

BACKGROUND OF THE INVENTION

About 30,000 new cases of hepatitis C virus (HCV) infection are estimated to occur in the United States each year (Kolykhalov, A.A.; Mihalik, K.; Feinstone, S.M.; Rice, C.M.; 2000; J. Virol. 74: 2046-2051*). HCV is not easily cleared by the hosts' immunological defences; as many as 85% of the people infected with HCV become chronically infected. Many of these persistent infections result in chronic liver disease, including cirrhosis and hepatocellular carcinoma (Hoofnagle, J.H.; 1997; Hepatology 26: 15S-20S*). There are an estimated 170 million HCV carriers worldwide, and HCV-associated end-stage liver disease is now one of the leading cause of liver transplantation. In the United States alone, hepatitis C is responsible for 8,000 to 10,000 deaths annually. Without effective intervention, the number is expected to triple in the next 10 to 20 years. There is no vaccine to prevent HCV infection. Prolonged treatment of chronically infected patients with interferon or interferon and ribavirin is the only currently approved therapy, but it achieves a sustained response in fewer than 50% of cases (Lindsay, K.L.; 1997; Hepatology 26: 71S-77S*, and Reichard, O.; Schwarcz, R.; Weiland, O.; 1997 Hepatology 26: 108S-111S*).

HCV belongs to the family Flaviviridae, genus hepacivirus, which comprises three genera of small enveloped positive-strand RNA viruses (Rice, C.M.; 1996; "Flaviviridae: the viruses and their replication"; pp. 931-960 in Fields Virology; Fields, B.N.; Knipe, D.M.; Howley, P.M. (eds.); Lippincott-Raven Publishers,
Philadelphia Pa. *). The 9.6 kb genome of HCV consists of a long open reading frame (ORF) flanked by 5' and 3' non-translated regions (NTR's). The HCV 5' NTR is 341 nucleotides in length and functions as an internal ribosome entry site for cap-independent translation initiation (Lemon, S.H.; Honda, M.; 1997; Semin. Virol. 8: 274-288*). The HCV polyprotein is cleaved co- and post-translationally into at least 10 individual polypeptides (Reed, K.E.; Rice, C.M.; 2000; Curr. Top. Microbiol. Immunol. 242: 55-84*). The structural proteins result from signal peptidases in the N-terminal portion of the polyprotein. Two viral proteases mediate downstream cleavages to produce non-structural (NS) proteins that function as components of the HCV RNA replicase. The NS2-3 protease spans the C-terminal half of the NS2 and the N-terminal one-third of NS3 and catalyses cis cleavage of the NS2/3 site. The same portion of NS3 also encodes the catalytic domain of the NS3-4A serine protease that cleaves at four downstream sites. The C-terminal two-thirds of NS3 is highly conserved amongst HCV isolates, with RNA-binding, RNA-stimulated NTPase, and RNA unwinding activities. Although NS4B and the NS5A phosphoprotein are also likely components of the replicase, their specific roles are unknown. The C-terminal polyprotein cleavage product, NS5B, is the elongation subunit of the HCV replicase possessing RNA-dependent RNA polymerase (RdRp) activity (Behrens, S.E.; Tomei, L.; DeFrancesco, R.; 1996; EMBO J. 15: 12-22*; and Lohmann, V.; Körner, F.; Herian, U.; Bartenschlager, R.; 1997; J. Virol. 71: 8416-8428*). It has been recently demonstrated that mutations destroying NS5B activity abolish infectivity of RNA in a chimp model (Kolykhalov, A.A.; Mihalik, K.; Feinstone, S.M.; Rice, C.M.; 2000; J. Virol. 74: 2046-2051*).

The development of new and specific anti-HCV treatments is a high priority, and virus-specific functions essential for replication are the most attractive targets for drug development. The absence of RNA dependent RNA polymerases in mammals, and the fact that this enzyme appears to be essential to viral replication, would suggest that the NS5B polymerase is an ideal target for anti-HCV therapeutics.

WO 00/06529 reports inhibitors of NS5B which are α, γ-diketoacids.
WO 00/13708, WO 00/10573, and WO 00/18231 report inhibitors of NS5B proposed for treatment of HCV.

Specific embodiments
Included within the scope of this invention are all compounds of formula (I), (Ia), (Ib), (Ic), or (Id), as presented in Tables 1 to 22.

Anti-NS5B activity
The ability of the compounds of formula (I) to inhibit RNA synthesis by the RNA dependent RNA polymerase of HCV, NS5B, can be demonstrated by any assay capable of measuring RNA dependent RNA polymerase activity. A suitable assay is described in the examples.

Specificity for RNA dependent RNA polymerase activity
To demonstrate that the compounds of the invention act by specific inhibition of
NS5B, the compounds may be tested for the lack of inhibitory activity in other RNA dependent RNA polymerase assays or DNA dependant RNA polymerase assays.

