IMIDAZOTHIAZOLE AND IMIDAZOPYRAZINE DERIVATIVES AS PROTEASE ACTIVATED RECEPTOR 4 (PAR4) INHIBITORS FOR TREATING PLATELET AGGREGATION

CROSS REFERENCES TO RELATED APPLICATIONS
[0001] This application claims the benefit of U.S. Provisional Applications Serial Numbers 61/638,577, and 61/787,680, filed on April 26, 2012 and March 15, 2013, respectively. The entirety of each of these applications is incorporated herein by reference.

FIELD OF THE INVENTION
[0002] The present invention provides novel imidazothiadiazole and imidazopyridazine inhibitors of platelet aggregation which are useful in preventing or treating thromboembolic disorders. This invention also relates to pharmaceutical compositions containing these compounds and methods of using the same.

BACKGROUND OF THE INVENTION
[0003] Thromboembolic diseases remain the leading cause of death in developed countries despite the availability of anticoagulants such as warfarin (COUMADIN®), heparin, low molecular weight heparins (LMWH), synthetic pentasaccharides, and antiplatelet agents such as aspirin and clopidogrel (PLAVIX®).
[0004] Current anti-platelet therapies have limitations including increased risk of bleeding as well as partial efficacy (relative cardiovascular risk reduction in the 20 to 30% range). Thus, discovering and developing safe and efficacious oral or parenteral antithrombotics for the prevention and treatment of a wide range of thromboembolic disorders remains an important goal.
[0005] Alpha-thrombin is the most potent known activator of platelet aggregation and degranulation. Activation of platelets is causally involved in atherothrombotic vascular occlusions. Thrombin activates platelets by cleaving G-protein coupled receptors termed protease activated receptors (PARs). PARs provide their own cryptic ligand present in the N-terminal extracellular domain that is unmasked by proteolytic cleavage, with subsequent intramolecular binding to the receptor to induce signaling (tethered ligand mechanism; Coughlin, S.R., Nature, 407:258-264 (2000)). Synthetic peptides that mimic the sequence of the newly formed N-terminus upon proteolytic activation can induce signaling independent of receptor cleavage. Platelets are a key player in atherothrombotic
events. Human platelets express at least two thrombin receptors, commonly referred to as PARI and PAR4. Inhibitors of PARI have been investigated extensively, and several compounds, including vorapaxar and atopaxar have advanced into late stage clinical trials. Recently, in the TRACER phase III trial in ACS patients, vorapaxar did not significantly reduce cardiovascular events, but significantly increased the risk of major bleeding (Tricoci, P. et al, *N. Eng. J. Med.*, 366(l):20-33 (2012). Thus, there remains a need to discover new antiplatelet agents with increased efficacy and reduced bleeding side effects.

"was found to be a selective and potent inhibitor or protease-activated receptor type 4 (PAR4)-dependent platelet activation."

[0008] EP1 166785 A1 and EP0667345 disclose various pyrazole derivatives which are useful as inhibitors of platelet aggregation.

**SUMMARY OF THE INVENTION**

[0009] It has been found that imidazothiadiazole and imidazopyridazine compounds in accordance with the present invention are PAR4 antagonists which inhibit platelet aggregation in gamma-thrombin induced platelet aggregation assays. Moreover, a compound(s) of the present invention has been shown to inhibit platelet aggregation in an
alpha-thrombin induced platelet aggregation assay, and to inhibit thrombus formation in an arterial thrombosis model in cynomolgus monkeys.

Accordingly, the present invention provides novel imidazothiadiazole analogues and imidazopyridazine analogues which are PAR4 antagonists and are useful as selective inhibitors of platelet aggregation, including stereoisomers, tautomers, pharmaceutically acceptable salts, solvates, or prodrug esters thereof.

The present invention also provides processes and intermediates for making the compounds of the present invention or stereoisomers, tautomers, pharmaceutically acceptable salts, solvates, or prodrug esters thereof.

The present invention also provides pharmaceutical compositions comprising a pharmaceutically acceptable carrier and at least one of the compounds of the present invention or stereoisomers, tautomers, pharmaceutically acceptable salts, solvates, or prodrug esters thereof.

The present invention also provides a method for the treatment or prophylaxis of thromboembolic disorders comprising administering to a patient in need of such treatment or prophylaxis a therapeutically effective amount of at least one of the compounds of the present invention or stereoisomers, tautomers, pharmaceutically acceptable salts, solvates, or prodrug esters thereof.

The present invention also provides the compounds of the present invention or stereoisomers, tautomers, pharmaceutically acceptable salts, solvates, or prodrug esters thereof, for use in therapy.

The present invention also provides the use of the compounds of the present invention or stereoisomers, tautomers, pharmaceutically acceptable salts, solvates, or prodrug esters thereof, for the manufacture of a medicament for the treatment or prophylaxis of a thromboembolic disorder.

Other features and advantages of the invention will be apparent from the following detailed description and claims.

Preferred carbocycles, unless otherwise specified, are cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, phenyl, and indanyl. When the term "carbocycle" is used, it is intended to include "aryl". A bridged ring occurs when one or more carbon atoms link two non-adjacent carbon atoms.

Preferred bridges are one or two carbon atoms. It is noted that a bridge always converts a monocyclic ring into a tricyclic ring. When a ring is bridged, the substituents recited for the ring may also be present on the bridge.
"Aryl" groups refer to monocyclic or polycyclic aromatic hydrocarbons, including, for example, phenyl, naphthyl, and phenanthryl. Aryl moieties are well known and described, for example, in Lewis, R.J., ed., *Hawley's Condensed Chemical Dictionary*, 13th Edition, John Wiley & Sons, Inc., New York (1997). "C₆H₅ aryI" refers to phenyl and naphthyl. Unless otherwise specified, "aryl", "C₆H₅ aryI" or "aromatic residue" may be unsubstituted or substituted with 1 to 3 groups selected from OH, OC₁-C₃ alkoxy, Cl, F, Br, I, CN, N0₂, NH₂, N(CH₃)₂H, N(CH₃)₂, CF₃, OCF₃, OCHF₂, C(=0)CH₃, SCH₃, S(=0)CH₃, S(=0)₂CH₃, C₁-C₃ alkyl, C0₂H, and C0₂CH₃.

As used herein, the term "heterocycle", "heterocycIo" or "heterocyclic" group is intended to mean a stable 4- to 14-membered monocyclic, bicycI or tricycI heterocycI ring which is saturated or partially unsaturated and which consists of carbon atoms and 1, 2, 3, or 4 heteroatoms independently selected from the group consisting of N, NH, O and S and including any bicycI group in which any of the above-defined heterocycI rings is fused to a benzene ring. The nitrogen and sulfur heteroatoms may optionally be oxidized (*i.e.*, N → 0 and S(0)ₚ, wherein p is 0, 1 or 2). The nitrogen atom may be substituted or unsubstituted (*i.e.*, N or NR wherein R is H or another substituent, if defined). The heterocycI ring may be attached to its pendant group at any heteroatom or carbon atom that results in a stable structure. The heterocycI rings described herein may optionally be substituted on carbon or on a nitrogen atom if the resulting compound is stable, with 1 to 3 groups selected from OH, OC₁-C₃ alkoxy, Cl, F, Br, I, CN, N0₂, NH₂, N(CH₃)₂H, N(CH₃)₂, CF₃, OCF₃, OCHF₂, =0, C(=0)CH₃, SCH₃, S(=0)CH₃, S(=0)₂CH₃, C₁-C₃ alkyl, C0₂H and C0₂CH₃. A nitrogen in the heterocycle may optionally be quaternized. It is preferred that when the total number of S and O atoms in the heterocycle exceeds 1, then these heteroatoms are not adjacent to one another. It is preferred that the total number of S and O atoms in the heterocycle is not more than 1. Spiro and bridged rings are also included in the definition of heterocycle. A bridged ring occurs when one or more atoms (*i.e.*, C, O, N, or S) link two non-adjacent carbon or nitrogen atoms. Examples of bridged rings include, but are not limited to, one carbon atom, two carbon atoms, one nitrogen atom, two nitrogen atoms, and a carbon-nitrogen group. It is noted that a bridge always converts a monocyclic ring into a tricycI ring. When a ring is bridged, the substituents recited for the ring may also be present on the bridge. When the term "heterocycle" is used, it is not intended to include heteroaryl.
Exemplary monocyclic heterocyclic groups include azetidinyl, pyrrolidinyl, oxetanyl, imidazolinyl, oxazolidinyl, isoxazolinyl, thiazolidinyl, isothiazolidinyl, tetrahydrofuranyl, piperidyl, piperazinyl, 2-oxopiperazinyl, 2-oxopiperidyl, 2-oxopyrrolodinyl, 2-oxoazepinyl, azepinyl, 4-piperidonyl, tetrahydropyranyl, morpholinyl, thiamorpholmyl, thiamorpholmyl sulfoxide, thiamorpholmyl sulfone, 1,3-dioxolane, and tetrahydro-1,1-dioxothienyl, and the like.

As used herein, the term "aromatic heterocyclic group" or "heteroaryl" is intended to mean stable monocyclic and polycyclic aromatic hydrocarbons that include at least one heteroatom ring member such as sulfur, oxygen, or nitrogen. Heteroaryl groups include, without limitation, pyridyl, pyrimidinyl, pyrazinyl, pyridazinyl, triazinyl, furyl, quinolyl, isoquinolyl, thienyl, imidazolyl, thiazolyl, indolyl, pyrroyl, oxazolyl, benzofuranyl, benzothienyl, benzthiazolyl, isoxazolyl, pyrazolyl, triazolyl, tetrazolyl, indazolyl, 1,2,4-thiadiazolyl, isothiazolyl, purinyl, carbazolyl, benzimidazolyl, indoliny1, benzidoxolanyl, and benzodioxane. Heteroaryl groups are unsubstituted or substituted with 1 to 3 groups selected from OH, OCH₃, alkoxy, Cl, F, Br, I, CN, N(O)₂, NH₂, N(CH₃)₂H, N(CH₃)₃, CF₃, OCF₃, OCHF₂, C₅H₀, C₆H₅, S(=O)₂CH₃, C₅H₅, C₆H₅, C₆H₅. The nitrogen atom is substituted or unsubstituted (i.e., N or NR wherein R is H or another substituent, if defined). The nitrogen and sulfur heteroatoms may optionally be oxidized (i.e., N→O and S(0)ₓ, wherein p is 0, 1 or 2). Bridged rings are also included in the definition of heteroaryl. A bridged ring occurs when one or more atoms (i.e., C, O, N, or S) link two non-adjacent carbon or nitrogen atoms. Examples of bridged rings include, but are not limited to, one carbon atom, two carbon atoms, one nitrogen atom, two nitrogen atoms, and a carbon-nitrogen group. It is
noted that a bridge always converts a monocyclic ring into a tricyclic ring. When a ring is bridged, the substituents recited for the ring may also be present on the bridge.

[0099] Preferred heteroaryl groups include

and the like.

[00100] When the term "unsaturated" is used herein to refer to a ring or group, which group may be fully unsaturated or partially unsaturated.

[00101] The term "acyl" alone or as part of another group refers to a carbonyl group linked to an organic radical, more particularly, the group C(=O)R<sub>e</sub>, as well as the bivalent groups -C(=0)- or -C(=0)Re-, which are linked to organic radicals. The group R<sub>e</sub> can be selected from alkyl, alkenyl, alkyynyl, aminoalkyl, substituted alkyl, substituted alkenyl, or substituted alkynyl, as defined herein, or when appropriate, the corresponding bivalent group, e.g., alkyylene, alkenylene, and the like.
The designation “\(\bigcirc\)” or “\(\frac{1}{2}\)" or “\(\frac{-1}{2}\)" attached to a ring or other group refers to a free bond or linking group.

