CANNABINOID RECEPTOR LIGANDS

CROSS REFERENCE TO RELATED APPLICATION

This is a continuation-in-part of U.S. Serial No. 10/072,354, filed February 6, 2002, which claims priority to U.S. Provisional Application 60/267,375, filed February 8, 2001.

BACKGROUND OF THE INVENTION

- 5 This invention relates to cannabinoid receptor ligands and, more particularly, to compounds that bind to cannabinoid (CB₂) receptors. Compounds according to the present invention generally exhibit anti-inflammatory and immunomodulatory activity and are useful in treating conditions characterized by inflammation and immunomodulatory irregularities. Examples of conditions which may be treated
- 10 include, but are not limited to, rheumatoid arthritis, asthma, allergy, psoriasis, Crohn's disease, systemic lupus erythematosus, multiple sclerosis, diabetes, cancer, glaucoma, osteoporosis, renal ischemia, cerebral stroke, cerebral ischemia, and nephritis. The invention also relates to pharmaceutical compositions containing said compounds.
- 15 Cannabinoid receptors belong to the superfamily of G-protein coupled receptors. They are classified into the predominantly neuronal CB1 receptors and the predominantly peripheral CB2 receptors. While the effects of CB1 receptors are principally associated with the central nervous system, CB2 receptors are believed to have peripheral effects related to bronchial constriction, immunomodulation and
- 20 inflammation. As such, a selective CB2 receptor binding agent is expected to have therapeutic utility in the control of diseases associated with inflammation, immunomodulation and bronchial constriction such as rheumatoid arthritis, systemic lupus erythematosus, multiple sclerosis, diabetes, osteoporosis, renal ischemia, cerebral stroke, cerebral ischemia, nephritis, inflammatory disorders of the lungs and
- 25 gastrointestinal tract, and respiratory tract disorders such as reversible airway obstruction, chronic asthma and bronchitis (see, e.g., R.G. Pertwee, Curr. Med. Chem. 6(8), (1999), 635).

- 2 -

Various compounds have reportedly been developed which interact with CB₂ receptors and/or which have, *inter alia*, anti-inflammatory activity associated with cannabinoid receptors. See, e.g., U.S. Pat. Nos. 5,338,753, 5,462,960, 5,532,237, 5,925,768, 5,948,777, 5,990,170, 6,013,648 and 6,017,919.

Compounds of the invention may have at least one asymmetrical carbon atom and therefore all isomers, including diastereomers and rotational isomers are

- 10 -

contemplated as being part of this invention. The invention includes (+)- and (-)- isomers in both pure form and in admixture, including racemic mixtures. Isomers can be prepared using conventional techniques, either by reacting optionally pure or optically enriched starting materials or by separating isomers of a compound of formula I. Those skilled in the art will appreciate that for some compounds of formula I, one isomer may show greater pharmacological activity than other isomers.

Compounds of formula I can exist in unsolvated and solvated forms, including hydrated forms. In general, the solvated forms, with pharmaceutically acceptable solvents such as water, ethanol and the like, are equivalent to the unsolvated forms for purposes of this invention.

Compounds of the invention with a basic group can form pharmaceutically acceptable salts with organic and inorganic acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those in the art. The salt is prepared by contacting the free base form with a sufficient amount of the desired acid to produce a salt. The free base form may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous sodium bicarbonate. The free base form differs from its respective salt form somewhat in certain physical properties, such as solubility in polar solvents, but the salt is otherwise equivalent to its respective free base forms for purposes of the invention.

Certain compounds of the invention are acidic (e.g., compounds where R^2 is a hydrogen covalently bonded to N). Acidic compounds according to the present invention can form pharmaceutically acceptable salts with inorganic and organic bases. Examples of such salts are the sodium, potassium, calcium, aluminum, magnesium, zinc, lithium, gold and silver salts. Also included are salts formed with pharmaceutically acceptable amines such as ammonia, alkyl amines, hydroxyalkylamines, N-methylglucamine, piperazines and other amines.