When a compound of formula (I), or one of its therapeutically acceptable salts, is employed as an antiviral agent, it is administered orally, topically or systemically to mammals, e.g. humans, rabbits or mice, in a vehicle comprising one or more pharmaceutically acceptable carriers, the proportion of which is determined by the solubility and chemical nature of the compound, chosen route of administration and standard biological practice.

For oral administration, the compound or a therapeutically acceptable salt thereof can be formulated in unit dosage forms such as capsules or tablets each containing a predetermined amount of the active ingredient, ranging from about 25 to 500 mg, in a pharmaceutically acceptable carrier.

For topical administration, the compound can be formulated in pharmaceutically accepted vehicles containing 0.1 to 5 percent, preferably 0.5 to 5 percent, of the active agent. Such formulations can be in the form of a solution, cream or lotion.

For parenteral administration, the compound of formula (I) is administered by either intravenous, subcutaneous or intramuscular injection, in compositions with pharmaceutically acceptable vehicles or carriers. For administration by injection, it is preferred to use the compounds in solution in a sterile aqueous vehicle which may also contain other solutes such as buffers or preservatives as well as sufficient quantities of pharmaceutically acceptable salts or of glucose to make the solution isotonic.

Suitable vehicles or carriers for the above noted formulations are described in pharmaceutical texts, e.g. in "Remington's The Science and Practice of Pharmacy", 19th ed., Mack Publishing Company, Easton, Penn., 1995, or in "Pharmaceutical Dosage Forms And Drugs Delivery Systems", 6th ed., H.C. Ansel et al., Eds.,
Williams & Wilkins, Baltimore, Maryland, 1995.

The dosage of the compound will vary with the form of administration and the particular active agent chosen. Furthermore, it will vary with the particular host under treatment. Generally, treatment is initiated with small increments until the optimum effect under the circumstance is reached. In general, the compound of formula I is most desirably administered at a concentration level that will generally afford antivirally effective results without causing any harmful or deleterious side effects.

For oral administration, the compound or a therapeutically acceptable salt is administered in the range of 10 to 200 mg per kilogram of body weight per day, with a preferred range of 25 to 150 mg per kilogram.

For systemic administration, the compound of formula (I) is administered at a dosage of 10 mg to 150 mg per kilogram of body weight per day, although the aforementioned variations will occur. A dosage level that is in the range of from about 10 mg to 100 mg per kilogram of body weight per day is most desirably employed in order to achieve effective results.

Although the formulations disclosed hereinafore are indicated to be effective and relatively safe medications for treating HCV infections, the possible concurrent administration of these formulations with other antiviral medications or agents to obtain beneficial results also included. Such other antiviral medications or agents include interferon or interferon and ribavirin.

**Methodology and Synthesis**

Benzimidazole derivatives or analogs according to the present invention can be prepared from known starting materials by following Scheme 1, shown below wherein \( R^1 \), \( R^2 \) and \( R^3 \) are as previously described.
Scheme 1

In carrying out the route illustrated in Scheme 1, illustrated above, a suitably protected form of 4-chloro-3-nitrobenzoic acid or 4-fluoro-3-nitrobenzoic acid is reacted with a primary amine \( R^2NH_2 \). Amines are of commercial sources or can be prepared by literature methods. This reaction is carried out in a suitable solvent such as DMSO, DMF or the like, at temperatures ranging from 20 °C to 170 °C, or alternatively without solvent by heating the two components together. The nitro group of these derivatives is subsequently reduced to the corresponding aniline, using a reducing agent such as hydrogen gas in the presence of a catalyst (e.g. Pd metal and the like), metals in the presence of mineral acids (e.g. Fe or Zn with aqueous HCl), or metal salts (SnCl₂). The diamino derivatives that are obtained are condensed with commercially available aldehydes \( R^1CHO \) in the presence of an oxidizing agent (e.g. air, oxygen, iodine, oxone®), quinones, peroxides etc.) to give benzimidazole 5-carboxylates.

Alternatively, other methods for benzimidazole ring construction can be employed, such as condensation of the diamino derivatives with carboxylic acids, nitriles or amides, in the presence or absence of a catalyst. Such methods are well known in the literature to those skilled in the art. Saponification of the ester protecting group of such derivatives using alkali metal hydroxides, followed by neutralization with
weak acids (e.g. AcOH) generates free 5-carboxybenzimidazole derivatives of
general formula I (X = CH, Y = O, Z = OH, n=0).

Derivatives of formula I in which Z = NHR³ may be obtained by condensation of 5-
carboxybenzimidazoles of formula I (X = CH or N, Y = O, Z = OH) with amines
H₂NR³ through formation of an amide bond. Amines H₂NR³ are from commercial
sources or can be prepared following literature procedures. Condensation of the
carboxylic acid with amine H₂NR³ can be accomplished using standard peptide bond
forming reagents such as TBTU, BOP, EDAC, DCC, isobutyl chloroformate and the
like, or by activation of the carboxyl group by conversion to the corresponding acid
chloride prior to condensation with an amine. This coupling reaction can then be
followed by elaboration of functional groups present in R³ and protecting groups are
subsequently removed in the last stage of the synthesis, if necessary, to provide
compounds of formula I.