Throughout the specification, groups and substituents thereof may be chosen by one skilled in the field to provide stable moieties and compounds and compounds useful as pharmaceutically-acceptable compounds and/or intermediate compounds useful in making pharmaceutically-acceptable compounds.

The term "counterion" is used to represent a negatively charged species such as chloride, bromide, hydroxide, acetate, and sulfate.

As referred to herein, the term "substituted" means that at least one hydrogen atom is replaced with a non-hydrogen group, provided that normal valencies are maintained and that the substitution results in a stable compound. When a substituent is keto (\(=\)O), then 2 hydrogens on the atom are replaced. Keto substituents are not present on aromatic moieties. Ring double bonds, as used herein, are double bonds that are formed between two adjacent ring atoms (\(e.g.,\ C=C, C=N,\) or \(N=N)\).

In cases wherein there are nitrogen atoms (\(e.g.,\) amines) on compounds of the present invention, these may be converted to N-oxides by treatment with an oxidizing agent (\(e.g.,\) mCPBA and/or hydrogen peroxides) to afford other compounds of this invention. Thus, shown and claimed nitrogen atoms are considered to cover both the shown nitrogen and its N-oxide (\(N\rightarrow\mathbf{O}\) ) derivative. In cases in which there are quaternary carbon atoms in compounds of the present invention, these can be replaced by silicon atoms, provided they do not form Si-N or Si-0 bonds.

When any variable occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0 to 3 \(R^3\), then said group may optionally be substituted with up to three \(R^3\) groups, and at each occurrence \(R^3\) is selected independently from the definition of \(R^3\). Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom in which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any
atom in such substituent. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

[00109] The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms that are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, and/or other problem or complication, commensurate with a reasonable benefit/risk ratio.

[00110] As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. Examples of pharmaceutically acceptable salts include, but are not limited to, mineral or organic acid salts of basic groups such as amines; and alkali or organic salts of acidic groups such as carboxylic acids. The pharmaceutically acceptable salts include the conventional non-toxic salts or the quaternary ammonium salts of the parent compound formed, for example, from non-toxic inorganic or organic acids. For example, such conventional non-toxic salts include those derived from inorganic acids such as hydrochloric, hydrobromic, sulfuric, sulfamic, phosphoric, and nitric; and the salts prepared from organic acids such as acetic, propionic, succinic, glycolic, stearic, lactic, malic, tartaric, citric, ascorbic, pamoic, maleic, hydroxymaleic, phenylacetic, glutamic, benzoic, salicylic, sulfanilic, 2-acetoxybenzoic, fumaric, toluenesulfonic, methanesulfonic, ethane disulfonic, oxalic, and isethionic, and the like.

[00111] The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound that contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in Allen, L.V., Jr., ed., Remington: The Science and Practice of Pharmacy, 22nd Edition, Pharmaceutical Press, London, UK (2012), the disclosure of which is hereby incorporated by reference.

[00112] In addition, compounds of formula I may have prodrug forms. Any compound that will be converted in vivo to provide the bioactive agent (i.e., a compound of formula
I) is a prodrug within the scope and spirit of the invention. Various forms of prodrugs are well known in the art. For examples of such prodrug derivatives, see:

Isotopically labeled compounds of the present invention, i.e., wherein one or more of the atoms described are replaced by an isotope of that atom (e.g., $^{13}$C replaced by $^{13}$C or by $^{14}$C; and isotopes of hydrogen including tritium and deuterium), are also provided herein. Such compounds have a variety of potential uses, e.g., as standards and reagents in determining the ability of a potential pharmaceutical compound to bind to target proteins or receptors, or for imaging compounds of this invention bound to biological receptors in vivo or in vitro.

Compounds of the present invention are, subsequent to their preparation, preferably isolated and purified to obtain a composition containing an amount by weight equal to or greater than 98%, preferably 99%, compound of the present invention ("substantially pure"), which is then used or formulated as described herein. Such "substantially pure" compounds are also contemplated herein as part of the present invention.
"Stable compound" and "stable structure" are meant to indicate a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent. It is preferred that compounds of the present invention do not contain a N-halo, S(0)₂H, or S(0)H group.

The term "solvate" means a physical association of a compound of this invention with one or more solvent molecules, whether organic or inorganic. This physical association includes hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolable solvates. Exemplary solvates include, but are not limited to, hydrates, ethanolates, methanolates, and isopropanolates. Methods of solvation are generally known in the art.

The compounds of the present invention can be prepared in a number of ways known to one skilled in the art of organic synthesis. The compounds of the present invention can be synthesized using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or by variations thereon as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below. The reactions are performed in a solvent or solvent mixture appropriate to the reagents and materials employed and suitable for the transformations being effected. It will be understood by those skilled in the art of organic synthesis that the functionality present on the molecule should be consistent with the transformations proposed. This will sometimes require a judgment to modify the order of the synthetic steps or to select one particular process scheme over another in order to obtain a desired compound of the invention.

It will also be recognized that another major consideration in the planning of any synthetic route in this field is the judicious choice of the protecting group used for protection of the reactive functional groups present in the compounds described in this

[00121] Compounds of formula I of this invention can be obtained by condensation of an amine of formula III with a ketone of formula IV which contains a leaving group Z such as a bromide, iodide or tosylate and a protecting group PG such as benzyl as shown in Scheme 1. Both compounds of formula III and IV are commercially available or can be prepared by means known to one skilled in the art. This condensation is promoted by heating, either thermally or preferably by microwave irradiation. The protecting group can be removed by methods known in the art, such as BC13 at -78 °C in the presence of pentamethylbenzene. Subsequent alkylation using either an alcohol VI under Mitsunobu conditions or a bromide VII in the presence of base such as potassium carbonate provides the compounds of Formula I. Alcohols and bromides VI and VII are commercially available or can be prepared by methods known in the art.
Alternatively, compounds of Formula I can be prepared from compounds of formula IX upon activation of the thiomethyl group by oxidation to a sulfone VII as shown in Scheme 2. This allows introduction of a variety of nucleophiles as groups R° such as alcohols, thiols and amines in the presence of a base such as potassium carbonate or sodium hydride either neat or in a polar, aprotic solvent such as dimethylformamide.
give compounds XI. Compounds XI can be converted to compounds of Formula I by removal of the protecting group (PG) and alkylation as discussed in Scheme 1.

[00123] Substituted benzofurans bearing α-bromoketone substituents at the 2-position (XV) can be prepared as shown in Scheme 3. o-Hydroxy benzaldehydes XII can be prepared by methods known to one skilled in the art of organic synthesis, and can be condensed with ketones of formula XIII bearing a leaving group Q such as chloro, bromo or tosylxy, to give benzofurans XIV. Bromination of compounds of formula XIV affords bromoketones XV, which can be condensed with a substituted aminoheterocycle III according to Scheme 1 to give compounds of Formula I. Bromoketones XV are a specific subset of compounds IV in Scheme 1.
Benoxazole compounds of Formula I can be prepared starting from substituted aminoheterocycle III and pyruvate esters of formula XVI which contain a leaving group Z such as a bromide, iodide or tosylate as shown in Scheme 4. Both compounds of formula III and XVI are commercially available or are available by means known to one skilled in the art. Following condensation and saponification of the ester to form acid XVIII, amino phenols of formula XIX are coupled to form amides of the formula XX, which can be cyclized under acid catalysis to form benzoxazole compounds of formula XXI. These can be deprotected and alkylated as shown in Scheme 1 to provide compounds of Formula I.
Ammoheterocycles XXIV can be prepared from carbon disulfide (XXII) via the thioxanthate intermediate XXIII. These ammoheterocycles are useful for the preparation of compounds of Formula I.

Ammoheterocycles XXX, which are useful intermediates for preparation of compounds of Formula I where Y = -CH$_2$CH$_2$-, can be prepared from ketoesters XXV.
Cyclization with hydrazine, followed by oxidation with bromine gives pyridazinones XXVII. Chlorination, displacement with hydrazine, and subsequent hydrogenation provides aminoheterocycles XXX, which are a specific subset of compounds III in Scheme I. As such, these aminoheterocycles are useful for the preparation of compounds of Formula I.

Example 1
2-Methoxy-6-(6-methoxy-4-((2-methylthiazol-4-yl)methoxy)benzofuran-2-yl)imidazo[2,1-b][1,3,4]thiadiazole
A solution of 2-methyl-thiazole-4-carboxylic acid ethyl ester (1.26g, 7.36 mmol) in ethyl ether (10 mL) was cooled to -78 °C and treated with a solution of LAH (0.83g, 21.9 mmol) in dry THF (30 mL) added dropwise over 10 min. After 3 hours, at -78 °C, the mixture was quenched with sat. Na₂S₂O₄ (app. 20 mL). The mixture was allowed to warm up to 22 °C and was extracted with ethyl ether (4 x 50 mL). The combined extracts were washed with brine, dried over anhydrous MgSO₄ and concentrated to give an oil. Filtration on a silica gel pad (3 x 7 cm) and elution with ethyl acetate gave an oil which was distilled to afford the title material (0.664g, 70%) as an oil which crystallized. B.p. 60-70 °C / 0.2 torr. HRMS(ESI) calcd for C₅H₈NOS [M+H]⁺ m/z 130.0321, found 130.0342. ¹H NMR (CDCl₃, 600 MHz) δ 6.99 (d, J = 0.8 Hz, 1H), 4.70 (s, 1H), 2.98 (br s, 1H), 2.68 (s, 3H).

A solution of 5-hydroxy-7-methoxy-2,2-dimethyl-4H-benzo[d][1,3]dioxin-4-one (30.00 g, 0.134 mol, see Kamisuki, S. et al, Tetrahedron, 60:5695-5700 (2004) for preparation) in N,N-dimethylformamide (400 mL) was treated with powdered anhydrous potassium carbonate (19.41 g, 0.14 mol) added all at once. The resulting mixture was stirred in vacuo for 10 min. and then flushed with nitrogen. The reaction flask was placed in a water bath (22 °C) and treated with benzyl bromide (24.03 g, 0.14 mol) added dropwise over 15 min. The resulting mixture was then stirred at 22 °C for 18 h (no starting material left by tic). The solid was filtered and washed with N,N-
dimethylformamide. The filtrate was evaporated in vacuo and the residual oil was diluted with ethyl acetate (500 mL), washed with cold 0.1 N hydrochloric acid, saturated sodium bicarbonate and brine. After drying over anhydrous magnesium sulfate, evaporation of the solvent gave a thick syrup. Crystallization from ethyl acetate (50 mL) and hexane (150 mL) gave 35.17 g of 5-(benzyloxy)-7-methoxy-2,2-dimethyl-4H-benzo[d][1,3]dioxin-4-one as large colorless prisms. Chromatography of the mother liquors on silica gel (4 x 13 cm, elution toluene - ethyl acetate 0-5%) gave 6.64 g of additional material to afford a total yield of 41.81 g (99%). HRMS(ESI) calcd for C_{14}H_{10}O_5 [M+H]^+ m/z 315.1227, found 315.1386. H NMR (CDCl₃, 600 MHz) δ 1.68 (s, 6H), 3.77 (s, 3H), 5.19 (s, 2H), 5.19 (s, 2H), 6.04 (d, J = 2.03 Hz, 1H), 6.15 (d, J = 2.03 Hz, 1H), 7.27 (broad t, 1H), 7.36 (broad t, 2H), 7.52 (broad d, 2H).