General Scheme I

Preparation of Aryl-Bis-Sulfone Compounds

5

Description of Reactions-General Scheme I

In step 1, trifluoroacetic anhydride is dissolved in a suitable inert solvent such as methylene chloride and reacted with a benzyl amine at room temperature for 1-5 hr. MsOH (2 eq) is added followed by DBDMH and the reaction mixture is stirred

- 13 -

overnight at room temperature and subjected to aqueous work up. The crude product is recrystallized from a mixture of Et₂O and hexanes or purified via chromatography.

In step 2, the product of step 1 is dissolved in THF, cooled in a dry ice/IPA bath and treated with methyllithium then n-BuLi. The resulting dianion may be trapped with a sulfonyl fluoride or a disulfide. If a disulfide is the trapping agent, the resulting product is oxidized with MCPBA in CH₂Cl₂ at room temperature for 1-6 h. The product may be purified via chromatography or crystallization.

In step 3, the product of step 2 is dissolved in THF and treated with n-BuLi at -78 °C to form a dianion that is trapped with a suitable electrophile.

Alternatively, in step 3 the product of step 2 is dissolved in THF treated with n-BuLi at -78 °C to form a dianion which is trapped with iodine to provide the iodo substituted product. The product may be purified via sgc or crystallization. The iodo product can be converted to a similar product by nucleophilic aromatic substitution with a variety of nucleophiles, including amines, alcohols, and thiols.

In step 4, the product of step 3 is dissolved in a suitable solvent such as dioxane, ethanol, methanol or THF and an alkali metal hydroxide or carbonate such as lithium hydroxide or potassium carbonate is added either as an aqueous solution or as a solid. The reaction mixture is stirred at room temperature for 0.5-24 h. The product may be purified via sgc or crystallization.

In step 5, a combination of the product of step 4 and a tertiary amine base was dissolved in a suitable solvent such as CH₂Cl₂ or dioxane, at room temperature, cooled, and a suitable electrophile is added. The reaction mixture is stirred between -78 °C and 100 °C for 0.5 to 48 h. The product may be purified via sgc or crystallization.

In step 6, the product of step 5 is dissolved in a suitable inert solvent such as THF or CH₂Cl₂ and treated with a suitable base such as NaH or triethylamine. An electrophile is added and the reaction mixture is stirred between 0 °C and 100°C for 0.5 to 48 h. The product may be purified via sgc or crystallization.

General Scheme II

Preparation of Methylene Linked Compounds

Description of reactions-General Scheme II

In step 1, trifluoroacetic anhydride is dissolved in a suitable inert solvent such as methylene chloride and treated with a benzyl amine at ambient temperature, then stirred for 1-5 h. Methanesulfonic acid (2 eq) is added followed by dibromodimethylhydantoin and the reaction mixture is stirred overnight at rt and subjected to aqueous work up. The product may be purified by chromatography or crystallization.

In step 2, the product of step 1 is dissolved in THF, cooled in a dry ice/acetone bath (-78°C) and treated with methyllithium, then n-BuLi. The dianion is then treated with a THF solution containing the aldehyde (i). The resulting mixture is warmed to rt and stirred for 10 h. The product is purified by chromatography.

In step 3, the alcohol product from step 2 is dissolved in methylene chloride and treated with ten fold excess of triethylsilane followed by a slight excess of boron trifluoride etherate. The resulting mixture is stirred at room temperature for 4h, and purified by chromatography.

In step 4, the product of step 3 is dissolved in a suitable solvent such as dioxane, ethanol, or THF and an alkali metal hydroxide such as lithium hydroxide is

- 15 -

added either as an aqueous solution or as a solid. The reaction mixture is stirred at rt for 0.5-24 h.

In step 5, the product of step 4 is dissolved in a mixture of a suitable inert solvent such as CH_2Cl_2 or dioxane and a tertiary amine base, and a suitable electrophile is added. The reaction mixture is stirred between -78°C and 100°C for 0.5 to 48 h.

In step 6, the product of step 5 is dissolved in a suitable inert solvent such as THF or CH_2Cl_2 and treated with a suitable base such as NaH or triethylamine. An electrophile is added and the reaction mixture is stirred between 0°C and 100°C for 0.5 to 48 h.