Alternatively, benzimidazole derivatives or analogs according to the present
invention can be prepared on a solid support as described in Scheme 2, below,
wherein R¹, R² and R³ are as previously described.

In carrying out the synthetic route illustrated in Scheme 2, 4-fluoro-3-nitrobenzoic
acid is converted to the acid chloride derivative using standard procedures (e.g.
thionyl chloride, oxalyl chloride, phosgene and the like in the presence of a catalytic
amount of DMF) in an inert solvent such as CH₂Cl₂.

Scheme 2

Wang resin is esterified with this acid chloride by condensation in the presence of an
organic tertiary amine such as triethylamine, N-methylmorpholine, DIEA and the like.
Other types of resins are well known to those skilled in the art, for example Rink resin, which may be functionalized without deviating from the scope of the invention. The functionalised resin thus obtained is then elaborated to resin-bound benzimidazole carboxylate derivatives as described above for the solution-phase chemistry. Cleavage of the benzimidazole from the resin is carried out with strong acids (e.g. trifluoroacetic acid) to give benzimidazole 5-carboxylic acids of general formula I (X = CH or N, Y = O, Z = OH, n=0), within the scope of this invention. As described previously in solution phase, carboxylic acids of general formula I (X = CH or N, Y = O, Z = OH) can be elaborated to benzimidazole derivatives of general formula I (Z = NHR³) by condensation with amines R³NH₂.

General procedure for the preparation of racemic phenylglycine methyl ester hydrochloride derivatives:

\[
\text{PhCHO} \xrightarrow{\text{NaCN}} \xrightarrow{\text{NH}_4\text{Cl} / \text{NH}_2\text{OH}} \xrightarrow{6 \text{ N HCl}} \text{PhCH(NH}_2\text{)} \text{N} \\

\]

Aromatic aldehydes, substituted according to the scope of the present invention, were reacted with an alkali metal cyanide (preferably sodium or potassium cyanide) in a mixture of aqueous ammonium chloride and ammonium hydroxide and a co-solvent such as MeOH or ethanol. The aminonitriles formed were hydrolyzed to the corresponding racemic phenylglycines in boiling aqueous mineral acid (preferably hydrochloric acid), and then converted to the racemic phenylglycine methyl ester hydrochlorides by reaction with MeOH in the presence of either thionyl chloride, oxalyl chloride, acetyl chloride, phosgene, hydrogen chloride or the like.

After stirring overnight at room temperature, the supernatant was decanted from oily polymeric residues and MeOH removed from the aqueous phase under reduced pressure. The aqueous phase was then extracted with EtOAc. The aminonitrile present in the extract was then extracted into 6 N HCl (2 X 50 mL), the aqueous acid phases combined and refluxed for 8 h. Water was removed under reduced pressure to precipitate out the phenylglycine derivative as the hydrochloride salt that was collected by filtration and dried in vacuo (2.20 g).

The solution was washed successively with 10% aqueous citric acid (25 mL) and saturated aqueous NaHCO₃ (25 mL), and dried (MgSO₄). Volatiles were removed under reduced pressure and the residue purified by flash chromatography with 40% EtOAc / hexane. The diazomethylketone was obtained as a yellow foam (0.783 g).

The diazomethylketone from above was dissolved in EtOAc (10 mL) and the solution cooled to −30 °C. A solution of HBr in AcOH (48% w/w, 0.384 mL) was added dropwise over 60 min. The cold reaction mixture was then diluted with Et₂O (100 mL) and washed successively with 10% aqueous citric acid (2 X 25 mL) and saturated aqueous NaHCO₃ (25 mL), and dried (MgSO₄). Volatiles were removed under reduced pressure and the residue coevaporated with hexane to give the bromomethylketone as a white foam (0.870 g). The bromomethylketone from above was reacted with N-methylthiourea as described for example 63.

Solid phase synthesis of inhibitors, wherein, X = CH, Y = O, Z = OH, n = 0:

![Diagram]

To a solution of the 4-fluoro-3-nitrobenzoic acid (0.12 mol, 22.2 g) in 100 mL of anhydrous DCM was added 10 drops of anhydrous DMF. To this solution was added dropwise over 60 min, oxalyl chloride (0.144 mol, 12.6 mL). During the addition, the solid slowly dissolved to give rise to a yellow solution. The mixture was stirred for an additional 4 h and the solvent was stripped down to give a yellow oil. This oil was distilled under vacuum (110 °C, 1.5 mm Hg) to give 4-fluoro-3-nitrobenzoyl chloride as a light yellow liquid (22.0 g, 90% yield).