1C. 2-(Benzyloxy)-6-hydroxy-4-methoxybenzaldehyde

A solution of 5-(benzyloxy)-7-methoxy-2,2-dimethyl-4H-benzo[d][1,3]dioxin-4-one (Example IB, 6.76 g, 21.5 mmol) in dichloromethane (120 mL) was cooled to -78 °C and treated with 43 mL (64.5 mmol) of a 1.5 M solution of diisobutylaluminum hydride in toluene added dropwise over 20 min. The resulting mixture was then stirred at -78 °C for 3 h. The reaction mixture was quenched by the careful addition of methanol (5 mL) added dropwise over 15 min, followed by 1N hydrochloric acid (50 mL) added dropwise over 15 min. The cooling bath was then removed and an additional 150 mL of 1N hydrochloric acid was added over 20 min. The mixture was then stirred at 22 °C for 2 h and diluted with dichloromethane (400 mL). The organic phase was collected and the aqueous phase (pH ~1) was extracted with dichloromethane (3 x 50 mL). The combined organic extracts were washed with brine, dried over anhydrous magnesium sulfate and concentrated in vacuo. The residual oil was diluted with tetrahydrofuran (70 mL), treated with 10 mL of 0.1N hydrochloric acid and stirred at 20 °C for 2 h. The reaction mixture was diluted with ethyl acetate (300 mL), washed with brine, dried over anhydrous magnesium sulfate, evaporated in vacuo to give a clear oil. [00132] A solution of 2-(benzylxoy)-6-hydroxy-4-methoxybenzaldehyde (Example 1C, 3.46 g, 13.4 mmol) in N,N-dimethylformamide (50 mL) was treated with powdered anhydrous cesium carbonate (4.58 g, 14.05 mmol) added all at once. The resulting mixture was stirred in vacuo for 10 min. and then flushed with nitrogen. The reaction flask was placed in a water bath (22 °C) and treated with chloroacetone (1.74 g, 18.7 mmol) added dropwise over 5 min. The resulting mixture was then stirred at 22 °C for 18 h (no starting aldehyde left by tic and formation of the intermediate alkylation aldehyde).

The solid was filtered and washed with N,N-dimethylformamide. The filtrate was evaporated in vacuo and the residual oil was diluted with ethyl acetate (300 mL), washed with cold 0.1 N hydrochloric acid, saturated sodium bicarbonate and brine. After drying over anhydrous magnesium sulfate, evaporation of the solvent gave a thick syrup. This syrup was diluted with tetrahydrofuran (50 mL) and ethyl acetate (50 mL), treated p-toluenesulfonic acid monohydrate (0.2 g) and stirred at 20 °C for 1 h (tic indicated complete cyclization of the intermediate alkylation aldehyde to the benzofuran). The reaction mixture was diluted with ethyl acetate (300 mL), washed with saturated sodium bicarbonate and brine. After drying over anhydrous magnesium sulfate, evaporation of the solvent gave a thick syrup. Chromatography on silica gel (4 x 12 cm, elution toluene - ethyl acetate 2-4%) gave 3.51 g (88% yield) of the title benzofuran as a yellow solid.

Recrystallization from ethyl acetate (10 mL) and hexane (20 mL) gave the title material as large yellow prisms (3.15 g). LC (Method D): 2.148 min. [00133] A 250-mL, three-necked flask is equipped with a magnetic stirring bar and
purged with a nitrogen atmosphere was charged with anhydrous tetrahydrofuran (25 mL)
followed by 9.3 mL (9.3 mmol) of a 1M solution of lithium bis(trimethylsilyl)amide in
tetrahydrofuran. The mixture was cooled to -78 °C and treated with a solution of 1-(4-(bensyloxy)-6-methoxybenzofuran-2-yl)ethanone (Example ID, 2.40 g, 8.1 mmole) in
tetrahydrofuran (20 mL) added dropwise over 10 min. The resulting mixture was then
stirred at -78 °C for 45 min. Then chlorotrimethylsilane (1.18 mL, 9.31 mmol) was added
dropwise over 5 min and the resulting solution was stirred at -78 °C for another 20 min.
The cooling bath was then removed and the mixture is allowed to warm to room

mixture was allowed to warm to 0 °C over 2h and then quenched by addition of ethyl
acetate (300 mL) and saturated sodium bicarbonate. The organic phase was washed with
brine, dried over anhydrous magnesium sulfate and evaporated to give an orange oil.
Chromatography on silica gel (4 x 12 cm, elution toluene - ethyl acetate 0-5%) gave 2.62

![Chemical Structure]
A solution of ethyl 4-phenylthiazole-2-carboxylate (Example 4B, 1.300 g, 5.57 mmol) in diethyl ether (60 mL) in a 500 mL flask under a nitrogen atmosphere was cooled to -40 °C (dry ice - water - calcium chloride bath) and treated with solid LiAlH₄ (0.40 g, 10.54 mmol) added all at once. The mixture was stirred at -40 °C over 2.5 h. The reaction was quenched by dropwise addition of ethyl acetate (1 mL), water (0.4 mL) followed by 15% aqueous sodium hydroxide (0.4 mL) and water (1.2 mL). The residue was purified on silica gel chromatography (100% CH$_2$Cl$_2$ up to 15% EtOAc/CH$_2$Cl$_2$) to give a residue which was triturated with MeCN and afforded the title material (36 mgs, 29%). LC (Method A): 2.901 min. HRMS(ESI) calcd for C$_{25}$H$_{17}$N$_5$O$_4$S$_2$ [M+H]$^+$ m/z 492.0722, found 492.0806. 9A. 2-Methoxy-6-(6-methoxy-4-(prop-2-yn-1-yloxy)benzofuran-2-yl)imidazo[2,1-b][1,3,4]thiadazole

A solution of 6-methoxy-2-(2-methoxyimidazo[2,1-b][1,3,4]thiadiazol-6-yl)benzofuran-4-ol (Example IH, 205 mgs, 0.646 mmol) in THF (10 mL) was treated at r.t. and under a nitrogen atmosphere, with propargyl alcohol (0.096 mL, 1.615 mmol), tri-n-butylphosphine (0.398 mL, 1.615 mmol) and dropwise, over a 25 min period with a solution of 1,1′-(azodicarbonyl)dipiperidine (408 mgs, 1.615 mmol) in THF (10 mL). The mixture was sonicated in a bath for 30 min and stirred at r.t. for another 30 min. The mixture was then dissolved in dichloromethane (50 mL) and washed with sat. aqueous NaHCO₃, brine and dried (MgSO₄). Evaporation of the solvent gave a solid that was purified by silica gel column chromatography ISCO to give the title material (180 mg, 0.507 mmol, 78% yield). H NMR (DMSO-d₆, 400 MHz) δ ppm: 8.38 (s, 1H), 6.92 (s, 1H), 6.86 (dd, J=1.8, 1.0 Hz, 1H), 6.53 (d, J=1.6 Hz, 1H), 4.94 (d, J=2.7 Hz, 2H), 4.21 (s, 3H), 3.77-3.84 (m, 3H), 3.60-3.66 (m, 1H).

9B. Azidobenzene

A solution of aniline (500 mgs, 5.37 mmol) in acetonitrile (10 mL, 191 mmol) was cooled down in an ice bath and treated with tert-butyl nitrite (680 mgs, 6.59 mmol) and dropwise with TMS-N₃ (0.713 mL, 5.37 mmol). The ice bath was removed and the mixture was stirred overnight at r.t. under N₂. Acetonitrile was carefully evaporated (NB: azidobenzene is also volatile) and the residue (750 mgs) was passed through a silica gel pad (20g) and eluted with petroleum ether (35-55 °C). Evaporation of the solvent gave the title material as an oil (500 mgs, 4.20 mmol, 78% yield) that still contains some traces of solvent as shown by H NMR. H NMR (CDCl₃, 400 MHz) δ ppm: 7.32-7.41 (m, 2H), 7.12-7.19 (m, IH), 7.01-7.09 (m, 2H).
Example 9. 2-Methoxy-6-(6-methoxy-4-((1-phenyl-1H-1,2,3-triazol-4-y1)methoxy)benzofuran-2-yl)imidazo [2,1-b][1,3,4]thiadiazole

A solution of 2-methoxy-6-(6-methoxy-4-(prop-2-yn-1-yloxy)benzofuran-2-yl)imidazo[2,1-b][1,3,4]thiadiazole (Example 9A, 20 mgs, 0.056 mmol) and azidobenzene (Example 9B, 19 mgs, 0.159 mmol) in DMF (4 mL, 51.7 mmol) was treated at r.t. and under a nitrogen atmosphere with sodium ((?)-2-((5)-1,2-dihydroxyethyl)-4-hydroxy-5-oxo-2,5-dihydrofuran-3-olate (8 mgs, 0.040 mmol) and copper(II) sulfate pentahydrate (5 mgs, 0.020 mmol). The mixture was stirred for 2 hours (reaction followed by HPLC) and was then diluted with dichloromethane (60 mL) and washed with sat. NaHCO₃, brine and dried (MgSO₄). The solvent was evaporated and the solid residue was triturated with acetonitrile (2 x 1 mL) and lyophilized to give the title material (13 mgs, 0.027 mmol, 49% yield). LC (Method A): 2.213 min. HRMS(ESI) calcd for C₂₃H₁₉N₁₀O₄S [M+H]^+ m/z 475.183, found 475.1204. ¹H NMR (DMSO-d₆, 400 MHz) δ ppm: 9.04 (s, 1H), 8.37 (s, 1H), 7.90-7.99 (m, 2H), 7.58-7.67 (m, 2H), 7.51 (tt, J=7.4, 1.2 Hz, 1H), 6.97-7.03 (m, 1H), 6.83-6.88 (m, 1H), 6.71 (d, J=1.6 Hz, 1H), 5.38 (s, 3H), 4.20 (s, 3H), 3.83 (s, 3H).

The vial was capped and heated at 110 °C for 20 min. in the microwave apparatus. The solvent was evaporated...
and the residue was purified by silica gel chromatography ISCO, concentrated and twice triturated with methanol (2 x 1 mL). To the solid was added acetonitrile (2 mL) and water (4 mL) and the mixture was freeze dried over the weekend to give the title material (5 mgs, 10.54 µmol, 14% yield). LC (Method F): 2.480 min. Example 83
2-Methoxy-6-(6-methoxy-4-(1-(2-phenylthiazol-4-yl)ethoxy)benzofuran-2-
yl)imidazo[2,1-b][1,3,4]thiadiazole

83A. 2-Phenylthiazole-4-carboxylic acid

A solution of ethyl 2-phenylthiazole-4-carboxylate (Example 4B, 3.046 g, 13.06 mmol) in methanol (20 mL) was treated with a solution of NaOH (1.044 g, 26.1 mmol) in water (10 mL) added dropwise over 2 min and the resulting solution was stirred at room temperature for 1 h. The methanol was then evaporated under reduced pressure and the residual paste was diluted with a mixture of water (30 mL) and ethyl acetate (200 mL). The pH was adjusted to ~3 with concentrated hydrochloric acid, the organic phase was separated and the aqueous phase was re-extracted with ethyl acetate (2 x 150 mL).

