Title: 6-SUBSTITUTED SULFONYL AZABICYCLO[3.2.1]OCTANES USEFUL TO INHIBIT 11β-HYDROXYSTEROID DEHYDROGENASE TYPE-I

Abstract: In its many embodiments, the present invention relates to a novel class of 6-substituted sulfonaryl-3,3,3-trialkyl-6-azabicyclo[3.2.1]octane compounds useful to inhibit 11β-hydroxysteroid dehydrogenase type-I, pharmaceutical compositions containing the compounds, and methods of treatment, prevention, inhibition, or amelioration of one or more conditions associated with the expression of 11β-hydroxysteroid dehydrogenase type-I using such compounds or pharmaceutical compositions.
6-SUBSTITUTED SULFONYL AZABICYCLO[3.2.1]OCTANES USEFUL TO INHIBIT 1β-HYDROXYSTEROID DEHYDROGENASE TYPE-1

Related Applications

This application claims benefit of provisional application USSN 60/955,985, filed August 15, 2007, herein incorporated by reference.

Field of the Invention

The present invention relates 6-substituted sulfonyl-1,3,3-trialkyl-6-azabicyclo[3.2.1]octane compounds useful to inhibit 1β-hydroxysteroid dehydrogenase type-I, pharmaceutical compositions containing the compounds, and methods of treatment, prevention, inhibition, or amelioration of one or more conditions associated with the expression of 11β-hydroxysteroid dehydrogenase type-I using such compounds or pharmaceutical compositions.

Background of the Invention

Glucocorticoids are steroid hormones that regulate many metabolic and homeostatic processes, including fat metabolism, function and distribution. Glucocorticoids also have profound and diverse physiological effects on development, neurobiology, inflammation, blood pressure, metabolism and programmed cell death.

Glucocorticoid action is dependent on the following factors: 1) circulating levels of glucocorticoid; 2) protein binding of glucocorticoids in circulation; 3) intracellular receptor density inside target tissues; and 4) tissue-specific pre-receptor metabolism by glucocorticoid-activating and glucocorticoid-inactivating enzymes collectively known as 11-beta-hydroxysteroid dehydrogenase (11-β-HSD). Two distinct isozymes of 11-β-HSD have been cloned and characterized. These two isozymes, known as 11-β-HSD type I and 11-β-HSD type II, respectively, catalyze the interconversion of active and inactive forms of various glucocorticoids. For example, in humans, the primary endogenously-produced glucocorticoid is Cortisol. 11-β-HSD type I and 11-β-HSD type II catalyze the interconversion
of hormonally active Cortisol and inactive cortisone. 11-β-HSD type I is widely
distributed in human tissues and its expression has been detected in lung,
testis, central nervous system and most abundantly in liver and adipose
tissue. Conversely, 11-β-HSD type II expression is found mainly in kidney,
placenta, colon and salivary gland tissue.

Up-regulation of 11-β-HSD type I can lead to elevated cellular
glucocorticoid levels and amplified glucocorticoid activity. This, in turn, can
lead to increased hepatic glucose production, adipocyte differentiation and
insulin resistance. In type II diabetes, insulin resistance is a significant
pathogenic factor in the development of hyperglycemia. Persistent or
uncontrolled hyperglycemia in both type 1 and type 2 diabetes has been
associated with increased incidence of macrovascular and/or microvascular
complications including atherosclerosis, coronary heart disease, peripheral
vascular disease, stroke, nephropathy, neuropathy and retinopathy. Insulin
resistance, even in the absence of profound hyperglycemia, is a component
also of metabolic syndrome, which is characterized by elevated blood
pressure, high fasting blood glucose levels, abdominal obesity, increased
triglyceride levels and/or decreased HDL cholesterol. Further, glucocorticoids
are known to inhibit the glucose-stimulated secretion of insulin from
pancreatic beta-cells. Inhibition of 11-β-HSD type I is, therefore, expected to
be beneficial in the treatment of metabolic syndromes, obesity, obesity-related
disorders, hypertension, atherosclerosis, lipid disorders, type-II diabetes,
insulin resistance, pancreatitis and associated conditions.

Mild cognitive impairment is a common feature of aging that may be
ultimately related to the progression of dementia. Chronic exposure to
glucocorticoid excess in certain brain subregions has been proposed to
contribute to the decline of cognitive function. Inhibition of 11-β-HSD type I is
expected to reduce exposure to glucocorticoids in the brain and protect
against deleterious glucocorticoid effects on neuronal function, including
cognitive impairment, dementia and/or depression, especially in connection
with Alzheimer's Disease.

Glucocorticoids also have a role in corticosteroid-induced glaucoma.
This particular pathology is characterized by a significant increase in intra-
ocular pressure, which unresolved can lead to partial visual field loss and
eventually blindness. Inhibition of 11-β-HSD type I is expected to reduce local glucocorticoid concentrations and, thus, intra-ocular pressure, producing beneficial effects in the management of glaucoma and other visual disorders.

Finally, glucocorticoids can have adverse effects on skeletal tissues. Continued exposure to excess glucocorticoids can produce osteoporosis and increased risk of fractures. Inhibition of 11-β-HSD type I should reduce local glucocorticoid concentration within osteoblasts and osteoclasts, producing beneficial effects for management of bone disease, including osteoporosis.

In view of the foregoing, there is a clear and continuing need for new compounds that target 11-β-HSD type I.

Summary of the Invention

In its many embodiments, the present invention provides a novel class of heterocyclic compounds as inhibitors of 11β-hydroxysteroid dehydrogenase type-I, pharmaceutical compositions containing the compounds, and methods of treatment, prevention, inhibition, or amelioration of one or more conditions associated with the expression of 11β-hydroxysteroid dehydrogenase type-I using such compounds or pharmaceutical compositions.

In one aspect, the present application discloses a compound, or a pharmaceutically acceptable salt, solvate, ester or prodrug of said compound, said compound having the general structure shown in Formula I:

$$\text{I}$$

wherein:

- $R^1$ represents alkyl, cycloalkyl, alkenyl, aryl, arylalkyl, arylalkenyl, heteroaryl or heteroarylalkyl; and
- $R^2-R^4$ independently represent alkyl;
with the exception of those compounds wherein:

\[ R^2 - R^4 \] each represent methyl; and
\[ R^1 \]
represents phenyl substituted by substituted alkoxycarbonyl, substituted alkylcarbonyloxy, substituted sulfonylamino, substituted carbonylamino, or unsubstituted or substituted aminocarbonyl;

and excluding the following compounds:

1. \( S^-\)trimethyl-6-KphenylmethyOsulphonyl-J-e-azabicyclota^\text{i}octane;
6-\([3,4\text{-difluorophenyl}]\)sulfonyl-1 ,3,3-trimethyl-6-azabicyclo[3.2. 1]octane;
6-\([4\text{-aminophenyl}]\)sulfonyl-1 ,3,3-trimethyl-6-azabicyclo[3.2. 1]octane;
1,3,3-trimethyl-6-\([4\text{-}(5\text{-phenyl-2-oxazolyl})phenyl\)sulfonyl]-6-azabicyclo[3.2. 1]octane;
6-\([2\text{-methyl-5-tert-butylphenyl}]\)sulfonyl-6-azabicyclo[3.2.1]octane;
6-\([3\text{-}(4,7\text{-dihydro-1-methyl-7-oxo-3-propyl-1H-pyrazolo}[4,3-d]pyrimidin-5-yl])\)ethyl-4-ethoxyphenyl]-1 ,3,3-trimethyl-6-azabicyclo[3.2. 1]octane;
6-\([5,2,6\text{-dichloro-4-(4,5-dihydro-3,5-dioxo-1,2,4-triazin-2(3H)-yl)phenoxy}]\)-2-hydroxyphenyl]-sulfonylH.S.S-trimethyl-e-azabicyclo[3^\text{i}octane;
1,3,3-trimethyl-6-\([5\text{-}[2\text{-[2-(2-oxo-1-imidazolidinyl)ethyl]amino]}\text{-4-pyrimidinyl]}\text{-2-thienyl}]\)sulfonyl]-6-azabicyclo[3.2. 1]octane;
6-\([4\text{-ethoxyphenyl}]\)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;
1,3,3-trimethyl-6-\([2\text{-}(trifluoromethyl)phenyl\)sulfonyl]-6-azabicyclo[3.2.1]octane;
6-\([2,3\text{-dichlorophenyl}]\)sulfonyl]-1 ,3,3-trimethyl-6-azabicyclo[3.2.1]octane;
3-\([1\text{-3,3-trimethyl-6-azabicyclo}[3.2.1]oct-6-yl]sulfonyl\)benzoic acid;
3-\([1\text{-3,3-trimethyl-6-azabicyclo}[3.2.1]oct-6-yl]sulfonyl\)benzoic acid methyl ester;
1,3,3-trimethyl-6-\([3\text{-nitrophenyl}]\)sulfonyl]-6-azabicyclo[3.2. 1]octane;
4-\([1\text{-3,3-trimethyl-6-azabicyclo}[3.2. 1]oct-6-yl]sulfonyl\)benzoic acid;
1.S.S-trimethyl-e^-S.\( S\)6-tetramethylphenyOsulfonyll-e-azabicyclo[3.2. 1]octane;
1,3,3-trimethyl-6-\([2\text{-nitrophenyl}]\)sulfonyl]-6-azabicyclo[3.2. 1]octane;
6-\([4\text{-acetylphenyl}]\)sulfonyl]-1 ,3,3-trimethyl-6-azabicyclo[3.2. 1]octane;
6-[(2,5-dimethylphenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;  
6-[(4-methoxyphenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;  
6-[(5-bromo-2-ethoxyphenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;  
6-[(2,5-dibromophenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;  
6-[(2,4-difluorophenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;  
6-[(5-bromo-6-chloro-3-pyridinyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;  
6-[(2,5-dichlorophenyl)sulfonyl]-1,3,3-trimethyl-6-phenylsulfonyl-6-azabicyclo[3.2.1]octane;  
6-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)benzo[d]oxazol-2(3H)-one;  
6-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)benzo[cd]indol-2(1H)-one;  
3-((1R,5S)-1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)-1H-pyrazolo[3,4-b]pyridine;  
2,2,2-trifluoro-1-(8-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)-3,4-dihydroisoquinolin-2(1H)-yl)ethanone;  
6-[(4-tert-butylphenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane; and  

The compounds of Formula I, including those excepted and excluded, as well as salts, solvates, esters and prodrugs thereof, are inhibitors of 11β-hydroxysteroid dehydrogenase type-I, and can be used in the treatment of metabolic syndromes, obesity, obesity-related disorders, hypertension, atherosclerosis, lipid disorders, type-I diabetes, insulin resistance, pancreatitis and associated conditions.

Alternatively, the present invention provides for a method for treating a metabolic syndrome in a patient in need thereof which comprises administering to said patient a therapeutically effective amount of at least one compound of the Formula I:
or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof;

wherein:

\[ R^1 \] represents alkyl, cycloalkyl, alkenyl, aryl, arylalkyl, arylalkenyl, heteroaryl or heteroarylalkyl; and
\[ R^2-R^4 \] independently represent alkyl.