On a solid phase synthesizer (Advanced Chemtech ACT 90), Wang resin (Nova Biochem, loading: 1.2 mmol/g, 20 mmol, 16.7 g) was washed twice with DCM (100 mL), twice with i-PrOH (100 mL) and was dried overnight under high vacuum over P₂O₅. The following day, the resin was washed with anhydrous DCM (2 x 100 mL) and was suspended in anhydrous DCM (100 mL). To the suspension was added DIEA (30 mmol, 5.2 mL) followed by a solution of 4-fluoro-3-nitrobenzoyl chloride (22 mmol, 4.48 g) dissolved in 10 ml of anhydrous DCM. The slurry was shaken for 3 h, the solution was drained and the resin was washed twice with 100 mL-portions of anhydrous DCM. The resin was then suspended in anhydrous DCM (100 mL) and was treated with DIEA (30 mmol, 5.2 mL) followed by acetic anhydride (24 mmol, 2.3 mL). After shaking for 2 h, the solution was drained and the resin was
washed successively with DCM (2 x 100 mL), i-PrOH (2 x 100 mL), DCM (2 x 100 mL) and finally with i-PrOH (3 x 100 mL). The resin was dried overnight under high vacuum. To calculate the level of incorporation, the resin (45.9 mg) was treated with a 1:1 mixture of TFA/1,2-dichloroethane (1.5 mL) for 1 h. The resin was filtered and was washed twice with 1,2-dichloroethane (1.5 mL). The filtrates were combined and concentrated under vacuum. The residue was lyophilized from MeCN/H₂O to give 4-fluoro-3-nitro benzoic acid as a yellow solid (6.3 mg, 0.033 mmol). Based on recovered compound, the loading was calculated to be 0.74 mmol/g.

The following steps were performed on a solid-phase synthesizer (ACT 496 from Advanced Chemtech), using the 96-well reaction block:

Amine addition:
Each well was filled with the benzoic acid resin from above (0.03 mmol, 40 mg) and was washed with DMF (3 x 1.2 mL) and DMSO (2 x 1.2 mL). To each well was added DMSO (530 µL), a 1 M solution of the amine R₂-NH₂ (600 µL, 0.6 mmol) and DIEA (0.4 mmol, 70 µL). The resins were shaken for 15 h at room temperature and the solvent was drained. The resins were washed successfully with 1.2-mL portions of DMF (3 x), MeOH (3 x), and DMF (4 x).

Reduction of the nitro group:
The resins were then suspended in DMF (600 µL) and were shaken with a 1 M solution of SnCl₂·2 H₂O (600 µL, 0.6 mmol) for 25 h. The solvent was drained, the resins were washed successively with 1.2-mL portions of 1:1 DMF-H₂O (4 x), DMF (4 x), MeOH (4 x) and NMP (4 x).

Formation of the benzimidazole ring:
Each resin was suspended in DMF (200 µL) and a 1 M solution of the aldehyde in DMF was added (0.20 mmol, 200 µL), followed by a 0.25 M solution of chloranil in NMP (0.20 mmol, 800 µL). The resins were shaken for 18 h, the liquid was drained and the resins were washed successively with 1.2-mL portions of NMP (3 x), 1 M DIEA/NMP (2 x), NMP (3 x), MeOH (3 x) and DCM (4 x). The reaction block was placed in a vacuum chamber for 30 min in order to dry the resin.
**Cleavage from the resin:**
In each well was added 1.0 mL of a 1:1 solution of TFA/1,2-dichloroethane and the resins were shaken for 1 h. The wells were drained and the resins washed once with 1.0 mL of the cleavage solution. Volatiles were evaporated in a vacuum centrifuge to give the crude benzimidazole 5-carboxylic acids in which X = CH, Y = O, Z = OH and n = 0.

**Example 107:**

(Entries 2110, 2111, 2112, 2114-2117, 2120-2123, 2125-2128, 2139-2143, Table 2):

\[

\end{align*}
\]

The following steps were performed on a solid-phase synthesizer (ACT 496 from Advanced Chemtech), using the 96-well reaction block.

The starting diamine resin was prepared as described in example 106. Each well was filled with resin (0.0203 mmol, 35 mg) and was washed with DMF (3 X 1.2 mL). To each well was added a 0.5 M solution of DIEA in DMF (200 μL, 0.1 mmol), a 0.2 M solution of the acid R-CO₂H in DMSO (500 μL, 0.1 mmol) and a 0.2 M solution of HATU in DMF (500 μL, 0.1 mmol). The resins were shaken for 6 h at room temperature and the solvent was drained. The coupling was repeated for another 6 h with fresh reagent. The resins were washed successfully with 1.2-mL portions of DMF (3 x), MeOH (3 x), and DCM (3 x).

**Cleavage from the resin:**
In each well was added 1.0 mL of a 30% solution of TFA/1,2-dichloroethane and the resins were shaken for 1.5 h. The wells were drained and the resins washed once with 2 mL of 1,2-dichloroethane. The resulting filtrates containing 10% TFA in 1,2-dichloroethane was heated at 80 °C for 13 h. The volatiles were removed under
vacuum and the residue was lyophilized from MeCN/H$_2$O. The crude benzimidazole 5-carboxylic acid derivatives thus obtained were coupled with 5-(S)-hydroxytryptophan methyl ester hydrochloride, saponified and purified in the usual manner:

**Example 108:**
(Entries 1157-1169, 1178, 1179, 1236-1239, Table 1):

![Chemical Diagram]

**Note 1:** In the case of compound entries 1157, 1158, 1236, 1237, 1238 and 1239, the coupling with the γ-amino butyryl fragment was omitted.