The combined organic extract was washed with brine (3 x 35 mL) and dried over anhydrous magnesium sulfate. After concentration of the solvent under reduced pressure, the solid residue obtained was dried in vacuo for 18 h to yield 2.629 g (98%) of the title compound as a white crystalline solid. LC (Method A): 1.842 min. HRMS(ESI)

Anal. Calcd for C_{10}H_{8}NO_{2}S [M+H]^+ m/z 206.027; found 206.0266.

H NMR (CDCl₃, 400 MHz) δ ppm: 8.30 (s, 1H), 7.94 - 8.05 (m, 2H), 7.4 - 7.55 (m, 3H).

83B. N-Methoxy-N-methyl-2-phenylthiazole-4-carboxamide

A mixture of 2-phenylthiazole-4-carboxylic acid (1.00 g, 4.87 mmol) in dichloromethane (20 mL) was treated with oxalyl chloride (1.237 g, 9.75 mmol) and a
drop of N,N-dimethylformamide and the resulting mixture was stirred at 22 °C for 4 h. The solvent was evaporated under reduced pressure and the residual solid was co-evaporated with toluene (10 mL). This solid was diluted with dichloromethane (10 mL) and added dropwise over 2 min to an ice-cold mixture of N,O-dimethyldimethyldihydroxyamine hydrochloride (0.713 g, 7.31 mmol) and triethylamine (2.03 mL, 14.62 mmol) in dichloromethane (20 mL). The cooling bath was then removed and the mixture with a white precipitate was stirred at room temperature for 1 h. The reaction mixture was quenched by addition of saturated aqueous sodium bicarbonate (30 mL) and dichloromethane (200 mL). The organic phase was washed with brine, dried over anhydrous magnesium sulfate and concentrated in vacuo to give a clear oil. This oil was chromatographed on silica gel (elution toluene-ethyl acetate; 8:2 to 7:3) to give 1.054 g (87%) of the title compound as a clear oil. LC (Method A): 2.022 min. HRMS(ESI) Anal. Calcd for C_{12}H_{13}N_{2}O_{2}S [M+H]^+ m/z 249.0692; found 249.0694. H NMR (CDCl\textsubscript{3}, 400 MHz) δ ppm: 8.03 (s, 1H), 7.91 - 8.01 (m, 2H), 7.39 - 7.55 (m, 3H), 3.90 (s, 3H), 3.51 (br s, 3H).

118A. 4-(4-(((tert-Butyldimethylsilyl)oxy)methyl)thiazol-2-yl)tetrahydro-2 H-pyran-4-ol

[0033] A solution of 2-bromo-4-(((tert-butyldimethylsilyl)oxy)methyl)thiazole (Example 37B, 3.39 g, 11.00 mmol) in dry THF (55 mL) was cooled at -78 °C under N₂ and then 1.45 M n-butyllithium (9.10 mL, 13.20 mmol) was added dropwise. The resulting mixture was stirred for 30 min to give a pale brown solution. To this mixture was slowly added a solution of dihydro-2H-pyran-4(3H)-one (1.219 mL, 13.20 mmol) in dry THF (5 mL) and the mixture was kept at -78 °C for 1 h, to give a pale brown solution. The reaction was quenched by the addition of saturated aqueous NH₄Cl (15 mL) and then the cooling bath was removed and the mixture was partitioned with EtOAc-water. The organic phase was separated, washed (brine), dried (Na₂SO₄) and evaporated to give a pale yellow oil. Flash chromatography (Isco/ 0-30% acetone-hexane) afforded 4-(4-(((tert-butyldimethylsilyl)oxy)methyl)thiazol-2-yl)tetrahydro-2H-pyran-4-ol (2.97 g, 82%) as a colorless oil which crystallized on standing in vacuo. LC (Method A): 2.262 min. HRMS(ESI): calcd for C₁₅H₂₈N⁰₃S Si [M+H]+ m/z 330.156; found 330.158. ¹H NMR (400 MHz, DMSO-d₆): δ 7.23 (s, 1H), 5.99 (s, 1H), 4.64 (s, 2H), 3.64 (m, 4H), 2.00 (ddd, J = 5.48, 11.35, 13.69 Hz, 2H), 1.56 (br d, J = 12.91 Hz, 2H), 0.81 (s, 9H), 0.00 (s, 6H).

The mixture was then concentrated to half volume and the concentrate was diluted with DCM and then saturated aqueous NaHCO\(_3\) was added (\textit{Caution: vigorous gas evolution}). The organic phase was separated, washed (saturated aqueous NaHCO\(_3\)), dried (Na\(_2\)SO\(_4\)) and evaporated to give only a small amount of a pale yellow residue. The aqueous phase was subsequently saturated with solid NaCl and the mixture was extracted with DCM (x6). The combined organic extracts were dried (Na\(_2\)SO\(_4\)) and evaporated to give a white solid. The aqueous phase was then neutralized with cone. HCl (pH 7) and re-extracted with DCM (x5). The organic extract was again dried (Na\(_2\)SO\(_4\)) and evaporated to give additional material as an off-white solid. These solids were combined to give 4-(4-(hydroxymethyl)thiazol-2-yl)tetrahydro-2 \(\HC\)-pyran-4-ol (1.145 g, 59.2%) as a cream solid which was used as such in the next step without further purification. General Method: A solution of 2-bromo-4-(((tert-butyldimethylsilyl)oxy)methyl)-thiazole (Example 37B, 0.195 g, 0.632 mmol) in dry THF (5 mL) was cooled at -78 °C under nitrogen before n-butyllithium (1.5 M in hexanes, 0.506 mL, 0.759 mmol) was added dropwise. The resulting mixture was stirred for 15 min and then a solution of cyclohexanone (0.075 mg, 0.759 mmol) in dry THF (1 mL) was added and stirring was continued at -78 °C for 1 h. The reaction was then quenched by the addition of saturated aqueous NH₄Cl (1.5 mL) and then the cooling bath was removed and the mixture was diluted with ethyl acetate. The organic phase was separated, washed (brine), dried (MgSO₄), filtered and evaporated to give a pale yellow oil. The crude 1-(4-(((tert-butyldimethylsilyl)-oxy)methyl)thiazol-2-yl)cyclohexanol obtained (0.185 g, 89%) was used as such for the next step. LC (Method A): 2.391 min. yl)benzofuran-4-yl)oxy)methyl)thiazol-2-yl)cyclohexanecarboxylate, respectively.

148A. 4-Oxocyclohexanecarboxylic acid

[00381] To a solution of ethyl 4-oxocyclohexanecarboxylate (5.00 g, 29.4 mmol) in a
mixture of methanol (30 mL) and THF (125 mL) was added an aqueous solution of
NaOH (3 N, 29.4 mL, 88 mmol) and the resulting reaction mixture was heated at 60 °C
for 3 h. The cooled mixture was concentrated under reduced pressure, the aqueous
concentrate was acidified (pH 1) with IN HCl and the mixture was extracted with DCM
(x3). The combined organic extract was washed with brine, dried over MgSO₄, filtered
and concentrated to give the title compound (3.175 g, 76%). ¹H NMR (DMSO-d₆, 400
MHz) δ ppm: 1.70-1.86 (m, 2H), 2.03-2.14 (m, 2H), 2.18-2.30 (m, 2H), 2.32-2.46 (m,
2H), 2.66-2.77 (m, 1H), 12.32 (br s, 1H).

148B. tert-Butyl 4-oxocyclohexanecarboxylate

[00382] To an ice-cold solution of 4-oxocyclohexanecarboxylic acid (3.175 g, 22.34
mmol) in pyridine (12 mL, 148 mmol) and tert-butanol (17 mL, 178 mmol) was added
neat POCI₃ (3.0 mL, 32.2 mmol). The cooling bath was then removed and the reaction
mixture was stirred at room temperature for 4 h. The crude mixture was then poured in
water and the product was extracted with EtOAc (3x). The combined organic extract was
washed with 2 N HCl (x2) and brine, dried over MgSO₄, filtered and concentrated. The
crude residue obtained was used as such without further purification (3.02 g, 68%).
NMR (DMSO-d$_6$, 400 MHz) δ ppm: 1.41 (s, 9H), 1.70-1.85 (m, 2H), 2.01-2.13 (m, 2H), 2.18-2.29 (m, 2H), 2.32-2.45 (m, 2H), 2.63-2.75 (m, 1H), 4.50 (s, 2H), 5.23 (t, $J = 5.1$ Hz, 1H), 5.78 (d, $J = 11.7$ Hz, 1H).

148C. tert-Butyl 4-hydroxy-4-(4-(hydroxymethyl)thiazol-2-yl)cyclohexanecarboxylate

To a solution of 2-bromo-4-(((tert-butyldimethylsilyl)oxy)methyl)thiazole (Example 37B, 0.200 g, 0.649 mmol) in dry THF (5 mL), cooled at -78 °C under nitrogen, was added n-butyllithium (1.5 M in hexanes, 0.519 mL, 0.778 mmol) dropwise. The resulting mixture was stirred for 5 min before a pre-cooled (-78 °C) solution of tert-butyl 4-oxocyclohexanecarboxylate (0.129 g, 0.649 mmol) in dry THF (1 mL) was cannulated into the reaction mixture. The resulting mixture was stirred at -78 °C for 1.5 h and then the reaction was quenched by the addition of saturated aqueous NH$_4$Cl (3 mL). The cooling bath was then removed and the mixture was diluted with ethyl acetate. The organic phase was separated, washed (brine), dried (MgSO$_4$), filtered and evaporated to give the crude product, tert-butyl 4-(4-(((tert-butyldimethylsilyl)oxy)methyl)thiazol-2-yl)-4-hydroxycyclohexanecarboxylate, (0.177 g, 64%), as a pale yellow oil. This material was used as such in the next step without further purification. LC (Method A): 2.447 min. LCMS (APCI): calcd for C$_2$i$_3$H$_{38}$NO$_4$Si [M+H]$^+$ m/z 428.23, found 428.2.

[00384] To a solution of tert-butyl 4-(4-(((tert-butyldimethylsilyl)oxy)methyl)thiazol-2-yl)-4-hydroxycyclohexanecarboxylate (0.277 g, 0.415 mmol) in THF (5mL) at room temperature was added TBAF (75% solution in water, 0.299 mL, 0.829 mmol). The resulting mixture was stirred for 1 h and then the reaction was quenched with brine and the resulting mixture was diluted with dichloromethane. The organic layer was separated, washed with brine, dried over MgSO$_4$, filtered and concentrated. The crude residue obtained was purified by column chromatography (Isco, 12 g cartridge) eluting with a gradient of ethyl acetate in dichloromethane (from 0 to 100%) to give the desired compound as viscous, colorless oil which was a mixture of cis- and trans-isomers (0.073 g, 56%). LC (Method A): 1.768, 1.789 min. LCMS (APCI): calcd for C$_5$H$_{24}$NO$_4$S [M+H]$^+$ m/z 314.14, found 314.2. H $^1$ NMR (DMSO-d$_6$, 400 MHz) δ ppm: 1.40 (s, 9H), 1.52-1.93 (m, 7H), 2.01-2.12 (m, 1H), 2.17-2.28 (m, 1H), 4.50 (s, 2H), 5.23 (t, $J = 5.1$ Hz, 1H), 5.78 (d, $J$ = 11.7 Hz, 1H), 7.24 (d, $J$ = 11.3 Hz, 1H).