A further embodiment of the present invention is a method for treating obesity or an obesity-related disorder in a patient in need thereof which comprises administering to said patient a therapeutically effective amount of at least one compound of the Formula I:

\[
\begin{align*}
\text{R1} & \quad \text{R2} \\
\text{R3} & \quad \text{R4} \\
\text{N} & \quad \text{SO}_2 \\
\text{R1} & \quad \text{R2}
\end{align*}
\]

or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof;

wherein:

\[ R^1 \] represents alkyl, cycloalkyl, alkenyl, aryl, arylalkyl, arylalkenyl, heteroaryl or heteroarylalkyl; and
\[ R^2-R^4 \] independently represent alkyl.

Another embodiment of the present invention is a method for treating type-II diabetes in a patient in need thereof which comprises administering to
said patient a therapeutically effective amount of at least one compound of the Formula I:

![Formula I](image)

or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof;

wherein:

- $R^1$ represents alkyl, cycloalkyl, alkenyl, aryl, arylalkyl, arylalkenyl, heteroaryl or heteroarylalkyl; and
- $R^2-R^4$ independently represent alkyl.

Another embodiment of the present invention is a method for treating atherosclerosis in a patient in need thereof which comprises administering to said patient a therapeutically effective amount of at least one compound of the Formula I:

![Formula I](image)

or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof;

wherein:
**Detailed Description**

In one embodiment, the present invention discloses certain heterocyclic compounds which are represented by structural Formula I, or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof, wherein the various moieties are as described above.

In another embodiment, the present invention embodies compounds of the Formula I, as well as salts, solvates, esters and prodrugs thereof, wherein:

- $R^1$ represents phenyl, naphthyl, benzyl, stryryl, furanyl, thienyl, pyrazolyl, pyridyl, oxazolyl, benzothienyl or benzooxadiazolyl, each of which is optionally substituted by one or more substituents selected from the group consisting of alkyl, halogen, alkoxy, alkylcarbonyl, alkylsulphonyl, cyano, nitro, aryl, heteroaryl, aryloxy, carboxyl, alkoxycarbonylalkyl, cycloalkyl and morpholino; and
- $R^2$-$R^4$ each represent alkyl.

Table 1 shows structures of representative compounds of this invention. The table and the compounds therein are not intended, nor should they be construed, to limit this invention in any manner whatsoever.

As used above, and throughout this disclosure, the following terms, unless otherwise indicated, shall be understood to have the following meanings:

"Patient" includes both human and animals.

"Mammal" means humans and other mammalian animals.

"Alkyl" means an aliphatic hydrocarbon group which may be straight or branched and comprising about 1 to about 20 carbon atoms in the chain. Preferred alkyl groups contain about 1 to about 12 carbon atoms in the chain. More preferred alkyl groups contain about 1 to about 6 carbon atoms in the chain. Branched means that one or more lower alkyl groups such as methyl, ethyl or propyl, are attached to a linear alkyl chain. "Lower alkyl" means a group having about 1 to about 6 carbon atoms in the chain which may be straight or branched. "Alkyl" may be unsubstituted or optionally substituted by one or more substituents which may be the same or different, each substituent being independently selected from the group consisting of halo, alkyl, aryl, cycloalkyl, cyano, hydroxy, alkoxy, alkylthio, amino, oxime (e.g., =N-OH), -NH(alkyl), -NH(cycloalkyl), -N(alkyl)$_2$, -O-C(O)-alkyl, -O-C(O)-aryl, -O-C(O)-cycloalkyl, carboxy and -C(O)O-alkyl. Non-limiting examples of suitable alkyl groups include methyl, ethyl, n-propyl, isopropyl and t-butyl.

"Alkenyl" means an aliphatic hydrocarbon group containing at least one carbon-carbon double bond and which may be straight or branched and comprising about 2 to about 15 carbon atoms in the chain. Preferred alkenyl groups have about 2 to about 12 carbon atoms in the chain; and more preferably about 2 to about 6 carbon atoms in the chain. Branched means that one or more lower alkyl groups such as methyl, ethyl or propyl, are attached to a linear alkenyl chain. "Lower alkenyl" means about 2 to about 6 carbon
atoms in the chain which may be straight or branched. "Alkenyl" may be unsubstituted or optionally substituted by one or more substituents which may be the same or different, each substituent being independently selected from the group consisting of halo, alkyl, aryl, cycloalkyl, cyano, alkoxy and S(alkyl). Non-limiting examples of suitable alkenyl groups include ethenyl, propenyl, n-butenyl, 3-methylbut-2-enyl, n-pentenyl, octenyl and decenyl.

"Alkylene" means a difunctional group obtained by removal of a hydrogen atom from an alkyl group that is defined above. Non-limiting examples of alkylene include methylene, ethylene and propylene.

"Alkynyl" means an aliphatic hydrocarbon group containing at least one carbon-carbon triple bond and which may be straight or branched and comprising about 2 to about 15 carbon atoms in the chain. Preferred alkynyl groups have about 2 to about 12 carbon atoms in the chain; and more preferably about 2 to about 4 carbon atoms in the chain. Branched means that one or more lower alkyl groups such as methyl, ethyl or propyl, are attached to a linear alkynyl chain. "Lower alkynyl" means about 2 to about 6 carbon atoms in the chain which may be straight or branched. Non-limiting examples of suitable alkynyl groups include ethynyl, propynyl, 2-butynyl and 3-methylbutynyl. "Alkynyl" may be unsubstituted or optionally substituted by one or more substituents which may be the same or different, each substituent being independently selected from the group consisting of alkyl, aryl and cycloalkyl.

"Aryl" means an aromatic monocyclic or multicyclic ring system comprising about 6 to about 14 carbon atoms, preferably about 6 to about 10 carbon atoms. The aryl group can be optionally substituted with one or more "ring system substituents" which may be the same or different, and are as defined herein. Non-limiting examples of suitable aryl groups include phenyl and naphthyl.

"Heteroaryl" means an aromatic monocyclic or multicyclic ring system comprising about 5 to about 14 ring atoms, preferably about 5 to about 10 ring atoms, in which one or more of the ring atoms is an element other than carbon, for example nitrogen, oxygen or sulfur, alone or in combination. Preferred heteroaryls contain about 5 to about 6 ring atoms. The "heteroaryl" can be optionally substituted by one or more "ring system substituents" which
may be the same or different, and are as defined herein. The prefix aza, oxa or thia before the heteroaryl root name means that at least a nitrogen, oxygen or sulfur atom respectively, is present as a ring atom. A nitrogen atom of a heteroaryl can be optionally oxidized to the corresponding N-oxide.

"Heteroaryl" may also include a heteroaryl as defined above fused to an aryl as defined above. Non-limiting examples of suitable heteroaryls include pyridyl-, pyrazinyl, furanyl, thiophenyl, pyrimidinyl, pyridone (including N-substituted pyridones), isoxazolyl, isothiazolyl, oxazolyl, thiazolyl, pyrazolyl, furazanyl, pyrrolyl, pyrazolyl, triazolyl, 1,2,4-thiadiazolyl, pyrazinyl, pyridazinyl, quinoxaliny, phthalazinyl, oxindolyl, imidazo[1,2-a]pyridinyl, imidazo[2,1-b]thiazolyl, benzofurazanyl, indolyl, azaindolyl, benzimidazolyl, benzothiophenyl, quinolinyl, imidazolyl, thienopyridyl, quinozolinyl, thienopyrimidyl, pyrrolopyridyl, imidazopyridyl, isoquinolinyl, benzoazaindolyl, 1,2,4-triazinyl, benzothiazolyl and the like. The term "heteroaryl" also refers to partially saturated heteroaryl moieties such as, for example, tetrahydroisoquinolyl, tetrahydroquinolyl and the like.

"Aralkyl" or "arylalkyl" means an aryl-alkyl- group in which the aryl and alkyl are as previously described. Preferred aralkyls comprise a lower alkyl group. Non-limiting examples of suitable aralkyl groups include benzyl, 2-phenethyl and naphthalenylmethyl. The bond to the parent moiety is through the alkyl.

"Alkylaryl" means an alkyl-aryl- group in which the alkyl and aryl are as previously described. Preferred alkylaryls comprise a lower alkyl group. Non-limiting example of a suitable alkylaryl group is tolyl. The bond to the parent moiety is through the aryl.

"Cycloalkyl" means a non-aromatic mono- or multicyclic ring system comprising about 3 to about 10 carbon atoms, preferably about 5 to about 10 carbon atoms. Preferred cycloalkyl rings contain about 5 to about 7 ring atoms. The cycloalkyl can be optionally substituted with one or more "ring system substituents" which may be the same or different, and are as defined above. Non-limiting examples of suitable monocyclic cycloalkyls include cyclopropyl, cyclopentyl, cyclohexyl, cycloheptyl and the like. Non-limiting examples of suitable multicyclic cycloalkyls include 1-decalinyl, norbomyl, adamantyl and the like.
"Cycloalkylalkyl" means a cycloalkyl moiety as defined above linked via an alkyl moiety (defined above) to a parent core. Non-limiting examples of suitable cycloalkylalkyls include cyclohexylmethyl, adamantylmethyl and the like.

"Cycloalkenyl" means a non-aromatic mono or multicyclic ring system comprising about 3 to about 10 carbon atoms, preferably about 5 to about 10 carbon atoms which contains at least one carbon-carbon double bond. Preferred cycloalkenyl rings contain about 5 to about 7 ring atoms. The cycloalkenyl can be optionally substituted with one or more "ring system substituents" which may be the same or different, and are as defined above. Non-limiting examples of suitable monocyclic cycloalkenyls include cyclopentenyl, cyclohexenyl, cyclohepta-1,3-dienyl, and the like. Non-limiting example of a suitable multicyclic cycloalkenyl is norbornylenyl.

"Cycloalkenylalkyl" means a cycloalkenyl moiety as defined above linked via an alkyl moiety (defined above) to a parent core. Non-limiting examples of suitable cycloalkenylalkyls include cyclopentenylmethyl, cyclohexenylmethyl and the like.

"Halogen" means fluorine, chlorine, bromine, or iodine. Preferred are fluorine, chlorine and bromine.