**Note 2:** In the case of compound entries 1159 and 1178, the amino acid fragment was coupled directly on the bromo Wang resin and, in the former case, Fmoc-d,l-alanine was used.

**Note 3:** In case of compound entries 1236, 1237, 1238, and 1239, the nitroacid was coupled to standard Wang resin using the MSNT method of J. Nielsen and L. O. LyngsØ (*Tetrahedron Lett.* **1996**, 37, 8439).

The following steps were performed on a solid-phase synthesizer (ACT 496 from Advanced Chemtech), using the 96-well reaction block:
Anchoring on the resin:
Each well was filled with the bromo Wang resin (0.044 mmol, 40 mg) and was washed with DMF (3 x 1.2 mL). To each well was added DMF (200 μL), a 1 M solution of DIEA in DMF (300 μL, 0.3 mmol), and each of the nitro acid derivatives (0.176 mmol) dissolved in 500 μL of DMF. The resins were shaken for 15 h at room temperature and the solvent was drained. The resins were washed successively with 1.2-mL portions of DMF (3 x), MeOH (3 x), and DMF (3 x).

Reduction of the nitro group and coupling of Fmoc-β-amino butyric acid:
The nitro group was reduced to the corresponding aniline using tin (II) chloride dihydrate (1.2 mL of a 0.5 M solution in DMF, 0.6 mmol) for 24 h followed by washing (3 X 1.2 mL) with DMF, DMF/H₂O, DMF, MeOH and DMF. The resin was then suspended in DMF (200 μL) and treated with a 0.5 M solution of DIEA in DMF (300 μL, 0.15 mmol), a 0.13 M solution of Fmoc-d,l-β-aminobutyric acid (500 μL, 0.066 mmol) and a 0.13 M solution of TBTU in DMF (500 μL, 0.066 mmol). After shaking for 5 h at 60 °C, and since several reactions were not complete as indicated by the cleavage of a few resin beads, fresh reagents were added and a second coupling was done using HATU as coupling agent at room temperature for 18 h.

Coupling of the core benzimidazole and cleavage from the resin:
The Fmoc group was cleaved with 20% piperidine/DMF (20 min) and after washing, the core benzimidazole was coupled under standard conditions to the carboxylic acid of example 2 using TBTU as coupling agent (room temperature, 18 h).

Cleavage from the resin:
In each well was added 1.0 mL of a 50% solution of TFA/1,2-dichloroethane and the resins were shaken for 1 h. The wells were drained and the resins washed once with 1 mL of the 50% TFA/1,2-DCE solution. The volatiles were removed under vacuum and the compounds were purified by semi-prep reversed phase chromatography.
EXAMPLE 109:
(Entries 1180-1185, Table 1):

The mono-Boc diamines 1-6 were synthesized from the corresponding diamino compounds according to a literature procedure (see Carceller, E.; Merlos, M.; Giral, M.; Balsa, D.; Garcia-Rafanell, J.; Forn, J. J. Med. Chem. 1996, 39, 487). 3-
Aminopiperidine was prepared by hydrogenation of 3-aminopyridine at 45 psi H₂ over 5% w/w Rh / Al₂O₃ for 9 days. Coupling of the mono-protected diamino compound to the carboxylic acid of example 2 was performed using HATU. Following removal of the carbamate protecting group (TFA), the title compounds of example 109 were isolated by preparative C18 reversed-phase HPLC:

Example 110:
(Entry 1191-1204, 1205-1209, 1210, 1211-1227, 1261-1274, and 1275-1292, Table 1)

The following steps were performed on a solid-phase synthesizer (ACT 496 from Advanced Chemtech), using the 96-well reaction block.
Reaction with anhydrides and isocyanates:

In each well of the reaction block was added 0.5 mL of DMF followed by a 0.06 M solution of the appropriate amine from example 109 in DMF (0.5 mL, 0.03 mmol). In the case of anhydride additions, DIEA was added to the well (8.7 μL, 0.05 mmol). The isocyanates or anhydrides were added to the appropriate wells as a 0.45 M solution in DMF (0.10 mL, 0.045 mmol).

Anhydrides addition: After shaking 5 h, a 1 M solution of NaOH / H2O was added (0.10 mL, 0.01 mmol) and the mixture was shaken for 14 h.

Isocyanates addition: The mixture was shaken for 19 h.

Work-up: In all the wells was added AcOH (11 μL, 0.2 mmol) and after shaking for 5 minutes, the solutions were sequentially purified by semi-Preparative C18 reversed-phase HPLC (20mm x 50 mm YMC column, 5μm, 120A) using a water-MeCN gradient containing 0.06% TFA.