To the resulting suspension was added tri-n-butylphosphine (0.143 mL, 0.551 mmol), followed by the dropwise addition of a solution of 1,1’-(azodicarbonyl)dipiperidine (0.141 g, 0.551 mmol) in dry THF (2.5 mL). The resulting reaction mixture was stirred at room temperature for 1.5 h and then it was diluted with ethyl acetate, washed with saturated aqueous NaHCO₃, dried over MgSO₄, filtered and concentrated. 192A. (S)-5-(1-Fluoroethyl)-1,3,4-thiadiazol-2-amine

[0051] A 350 mL sealable pressure vessel was charged with thiosemicarbazide (11.17 g, 122.5 mmol) and dry dioxane (100 mL), and the mixture was cooled at 0 °C under an N₂ atmosphere. To this rapidly stirring mixture was slowly added a solution of (S)-2-fluoropropanoic acid (9.40 g, 102.1 mmol, from Fritz-Langhals, E., Tetrahedron Asymmetry, 981 (1994)) in dioxane (10 mL). To the resulting mixture was added POCl₃ (11.22 mL, 122.5 mmol) dropwise, then the cooling bath was removed and the thick white slurry was stirred at room temperature for 1 h. The vessel was then sealed and the mixture was heated at 90-95 °C (oil bath temperature) for 5 h. The cooled mixture was stirred at room temperature for 14 h and then the supernatant (two-phase mixture) was decanted and concentrated under reduced pressure. The lower phase was slowly poured into ice water (250 mL) and then the concentrate was also added. This mixture was rapidly stirred until it was essentially a homogeneous (turbid) solution, and then it was basified to pH 9-9.5 using 40% aqueous NaOH. The resulting slurry was filtered and the filter-cake was washed with water (Note: LC of this beige solid showed that it contained only a trace of the desired product, so it was not further investigated). The combined filtrate was then extracted with EtOAc (x3) and the organic phase was dried (Na₂SO₄) and evaporated to give a cream solid (10.58 g, 70%>) which was the essentially pure product according to LC and LCMS. This material was used as such without further purification.

The mixture was then heated in a microwave reactor at 150 °C for 30 min. The cooled mixture was evaporated to dryness and the obtained residue was taken up in CH₂Cl₂ (200 mL), washed (saturated aqueous NaHCO₃), dried (Na₂SO₄) and concentrated. Example 201A

Ethyl 2-(methylthio)imidazo[2,1-b][1,3,4]thiadiazole-6-carboxylate
A mixture of 2-amino-5-methylthio-1,3,4-thiadiazole (25.0 g, 0.17 mol), ethyl 3-bromopyruvate (23.7 mL, 0.189 mol) and ethanol (125 mL) in a 350 mL sealable vessel was heated at 150 °C (oil bath temperature) for 20 min. The cooled mixture was then concentrated to dryness and the residue was partitioned with ethyl acetate-saturated aqueous NaHCO₃. The organic phase was separated, washed (brine), dried (MgSO₄), filtered and concentrated to dryness. The obtained residue was taken up in a minimum volume of dichloromethane and the resulting slurry was filtered and the filter-cake was washed with a little dichloromethane. The solid residue was dried in vacuo to give recovered amino-5-methylthio-1,3,4-thiadiazole (3.7 g, 15%). The obtained filtrate was subsequently evaporated and the residue was crystallized from a minimum volume of hot ethanol to give the title compound as a beige crystalline solid (10.8 g, 26%).

[M+H]⁺ m/z 470.12, found 470.2. 1H NMR (CDCl�, 400 MHz) δ ppm: 8.70-8.79 (m, 2H), 8.20 (s, 1H), 7.81-7.87 (m, 3H), 7.54 (s, 1H), 7.36 (s, 1H), 6.95 (d, J = 9.4 Hz, 1H), 6.78 (s, 1H), 6.48 (d, J = 1.6 Hz, 1H), 5.43 (s, 2H), 3.87 (s, 3H), 2.60 (s, 3H).

Example 212

2-(4-Fluorotetrahydro-2H-pyran-4-yl)-4-(((6-methoxy-2-(6-methylimidazo[1,2-b]pyridazin-2-yl)benzofuran-4-yl)oxy)methyl)thiazole

To a solution of 6-methoxy-2-(6-methylimidazo[1,2-b]pyridazin-2-yl)benzofuran-4-ol (Example 203B, 0.0285 g, 0.096 mmol) and 4-(bromomethyl)-2-(4-fluorotetrahydro-2H-pyran-4-yl)thiazole (Example 119C, 0.027 g, 0.096 mmol) in DMF (2 mL) under nitrogen was added potassium carbonate (0.0306 g, 0.222 mmol) and the resulting reaction mixture was stirred at room temperature for 2.5 h. The crude reaction mixture was then diluted with dichloromethane, washed with water and brine, dried over MgSC⁴O₄, filtered and concentrated. The crude residue obtained was purified by column chromatography (Isco, 12 g cartridge) eluting with a gradient of ethyl acetate in dichloromethane (from 0 to 100%). The product obtained from the column chromatography was triturated in ethanol and the solid was collected by filtration and dried in vacuo to give the pure title compound (0.034 g, 71%). LC (Method A): 2.306 min. HRMS(ESI): calcd for C₂₅H₂₄FN₄O₄S [M+H]⁺ m/z 495.1502, found 495.1797. 1H NMR (DMSO-de, 400 MHz) δ ppm: 2.03-2.15 (m, 2H), 2.18-2.40 (m, 2H), 2.54 (s, 3H), 3.65-3.76 (m, 2H), 3.81-3.89 (m, 2H), 3.83 (s, 3H), 5.34 (s, 2H), 6.65 (d, J = 2.0 Hz, 1H), 6.89-6.91 (m, 1H), 7.19 (d, J = 9.4 Hz, 1H), 7.28 (s, 1H), 7.97 (s, 1H), 8.01 (d, J = 9.0 Hz, 1H), 8.54 (s, 1H).

Examples 243 to 286 are prepared according to the following procedure:

\[

\text{2-Bromo-4-} & \text{-} ((6\text{-methoxy-2-} \text{-} (6\text{-methylimi} \\
& \text{dazo}[1,2\text{-b}]) \text{pyridazin-2-y} \\
& \text{l}) \text{benzofuran-4-yl} \text{oxy)methyl)thiazole} \quad \text{(Example 205, 15 mg, 0.031 mmol)} \ \\
\text{in dioxane (0.6 mL)} \text{ was added into a Wheaton tube (16 x 100 mm) which contains an amine (0.108 mmol) and a stir bar. Then potassium butoxide (8.1 mg, 72 µmol) and palladium-chloro(2-dicyclohexylphosphino-2',4',6'-tri-i-propyl-1,1'-biphenyl)[2-(2-aminoethyl)phenyl] palladium(II) methyl-t-butyl ether adduct (2.1 mg, 2.9 µmol)} \text{ were added into the solution. All tubes were capped and heated at 105 °C in a heating block overnight. All samples were dried by a stream of nitrogen, dissolved in DMF (1.0 mL), filtered with Whatman 0.45um PVDF filter, and purified by preparative HPLC.}
\end{align*}
\]

Examples 287 to 317 are prepared according to the following procedure:

\[
\begin{align*}
\text{HATU (9.71 mg, 26 µmol)} \text{ and DIPEA(14 µl, 79 µmol)} \text{ was added to a solution of 4-} & \text{-(6-methoxy-2-} \text{-} (2\text{-methoxyim} \\

& \text{l)benzofuran-4-yl} \text{oxy)methyl)thiazol-2-yl)benzoic acid (Example 39D, 10.5 mg, 20 µmol)} \text{ in DMF (0.6 mL) in a Wheaton tube (16 x 100mm). The mixture was stirred at rt for 5 minutes and then the solution of the amine (200 µmol)} \text{ in DMF was added and the tube was capped and shaken for 2 hours at rt. The crude reaction mixture was purified by preparative HPLC.}

\]

In the structures set forth below for Examples 243 to 317, the "-O" attached to a carbon atom is used to denote an "-OH" group. Similarly, in the structures set forth below for Examples 243 to 317, the "N" attached to a carbon atom is used to denote an "NH" moiety.

Tritium Labeled 2-Methoxy-6-(6-methoxy-4-((2-phenylthiazol-4-yl)methoxy)benzofuran-2-yl)imidazo[2,1-b][1,3,4]thiadiazole

[00566] A Trisorber flask with stirbar was charged with 2-methoxy-6-(6-methoxy-4-((2-phenylthiazol-4-yl)methoxy)benzofuran-2-yl)imidazo[2, 1-b][1,3,4]thiadiazole (Example 3, 0.50 mg, 1.02 μmol) and Crabtree's catalyst (((SP-4)tris(cyclohexyl)phosphane[(l-2^:5-6^-)-cyclocta-1,5-diene]pyridineiridium hexafluoridophosphate) (2.3 mg, 2.86 μmol). To this was added CH₂C₁₂ (0.50 ml) by syringe. The flask was attached to the Trisorber and submitted to freeze, pump and thaw cycles to remove dissolved gases. To the reaction mixture was added 1.0 Ci of Tritium gas and the mixture was stirred at room temperature. After 18 h, the CH₂C₁₂ was removed by rotovap. The crude product was dissolved in ethanol and the labile tritium was exchanged as the ethanol was removed by rotovap. This was repeated two additional times. The crude product was dissolved in 5.0 ml of ethanol. An aliquot of the crude mixture (20 μl) was diluted in 5.0 ml of ethanol. A 20 μl aliquot of this diluted solution was counted by Liquid Scintillation Counting and showed 207 mCi of tritiated material to be present. HPLC analysis (AGILENT® 1100 HPLC with a BetaRam radiochemical detector, column = PHENOMEX® Luna 5 urn C18(2), 250 X 4.6 mm Mobile Phase A= 100 Water: 1 TFA, Mobile Phase B = 1000 Acetonitrile: 1 TFA. Gradient = 0 min 90% B, 8 min 90% B, 15 min 100% B, flowrate = 1.0 ml/min) showed the crude product mixture contained 8.5% of the desired product (retention time = 6.4 min). The crude product was purified by Semi-preparative HPLC (AGILENT® 1100 HPLC, Column = PHENOMEX® Luna, 5 urn C18(2), 10 X 250 mm, Mobile phase A = 700 CH₃CN : 300 Water with 0.1% TFA, Mobile phase B = MeOH, Gradient = 0 min 100% A, 25 min 100% A, 30 min 100% B, Flowrate = 4.0 ml/min, UV detection at 305 nm. The fractions containing product were collected with retention times between 20.2 to 23.5 min. Collected fractions were pooled and the solvent removed by rotovap. The resulting product was dissolved in 8.5 ml of 90: 10 Ethanol : Water to produce a 1.0 mCi/ml solution, 8.5 mCi total. HPLC/Rad analysis (AGILENT® 1100 HPLC system, column =

Gradient = 0 min 65% D, 20 min 65% D, 25 min 100% D, 35min 100% D, flowrate = 1.2 ml/min; UV detection at 305 nm, retention time = 11.95 min, 99.74% radiochemically pure. LC/MS analysis (+ ion) showed m/z =491/492/493/494/495/496/497/498/499. The specific activity was determined by LC/MS by comparison to the LC/MS analysis of unlabeled Example 3 and was 42.5 Ci/mmol. ³H-NMR (320 MHz, DMSO-D₆) δ 8.02 (s, T), 7.09 (s, T).