"Ring system substituent" means a substituent attached to an aromatic or non-aromatic ring system which, for example, replaces an available hydrogen on the ring system. Ring system substituents may be the same or different, each being independently selected from the group consisting of alkyl, alkenyl, alkynyl, aryl, heteroaryl, aralkyl, alkylaryl, heteroaralkyl, heteroaryalkenyl, heteroaryalkynyl, alkylheteroaryl, hydroxy, hydroxyalkyl, alkoxy, alkoxyalkyl, aryloxy, aralkoxy, acyl, aroyl, halo, nitro, cyano, carboxy, alkoxy carbonyl, aryloxycarbonyl, aralkoxycarbonyl, alkylsulfonyl, arylsulfonyl, heteroarylsulfonyl, alkylthio, arylthio, heteroarylthio, aralkylthio, heteroaralkylthio, cycloalkyl, heterocyclyl, -O-C(O)-aryl, -O-C(O)-alkyl, -O-C(O)-alkenyl, -O-C(O)-acyl, oxo, -C(=N-CN)-NH$_2$, -C(=NH)-NH$_2$, -C(=NH)-NH(alkyl), oxime (e.g., =N-OH), YiY$_2$N-, YiY$_2$N-alkyl-, Y$_1$Y$_2$NC(O)-, YiY$_2$NO$_2$- and -SO$_2$NYiY$_2$, wherein Yi and Y$_2$ can be the same or different and are independently selected from the group consisting of hydrogen, alkyl, aryl, cycloalkyl, and aralkyl. "Ring system substituent" may also mean a single
moiety which simultaneously replaces two available hydrogens on two adjacent carbon atoms (one H on each carbon) on a ring system. Examples of such moiety are methylene dioxy, ethylenedioxy, -C(CH$_3$)$_2$- and the like. "Heterocyclyl" may also form tetrahydrothiophenyl, thiomorpholinyl, can such system about substituent embodiment, substituted such adjacent sulfur, such as, for example, 2-pyridinylmethyl, quinolinylmethyl and the like. "Heteroarylalkyl" means a heteroaryl moiety as defined above linked via an alkyl moiety (defined above) to a parent core. Non-limiting examples of suitable heteroaryls include 2-pyridinylmethyl, quinolinylmethyl and the like. "Heterocycl" means a non-aromatic saturated monocyclic or multicyclic ring system comprising about 3 to about 10 ring atoms, preferably about 5 to about 10 ring atoms, in which one or more of the atoms in the ring system is an element other than carbon, for example nitrogen, oxygen or sulfur, alone or in combination. There are no adjacent oxygen and/or sulfur atoms present in the ring system. Preferred heterocycls contain about 5 to about 6 ring atoms. The prefix aza, oxa or thia before the heterocycl root name means that at least a nitrogen, oxygen or sulfur atom respectively is present as a ring atom. Any -NH in a heterocycl ring may exist protected such as, for example, as an -N(Boc), -N(CBz), -N(Tos) group and the like; such protections are also considered part of this invention. The heterocycl can be optionally substituted by one or more "ring system substituents" which may be the same or different, and are as defined herein. The nitrogen or sulfur atom of the heterocycl can be optionally oxidized to the corresponding N-oxide, S-oxide or S,S-dioxide. Non-limiting examples of suitable monocyclic heterocycl rings include piperidyl, pyrrolidinyl, piperazinyl, morpholinyl, thiomorpholinyl, thiazolidinyl, 1,4-dioxanyl, tetrahydrofuranyl, tetrahydrothiophenyl, lactam, lactone, and the like. "Heterocycl" may also
mean a single moiety (e.g., carbonyl) which simultaneously replaces two available hydrogens on the same carbon atom on a ring system. Example of such moiety is pyrrolidone:

\[ \text{N} \]
\[ \text{O} \]

"Heterocyclylalkyl" means a heterocyclyl moiety as defined above linked via an alkyl moiety (defined above) to a parent core. Non-limiting examples of suitable heterocyclylalkyls include piperidinylmethyl, piperazinylmethyl and the like.

"Heterocyclenyl" means a non-aromatic monocyclic or multicyclic ring system comprising about 3 to about 10 ring atoms, preferably about 5 to about 10 ring atoms, in which one or more of the atoms in the ring system is an element other than carbon, for example nitrogen, oxygen or sulfur atom, alone or in combination, and which contains at least one carbon-carbon double bond or carbon-nitrogen double bond. There are no adjacent oxygen and/or sulfur atoms present in the ring system. Preferred heterocyclenyl rings contain about 5 to about 6 ring atoms. The prefix aza, oxa or thia before the heterocyclenyl root name means that at least a nitrogen, oxygen or sulfur atom respectively is present as a ring atom. The heterocyclenyl can be optionally substituted by one or more ring system substituents, wherein "ring system substituent" is as defined above. The nitrogen or sulfur atom of the heterocyclenyl can be optionally oxidized to the corresponding N-oxide, S-oxide or S,S-dioxide. Non-limiting examples of suitable heterocyclenyl groups include 1,2,3,4-tetrahydropyrindinyl, 1,2-dihydropyridinyl, 1,4-dihydropyridinyl, 1,2,3,6-tetrahydropyridinyl, 1,4,5,6-tetrahydropyrimidinyl, 2-pyrrolinyl, 3-pyrrolinyl, 2-imidazolinyl, 2-pyrazolinyl, dihydroimidazolyl, dihydrooxazolyl, dihydrooxadiazolyl, dihydrothiazolyl, 3,4-dihydro-2H-pyranyl, dihydrofuranyl, fluorodihydrofuranyl, 7-oxabicyclo[2.2.1]heptenyl, dihydrothiophenyl, dihydrothiopyranyl, and the like. "Heterocyclenyl" may also mean a single moiety (e.g., carbonyl) which simultaneously replaces two available
hydrogens on the same carbon atom on a ring system. Example of such moiety is pyrrolidinone:

"Heterocyclenylalkyl" means a heterocyclenyl moiety as defined above linked via an alkyl moiety (defined above) to a parent core.

It should be noted that in hetero-atom containing ring systems of this invention, there are no hydroxyl groups on carbon atoms adjacent to a N, O or S, as well as there are no N or S groups on carbon adjacent to another heteroatom. Thus, for example, in the ring:

there is no -OH attached directly to carbons marked 2 and 5.

It should also be noted that tautomeric forms such as, for example, the moieties:

are considered equivalent in certain embodiments of this invention.

"Alkynylalkyl" means an alkynyl-alkyl- group in which the alkynyl and alkyl are as previously described. Preferred alkynylalkyls contain a lower alkynyl and a lower alkyl group. The bond to the parent moiety is through the alkyl. Non-limiting examples of suitable alkynylalkyl groups include propargylmethyl.

"Heteroaralkyl" means a heteroaryl-alkyl- group in which the heteroaryl and alkyl are as previously described. Preferred heteroaralkyls contain a lower alkyl group. Non-limiting examples of suitable aralkyl groups include pyridylmethyl, and quinolin-3-ylmethyl. The bond to the parent moiety is through the alkyl.
"Hydroxyalkyl" means a HO-alkyl- group in which alkyl is as previously defined. Preferred hydroxyalkyls contain lower alkyl. Non-limiting examples of suitable hydroxyalkyl groups include hydroxymethyl and 2-hydroxyethyl.

"Acyl" means an H-C(O)-, alkyl-C(O)- or cycloalkyl-C(O)-, group in which the various groups are as previously described. The bond to the parent moiety is through the carbonyl. Preferred acyls contain a lower alkyl. Non-limiting examples of suitable acyl groups include formyl, acetyl and propanoyl.

"Aroyl" means an aryl-C(O)- group in which the aryl group is as previously described. The bond to the parent moiety is through the carbonyl. Non-limiting examples of suitable groups include benzoyl and 1- naphthoyl.

"Alkoxy" means an alkyl-O- group in which the alkyl group is as previously described. Non-limiting examples of suitable alkoxy groups include methoxy, ethoxy, n-propoxy, isopropoxy and n-butoxy. The bond to the parent moiety is through the ether oxygen.

"Aryloxy" means an aryl-O- group in which the aryl group is as previously described. Non-limiting examples of suitable aryloxy groups include phenoxy and naphthoxy. The bond to the parent moiety is through the ether oxygen.

"Aralkylthio" means an aralkyl-S- group in which the aralkyl group is as previously described. Non-limiting examples of suitable aralkylthio groups include benzylthio and 1- or 2-naphthalenemethoxy. The bond to the parent moiety is through the ether oxygen.

"Alkylthio" means an alkyl-S- group in which the alkyl group is as previously described. Non-limiting examples of suitable alkylthio groups include methylthio and ethylthio. The bond to the parent moiety is through the sulfur.

"Arylthio" means an aryl-S- group in which the aryl group is as previously described. Non-limiting examples of suitable arylthio groups include phenylthio and naphthylthio. The bond to the parent moiety is through the sulfur.

"Aralkylthio" means an aralkyl-S- group in which the aralkyl group is as previously described. Non-limiting example of a suitable aralkylthio group is benzylthio. The bond to the parent moiety is through the sulfur.
"Alkoxycarbonyl" means an alkyl-O-CO- group. Non-limiting examples of suitable alkoxycarbonyl groups include methoxycarbonyl and ethoxycarbonyl. The bond to the parent moiety is through the carbonyl.

"Aryloxycarbonyl" means an aryl-O-C(O)- group. Non-limiting examples of suitable aryloxycarbonyl groups include phenoxycarbonyl and naphthoxycarbonyl. The bond to the parent moiety is through the carbonyl.

"Aralkoxycarbonyl" means an aralkyl-O-C(O)- group. Non-limiting example of a suitable aralkoxycarbonyl group is benzyloxycarbonyl. The bond to the parent moiety is through the carbonyl.

"Alkylsulfonyl" means an alkyl-S(O\(_2\))- group. Preferred groups are those in which the alkyl group is lower alkyl. The bond to the parent moiety is through the sulfonyl.

"Arylsulfonyl" means an aryl-S(O\(_2\))- group. The bond to the parent moiety is through the sulfonyl.

The term "substituted" means that one or more hydrogens on the designated atom is replaced with a selection from the indicated group, provided that the designated atom's normal valency under the existing circumstances is not exceeded, and that the substitution results in a stable compound. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds. By "stable compound" or "stable structure" is meant a compound that is sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent.

The term "optionally substituted" means optional substitution with the specified groups, radicals or moieties.

The term "purified", "in purified form" or "in isolated and purified form" for a compound refers to the physical state of said compound after being isolated from a synthetic process (e.g. from a reaction mixture), or natural source or combination thereof. Thus, the term "purified", "in purified form" or "in isolated and purified form" for a compound refers to the physical state of said compound after being obtained from a purification process or processes described herein or well known to the skilled artisan (e.g., chromatography, recrystallization and the like) , in sufficient purity to be characterizable by
standard analytical techniques described herein or well known to the skilled artisan.

It should also be noted that any carbon as well as heteroatom with unsatisfied valences in the text, schemes, examples and Tables herein is assumed to have the sufficient number of hydrogen atom(s) to satisfy the valences.

When a functional group in a compound is termed "protected", this means that the group is in modified form to preclude undesired side reactions at the protected site when the compound is subjected to a reaction. Suitable protecting groups will be recognized by those with ordinary skill in the art as well as by reference to standard textbooks such as, for example, T. W. Greene et al., *Protective Groups in Organic Synthesis* (1991), Wiley, New York.