Reaction with aldehydes:

In each well of the reaction block was added 0.2 mL of trimethylorthoformate followed by a 0.345 M solution of each of the appropriate amines from example 109 dissolved in trimethylorthoformate (0.30 mL, 0.115 mmol). Each of the aldehydes was dissolved in a 1% AcOH solution in trimethylorthoformate to make a 1.15 M solution. Each aldehyde solution was added to the appropriate well (0.10 mL, 0.115 mmol) and the solutions were shaken for 30 minutes. A solution 0.57 M of sodium cyanoborohydride in trimethylorthoformate was then added in each well (0.10 mL,
0.057 mmol) and the mixture was shaken for 3 h after which time, a 0.1 M solution of HCl in water was added (0.10 mL, 0.010 mmol). After shaking for 5 minutes, the solutions were filtered into a 8-mL vial and the well was washed with 1 mL of MeOH. The volatile solvents were removed under vacuum and the residue was dissolved in DMSO for purification by semi-preparative C18 reversed-phase HPLC.

**Example 111:**

After cooling to room temperature, the solution was filtered to remove insoluble material and the filtrate evaporated to dryness. The residue was taken up in MeCN (20 mL), DIEA (2.74 mL, 15.8 mmol) and di-tert-butyl dicarbonate (1.15 g, 5.26 mmol) were added, and the mixture stirred overnight at room temperature. **Substituted racemic phenylalanine fragments:**

A variety of racemic substituted phenylalanine derivatives were prepared from the corresponding bromobenzene derivatives via palladium-catalyzed Heck coupling with 2-acetamido methyl acrylate as described in the scheme below. For this purpose, phenolic functions were protected as acetate and carboxyl groups as methyl esters. Following Heck coupling, the resulting protected dehydroamino acids were hydrogenated to the racemic phenylalanine derivatives which were deprotected to the free amino acids by hydrolysis under acidic conditions. Free carboxylic acid functions were then reprotected as methyl esters prior to coupling with the carboxylic acid of example 2. The following examples are representative and are meant to illustrate the process:
Racemic 3-fluoro-4-(carboxymethyl)phenylalanine methyl ester hydrochloride:

4-Bromo-2-fluorobenzoic acid (3.00 g, 13.7 mmol) was dissolved in MeOH (25 mL) and thionyl chloride (1.5 mL, 20.1 mmol) was added dropwise. The mixture was refluxed overnight and then volatiles were removed under reduced pressure. The residue was triturated with a small amount of MeOH and the methyl ester collected by filtration (3.02 g).
The methyl ester from above (2.66 g, 11.4 mmol) was dissolved in MeCN (15 mL) and triethylamine (4.0 mL, 28.5 mmol) was added, followed by 2-acetamido methyl acrylate (1.80 g, 12.6 mmol) and tri-o-tolylphosphine (0.28 g, 0.91 mmol). The mixture was degassed with argon for 15 min and palladium acetate (0.17 g, 0.80 mmol) was added. Following an additional 15 min of degassing, the mixture was refluxed for 20 h. EtOAc was added and the solution washed with water, dried (MgSO₄) and concentrated. The residue was crystallized from EtOAc to give the desired dehydroamino ester (1.30 g).
The dehydroaminoester from above was dissolved in MeOH and hydrogenated over 20% Pd(OH)$_2$ under one atmosphere of hydrogen gas for 20 h. After removal of the catalyst by filtration and removal of the solvent under reduced pressure, the desired protected phenylalanine derivative was obtained.
The protected phenylalanine derivative from above (0.210 g, 0.71 mmol) was added to 4N HCl and the mixture refluxed overnight. Volatiles were then removed under vacuum to give the desired free amino acid as the hydrochloride salt (0.182 g).
The fully deprotected phenylalanine derivative from above (0.187 g, 0.69 mmol) was dissolved in MeOH (30 mL) and thionyl chloride (3 mL) was added dropwise. The mixture was refluxed overnight and then evaporated under vacuum. The residue was triturated with MeOH to give the title compound (0.193 g).

**Example 151:**
1-Cyclohexyl-2-furan-3-yl-4-methyl-1H-benzimidazole-5-carboxylic acid (Entry 5004, Table 5):

4-Chloro-2-methylbenzoic:
In a dry round-bottomed flask (3L) equipped with a mechanical stirrer under N₂, anhydrous N,N,N',N'-tetramethylethylenediamine (TMEDA, 99.7 mL, 660 mmol, 2.2 eq.) and anhydrous THF (600 mL) were added and the mixture was cooled to -90 °C in a bath of liquid N₂/EnOH. Freshly titrated sec-BuLi (550 mL, 1.2M in cyclohexane, 660 mmol., 2.2 eq.) was added slowly via cannula as to maintain the temperature at -50 °C. The solution was cooled to -90 °C and 4-chlorobenzoic acid (47.0 g in 400 mL anhydrous THF, 300 mmol) was added slowly via cannula, while stirring carefully to maintain the temperature at -90 °C. The reaction mixture was stirred at -90 °C for 1 h before allowed to warm-up to -80 °C and CH₃I (80 mL, 1.28 moles) was added very slowly. The reaction mixture was stirred for 10 min at -80 °C, then quenched slowly with H₂O (600 mL) and allowed to warm-up to room temperature. The aqueous layer was separated, washed with Et₂O (2 x 500 mL) and then acidified with HCl (2.5 N, 600 mL) while cooling in an ice bath; cooling was continued for 16 h at 4°C to allow crystallization of the desired product. The crude product was dried under vacuum and over anhydrous P₂O₅ and then re-crystallized from hot toluene (700 mL) to obtain pure 4-chloro-2-methylbenzoic acid (40 g).