**BIOLOGY**

[00567] The term "PAR4 antagonist" denotes an inhibitor of platelet aggregation which binds PAR4 and inhibits PAR4 cleavage and/or signaling. Typically, PAR4 activity is reduced in a dose dependent manner by at least 10%>, 20%>, 30%>, 40%>, 50%>, 60%>, 70%>, 80%>, 90%>, or 100% compared to such activity in a control cell. The control cell is a cell that has not been treated with the compound. PAR4 activity is determined by any standard method in the art, including those described herein (for example calcium mobilization in PAR4 expressing cells, platelet aggregation, platelet activation assays measuring e.g., calcium mobilization, p-selectin or CD40L release, or thrombosis and hemostasis models). The term "PAR4 antagonist" also includes a compound that inhibits both PAR1 and PAR4.

[00568] It is desirable to find compounds with advantageous and improved characteristics compared with known anti-platelet agents, in one or more of the following categories that are given as examples, and are not intended to be limiting: (a) pharmacokinetic properties, including oral bioavailability, half life, and clearance; (b) pharmaceutical properties; (c) dosage requirements; (d) factors that decrease blood concentration peak-to-trough characteristics; (e) factors that increase the concentration of active drug at the receptor; (f) factors that decrease the liability for clinical drug-drug interactions; (g) factors that decrease the potential for adverse side-effects, including selectivity versus other biological targets; (h) improved therapeutic index with less propensity for bleeding; and (h) factors that improve manufacturing costs or feasibility.

[00569] The term "compound", as used herein, means a chemical, be it naturally-occurring or artificially-derived. Compounds may include, for example, peptides,
polypeptides, synthetic organic molecules, naturally occurring organic molecules, nucleic acid molecules, peptide nucleic acid molecules, and components and derivatives thereof.

As used herein, the term "patient" encompasses all mammalian species.

As used herein, the term "subject" refers to any human or nonhuman organism that could potentially benefit from treatment with a PAR4 antagonist. Exemplary subjects include human beings of any age with risk factors for cardiovascular disease, or patients that have already experienced one episode of cardiovascular disease. Common risk factors include, but are not limited to, age, male sex, hypertension, smoking or smoking history, elevation of triglycerides, elevation of total cholesterol or LDL cholesterol.

In some embodiments, the subject is a species having a dual PAR1/PAR4 platelet receptor repertoire. As used herein, the term "dual PAR1/PAR4 platelet receptor repertoire" means that a subject expresses PAR1 and PAR4 in platelets or their precursors. Exemplary subjects having a dual PAR1/PAR4 platelet receptor repertoire include human beings, non-human primates, and guinea pigs.

In other embodiments, the subject is a species having a dual PAR3/PAR4 platelet receptor repertoire. As used herein, the term "dual PAR3/PAR4 platelet receptor repertoire" means that a subject expresses PAR3 and PAR4 in platelets or their precursors. Exemplary subjects having a dual PAR3/PAR4 platelet receptor repertoire include rodents and rabbits.

As used herein, "treating" or "treatment" cover the treatment of a disease-state in a mammal, particularly in a human, and include: (a) inhibiting the disease-state, i.e., arresting its development; and/or (b) relieving the disease-state, i.e., causing regression of the disease state.

As used herein, "prophylaxis" or "prevention" cover the preventive treatment of a subclinical disease-state in a mammal, particularly in a human, aimed at reducing the probability of the occurrence of a clinical disease-state. Patients are selected for preventative therapy based on factors that are known to increase risk of suffering a clinical disease state compared to the general population. "Prophylaxis" therapies can be divided into (a) primary prevention and (b) secondary prevention. Primary prevention is defined as treatment in a subject that has not yet presented with a clinical disease state,
whereas secondary prevention is defined as preventing a second occurrence of the same or similar clinical disease state.

[00576] As used herein, "risk reduction" covers therapies that lower the incidence of development of a clinical disease state. As such, primary and secondary prevention therapies are examples of risk reduction.

[00577] "Therapeutically effective amount" is intended to include an amount of a compound of the present invention that is effective when administered alone or in combination to inhibit and / or antagonize PAR4 and/or to prevent or treat the disorders listed herein. When applied to a combination, the term refers to combined amounts of the active ingredients that result in the preventive or therapeutic effect, whether administered in combination, serially, or simultaneously.

[00578] The term "thrombosis", as used herein, refers to formation or presence of a thrombus (pi. thrombi) within a blood vessel that may cause ischemia or infarction of tissues supplied by the vessel. The term "embolism", as used herein, refers to sudden blocking of an artery by a clot or foreign material that has been brought to its site of lodgment by the blood current. The term "thromboembolism", as used herein, refers to obstruction of a blood vessel with thrombotic material carried by the blood stream from the site of origin to plug another vessel. The term "thromboembolic disorders" entails both "thrombotic" and "embolic" disorders (defined above).

[00579] The term "thromboembolic disorders" as used herein includes arterial cardiovascular thromboembolic disorders, venous cardiovascular or cerebrovascular thromboembolic disorders, and thromboembolic disorders in the chambers of the heart or in the peripheral circulation. The term "thromboembolic disorders" as used herein also includes specific disorders selected from, but not limited to, unstable angina or other acute coronary syndromes, atrial fibrillation, first or recurrent myocardial infarction, ischemic sudden death, transient ischemic attack, stroke, atherosclerosis, peripheral occlusive arterial disease, venous thrombosis, deep vein thrombosis, thrombophlebitis, arterial embolism, coronary arterial thrombosis, cerebral arterial thrombosis, cerebral embolism, kidney embolism, pulmonary embolism, and thrombosis resulting from medical implants, devices, or procedures in which blood is exposed to an artificial surface that promotes thrombosis. The medical implants or devices include, but are not limited to: prosthetic valves, artificial valves, indwelling catheters, stents, blood oxygenators,
shunts, vascular access ports, ventricular assist devices and artificial hearts or heart chambers, and vessel grafts. The procedures include, but are not limited to: cardiopulmonary bypass, percutaneous coronary intervention, and hemodialysis. In another embodiment, the term "thromboembolic disorders" includes acute coronary syndrome, stroke, deep vein thrombosis, and pulmonary embolism. 

[00580] In another embodiment, the present invention provides a method for the treatment of a thromboembolic disorder, wherein the thromboembolic disorder is selected from unstable angina, an acute coronary syndrome, atrial fibrillation, myocardial infarction, transient ischemic attack, stroke, atherosclerosis, peripheral occlusive arterial disease, venous thrombosis, deep vein thrombosis, thrombophlebitis, arterial embolism, coronary arterial thrombosis, cerebral arterial thrombosis, cerebral embolism, kidney embolism, pulmonary embolism, and thrombosis resulting from medical implants, devices, or procedures in which blood is exposed to an artificial surface that promotes thrombosis. In another embodiment, the present invention provides a method for the treatment of a thromboembolic disorder, wherein the thromboembolic disorder is selected from acute coronary syndrome, stroke, venous thrombosis, atrial fibrillation, and thrombosis resulting from medical implants and devices.

[00581] In another embodiment, the present invention provides a method for the primary prophylaxis of a thromboembolic disorder, wherein the thromboembolic disorder is selected from unstable angina, an acute coronary syndrome, atrial fibrillation, myocardial infarction, ischemic sudden death, transient ischemic attack, stroke, atherosclerosis, peripheral occlusive arterial disease, venous thrombosis, deep vein thrombosis, thrombophlebitis, arterial embolism, coronary arterial thrombosis, cerebral arterial thrombosis, cerebral embolism, kidney embolism, pulmonary embolism, and thrombosis resulting from medical implants, devices, or procedures in which blood is exposed to an artificial surface that promotes thrombosis. In another embodiment, the present invention provides a method for the primary prophylaxis of a thromboembolic disorder, wherein the thromboembolic disorder is selected from acute coronary syndrome, stroke, venous thrombosis, and thrombosis resulting from medical implants and devices.

[00582] In another embodiment, the present invention provides a method for the secondary prophylaxis of a thromboembolic disorder, wherein the thromboembolic disorder is selected from unstable angina, an acute coronary syndrome, atrial fibrillation,
recurrent myocardial infarction, transient ischemic attack, stroke, atherosclerosis, peripheral occlusive arterial disease, venous thrombosis, deep vein thrombosis, thrombophlebitis, arterial embolism, coronary arterial thrombosis, cerebral arterial thrombosis, cerebral embolism, kidney embolism, pulmonary embolism, and thrombosis resulting from medical implants, devices, or procedures in which blood is exposed to an artificial surface that promotes thrombosis. In another embodiment, the present invention provides a method for the secondary prophylaxis of a thromboembolic disorder, wherein the thromboembolic disorder is selected from acute coronary syndrome, stroke, atrial fibrillation and venous thrombosis.

The term "stroke", as used herein, refers to embolic stroke or atherothrombotic stroke arising from occlusive thrombosis in the carotid communis, carotid interna, or intracerebral arteries.

It is noted that thrombosis includes vessel occlusion (e.g., after a bypass) and reocclusion (e.g., during or after percutaneous transluminal coronary angioplasty). The thromboembolic disorders may result from conditions including but not limited to atherosclerosis, surgery or surgical complications, prolonged immobilization, arterial fibrillation, congenital thrombophilia, cancer, diabetes, effects of medications or hormones, and complications of pregnancy.

Thromboembolic disorders are frequently associated with patients with atherosclerosis. Risk factors for atherosclerosis include but are not limited to male gender, age, hypertension, lipid disorders, and diabetes mellitus. Risk factors for atherosclerosis are at the same time risk factors for complications of atherosclerosis, i.e., thromboembolic disorders.

Similarly, arterial fibrillation is frequently associated with thromboembolic disorders. Risk factors for arterial fibrillation and subsequent thromboembolic disorders include cardiovascular disease, rheumatic heart disease, nonrheumatic mitral valve disease, hypertensive cardiovascular disease, chronic lung disease, and a variety of miscellaneous cardiac abnormalities as well as thyrotoxicosis.

Diabetes mellitus is frequently associated with atherosclerosis and thromboembolic disorders. Risk factors for the more common type 2 include but are not limited to family history, obesity, physical inactivity, race / ethnicity, previously impaired fasting glucose or glucose tolerance test, history of gestational diabetes mellitus or
delivery of a "big baby", hypertension, low HDL cholesterol, and polycystic ovary syndrome.

Thrombosis has been associated with a variety of tumor types, e.g., pancreatic cancer, breast cancer, brain tumors, lung cancer, ovarian cancer, prostate cancer, gastrointestinal malignancies, and Hodgkin's or non-Hodgkin's lymphoma. Recent studies suggest that the frequency of cancer in patients with thrombosis reflects the frequency of a particular cancer type in the general population. (Levitan, N. et al., *Medicine* (Baltimore), 78(5):285-291 (1999); Levine M. et al, *N. Engl. J. Med.*, 334(11):677-681 (1996); Blom, J.W. et al, *JAMA*, 293(6):715-722 (2005).) Hence, the most common cancers associated with thrombosis in men are prostate, colorectal, brain, and lung cancer, and in women are breast, ovary, and lung cancer. The observed rate of venous thromboembolism (VTE) in cancer patients is significant. The varying rates of VTE between different tumor types are most likely related to the selection of the patient population. Cancer patients at risk for thrombosis may possess any or all of the following risk factors: (i) the stage of the cancer (i.e., presence of metastases), (ii) the presence of central vein catheters, (iii) surgery and anticancer therapies including chemotherapy, and (iv) hormones and antiangiogenic drugs. Thus, it is common clinical practice to dose patients having advanced tumors with heparin or low molecular heparin to prevent thromboembolic disorders. A number of low molecular weight heparin preparations have been approved by the FDA for these indications.