When any variable (e.g., aryl, heterocycle, R², etc.) occurs more than one time in any constituent or in Formula I, its definition on each occurrence is independent of its definition at every other occurrence.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

Prodrugs and solvates of the compounds of the invention are also contemplated herein. A discussion of prodrugs is provided in T. Higuchi and V. Stella, *Pro-drugs as Novel Delivery Systems* (1987) 14 of the A.C.S. Symposium Series, and in *Bioreversible Carriers in Drug Design*, (1987) Edward B. Roche, ed., American Pharmaceutical Association and Pergamon Press. The term "prodrug" means a compound (e.g., a drug precursor) that is transformed in vivo to yield a compound of Formula (I) or a pharmaceutically acceptable salt, hydrate or solvate of the compound. The transformation may occur by various mechanisms (e.g., by metabolic or chemical processes), such as, for example, through hydrolysis in blood. A discussion of the use of prodrugs is provided by T. Higuchi and W. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A.C.S. Symposium Series, and in *Bioreversible Carriers in Drug Design*, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987.
For example, if a compound of Formula (I) or a pharmaceutically acceptable salt, hydrate or solvate of the compound contains a carboxylic acid functional group, a prodrug can comprise an ester formed by the replacement of the hydrogen atom of the acid group with a group such as, for example, 5 (C\textsubscript{1}-C\textsubscript{6})alkyl, (C\textsubscript{2}-C\textsubscript{6})alkanoyloxy)methyl, 1-(alkanoyloxy)ethyl having from 4 to 9 carbon atoms, 1-methyl-1-(alkanoyloxy)-ethyl having from 5 to 10 carbon atoms, alkoxy carbonyloxy)methyl having from 3 to 6 carbon atoms, 1-(alkoxycarbonyloxy)ethyl having from 4 to 7 carbon atoms, 1-methyl-1-(alkoxycarbonyloxy)ethyl having from 5 to 8 carbon atoms, N-(alkoxycarbonyl)aminomethyl having from 3 to 9 carbon atoms, 1-(N-(alkoxycarbonyl)amino)ethyl having from 4 to 10 carbon atoms, 3-phthalidyl, 4-crotonolactonyl, gamma-butyrolacton-4-yl, di-N,N-(C\textsubscript{2}-C\textsubscript{3})alkylamino(C\textsubscript{2}-C\textsubscript{3})alkyl (such as β-dimethylaminoethyl), carbamoyl-(C\textsubscript{2})alkyl, N,N-di (Cr C\textsubscript{2})alkylcarbamoyl-(Cr C\textsubscript{2})alkyl and piperidino-, pyrrolidino- or morpholino(C\textsubscript{2}-C\textsubscript{3})alkyl, and the like.

Similarly, if a compound of Formula (I) contains an alcohol functional group, a prodrug can be formed by the replacement of the hydrogen atom of the alcohol group with a group such as, for example, (C\textsubscript{1}-C\textsubscript{6})alkanoyloxy)methyl, 1-((C\textsubscript{1}-C\textsubscript{6})alkanoyloxy)ethyl, 1-methyl-1-(((C\textsubscript{1}-C\textsubscript{6})alkanoyloxy)methyl, N-(Cr C\textsubscript{6})alkanoyloxy)ethyl, (C\textsubscript{1}-C\textsubscript{6})alkoxycarbonyloxy)methyl, N-(Cr C\textsubscript{6})alkoxycarbonylaminomethyl, succinoyl, (C\textsubscript{1}-C\textsubscript{6})alkanoyl, α-amino(Cr C\textsubscript{4})alkanoyl, ary lacyl and α-aminoacyl, or α-aminoacyl-α-aminoacyl, where each α-aminoacyl group is independently selected from the naturally occurring L-amino acids, P(O)(OH)\textsubscript{2}, -P(O)(O(C\textsubscript{6})alkyl)\textsubscript{2} or glycosyl (the radical resulting from the removal of a hydroxyl group of the hemiacetal form of a carbohydrate), and the like.

If a compound of Formula (I) incorporates an amine functional group, a prodrug can be formed by the replacement of a hydrogen atom in the amine group with a group such as, for example, R-carbonyl, RO-carbonyl, NRR'-carbonyl where R and R' are each independently (CrC\textsubscript{10})alkyl, (C\textsubscript{3}-C\textsubscript{7})cycloalkyl, benzyl, or R-carbonyl is a natural α-aminoacyl or natural α-aminoacyl, -C(OH)C(O)OY\textsuperscript{1} wherein Y\textsuperscript{1} is H, (C\textsubscript{6})alkyl or benzyl, —C(OY\textsuperscript{2})Y\textsuperscript{3} wherein Y\textsuperscript{2} is (C\textsubscript{4})alkyl and Y\textsuperscript{3} is (C\textsubscript{6})alkyl, carboxy (d-C\textsubscript{6})alkyl, amino(C\textsubscript{4})alkyl or mono-N— or di-N,N-(C\textsubscript{6})alkylaminoalkyl, —
C(Y^4)Y^5 wherein Y^4 is H or methyl and Y^5 is mono-N— or di-N,N-(Ci-C_6)alkylamino morpholino, piperidin-1-yl or pyrrolidin-1-yl, and the like.

One or more compounds of the invention may exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like, and it is intended that the invention embrace both solvated and unsolvated forms. "Solvate" means a physical association of a compound of this invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolatable solvates. Non-limiting examples of suitable solvates include ethanolates, methanolates, and the like. "Hydrate" is a solvate wherein the solvent molecule is H_2O.

One or more compounds of the invention may optionally be converted to a solvate. Preparation of solvates is generally known. Thus, for example, M. Caira et al, J. Pharmaceutical Sci., 93(3), 601-611 (2004) describe the preparation of the solvates of the antifungal fluconazole in ethyl acetate as well as from water. Similar preparations of solvates, hemisolvate, hydrates and the like are described by E. C. van Tonder et al, AAPS PharmSciTech., 5(1), article 12 (2004); and A. L Bingham et al, Chem. Commun., 603-604 (2001). A typical, non-limiting, process involves dissolving the inventive compound in desired amounts of the desired solvent (organic or water or mixtures thereof) at a higher than ambient temperature, and cooling the solution at a rate sufficient to form crystals which are then isolated by standard methods. Analytical techniques such as, for example I. R. spectroscopy, show the presence of the solvent (or water) in the crystals as a solvate (or hydrate).

"Effective amount" or "therapeutically effective amount" is meant to describe an amount of compound or a composition of the present invention effective in inhibiting the above-noted diseases and thus producing the desired therapeutic, ameliorative, inhibitory or preventative effect.

The compounds of Formula I can form salts which are also within the scope of this invention. Reference to a compound of Formula I herein is
understood to include reference to salts thereof, unless otherwise indicated. The term "salt(s)" as employed herein, denotes acidic salts formed with inorganic and/or organic acids, as well as basic salts formed with inorganic and/or organic bases. In addition, when a compound of Formula I contains both a basic moiety, such as, but not limited to a pyridine or imidazole, and an acidic moiety, such as, but not limited to a carboxylic acid, zwitterions ("inner salts") may be formed and are included within the term "salt(s)" as used herein. Pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable) salts are preferred, although other salts are also useful. Salts of the compounds of the Formula I may be formed, for example, by reacting a compound of Formula I with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

Exemplary acid addition salts include acetates, ascorbates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates, camphorsulfonates, fumarates, hydrochlorides, hydrobromides, hydroiodides, lactates, maleates, methanesulfonates, naphthalenesulfonates, nitrates, oxalates, phosphates, propionates, salicylates, succinates, sulfates, tartarates, thiocyanates, toluenesulfonates (also known as tosylates,) and the like. Additionally, acids which are generally considered suitable for the formation of pharmaceutically useful salts from basic pharmaceutical compounds are discussed, for example, by P. Stahl et al, Camille G. (eds.) Handbook of Pharmaceutical Salts. Properties, Selection and Use. (2002) Zurich: Wiley-VCH; S. Berge et al, Journal of Pharmaceutical Sciences (1977) 66(1) 1-19; P. Gould, International J. of Pharmaceutics (1986) 33 201 -217; Anderson et al, The Practice of Medicinal Chemistry (1996), Academic Press, New York; and in The Orange Book (Food & Drug Administration, Washington, D.C. on their website). These disclosures are incorporated herein by reference thereto.

Exemplary basic salts include ammonium salts, alkali metal salts such as sodium, lithium, and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases (for example, organic amines) such as dicyclohexylamines, t-butyl amines, and salts with amino acids such as arginine, lysine and the like. Basic nitrogen-containing groups
may be quarternized with agents such as lower alkyl halides (e.g. methyl, ethyl, and butyl chlorides, bromides and iodides), dialkyl sulfates (e.g. dimethyl, diethyl, and dibutyl sulfates), long chain halides (e.g. decyl, lauryl, and stearyl chlorides, bromides and iodides), aralkyl halides (e.g. benzyl and phenethyl bromides), and others.

All such acid salts and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

Pharmaceutically acceptable esters of the present compounds include the following groups: (1) carboxylic acid esters obtained by esterification of the hydroxy groups, in which the non-carbonyl moiety of the carboxylic acid portion of the ester grouping is selected from straight or branched chain alkyl (for example, acetyl, n-propyl, t-butyl, or n-butyl), alkoxyalkyl (for example, methoxymethyl), aralkyl (for example, benzyl), arloxyalkyl (for example, phenoxyalkyl), aryl (for example, phenyl optionally substituted with, for example, halogen, C_4 alkyl, or C_4 alkoxy or amino); (2) sulfonate esters, such as alkyl- or aralkylsulfonyl (for example, methanesulfonyl); (3) amino acid esters (for example, L-valyl or L-isoleucyl); (4) phosphonate esters and (5) mono-, di- or triphosphate esters. The phosphate esters may be further esterified by, for example, a C1-20 alcohol or reactive derivative thereof, or by a 2,3-di (C_6-24)acyl glycerol.

Compounds of Formula I, and salts, solvates, esters and prodrugs thereof, may exist in their tautomeric form (for example, as an amide or imino ether). All such tautomeric forms are contemplated herein as part of the present invention.

The compounds of Formula (I) may contain asymmetric or chiral centers, and, therefore, exist in different stereoisomeric forms. It is intended that all stereoisomeric forms of the compounds of Formula (I) as well as mixtures thereof, including racemic mixtures, form part of the present invention. In addition, the present invention embraces all geometric and positional isomers. For example, if a compound of Formula (I) incorporates a double bond or a fused ring, both the cis- and trans-forms, as well as mixtures, are embraced within the scope of the invention.
Diastereomeric mixtures can be separated into their individual
diastereomers on the basis of their physical chemical differences by methods
well known to those skilled in the art, such as, for example, by
chromatography and/or fractional crystallization. Enantiomers can be
separated by converting the enantiomeric mixture into a diastereomeric
mixture by reaction with an appropriate optically active compound (e.g., chiral
auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the
diastereomers and converting (e.g., hydrolyzing) the individual diastereomers
to the corresponding pure enantiomers. Also, some of the compounds of
Formula (I) may be atropisomers (e.g., substituted biaryls) and are considered
as part of this invention. Enantiomers can also be separated by use of chiral
HPLC column.

It is also possible that the compounds of Formula (I) may exist in
different tautomeric forms, and all such forms are embraced within the scope
of the invention. Also, for example, all keto-enol and imine-enamine forms of
the compounds are included in the invention.