Mixture of 4-chloro-2-methyl-5-nitrobenzoic acid methyl ester and 4-chloro-2-methyl-3-nitrobenzoic acid methyl ester:
These compounds were prepared using a modification of the procedure reported by M. Baumgarth et al. (J. Med. Chem. 1997, 40, 2017-2034).
4-Chloro-2-methylbenzoic acid (6 g) was added to fuming HNO₃ (100%, 36 g) in small portions over a period of 20 min, at 10 °C, while stirring vigorously. The reaction mixture was stirred vigorously for a period of 1 h and the temperature allowed to warm-up to 20 °C. The reaction mixture was then poured onto ice (100 g) and the yellow precipitate formed was collected, washed with H₂O, dissolved in EtOAc (25 mL) and the solution was dried over Na₂CO₃ and filtered. After concentration of the remaining mother liquor to 1/2 of the original volume, more precipitate was formed, however, the solid formed was always a mixture of 4-chloro-2-methyl-5-nitrobenzoic acid and 4-chloro-2-methyl-3-nitrobenzoic acid. Thus, all of the solid material formed was collected by filtration (~6.5 g), stirred in MeOH/HCl at 0 °C for 1 h to form a mixture of methyl esters. This mixture was used in the following step without further purification.

4-Cyclohexylamino-2-methyl-5-nitrobenzoic acid methyl ester and 4-cyclohexylamino-2-methyl-3-nitrobenzoic acid methyl ester:

The mixture of esters from above (1.1 g, 4.8 mmol) and cyclohexylamine (1.7 mL, 14.4 mmol) in DMSO (2 mL) were stirred at 60 °C for 16 h. The reaction mixture was then cooled and poured onto ice (~5 g) and mixed vigorously to allow the formation of a precipitate. The solid material was filtered, washed with H₂O and dissolved in EtOAc. The solution was washed with H₂O and brine, dried over anhydrous MgSO₄ and evaporated to an oil containing the desired products. The oil was triturated with hexane (~5 mL) to allow precipitation of relatively pure 4-cyclohexylamino-2-methyl-5-nitrobenzoic acid methyl ester (600 mg), whereas the mother liquor contained mostly 4-cyclohexylamino-2-methyl-3-nitrobenzoic acid methyl ester (600 mg).

3-Amino-4-cyclohexylamino-2-methylbenzoic acid methyl ester:

4-Cyclohexylamino-2-methyl-3-nitrobenzoic acid methyl ester (150 mg) was dissolved in THF/MeOH (30 mL, 1:2 ratio) and stirred in the presence of H₂ (1 atm) and a catalytic amount of Pd(OH)₂ (20 mg) at room temperature for 14 h. The reaction mixture was then filtered, evaporated to dryness and purified by flash column chromatography, using 25% EtOAc in hexane with 0.2% NH₄OH as the eluent, to give the pure aniline (106 mg).
1-Cyclohexyl-2-furan-3-yl-4-methyl-1H-benzimidazole-5-carboxylic acid:
To a solution of the diamine from above (500 mg, 1.9 mmol) in DMF (3 mL) and H₂O
(0.15 mL), 3-furaldehyde (0.22 mL, 2.5 mmol) and oxone® (1.29 g, 2.1 mmol) were
added and the reaction mixture was stirred at room temperature for 1 h.
Subsequently, H₂O (60 mL) was added and the pH was adjusted to 8 with aqueous
NaHCO₃. The reaction mixture was then extracted with DCM, the organic layer was
washed with brine, dried over anhydrous Na₂SO₄ and evaporated to dryness. The
desired benzimidazole methyl ester (446 mg) was obtained pure after column
chromatography, using 25% EtOAc in hexane.
Hydrolysis of the methyl ester was achieved with an aqueous solution of NaOH (1.0
N, 0.66 mL, 6.6 mmol) in a solution of MeOH/THF (10 mL, 1:1 ratio) at 60 °C for 1.5
h. The reaction mixture was then cooled to room temperature, the pH was adjusted
to 4 with AcOH and the organic solvents were evaporated to dryness. The
remaining aqueous mixture was extracted with DCM (3 x 15 mL) and the combined
organic layers were washed with H₂O, dried over anhydrous Na₂SO₄ and
evaporated to dryness to give the desired title compound of example 151, 1-
cyclohexyl-2-furan-3-yl-4-methyl-1H-benzimidazole-5-carboxylic acid (392 mg).