The term "pharmaceutical composition", as used herein, means any composition, which contains at least one therapeutically or biologically active agent and is suitable for administration to the patient. Any of these formulations can be prepared by well-known and accepted methods of the art. See, for example, Gennaro, A.R., ed., *Remington: The Science and Practice of Pharmacy*, 20th Edition, Mack Publishing Co., Easton, Pa. (2000).

The invention includes administering to a subject a pharmaceutical composition that includes a compound that binds to PAR4 and inhibits PAR4 cleavage and/or signaling (referred to herein as a "PAR4 antagonist" or "therapeutic compound").

The compounds of this disclosure can be administered in such oral dosage forms as tablets, capsules (each of which includes sustained release or timed release formulations), pills, powders, granules, elixirs, tinctures, suspensions, syrups, and
emulsions. They may also be administered in intravenous (bolus or infusion), intraperitoneal, subcutaneous, or intramuscular form, all using dosage forms well known to those of ordinary skill in the pharmaceutical arts. They can be administered alone, but generally will be administered with a pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice.

[00592] The preferred dose of the PAR4 antagonist is a biologically active dose. A biologically active dose is a dose that will inhibit cleavage and / or signaling of PAR4 and have an anti-thrombotic effect. Desirably, the PAR4 antagonist has the ability to reduce the activity of PAR4 by at least 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, or more than 100% below untreated control levels. The levels of PAR4 in platelets is measured by any method known in the art, including, for example, receptor binding assay, platelet aggregation, platelet activation assays (e.g., p-selectin expression by FACS), Western blot or ELISA analysis using PAR4 cleavage sensitive antibodies. Alternatively, the biological activity of PAR4 is measured by assessing cellular signaling elicited by PAR4 (e.g., calcium mobilization or other second messenger assays).

[00593] In some embodiments, a therapeutically effective amount of a PAR4 compound is preferably from about less than 100 mg/kg, 50 mg/kg, 10 mg/kg, 5 mg/kg, 1 mg/kg, or less than 1 mg/kg. In a more preferred embodiment, the therapeutically effective amount of the PAR4 compound is less than 5 mg/kg. In a most preferred embodiment, the therapeutically effective amount of the PAR4 compound is less than 1 mg/kg. Effective doses vary, as recognized by those skilled in the art, depending on route of administration and excipient usage.

[00594] Compounds of this invention can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using transdermal skin patches. When administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen.

[00595] The compounds are typically administered in admixture with suitable pharmaceutical diluents, excipients, or carriers (collectively referred to herein as pharmaceutical carriers) suitably selected with respect to the intended form of administration, that is, oral tablets, capsules, elixirs, syrups and the like, and consistent with conventional pharmaceutical practices.
For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic, pharmaceutically acceptable, inert carrier such as lactose, starch, sucrose, glucose, methyl cellulose, magnesium stearate, dicalcium phosphate, calcium sulfate, mannitol, sorbitol and the like; for oral administration in liquid form, the oral drug components can be combined with any oral, non-toxic, pharmaceutically acceptable inert carrier such as ethanol, glycerol, water, and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents, and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth, or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes, and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride, and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum, and the like.

The compounds of the present invention can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles, and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine, or phosphatidylcholines.

Compounds of the present invention may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamide-phenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxide-polylysine substituted with palmitoyl residues. Furthermore, the compounds of the present invention may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyglycolic acid, copolymers of polylactic and polyglycolic acid, polyeplson caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrrans, polycyanoacylates, and crosslinked or amphipathic block copolymers of hydrogels.

Dosage forms (pharmaceutical compositions) suitable for administration may contain from about 1 milligram to about 100 milligrams of active ingredient per dosage unit. In these pharmaceutical compositions the active ingredient will ordinarily be
present in an amount of about 0.5-95% by weight based on the total weight of the composition.

[00600] Gelatin capsules may contain the active ingredient and powdered carriers, such as lactose, starch, cellulose derivatives, magnesium stearate, stearic acid, and the like. Similar diluents can be used to make compressed tablets. Both tablets and capsules can be manufactured as sustained release products to provide for continuous release of medication over a period of hours. Compressed tablets can be sugar coated or film coated to mask any unpleasant taste and protect the tablet from the atmosphere, or enteric coated for selective disintegration in the gastrointestinal tract.

[00601] Liquid dosage forms for oral administration can contain coloring and flavoring to increase patient acceptance.

[00602] In general, water, a suitable oil, saline, aqueous dextrose (glucose), and related sugar solutions and glycols such as propylene glycol or polyethylene glycols are suitable carriers for parenteral solutions. Solutions for parenteral administration may contain a water soluble salt of the active ingredient, suitable stabilizing agents, and if necessary, buffer substances. Antioxidizing agents such as sodium bisulfite, sodium sulfite, or ascorbic acid, either alone or combined, are suitable stabilizing agents. Also used are citric acid and its salts and sodium EDTA. In addition, parenteral solutions can contain preservatives, such as benzalkonium chloride, methyl- or propyl-paraben, and chlorobutanol.

[00603] Suitable pharmaceutical carriers are described in Remington's Pharmaceutical Sciences, Mack Publishing Company, a standard reference text in this field.

[00604] Representative useful pharmaceutical dosage-forms for administration of the compounds of this invention can be illustrated as follows:

Capsules

[00605] A large number of unit capsules can be prepared by filling standard two-piece hard gelatin capsules each with 100 milligrams of powdered active ingredient, 150 milligrams of lactose, 50 milligrams of cellulose, and 6 milligrams magnesium stearate.

Soft Gelatin Capsules
A mixture of active ingredient in a digestible oil such as soybean oil, cottonseed oil or olive oil may be prepared and injected by means of a positive displacement pump into gelatin to form soft gelatin capsules containing 100 milligrams of the active ingredient. The capsules should be washed and dried.

Tablets
Tablets may be prepared by conventional procedures so that the dosage unit is 100 milligrams of active ingredient, 0.2 milligrams of colloidal silicon dioxide, 5 milligrams of magnesium stearate, 275 milligrams of microcrystalline cellulose, 11 milligrams of starch and 98.8 milligrams of lactose. Appropriate coatings may be applied to increase palatability or delay absorption.

Dispersion
A spray dried dispersion can be prepared for oral administration by methods know to one skilled in the art.

Injectable
A parenteral composition suitable for administration by injection may be prepared by stirring 1.5% by weight of active ingredient in 10% by volume propylene glycol and water. The solution should be made isotonic with sodium chloride and sterilized.

Suspension
An aqueous suspension can be prepared for oral administration so that each 5 mL contain 100 mg of finely divided active ingredient, 200 mg of sodium carboxymethyl cellulose, 5 mg of sodium benzoate, 1.0 g of sorbitol solution, U.S.P., and 0.025 mL of vanillin.

Where two or more of the foregoing second therapeutic agents are administered with the compound of Formula I, IA, IB, IC, ID, IE or IF, preferably, a compound selected from one of the examples, generally the amount of each component in a typical daily dosage and typical dosage form may be reduced relative to the usual
dosage of the agent when administered alone, in view of the additive or synergistic effect of the therapeutic agents when administered in combination.

[00612] Particularly when provided as a single dosage unit, the potential exists for a chemical interaction between the combined active ingredients. For this reason, when the compound of the examples and a second therapeutic agent are combined in a single dosage unit they are formulated such that although the active ingredients are combined in a single dosage unit, the physical contact between the active ingredients is minimized (that is, reduced). For example, one active ingredient may be enteric coated. By enteric coating one of the active ingredients, it is possible not only to minimize the contact between the combined active ingredients, but also, it is possible to control the release of one of these components in the gastrointestinal tract such that one of these components is not released in the stomach but rather is released in the intestines. One of the active ingredients may also be coated with a material which effects a sustained-release throughout the gastrointestinal tract and also serves to minimize physical contact between the combined active ingredients. Furthermore, the sustained-released component can be additionally enteric coated such that the release of this component occurs only in the intestine. Still another approach would involve the formulation of a combination product in which the one component is coated with a sustained and/or enteric release polymer, and the other component is also coated with a polymer such as a low viscosity grade of hydroxypropyl methylcellulose (HPMC) or other appropriate materials as known in the art, in order to further separate the active components. The polymer coating serves to form an additional barrier to interaction with the other component.

[00613] These as well as other ways of minimizing contact between the components of combination products of the present invention, whether administered in a single dosage form or administered in separate forms but at the same time by the same manner, will be readily apparent to those skilled in the art, once armed with the present disclosure.

[00614] Additionally, certain compounds disclosed herein may be useful as metabolites of other compounds. Therefore, in one embodiment, compounds may be useful either as a substantially pure compound, which may also then be incorporated into a pharmaceutical composition, or may be useful as metabolite which is generated after administration of the prodrug of that compound. In one embodiment, a compound may be useful as a metabolite by being useful for treating disorders as described herein.
The activity of the PAR4 antagonists of the present invention can be measured in a variety of in vitro assays. Exemplary assays are shown in the Examples below.

The FLIPR assay is an exemplary in vitro assay for measuring the activity of the PAR4 antagonists of the present invention. In this assay, intracellular calcium mobilization is induced in PAR4 expressing cells by a PAR4 agonist and calcium mobilization is monitored. See, e.g., Example A.

AYPGKF is a known PAR4 agonist. An alternative PAR4 agonist is H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH$_2$. As shown in Example B below, H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH$_2$ was validated as a PAR4 agonist in the FLIPR assay. A side-by-side comparison of the IC$_{50}$ values of -180 compounds were performed using AYPGKF versus H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH$_2$. The results demonstrated a strong correlation between the two assays. Additionally, H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH$_2$ has improved agonist activity as compared to AYPGKF with an EC$_{50}$ that is 10 fold lower than the EC$_{50}$ for AYPGKF in the FLIPR assay. H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH$_2$ can be synthesized using methods well known to those of skill in the art.

The FLIPR assay can also be used as a counterscreen to test agonist activity or PARI antagonist activity in a cell line that expresses both PARI and PAR4. The PARI antagonist activity can be tested by the ability of the compound to inhibit calcium mobilization induced by the PARI agonist peptide SFLLRN or other PARI agonist peptides.

The compounds of the current invention can be tested in vitro for their ability to inhibit platelet aggregation induced by gamma-thrombin as shown in Example C. Gamma-thrombin, a proteolytic product of alpha-thrombin which no longer interacts with PARI, selectively cleaves and activates PAR4 (Soslow, G. et al, "Unique pathway of thrombin-induced platelet aggregation mediated by glycoprotein Ib", J. Biol. Chem., 276:21 173-21 183 (2001)). Platelet aggregation can be monitored in a 96-well microplate aggregation assay format or using standard platelet aggregometer. The aggregation assay can also be employed to test the selectivity of the compound for inhibiting platelet aggregation induced by PAR4 agonist peptides, PARI agonist peptide, ADP, or thromboxane analogue U46619.
Example D is an alpha-thrombin-induced platelet aggregation assay. Alpha-thrombin activates both PARI and PAR4. The ability of a selective PAR4 antagonist of the present invention, namely, the Example 3 compound to inhibit platelet aggregation was measured using a standard optical aggregometer. Inhibition of alpha-thrombin induced platelet aggregation by the Example 3 compound is shown in Figures 1A and IB. The data shows, for the first time in the art, that a PAR4 antagonist alone can effectively inhibit platelet aggregation. The extent of platelet inhibition by the PAR4 antagonist is at least comparable to what has been previously described for PARI antagonists.