All stereoisomers (for example, geometric isomers, optical isomers and
the like) of the present compounds (including those of the salts, solvates,
esters and prodrugs of the compounds as well as the salts, solvates and
esters of the prodrugs), such as those which may exist due to asymmetric
carbons on various substituents, including enantiomeric forms (which may
exist even in the absence of asymmetric carbons), rotameric forms,
atropisomers, and diastereomeric forms, are contemplated within the scope of
this invention, as are positional isomers (such as, for example, 4-pyridyl and
3-pyridyl). (For example, if a compound of Formula (I) incorporates a double
bond or a fused ring, both the cis- and trans-forms, as well as mixtures, are
embraced within the scope of the invention. Also, for example, all keto-enol
and imine-enamine forms of the compounds are included in the invention.)
Individual stereoisomers of the compounds of the invention may, for example,
be substantially free of other isomers, or may be admixed, for example, as
racemates or with all other, or other selected, stereoisomers. The chiral
centers of the present invention can have the S or R configuration as defined
by the IUPAC1974 Recommendations. The use of the terms "salt", "solvate",
"ester", "prodrug" and the like, is intended to equally apply to the salt, solvate,
ester and prodrug of enantiomers, stereoisomers, rotamers, tautomers, positional isomers, racemates or prodrugs of the inventive compounds.

The present invention also embraces isotopically-labelled compounds of the present invention which are identical to those recited herein, but for the fact that one or more atoms are replaced by an atom having an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, fluorine and chlorine, such as \( ^2H, ^3H, ^{13}C, ^{14}C, ^{15}N, ^{16}O, ^{17}O, ^{31}P, ^{32}P, ^{35}S, ^{18}F, \) and \(^{36}Cl, \) respectively.

Certain isotopically-labelled compounds of Formula (I) (e.g., those labeled with \( ^3H \) and \( ^{14}C \) are useful in compound and/or substrate tissue distribution assays. Tritiated (i.e., \( ^3H \)) and carbon-14 (i.e., \( ^{14}C \)) isotopes are particularly preferred for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium (i.e., \( ^2H \)) may afford certain therapeutic advantages resulting from greater metabolic stability (e.g., increased in vivo half-life or reduced dosage requirements) and hence may be preferred in some circumstances. Isotopically labelled compounds of Formula (I) can generally be prepared by following procedures analogous to those disclosed in the Schemes and/or in the Examples hereinbelow, by substituting an appropriate isotopically labelled reagent for a non-isotopically labelled reagent.

Polymorphic forms of the compounds of Formula I, and of the salts, solvates, esters and prodrugs of the compounds of Formula I, are intended to be included in the present invention.

The compounds according to the invention have pharmacological properties; in particular, the compounds of Formula I can be inhibitors of 11\( \beta \)-hydroxysteroid dehydrogenase type 1.

The term "obesity" as used herein, refers to a patient being overweight and having a body mass index (BMI) of 25 or greater. In one embodiment, an obese patient has a BMI of 25 or greater. In another embodiment, an obese patient has a BMI from 25 to 30. In another embodiment, an obese patient has a BMI greater than 30. In still another embodiment, an obese patient has a BMI greater than 40.
The term "obesity-related disorder" as used herein refers to: (i) disorders which result from a patient having a BMI of 25 or greater; and (ii) eating disorders and other disorders associated with excessive food intake. Non-limiting examples of an obesity-related disorder include edema, shortness of breath, sleep apnea, skin disorders and high blood pressure.

The term "metabolic syndrome" as used herein, refers to a set of risk factors that make a patient more susceptible to cardiovascular disease and/or type 2 diabetes. A patient is said to have metabolic syndrome if the patient has one or more of the following five risk factors:

1) central/abdominal obesity as measured by a waist circumference of greater than 40 inches in a male and greater than 35 inches in a female;
2) a fasting triglyceride level of greater than or equal to 150 mg/dL;
3) an HDL cholesterol level in a male of less than 40 mg/dL or in a female of less than 50 mg/dL;
4) blood pressure greater than or equal to 130/85 mm Hg; and
5) a fasting glucose level of greater than or equal to 110 mg/dL.

A preferred dosage is about 0.001 to 5 mg/kg of body weight/day of the compound of Formula 1. An especially preferred dosage is about 0.01 to 5 mg/kg of body weight/day of a compound of Formula 1, or a pharmaceutically acceptable salt, solvate, ester or prodrug of said compound.

In one embodiment, the present invention provides methods for treating a Condition in a patient, the method comprising administering to the patient one or more compounds of Formula 1, or a pharmaceutically acceptable salt or solvate thereof and at least one additional therapeutic agent that is not a compound of Formula 1, wherein the amounts administered are together effective to treat or prevent a Condition.

Non-limiting examples of additional therapeutic agents useful in the present methods for treating or preventing a Condition include, anti-obesity agents, antidiabetic agents, any agent useful for treating metabolic syndrome, any agent useful for treating a cardiovascular disease, cholesterol biosynthesis inhibitors, cholesterol absorption inhibitors, bile acid sequestrants, probucol derivatives, IBAT inhibitors, nicotinic acid receptor
agonists, ACAT inhibitors, cholesteryl ester transfer protein (CETP) inhibitors, low-density lipoprotein (LDL) activators, fish oil, water-soluble fibers, plant sterols, plant stands, fatty acid esters of plant stands, or any combination of two or more of these additional therapeutic agents.

Non-limiting examples of anti-obesity agents useful in the present methods for treating a Condition include CB1 antagonists or inverse agonists such as rimonabant, neuropeptide Y antagonists, MCR4 agonists, MCH receptor antagonists, histamine H3 receptor antagonists or inverse agonists, metabolic rate enhancers, nutrient absorption inhibitors, leptin, appetite suppressants and lipase inhibitors.

Non-limiting examples of appetite suppressant agents useful in the present methods for treating or preventing a Condition include cannabinoid receptor 1 (CB1) antagonists or inverse agonists (e.g., rimonabant); Neuropeptide Y (NPY1, NPY2, NPY4 and NPY5) antagonists; metabotropic glutamate subtype 5 receptor (mGluR5) antagonists (e.g., 2-methyl-6-(phenylethynyl)-pyridine and 3[(2-methyl-1,4-thiazol-4-yl)ethynyl]pyridine); melanin-concentrating hormone receptor (MCH1R and MCH2R) antagonists; melanocortin receptor agonists (e.g., Melanotan-II and Mc4r agonists); serotonin uptake inhibitors (e.g., dexfenfluramine and fluoxetine); serotonin (5HT) transport inhibitors (e.g., paroxetine, fluoxetine, fenfluramine, fluvoxamine, sertaline and imipramine); norepinephrine (NE) transporter inhibitors (e.g., desipramine, talsupram and nomifensine); ghrelin antagonists; leptin or derivatives thereof; opioid antagonists (e.g., nalmefene, 3-methoxynaltrexone, naloxone and nalterezone); orexin antagonists; bombesin receptor subtype 3 (BRS3) agonists; Cholecystokinin-A (CCK-A) agonists; ciliary neurotrophic factor (CNTF) or derivatives thereof (e.g., butabindide and axokine); monoamine reuptake inhibitors (e.g., sibutramine); glucagon-like peptide 1 (GLP-1) agonists; topiramate; and phytopharm compound 57.

Non-limiting examples of metabolic rate enhancers useful in the present methods for treating or preventing a Condition include acetyl-CoA carboxylase-2 (ACC2) inhibitors; beta adrenergic receptor 3 (β3) agonists; diacylglycerol acyltransferase inhibitors (DGAT1 and DGAT2); fatty acid synthase (FAS) inhibitors (e.g., Cerulenin); phosphodiesterase (PDE) inhibitors (e.g., theophylline, pentoxifylline, zaprinast, sildenafil, amrinone,
milrinone, cilostamide, rolipram and cilomilast); thyroid hormone β agonists; uncoupling protein activators (UCP-1,2 or 3) (e.g., phytanic acid, 4-[(E)-2-(5,6,7,8-tetramethyl-2-naphthalenyl)-1-propenyl]benzoic acid and retinoic acid); acyl-estrogens (e.g., oleoyl-estrone); glucocorticoid antagonists; 11-beta hydroxy steroid dehydrogenase type 1 (11β HSD-1) inhibitors; melanocortin-3 receptor (Mc3r) agonists; and stearoyl-CoA desaturase-1 (SCD-1) compounds.

Non-limiting examples of nutrient absorption inhibitors useful in the present methods for treating or preventing a Condition include lipase inhibitors (e.g., orlistat, lipstatin, tetrahydrolipstatin, teasaponin and diethylumbelliferyl phosphate); fatty acid transporter inhibitors; dicarboxylate transporter inhibitors; glucose transporter inhibitors; and phosphate transporter inhibitors.

Non-limiting examples of cholesterol biosynthesis inhibitors useful in the present methods for treating or preventing a Condition include HMG-CoA reductase inhibitors, squalene synthase inhibitors, squalene epoxidase inhibitors and mixtures thereof.

Non-limiting examples of cholesterol absorption inhibitors useful in the present methods for treating or preventing a Condition include ezetimibe and other compounds suitable for the same purpose. In one embodiment, the cholesterol absorption inhibitor is ezetimibe.

HMG-CoA reductase inhibitors useful in the present methods for treating or preventing a Condition include, but are not limited to, statins such as lovastatin, pravastatin, fluvastatin, simvastatin, atorvastatin, cerivastatin, CI-981, resuvastatin, rivastatin, pitavastatin, rosuvastatin or L-659,699 ((E,E)-11^-^^-(hydroxy-methyO^~^-oxo-a'R-oxetany I]-3,8JR-trimethyl^~^-undecadienoic acid).

Squalene synthesis inhibitors useful in the present methods for treating or preventing a Condition include, but are not limited to, squalene synthetase inhibitors; squalestatin 1; and squalene epoxidase inhibitors, such as NB-598 ((E)-N-ethyl-N-(6,6-dimethyl-2-hepten-4-ynyl)-3-[3,3'-bithiophen-5-yl)methoxy]benzene-methanamine hydrochloride).

Bile acid sequestrants useful in the present methods for treating or preventing a Condition include, but are not limited to, cholestyramine (a
styrene-divinylbenzene copolymer containing quaternary ammonium cationic
groups capable of binding bile acids, such as QUESTRAN® or QUESTRAN
LIGHT® cholestyramine which are available from Bristol-Myers Squibb),
colestipol (a copolymer of diethylenetriamine and 1-chloro-2,3-epoxypropane,
such as COLESTID® tablets which are available from Pharmacia),
colesevelam hydrochloride (such as WelChol® Tablets (poly(allylamine
hydrochloride) cross-linked with epichlorohydrin and alkylated with 1-
bromodecane and (6-bromoethyl)-trimethylammonium bromide) which are
available from Sankyo), water soluble derivatives such as 3,3-ioene, N-
(cycloalkyl) alkylamines and poliglusam, insoluble quaternized polystyrenes,
saponins and mixtures thereof. Suitable inorganic cholesterol sequestrants
include bismuth salicylate plus moritmorillonite clay, aluminum hydroxide and
calcium carbonate antacids.

Probucol derivatives useful in the present methods for treating or
preventing a Condition include, but are not limited to, AGI-1067 and others
disclosed in U.S. Patents Nos. 6,121,319 and 6,147,250.

IBAT inhibitors useful in the present methods for treating or preventing
a Condition include, but are not limited to, benzothiepines such as therapeutic
compounds comprising a 2,3,4,5-tetrahydro-1-benzothiepine 1,1-dioxide
structure such as are disclosed in International Publication No. WO 00/38727.