The aldehyde (i) used in step 2 was prepared by one of the following two procedures; 1) Regioselective ortho lithiation of a 4-substituted benzaldehyde, and quenching with a substituted phenyl disulfide followed by oxidation with metachloroperoxybenzoic acid to the sulfone. 2) Base promoted displacement of fluoride from an ortho-fluorobenzaldehyde by a thiophenol, phenol, or aniline.

In step 2, the ketone is treated with the ylide obtained by base treatment of dried methyltriphenylphosphonium bromide, providing the exo methylene product. In

- 16 -

step 3 the trifluoroacetamide group can be hydrolyzed with base and reacted with a variety of acylating, sulfonylating, alkylating and other electrophilic reagents.

The ketone product can be treated with hydroxylamine hydrochloride in pyridine and heated at 80°C for 24 h. The mixture was cooled to room temperature and the solvent removed under reduced pressure. Upon workup and purification, the oxime is obtained.

and bronchitis. This utility is manifested as demonstrated by activity in the following assay.

Potential cannabinoid receptor ligands were screened for the ability to compete with [³H] CP-55,940 for binding to recombinant cannabinoid receptors. Test compounds were serially diluted in Diluent Buffer (50 mM Tris pH 7.1, 1 mM EDTA, 3 mM MgCl₂, 0.1% BSA, 10% DMSO, 0.36% methyl cellulose (Sigma M-6385)) from stocks prepared in 100% DMSO. Aliquots (10 ul) were transferred into 96-well microtiter plates. Membrane preparations of recombinant human cannabinoid CB2 receptor (Receptor Biology #RB-HCB2) or recombinant human cannabinoid CB1 receptor (Receptor Biology #RB-HCB1) were diluted to 0.3 mg/ml in Binding Buffer (50 mM Tris pH 7.2, 1 mM EDTA, 3 mM MgCl₂, 0.1% BSA). Aliquots (50 ul) were added to each well of the microtiter plate. The binding reactions were initiated by addition of [³H] CP-55,940 (New England Nuclear # NET 1051; specific activity =180 Ci/mmol) to each well of the microtiter plate. Each 100 ul reaction mixture contained 0.48 nM [³H] CP-55,940, 15 ug membrane protein in binding buffer containing 1% DMSO and 0.036 % methyl cellulose. Following incubation for 2 hours at room temperature, the reactions were filtered through 0.5% polyethylenimine-coated GF/C filter plates (UniFilter-96, Packard) with a TomTec Mark 3U Harvester (Hamden, CT). The filter plate was washed 5 times with binding buffer, rotated 180°, then re-washed 5 times with binding buffer. Bound radioactivity was quantitated following addition of 30 ul of Packard Microscint 20 scintillant in a Packard TopCount NXT microplate scintillation counter. Non-linear regression analysis of the resulting data was performed using Prism 2.0b (GraphPad, San Diego, CA).

Other drugs that the compounds of the invention can be co-administered or used in combination with include Anaprox, Arava, Arthrotec, Azulfidine, Aspirin, Cataflam, Celestone Soluspan, Clinoril, Cortone Acetate, Cuprimine, Daypro, Decadron, Depen, Depo-Medrol, Disalcid, Dolobid,
20 Naprosyn, Gengraf, Hydrocortone, Imuran, Indocin, Lodine, Motrin, Myochrysine, Nalfon, Naprelan, Neoral, Orudis, Oruvail, Pediapred, Plaquenil, Prelone, Relafen, Solu-Medrol, Tolectin, Trilisate and/or Volataren. These include any formulation of the above named drugs.

For the treatment of multiple sclerosis, one or more compounds of the invention
25 can be co-administered or used in combination with Avonex, Betaseron and/or Copaxone.

For combination treatment with more than one active agent, where the active agents are in separate dosage formulations, the active agents can be administered separately or in conjunction. In addition, the administration of one element may be
30 prior to, concurrent to, or subsequent to the administration of the other agents.