Example E is a tissue factor-induced platelet aggregation assay. The conditions in this assay mimic the physiological events during thrombus formation. In this assay, platelet aggregation in human PRP was initiated by the addition of tissue factor and CaCl₂. Tissue factor, the initiator of the extrinsic coagulation cascade, is highly elevated in human atherosclerotic plaque. Exposure of blood to tissue factor at the atherosclerotic site triggers a robust generation of thrombin and induces the formation of obstructive thrombi.

The efficacy of the PAR4 antagonists of the present invention in preventing thrombosis can also be measured in a variety of in vivo assays. Exemplary mammals that can provide models of thrombosis and hemostasis to test the effectiveness of the PAR4 antagonists of the present invention as antithrombotic agents include, but are not limited to, guinea pigs and primates. Relevant efficacy models include, but are not limited to, electrolytic injury-induced carotid artery thrombosis, FeCl₃-induced carotid artery thrombosis and arteriovenous-shunt thrombosis. Models of kidney bleeding time, renal bleeding time and other bleeding time measurements can be used to assess the bleeding risk of the antithrombotic agents described in the current invention. Example G describes an in vivo model of arterial thrombosis in cynomolgus monkeys. Compounds of the present invention can be tested in this model for their ability to inhibit thrombus formation induced by electrolytic injury of the carotid artery. Demonstration of efficacy in this model supports the utility of PAR4 antagonists of the present invention for treatment of thromboembolic diseases.

ASSAYS

Materials
1) **PARI and PAR4 Agonist Peptides**

SFFLRR is a known high affinity PARI selective agonist peptide. (Reference: Seiler, S.M., "Thrombin receptor antagonists", *Seminars in Thrombosis and Hemostasis*, 22(3):223-232 (1996).) The PAR4 agonist peptides AYPGF and H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂ were synthesized. H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂ showed improved PAR4 agonist activity over AYPGF in the FLIPR assay (EC₅₀ of 8 µM for H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂ and 60 µM for AYPGF) and in washed platelet aggregation assay (EC₅₀ of 0.9 µM for H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂ and 12 µM for AYPGF).

2) **PAR4 Expressing Cells**

HEK293 cells stably expressing PAR4 were generated by a standard method of transfection of human F2R23 cDNA expression vector or by RAGE technology from Athersys Inc. (Cleveland, OH) and selected based on PAR4 protein expression of mRNA expression. Those cells demonstrated functional responses to PAR4 agonist peptide-induced intracellular calcium elevation using FLIPR (Fluorometric Imaging Plate Reader; Molecular Devices Corp.). These cells express endogenous PARI and can elicit calcium signal upon stimulation with PARI agonist peptide. Cells were grown in Dulbecco's Modified Eagle's Medium (DMEM) (Invitrogen, Carlsbad, CA), 10%FBS, 1% PSG, 3 µg/ml puromycin and 25 nM Methotrexate) at 37 °C with 5% CO₂.

3) **Preparation of Platelet Rich Plasma (PRP)**

Human blood was collected in 3.8% sodium citrate at a ratio of 1 ml per 9 ml blood. The platelet rich plasma was isolated by centrifugation at 170 g for 14 minutes.

4) **Preparation of Washed Platelets (WP)**

Human blood was collected in ACD (85 mM tri-sodium citrate, 78 mM citric acid, 110 mM D-glucose, pH 4.4) at a ratio of 1.4 ml per 10 ml blood. PRP was isolated by centrifugation at 170 g for 14 minutes and platelets were further pelleted by centrifugation at 1300 g for 6 minutes. Platelets were washed once with 10 ml ACD containing 1 mg/ml bovine serum albumin. Platelets were resuspended at -2.5X10⁷/ml in
Tyrode's Buffer (137 mM NaCl, 2 mM KCl, 1.0 mM MgCl₂, 1 mM CaCl₂, 5 mM glucose, 20 mM HEPES pH 7.4).

Example A

FLIPR Assay in PAR4-Expressing HEK293 Cells

The activity of the PAR4 antagonists of the present invention were tested in PAR4 expressing cells by monitoring H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂-induced intracellular calcium mobilization using FDSS6000 (Hamamatsu Photonics, Japan) by fluo-4. Counter screens for agonist activity and PARI antagonist activity were also performed. Briefly, HEK293 EBNA PAR4 clone 20664.1J cells were plated 24 hrs. prior to experiment in 384 well, Poly-D-Lysine coated, black, clear bottom plates (Greiner Bio-One, Monroe, NC). Cells were plated at 20,000 cells/well in 20 µl growth medium and incubated at 37 °C with 5% CO₂ overnight. At time of assay, media was replaced with 40 µl 1x Hank's Buffered Saline Solution (HBSS) (with 10 mM HEPES) and 20 µl test compound also diluted in IX HBSS buffer was added at various concentrations and 0.67% DMSO final concentration on the FDSS for agonist measurement. The cells were then incubated for 30 minutes at room temperature followed by addition of 20 µl of agonist peptide for antagonist measurement on the FDSS. The agonist peptide H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂ for PAR4 agonist screen or SFFLRR for PARI counter screen were routinely tested to ensure a response at EC₅₀ in the assay (~2,5 µM for H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂ and 600 nM for SFFLRR).

Example B

Validation of H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂ as a PAR4 Agonist

To validate H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂ as a PAR4 agonist in the FLIPR assay, side-by-side comparison of the IC₅₀ values of 180 compounds were performed using AYPGKF versus H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH₂. The results demonstrated a strong correlation between the two assays (Spearman's rank correlation coefficient ρ = 0.7760, p<0.0001). The relevance of the FLIPR assay in the HEK293 cells was confirmed by a direct assay connectivity to the

- 520 -
washed platelet assay. The IC\textsubscript{50} values of -200 compounds from AYPGKF FLIPR assay was strongly correlated to that from AYPGKF washed platelet aggregation assay (Spearman's rank correlation coefficient rho= 0.836, p<0.001). Similar results were obtained comparing FLIPR and washed platelet data using H-Ala-Phe(4-F)-Pro-Gly-Trp-Leu-Val-Lys-Asn-Gly-NH\textsubscript{2}.

Example C
Gamma Thrombin Induced Platelet Aggregation Assays

The ability of the compounds of the current invention to inhibit platelet aggregation induced by gamma-thrombin was tested in a 96-well microplate aggregation assay format. Briefly, PRP or washed platelet suspension (100 µl) was pre-incubated for 5 minutes at room temperature with varying concentrations of compounds. Aggregation was initiated by -10-50 nM gamma thrombin (Haematologic Technologies, Essex Junction, VT), which was titrated daily to achieve 80% platelet aggregation. Refudan at 1 U/mL (Berlex, Montville, NJ) was added to the gamma thrombin sample to prevent PARI activation induced by residual alpha-thrombin contamination. The plate was then placed into a 37 °C Molecular Devices (Sunnyvale, CA) SPECTRAMAX® Plus Plate Reader. The plate was mixed for 10 seconds before the first read and 50 seconds between each read for up to 15 minutes at 405 nM. Data was collected with SOFTMAX® 4.71 software. The plate also included an untreated control sample which served as ODmax, while buffer containing no platelets was the ODmin. Platelet aggregation was determined by subtracting the ODmax from the ODmin for the 100% aggregation value. In experimental samples, the observed transmission was subtracted from the minimum value and then compared to the 100% aggregation value to determine the percentage aggregation. IC\textsubscript{50} values are determined using Excel Fit software.

Example D
Alpha-thrombin Induced Platelet Aggregation Assays
The ability of PAR4 antagonist to inhibit platelet aggregation induced by alpha-thrombin was tested using human washed platelets. Example 3 was pre-incubated with washed platelets for 20 min. Aggregation was initiated by addition of 1.5 nM alpha-thrombin (Haematologic Technologies, Essex Junction, VT) to 300 µl of washed platelets at stirring speed of 1000 rpm. Platelet aggregation was monitored using Optical Aggregometer (Chrono-Log, Havertown, PA) and the area under the curve (AUC) at 6 min was measured. IC_{50} was calculated using vehicle control as 0% inhibition. The IC_{50} for the inhibition of platelet aggregation by Example 3 was calculated to be 5 nM (n=3) (Figures 1A and IB).

Example E
Tissue Factor-Induced Platelet Aggregation Assay

The ability of PAR1 or PAR4 antagonists to inhibit platelet aggregation induced by endogenous thrombin can be tested in a tissue factor driven aggregation assay. Aggregation is initiated by addition of CaCl_{2} and recombinant human tissue factor, which results in the generation of thrombin through activation of the coagulation pathway in the plasma. Anticoagulant agents such as corn trypsin inhibitor (Haematologic Technologies, Essex Junction, VT) at 50 µg/ml and PEFABLOC® FG (Centerchem, Norwalk, CT) are also added to the sample to prevent fibrin clot formation during the time of the study. Platelet aggregation is monitored using standard instrumentation including optical aggregometer or impedance aggregometer.

Example F

The following tables set out results obtained employing various compounds of the invention tested in the FLIPR assay and the platelet aggregation assay (PRP assay). As indicated above, the FLIPR assay, an in vitro assay, measures the PAR4 antagonist activity of compounds tested as described in Example A. The PRP assay, an in vitro assay, measures the PAR4 antagonist assay of the compounds tested in the presence of plasma proteins and thrombin agonist as described in Example C.

Example G

Cynomolgus Monkey Electrolytic Injury-induced Carotid Artery Thrombosis Model

Healthy cynomolgus monkeys were used in the study. These monkeys were retired from other pharmacokinetic and pharmacodynamic studies and had at least a 4-week washout period.

On the day of the study, compounds or vehicles were administered orally at 1 to 2 hours before the experiment. Monkeys were then sedated by intramuscular administration of 0.2 mg/kg atropine, 5 mg/kg TELAZOL® (tiletamine/zolazepam) and 0.1 mg/kg hydromorphone to facilitate placement of an endotracheal tube. An intravenous catheter was placed in the left cephalic vein for fluid administration to prevent dehydration. Animals were then administered with an inhalant anesthetic, isoflurane (1-5% to effect) and oxygen, ventilated, and placed on a thermostatically controlled heating pad to maintain the body temperature at 37 °C. General anesthesia was maintained at a surgical plane using inhaled isoflurane and oxygen. The left brachial artery was cannulated to record blood pressure and heart rate. Blood pressure and heart rate were monitored to maintain normal vital signs.

The carotid arterial thrombosis model in monkeys was based on a rabbit arterial thrombosis model, as described by Wong et al. (Wong, P.C. et al, "Nonpeptide

Thrombosis was induced by electrical stimulation of the carotid artery for 5 min at 10 mA using an external stainless-steel bipolar electrode. Carotid blood flow was measured with an appropriately sized TRANSONIC® flow probe and a TRANSONIC® perivascular flowmeter (TS420 Model, Transonic Systems Inc., Ithaca, NY). It was continuously recorded over a 90-min period to monitor thrombosis-induced occlusion. Integrated carotid blood flow was measured by the area under the flow-time curve. It was expressed as percent of total control carotid blood flow, which would result if control blood flow had been maintained continuously for 90 min. In addition, thrombus from the injured artery was removed, blotted twice on a weighing paper to remove residual fluid, and weighed. Figure 1C shows the results of a dose response experiment with Example 3 in the cynomolgus monkey electrically-induced arterial thrombus model, demonstrating the *in vivo* antithrombotic efficacy of a PAR4 antagonist.