Nicotinic acid receptor agonists useful in the present methods for
treating or preventing a Condition include, but are not limited to, those having
a pyridine-3-carboxylate structure or a pyrazine-2-carboxylate structure,
including acid forms, salts, esters, zwitterions and tautomers, where available.

Other examples of nicotinic acid receptor agonists useful in the present
methods include nicotinic acid, nicipitol, nicofuranose and acipimox. An
eexample of a suitable nicotinic acid product is NIASPAN® (niacin extended-
release tablets) which are available from Kos Pharmaceuticals, Inc.
(Cranbury, NJ).

ACAT inhibitors useful in the present methods for treating or preventing
a Condition include, but are not limited to, avasimibe, HL-004, lecimibide and
CL-277082 (N-{(2,4-difluorophenyl}-N-{[(4-(2,2-dimethylpropyl)phenyl]-methyl]-
N-heptylurea). See P. Chang et al., "Current, New and Future Treatments in
Dyslipidaemia and Atherosclerosis", DRUGS 2000 Jul;60(1); 55-93, which is incorporated by reference herein.

CETP inhibitors useful in the present methods for treating or preventing a Condition include, but are not limited to, those disclosed in International Publication No. WO 00/38721 and U.S. Patent No. 6,147,090, which are incorporated herein by reference.

LDL-receptor activators useful in the present methods for treating or preventing a Condition include, but are not limited to, HOE-402, an imidazolidinyl-pyrimidine derivative that directly stimulates LDL receptor activity. See M. Huettinger et al., "Hypolipidemic activity of HOE-402 is Mediated by Stimulation of the LDL Receptor Pathway", Arterioscler. Thromb. 1993; 13:1005-12.

Natural water-soluble fibers useful in the present methods for treating or preventing a Condition include, but are not limited to, psyllium, guar, oat and pectin.

Fatty acid esters of plant stands useful in the present methods for treating or preventing a Condition include, but are not limited to, the sitostanol ester used in BENECOL® margarine.

Non-limiting examples of antidiabetic agents useful in the present methods for treating a Condition include insulin sensitizers, β-glucosidase inhibitors, DPP-IV inhibitors, insulin secretagogues, hepatic glucose output lowering compounds, antihypertensive agents, sodium glucose uptake transporter 2 (SGLT-2) inhibitors, insulin and insulin-containing compositions, and anti-obesity agents as set forth above.

In one embodiment, the antidiabetic agent is an insulin secretagogue. In one embodiment, the insulin secretagogue is a sulfonylurea.

Non-limiting examples of sulfonylureas useful in the present methods include glipizide, tolbutamide, glyburide, glimepiride, chlorpropamide, acetohexamide, gliamilide, gliclazide, gliquidone, glibenclamide and tolazamide.

In another embodiment, the insulin secretagogue is a meglitinide.

Non-limiting examples of meglitinides useful in the present methods for treating a Condition include repaglinide, mitiglinide, and nateglinide.
In still another embodiment, the insulin secretagogue is GLP-1 or a GLP-1 mimetic.

Non-limiting examples of GLP-1 mimetics useful in the present methods include Byetta-Exanatide, Liraglutide, CJC-1 131 (ConjuChem, Exanatide-LAR (Amylin), BIM-51 077 (Ipsen/LaRoche), ZP-1 0 (Zealand Pharmaceuticals), and compounds disclosed in International Publication No. WO 00/07617.

Other non-limiting examples of insulin secretagogues useful in the present methods include exendin, GIP and secretin.

In another embodiment, the antidiabetic agent is an insulin sensitizer.

Non-limiting examples of insulin sensitizers useful in the present methods include PPAR activators or agonists, such as troglitazone, rosiglitazone, pioglitazone and enagliptazone; biguanidines such as metformin and phenformin; PTP-1 B inhibitors; and glucokinase activators.

In another embodiment, the antidiabetic agent is a β-Glucosidase inhibitor.

Non-limiting examples of β-Glucosidase inhibitors useful in the present methods include miglitol, acarbose, and voglibose.

In another embodiment, the antidiabetic agent is a hepatic glucose output lowering agent.

Non-limiting examples of hepatic glucose output lowering agents useful in the present methods include Glucophage and Glucophage XR.

In yet another embodiment, the antidiabetic agent is insulin, including all formulations of insulin, such as long acting and short acting forms of insulin.

Non-limiting examples of orally administrable insulin and insulin containing compositions include AL-401 from Autoimmune, and the compositions disclosed in U.S. Patent Nos. 4,579,730; 4,849,405; 4,963,526; 5,642,868; 5,763,396; 5,824,638; 5,843,866; 6,153,632; 6,191,105; and International Publication No. WO 85/05029, each of which is incorporated herein by reference.

In another embodiment, the antidiabetic agent is a DPP-IV inhibitor.

Non-limiting examples of DPP-IV inhibitors useful in the present methods include sitagliptin, saxagliptin, denagliptin, vildagliptin, alogliptin,
alogliptin benzoate, Galvus (Novartis), ABT-279 and ABT-341 (Abbott), ALS-2-0426 (Alantos), ARI-2243 (Arisaph), BI-A and BI-B (Boehringer Ingelheim), SYR-322 (Takeda), MP-513 (Mitsubishi), DP-893 (Pfizer) and RO-0730699 (Roche).

In a further embodiment, the antidiabetic agent is a SGLT-2 inhibitor.

Non-limiting examples of SGLT-2 inhibitors useful in the present methods include dapagliflozin and sergliflozin, AVE2268 (Sanofi-Aventis) and T-1095 (Tanabe Seiyaku).

Non-limiting examples of antihypertensive agents useful in the present methods for treating a Condition include β-blockers and calcium channel blockers (for example diltiazem, verapamil, nifedipine, amlopidine, and mybefradil), ACE inhibitors (for example captopril, lisinopril, enalapril, spirapril, ceranopril, zefenopril, fosinopril, cilazopril, and quinapril), AT-1 receptor antagonists (for example losartan, irbesartan, and valsartan), renin inhibitors and endothelin receptor antagonists (for example sitaxsentan).

In one embodiment, the antidiabetic agent is an agent that slows or blocks the breakdown of starches and certain sugars.

Non-limiting examples of antidiabetic agents that slow or block the breakdown of starches and certain sugars and are suitable for use in the compositions and methods of the present invention include alpha-glucosidase inhibitors and certain peptides for increasing insulin production. Alpha-glucosidase inhibitors help the body to lower blood sugar by delaying the digestion of ingested carbohydrates, thereby resulting in a smaller rise in blood glucose concentration following meals. Non-limiting examples of suitable alpha-glucosidase inhibitors include acarbose; miglitol; camiglibose; certain polyamines as disclosed in WO 01/47528 (incorporated herein by reference); voglibose. Non-limiting examples of suitable peptides for increasing insulin production including amlintide (CAS Reg. No. 122384-88-7 from Amylin; pramlintide, exendin, certain compounds having Glucagon-like peptide-1 (GLP-1) agonistic activity as disclosed in International Publication No. WO 00/07617.

Other specific additional therapeutic agents useful in the present methods for treating or preventing a Condition include, but are not limited to, rimonabant, 2-methyl-6-(phenylethynyl)-pyridine, 3[(2-methyl-1,4-thiazol-4-
yl)ethynyl]pyridine, Melanotan-II, dexfenfluramine, fluoxetine, paroxetine, fenfluramine, fluvoxamine, sertaline, imipramine, desipramine, talsupram, nomifensine, leptin, nalmefene, 3-methoxynaltrexone, naloxone, naltrexone, butabindide, axokine, sibutramine, topiramate, phytopharm compound 57, Cerulenin, theophylline, pentoxifylline, zaprinast, sildenafil, amrinone, milrinone, cilostamide, rolipram, cilomilast, phytanic acid, 4-[(E)-2-(5, 6,7,8-tetramethyl-2-naphthalenyl)-1-propenyl]benzoic acid, retinoic acid, oleoyl-estrone, orlistat, lipstatin, tetrahydrolipstatin, teasaponin and diethylumbelliferyl phosphate.

In one embodiment, the present combination therapies for treating or preventing diabetes comprise administering a compound of formula (I), an antidiabetic agent and/or an antiobesity agent.

In another embodiment, the present combination therapies for treating or preventing diabetes comprise administering a compound of formula (I) and an antidiabetic agent.

In another embodiment, the present combination therapies for treating or preventing diabetes comprise administering a compound of formula (I) and an antiobesity agent.

In one embodiment, the present combination therapies for treating or preventing obesity comprise administering a compound of formula (I), an antidiabetic agent and/or an antiobesity agent.

In another embodiment, the present combination therapies for treating or preventing obesity comprise administering a compound of formula (I) and an antidiabetic agent.

In another embodiment, the present combination therapies for treating or preventing obesity comprise administering a compound of formula (I) and an antiobesity agent.

In one embodiment, the present combination therapies for treating or preventing metabolic syndrome comprise administering a compound of formula (I) and one or more additional therapeutic agents selected from: antiobesity agents, antidiabetic agents, any agent useful for treating metabolic syndrome, any agent useful for treating a cardiovascular disease, cholesterol biosynthesis inhibitors, sterol absorption inhibitors, bile acid sequestrants, probucol derivatives, IBAT inhibitors, nicotinic acid receptor (NAR) agonists,
ACAT inhibitors, cholesteryl ester transfer protein (CETP) inhibitors, low-density lipoprotein (LDL) activators, fish oil, water-soluble fibers, plant sterols, plant stanols and fatty acid esters of plant stanols.

In one embodiment, the additional therapeutic agent is a cholesterol biosynthesis inhibitor. In another embodiment, the cholesterol biosynthesis inhibitor is an HMG-CoA reductase inhibitor. In another embodiment, the HMG-CoA reductase inhibitor is a statin. In another embodiment, the statin is lovastatin, pravastatin, simvastatin or atorvastatin.

In one embodiment, the additional therapeutic agent is a cholesterol absorption inhibitor. In another embodiment, the cholesterol absorption inhibitor is ezetimibe. In another embodiment, the cholesterol absorption inhibitor is a squalene synthetase inhibitor. In another embodiment, the cholesterol absorption inhibitor is a squalene epoxidase inhibitor.

In one embodiment, the additional therapeutic agent comprises a cholesterol absorption inhibitor and a cholesterol biosynthesis inhibitor. In another embodiment, the additional therapeutic agent comprises a cholesterol absorption inhibitor and a statin. In another embodiment, the additional therapeutic agent comprises ezetimibe and a statin. In another embodiment, the additional therapeutic agent comprises ezetimibe and simvastatin.

In one embodiment, the present combination therapies for treating or preventing metabolic syndrome comprise administering a compound of formula (I), an antidiabetic agent and/or an antiobesity agent.

In another embodiment, the present combination therapies for treating or preventing metabolic syndrome comprise administering a compound of formula (I) and an antidiabetic agent.

In another embodiment, the present combination therapies for treating or preventing metabolic syndrome comprise administering a compound of formula (I) and an anti-obesity agent.

In one embodiment, the present combination therapies for treating or preventing cardiovascular disease comprise administering one or more compounds of formula (I), and an additional agent useful for treating or preventing a cardiovascular disease.