The present invention also relates to a pharmaceutical composition comprising one or more compounds of formula I and one or more pharmaceutically acceptable carriers. The compounds of formula I can be administered in any conventional

- 42 -

dosage form known to those skilled in the art. Pharmaceutical compositions containing the compounds of formula I can be prepared using conventional pharmaceutically acceptable excipients and additives and conventional techniques. Such pharmaceutically acceptable excipients and additives include non-toxic
5 compatible fillers, binders, disintegrants, buffers, preservatives, anti-oxidants, lubricants, flavorings, thickeners, coloring agents, emulsifiers and the like. All routes of administration are contemplated including, but not limited to, parenteral, transdermal, subcutaneous, intramuscular, sublingual, inhalation, rectal and topical.

Thus, appropriate unit forms of administration include oral forms such as
10 tablets, capsules, powders, cachets, granules and solutions or suspensions, sublingual and buccal forms of administration, aerosols, implants, subcutaneous, intramuscular, intravenous, intranasal, intraocular or rectal forms of administration.

When a solid composition is prepared in the form of tablets, e.g., a wetting agent such as sodium lauryl sulfate can be added to micronized or non-micronized
15 compounds of formula I and mixed with a pharmaceutical vehicle such as silica, gelatin starch, lactose, magnesium stearate, talc, gum arabic or the like. The tablets can be coated with sucrose, various polymers, or other appropriate substances. Tablets can be treated so as to have a prolonged or delayed activity and so as to release a predetermined amount of active principle continuously or at predetermined
20 intervals, e.g., by using ionic resins and the like.

A preparation in the form of gelatin capsules may be obtained, e.g., by mixing the active principle with a diluent, such as a glycol or a glycerol ester, and incorporating the resulting mixture into soft or hard gelatin capsules.

A preparation in the form of a syrup or elixir can contain the active principle
25 together, e.g., with a sweetener, methylparaben and propylparaben as antiseptics, flavoring agents and an appropriate color.

Water-dispersible powders or granules can contain the active principle mixed, e.g., with dispersants, wetting agents or suspending agents, such as polyvinylpyrrolidone, as well as with sweeteners and/or other flavoring agents.

30 Rectal administration may be provided by using suppositories which may be prepared, e.g., with binders melting at the rectal temperature, for example cocoa butter or polyethylene glycols.

- 43 -

Parenteral, intranasal or intraocular administration may be provided by using, e.g., aqueous suspensions, isotonic saline solutions or sterile and injectable solutions containing pharmacologically compatible dispersants and/or solubilizers, for example, propylene glycol or polyethylene glycol.

5 Thus, to prepare an aqueous solution for intravenous injection, it is possible to use a co-solvent, e.g., an alcohol such as ethanol or a glycol such as polyethylene glycol or propylene glycol, and a hydrophilic surfactant such as Tween® 80. An oily solution injectable intramuscularly can be prepared, e.g., by solubilizing the active principle with a triglyceride or a glycerol ester.

10 Topical administration can be provided by using, e.g., creams, ointments or gels.

Transdermal administration can be provided by using patches in the form of a multilaminate, or with a reservoir, containing the active principle and an appropriate solvent.

15 Administration by inhalation can be provided by using, e.g., an aerosol containing sorbitan trioleate or oleic acid, for example, together with trichlorofluoromethane, dichlorofluoromethane, dichlorotetrafluoroethane or any other biologically compatible propellant gas; it is also possible to use a system containing the active principle, by itself or associated with an excipient, in powder form.

20 The active principle can also be formulated as microcapsules or microspheres, e.g., liposomes, optionally with one or more carriers or additives.

Implants are among the prolonged release forms which can be used in the case of chronic treatments. They can be prepared in the form of an oily suspension or in the form of a suspension of microspheres in an isotonic medium.

25 The daily dose of a compound of formula I for treatment of a disease or condition cited above is about 0.001 to about 100 mg/kg of body weight per day, preferably about 0.001 to about 10 mg/kg. For an average body weight of 70 kg, the dosage level is therefore from about 0.1 to about 700 mg of drug per day, given in a single dose or 2-4 divided doses. The exact dose, however, is determined by the
30 attending clinician and is dependent on the potency of the compound administered, the age, weight, condition and response of the patient.