The material from above was dissolved in a 4N HCl in dioxane (10 mL) and stirred 30 min at room temperature. The solvent was evaporated to dryness and the solid residue coupled to the carboxylic acid of example 2 in the usual manner. Following saponification of ester protecting groups the title compound of example 158 was purified by reversed phase C18 HPLC.

The compounds of formula (I) can be obtained in the form of therapeutically acceptable salts. (see, for example Pharmaceutical salts, Birge, S.M. et al., J. Pharm. Sci. (1977), 66, 1-19, incorporated herein by reference).

Example 159: Inhibition of NS5B RNA Dependent RNA Polymerase Activity

The compounds of the invention were tested for inhibitory activity against the hepatitis C virus RNA dependant polymerase (NS5B), according to the following assay:

The substrates are:
a 12 nucleotide RNA oligo-uridylate (or oligo-uridine-monophosphate) (oligo-U) primer modified with biotin at the free 5°C position;

a complementary poly-adenylate (or adenosine monophosphate) (polyA) template of heterogeneous length (1000-10000 nucleotides); and

5 UTP-[5,6 $^3$H].

Polymerase activity is measured as the incorporation of UMP-[5,6 $^3$H] into the chain elongated from the oligo-U primer. The $^3$H-labelled reaction product is captured by SPA-beads coated with streptavidin and quantified on the TopCount.

10 All solutions were made from DEPC treated MilliQ water [2 ml of DEPC is added to 1 l of MilliQ water; the mixture is shaken vigorously to dissolve the DEPC, then autoclaved at 121°C for 30 minutes].

Enzyme: The full length HCV NS5B (SEQ ID NO.1) was purified as an N-terminal hexa-histidine fusion protein from baculovirus infected insect cells. The enzyme can be stored at –20°C in storage buffer (see below). Under these conditions, it was found to maintain activity for at least 6 months.

Substrates: The biotinylated oligo-U$_{12}$ primer, the Poly(A) template, and the UTP-[5,6 $^3$H] were dissolved in water. The solutions can be stored at –80°C.

Assay buffer: 20 mM Tris-HCl pH 7.5

5 mM MgCl$_2$

25 mM KCl

1 mM EDTA

1 mM DTT

NS5B storage buffer: 0.1 µM NS5B

25 mM Tris-HCl pH 7.5
300 mM NaCl
5 mM DTT
1 mM EDTA
0.1 % n-Dodecyl maltoside
30 % glycerol

**Test compound cocktail:** Just prior to assay, test compounds of the invention were dissolved in assay buffer containing 15% DMSO.

**Substrate cocktail:** Just prior to assay, the substrates were mixed in assay buffer to the following concentrations:

**Protocol:**

The assay reaction was performed in a Microfluor™ white "U" bottom plate (Dynatech™ #7105), by successively adding:

- 20 µl of test compound cocktail;
- 20 µl of substrate cocktail; and
- 20 µl of enzyme cocktail

(final [NS5B] in assay = 10 nM; final [n-dodecyl maltoside] in assay = 0.33%; final DMSO in assay = 5%).

The reaction was incubated at room temperature for 1.5 hours. STOP solution (20 µl; 0.5 M EDTA, 150 ng/µl tRNA) was added, followed by 30 µl streptavidin coated PVT beads (8mg/ml in 20 mM Tris-HCl, pH 7.5, 25 mM KCl, 0.025% NaN₃). The plate was then shaken for 30 minutes. A solution of CsCl was added (70 µl, 5 M), to bring the CsCl concentration to 1.95 M. The mixture was then allowed to stand for 1 hour. The beads were then counted on a Hewlett Packard TopCount™ instrument using the following protocol:

- Data mode: counts per minute
- Scintillator: liq/plast
- Energy range: low
- Efficiency mode: normal
- Region: 0-50
- Count delay: 5 Minutes
- Count time: 1 minute
Expected results: 6000 cpm/well
200 cpm/well no enzyme control

Based on the results at ten different concentrations of test compound, standard concentration-% inhibition curves were plotted and analysed to determine IC_{50}'s for the compounds of the invention. For some compounds the IC_{50} was estimated from two points.

**EXAMPLE 160: SPECIFICITY FOR NS5B RNA DEPENDENT RNA POLYMERASE INHIBITION**

The compounds of the invention were tested for inhibitory activity against polio virus RNA dependent RNA polymerase and calf thymus DNA dependent RNA polymerase II in the format that is described for the HCV polymerase with the exception that poliovirus polymerase was used in place of the HCV NS5B polymerase.

**TABLE OF COMPOUNDS**

The compounds listed in Tables 1 to 22 were found to be active in the above-described NS5B assay, with IC_{50}'s of less than 25 \mu M. None of these compounds were found to exhibit significant inhibition of poliovirus RNA dependent RNA polymerase or calf thymus DNA dependent RNA polymerase II at 25\mu M concentration.

In Tables 1 to 22, the following ranges apply: A: 25-100 \mu M; B: 10-50 \mu M; C: 5-1 \mu M; and D: < 1 \mu M.