When administering a combination therapy to a patient in need of such administration, the therapeutic agents in the combination, or a pharmaceutical
composition or compositions comprising the therapeutic agents, may be administered in any order such as, for example, sequentially, concurrently, together, simultaneously and the like. The amounts of the various actives in such combination therapy may be different amounts (different dosage amounts) or same amounts (same dosage amounts).

In one embodiment, the one or more compounds of Formula I are administered during a time when the additional therapeutic agent(s) exert their prophylactic or therapeutic effect, or vice versa.

In another embodiment, the one or more compounds of Formula I and the additional therapeutic agent(s) are administered in doses commonly employed when such agents are used as monotherapy for treating a Condition.

In another embodiment, the one or more compounds of Formula I and the additional therapeutic agent(s) are administered in doses lower than the doses commonly employed when such agents are used as monotherapy for treating a Condition.

In still another embodiment, the one or more compounds of Formula I and the additional therapeutic agent(s) act synergistically and are administered in doses lower than the doses commonly employed when such agents are used as monotherapy for treating a Condition.

In one embodiment, the one or more compounds of Formula I and the additional therapeutic agent(s) are present in the same composition. In one embodiment, this composition is suitable for oral administration. In another embodiment, this composition is suitable for intravenous administration.

The one or more compounds of Formula I and the additional therapeutic agent(s) can act additively or synergistically. A synergistic combination may allow the use of lower dosages of one or more agents and/or less frequent administration of one or more agents of a combination therapy. A lower dosage or less frequent administration of one or more agents may lower toxicity of the therapy without reducing the efficacy of the therapy.

In one embodiment, the administration of one or more compounds of Formula I and the additional therapeutic agent(s) may inhibit the resistance of a Condition to these agents.
In one embodiment, when the patient is treated for diabetes or a diabetic complication, the additional therapeutic agent is an antidiabetic agent which is not a compound of Formula I. In another embodiment, the additional therapeutic agent is an agent useful for reducing any potential side effect of a compound of Formula I. Such potential side effects include, but are not limited to, nausea, vomiting, headache, fever, lethargy, muscle aches, diarrhea, general pain, and pain at an injection site.

The pharmacological properties of the compounds of this invention may be confirmed by a number of pharmacological assays. The exemplified pharmacological assays which are described later have been carried out with the compounds according to the invention and their salts.

The invention is also directed to pharmaceutical compositions which comprise at least one compound of Formula I, or a pharmaceutically acceptable salt, solvate, ester or prodrug of said compound and at least one pharmaceutically acceptable carrier.

The term "pharmaceutical composition" is also intended to encompass both the bulk composition and individual dosage units comprised of more than one (e.g., two) pharmaceutically active agents such as, for example, a compound of the present invention and an additional agent selected from the lists of the additional agents described herein, along with any pharmaceutically inactive excipients. The bulk composition and each individual dosage unit can contain fixed amounts of the afore-said "more than one pharmaceutically active agents". The bulk composition is material that has not yet been formed into individual dosage units. An illustrative dosage unit is an oral dosage unit such as tablets, pills and the like. Similarly, the herein-described method of treating a patient by administering a pharmaceutical composition of the present invention is also intended to encompass the administration of the afore-said bulk composition and individual dosage units.

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 95 percent active
ingredient. Suitable solid carriers are known in the art, e.g., magnesium carbonate, magnesium state, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), *Remington's Pharmaceutical Sciences*, 18th Edition, (1990), Mack Publishing Co., Easton, Pennsylvania.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also be intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

Also included are solid form preparations that are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

The compounds of this invention may also be delivered subcutaneously.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitable sized unit doses containing appropriate quantities of the active component, e.g. an effective amount to achieve the desired purpose.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 1 mg to about 100 mg, preferably from about 1 mg to about 50 mg, more preferably from about 1 mg to about 25 mg, according to the particular application.
The actual dosage employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage regimen for a particular situation is within the skill of the art. For convenience, the total daily dosage may be divided and administered in portions during the day as required.

The amount and frequency of administration of the compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical recommended daily dosage regimen for oral administration can range from about 1 mg/day to about 500 mg/day, preferably 1 mg/day to 200 mg/day, in two to four divided doses.

Another aspect of this invention is a kit comprising a therapeutically effective amount of at least one compound of Formula I, or a pharmaceutically acceptable salt, solvate, ester or prodrug of said compound and a pharmaceutically acceptable carrier, vehicle or diluent.

Yet another aspect of this invention is a kit comprising an amount of at least one compound of Formula I, or a pharmaceutically acceptable salt, solvate, ester or prodrug of said compound and an amount of at least one therapeutic agent listed above, wherein the amounts of the two or more ingredients result in a desired therapeutic effect.

The invention disclosed herein is exemplified by the following preparations and examples which should not be construed to limit the scope of the disclosure. Alternative mechanistic pathways and analogous structures will be apparent to those skilled in the art.

Where NMR data are presented, \(^1\text{H}\) spectra were obtained on either a Variant VXR-200 (200 MHz, \(^1\text{H}\)), Varian Gemini-300 (300 MZH), Varian Mercury VX-400 (400MHz), or Bruker-Biospin AV-500(500MHz), and are reported as ppm with number of protons and multiplicities indicated parenthetically. Where LC/MS data are presented, analyses was performed using an Applied Biosystems API-100 mass spectrometer and C18 column, 10-95% CH\(_3\)CN-H\(_2\)O (with 0.05% TFA) gradient. The observed parent ion is given.
The following solvents and reagents may be referred to by their abbreviations in parenthesis:

- Me = methyl
- Et = ethyl
- Pr = propyl
- Bu = butyl
- Ph = phenyl
- Ac = acetyl
- µl = microliters
- AcOEt or EtOAc = ethyl acetate
- AcOH or HOAc = acetic acid
- ACN = acetonitrile
- atm = atmosphere
- Boc or BOC = tert-butoxycarbonyl
- DCE = dichloroethane
- DCM or CH₂Cl₂ = dichloromethane
- DIPEA = diisopropylethylamine
- DMAP = 4-dimethylaminopyridine
- DMF = dimethylformamide
- DMS = dimethylsulfide
- DMSO = dimethyl sulfoxide
- EDCI = 1-(3-dimethylaminopropyl)-3-ethylcarbodiimine
- Fmoc or FMOC = 9-fluorenylmethoxycarbonyl
- g = grams
- h = hour
- hal = halogen
- HOBt = 1-hydroxybenzotriazole
- LAH = lithium aluminum hydride
- LCMS = liquid chromatography mass spectrometry
- min = minute
- mg = milligrams
- mL = milliliters
- mmol = millimoles
- MCPBA = 3-chloroperoxybenzoic acid
Examples

The compounds of this invention can be prepared as generally described in the Preparation Scheme, and the following examples.

Preparation Scheme

Polystyrene DIEA resin (47 mg, 0.045 mmol) was added to 40-wells of a deep well polypropylene microtiter plate followed by a MeCN/THF (2:1) stock solution (1 ml) of 1,3,3-trimethyl-6-azabicyclo-[3.2.1]octane X (8.0 mg, 0.05 mmol). Then 0.5 M stock solutions of each of the individual sulfonyl chlorides (Ri₄₅SO₂Cl) (0.210 ml, 0.10 mmol) were added to the wells, which was then sealed and shaken at 25 °C for 20 h. The solutions were filtered thru a polypropylene frit into a 2nd microtiter plate containing polystyrene isocyanate resin (103 mg, 3 equivalents, 1.52 mmol/g) and polystyrene trisamine resin (74 mg, 6 equivalents, 4.23 mmol/g). After the top plate was washed with MeCN (0.5 mL), the plate was removed, the bottom microtiter plate sealed and shaken at 25°C for 16hrs. Then the solutions were filtered thru a polypropylene frit into a 96-well collection plate. The wells of the top
plate were then washed with MeCN (2 x 0.5 mL), and the plate removed. Then the resultant solutions in the collection plate were transferred into vials and the solvents removed in vacuo via a SpeedVac to provide the sulfonamides.

Using this Preparation Scheme, the inventive compounds can be prepared.

**Compound No. 1**

![Compound No. 1](image)

To a solution of 1,3,3-trimethyl-6-azabicyclo-[3.2.1]octane (0.06 mL, 0.33 mmol) in CH₂Cl₂ (3.3 mL) was added diisopropylethyl amine (0.17 mL, 0.99 mmol) followed by the sulfonyl chloride (0.49 mmol). The reaction was stirred at RT under nitrogen for 21 h after which it was quenched with 1 N HCl and extracted with CH₂Cl₂. The organics were dried over MgSO₄, filtered and concentrated to give crude material. Purification by PTLC (15 % EtOAc/hexanes) afforded the desired sulfonamide **Compound No. 1** (115 mg, 100 %).

Compound Nos. 2, 3, 47, 48, 51-67, 76-81 and N-(4-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)phenyl)acetamide, a compound purchased from TRIPOS, were prepared using commercially available sulfonyl chlorides in a similar manner as described for the synthesis of **Compound No. 1**. Yields ranged from 40 to 100 %.
Separation of Compound No. 23

Compound No. 23 was prepared in the same manner as Compound No. 1.

About 90 mg of Compound No. 23 was dissolved in 5% IPA/hexanes (1.2 ml) and injected onto a chiralpak AS prep HPLC column (5 cm x 50 cm) and eluted with 5% IPA/hexanes at 100 mU/min. Detection at 254 nm. 45 mg of Compound No. 54 (isomer 1, retention time = 30.1 min) and 45 mg of a mixture of isomer 1 and 2 were obtained. The mixture (45 mg) was dissolved in 25% IPA/hexanes and injected onto the chiralpak AS prep column for the second time and eluted with 3% IPA/hexanes at 50 mL/min. 20.5 mg of Compound No. 55 (isomer 2, retention time = ~67 min) was obtained.

Separation of Compound No. 16

Compound No. 16 was prepared in the same manner as Compound No. 1.
About 240 mg of Compound No. 16 was dissolved in 5 % IPA/hexanes (1.2 mL) and injected onto a chiralpak AS prep HPLC column (5 cm x 50 cm) and eluted with 15 % IPA/hexanes at 75 mL/min. Detection at 254 nm. 81.3 mg of Compound No. 67 (isomer 1, retention time = 46.4 min) and 102 mg of a mixture of isomer 1 and 2 were obtained. The mixture (102 mg) was dissolved in 25 % IPA/hexanes and injected onto the chiralpak AS prep column for the second time and eluted with 15 % IPA/hexanes at 50 mL/min. 44.0 mg of Compound No. 66 (isomer 2, retention time = 86.9 min) was obtained.

**Reduction of Compound No. 67**

To a solution of Compound No. 67 (0.039 g, 0.12 mmol) in MeOH (1.5 mL) was added sodium borohydride (0.012 g, 0.32 mmol) at 0 °C in (ice bath). After stirring at room temperature for 1 h, the reaction was quenched with saturated ammonium chloride solution and extracted with CH$_2$Cl$_2$. The organic fractions were combined, dried over MgSO$_4$, filtered, and concentrated to give the crude material. Purification by PTLC (2 % MeOH/CH$_2$Cl$_2$) yielded the desired reduction product Intermediate A as a mixture of enantiomers (33 mg, 85 %).
**Separation of Compound No. 67**

About 18 mg of Intermediate A from the previous example was dissolved in 20 % IPA/hexanes (1.0 ml) and injected onto a chiralpak AD semi-prep HPLC column and eluted with 10 % IPA/hexanes at 10 mL/min. Detection at 254 nm. 7.9 mg of Compound No. 73 (isomer 1, retention time = 19.1 min) and 7.3 mg of Compound No. 72 (isomer 2, retention time = 22.6 min) were obtained.

**Separation of Compound No. 66**

Intermediate B was prepared from Compound No. 66 in the same manner as Intermediate A was prepared from Compound No. 67. Compound No. 71 (isomer 3, retention time = 18.8 min, 95 %) and Compound No. 70 (isomer 4, retention time = 22.8 min, 5 %) were prepared in the same manner as Compound No. 72 and Compound No. 73.
Preparation of Compound No. 81

To a solution of Compound No. 67 (34 mg, 0.10 mmol) in THF (2 mL) was added methylmagnesium bromide (3M in ether, 0.18 mL, 0.40 mmol). The reaction was stirred at room temperature for 1.5 h after which it was quenched with saturated ammonium chloride solution and extracted with CH₂Cb. The organic fraction was dried (MgSO₄), filtered, and concentrated to give a crude material. Purification by preparative TLC (25 % EtOAc/Hexanes) afforded the desired compound Compound No. 81 (20.9 mg, 60%).

Compound No. 80 was prepared in the same manner as Compound No. 81 from Compound No. 66.

Preparation of Compound No. 79

NaH (6 mg, 0.25 mmol) was added to a solution of Compound No. 81 (18.2 mg, 0.050 mmol) in DMF (1 mL) at 0 °C. After 15 min., iodomethane (0.01 mL, 0.10 mmol) was added and the reaction was warmed to room temperature. After 1.75 hours, the reaction was quenched with water and extracted with EtOAc. The combined organics were washed with water, dried
over MgSO₄, filtered and concentrated to give the crude material. Purification by PTLC (20% EtOAc/Hexanes) yielded the **Compound No. 79** (9.0 mg, 48%).

**Compound No. 78** was prepared in a similar manner as **Compound No. 79** from **Compound No. 80**.

![Diagram](attachment:image.png)

**In vitro 11B-HSD1 activity assay**

**Preparation of 11B-HSD1 membranes**

Human 11β-HSD1 with N-terminal myc tag was expressed in Sf9 cells using baculovirus Bac-to-Bac expression system (Invitrogen) according to manufacturer's instructions. Cells were harvested three days after infection and washed in PBS before frozen. To make membranes, the cells were resuspended in buffer A (20 mM Tris-HCl, pH 7.4, 100 mM NaCl, 2 mM EDTA, 2 mM EGTA and Complete™ protease inhibitor tablets (Roche Molecular Biochemicals)), and lysed in a nitrogen bomb at 900 psi. The cell lysate was centrifuged at 600 g for 10 min to remove nuclei and large cell debris. The supernatant was centrifuged at 100,000 g for 1 hr. The membrane pellet was resuspended in buffer A, flash-frozen in liquid nitrogen and stored at -70 °C before use.

**Measurement of 11B-HSD1 activity**

11β-HSD1 enzymatic activity was measured in a 50 µl reaction containing 20 mM NaPO₄ pH 7.5, 0.1 mM MgCl₂, 3 mM NADPH (prepared fresh daily), 125 nM ³H-cortisone (American Radiochemicals) and 0.5 µg
membrane. The reaction was incubated at room temperature for 1 hr before it was stopped by addition of 50 μM buffer containing 20 mM NaPO₄ pH 7.5, 30 μM 18β-glycyrrhetinic acid, 1 μg/ml monoclonal anti-cortisol antibody (Biosource) and 2 ring/ml anti-mouse antibody coated scintillation proximity assay (SPA) beads (Amersham Bioscience). The mixture was incubated at room temperature for 2 hrs with vigorous shaking and analyzed on TopCount scintillation counter.

Compounds according to the present invention showed activity against 11β-HSD1 in this assay.

In vivo screen for inhibition of 11β-HSD-1

Lean male C57Bl/6N mice were orally dosed with a solution of dexamethasone (0.5 mg/kg) and test agent or vehicle (20% HPβCD (10 ml/kg)). One hour later, cortisone was administered (1 mg/kg sc in sesame oil). One hour after cortisone administration, animals were euthanized for blood collection, and plasma Cortisol levels were determined with a commercially available ELISA.

Compounds according to the present invention inhibited 11β-HSD1 in this screen.

Table 2 shows 11β-HSD-1 activity of representative compounds of this invention. The table and the compounds therein are not intended, nor should they be construed, to limit this invention in any manner whatsoever.

While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and other variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.
What is claimed is:

1. A compound represented by the structural Formula I:

\[
\text{I}
\]

or a pharmaceutically acceptable salt, solvate, ester or prodrug of said compound, wherein:

- \( R^1 \) represents alkyl, cycloalkyl, alkenyl, aryl, arylalkyl, arylalkenyl, heteroaryl or heteroarylalkyl; and
- \( R^2 \) to \( R^4 \) independently represent alkyl;

with the exception of those compounds wherein:

- \( R^2 \) to \( R^4 \) each represent methyl; and
- \( R^1 \) represents phenyl substituted by substituted alkoxy carbonyl, substituted alkylcarbonyloxy, substituted sulfonylamino, substituted carbonylamino, or unsubstituted or substituted aminocarbonyl;

and excluding the following compounds:

1,3,3-trimethyl-6-[(phenylmethyl)sulphonyl]-6-azabicyclo[3.2.1]octane;
6-[(3,4-difluorophenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(4-aminophenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;
1,3,3-trimethyl-6-[(4-(5-phenyl-2-oxazolyl)phenyl)sulfonyl]-6-azabicyclo[3.2.1]octane;
6-[(2-methyl-5-tert-butylphenyl)sulfonyl]-6-azabicyclo[3.2.1]octane;
6-[[3-(4,7-dihydro-1-methyl-7-oxo-3-propyl-1H-pyrazolo[4,3-d]pyrimidin-5-yl)-4-ethoxyphenyl]sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;
6-[[5-[2-[2-(2-oxo-1-imidazolidinyl)ethyl]amino]-4-pyrimidinyl]-2-thienyl]sulfonyl]-6-azabicyclo[3.2.1]octane;
1,3,3-trimethyl-6-[[5-[2-[[2-(2-oxo-1-imidazolidinyl)ethyl]amino]-4-pyrimidinyl]-2-thienyl]sulfonyl]-6-azabicyclo[3.2.1]octane;
6-[[4-ethoxyphenyl]sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;
1,3,3-trimethyl-6-[(2-nitrophenyl)sulfonyl]-6-azabicyclo[3.2.1]octane;
6-[(2,2-dichlorophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[[3-(4,7-dihydro-1-methyl-7-oxo-3-propyl-1H-pyrazolo[4,3-d]pyrimidin-5-yl)-4-ethoxyphenyl]sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[[5-2,6-dichloro-4-(4,5-dihydro-3,5-dioxo-1,2,4-triazin-2(3H)-yl)phenoxy]-2-hydroxyphenyl]sulfonyll-S,S-trimethyl-6-azabicyclo[3.2.1]octane;
5,1,3,3-trimethyl-6-[[5-[2-[2-(2-oxo-1-imidazolidinyl)ethyl]amino]-4-pyrimidinyl]-2-thienyl]sulfonyl]-6-azabicyclo[3.2.1]octane;
6-[[4-ethoxyphenyl]sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane;
1,S,S-trimethyl-6-[(2,3-nitrophenyl)sulfonyl]-6-azabicyclo[3.2.1]octane;
6-[(2,3-dichlorophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(2,5-dimethylphenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(2,5-dichlorophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(4-acetylphenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(2,3-dichlorophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(2,4-difluorophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(5-bromo-6-chloro-3-pyridinyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(5-bromo-2-ethoxyphenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(2,5-dibromophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(2,4-difluorophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(5-bromo-2-ethoxyphenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(5-bromo-2-ethoxyphenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(5-bromo-6-chloro-3-pyridinyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(2,5-dichlorophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(5-bromo-2-ethoxyphenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(5-bromo-6-chloro-3-pyridinyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
6-[(2,5-dichlorophenyl)sulfonyl]-1,S,S-trimethyl-6-azabicyclo[3.2.1]octane;
1,S,S-trimethyl-6-[(2,3-nitrophenyl)sulfonyl]-6-azabicyclo[3.2.1]octane;
6-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)benzo[d]oxazol-2(3H)-one;
6-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)benzo[cd]indol-2(1H)-one;
6-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)benzo[d]oxazol-2(3H)-one;
6-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)benzo[cd]indol-2(1H)-one;
3-((1R,5S)-1S,a-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)H-pyrazolo[3,4-b]pyridine;
2,2,2-trifluoro-1-(8-(1,3,3-trimethyl-6-azabicyclo[3.2.1]octan-6-ylsulfonyl)-3,4-dihydroisoquinolin-2(1 H)-yl)ethanone;
6-[(4-tert-butylphenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane; and
6-[(3-aminophenyl)sulfonyl]-1,3,3-trimethyl-6-azabicyclo[3.2.1]octane.

2. The compound of claim 1, or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof, wherein:

- R¹ represents phenyl, naphthyl, benzyl, stryryl, furanyl, thieryl, pyrazolyl, pyridyl, oxazolyl, benzothienyl or benzoxadiazolyl, each of which is optionally substituted by one or more substituents selected from the group consisting of alkyl, halogen, alkoxy, alkylcarbonyl, alkylsulphonyl, cyano, nitro, aryl, heteroaryl, aryloxy, carboxyl, alkoxy carbonyl alkyl, cycloalkyl and morpholino; and
- R²-R⁴ each represent alkyl.

3. A compound selected from the group consisting of:
enantiomer 2

isomer 4

isomer 3

isomer 2

isomer 1

enantiomer 2

enantiomer 1

enantiomer 2

and
or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof.

4. A pharmaceutical composition comprising at least one compound of claim 1, or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof and at least one pharmaceutically acceptable carrier, adjuvant or vehicle.

5. A pharmaceutical composition comprising at least one compound of claim 3, or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof and at least one pharmaceutically acceptable carrier, adjuvant or vehicle.

6. The pharmaceutical composition of claim 4, further comprising one or more additional therapeutic agents.

7. The pharmaceutical composition of claim 5, further comprising one or more additional therapeutic agents.

8. The pharmaceutical composition of claim 6, wherein said additional therapeutic agents are one or more members selected from the group consisting of anti-obesity agents, antidiabetic agents, agents useful for treating metabolic syndrome, agents useful for treating a cardiovascular disease, cholesterol biosynthesis inhibitors, cholesterol absorption inhibitors, bile acid sequestrants, probucol derivatives, IBAT inhibitors, nicotinic acid receptor (NAR) agonists, ACAT inhibitors, cholesteryl ester transfer protein (CETP) inhibitors, low-density lipoprotein (LDL) activators, fish oil, water-soluble fibers, plant sterols, plant stands and fatty acid esters of plant stanols.

9. The pharmaceutical composition of claim 7, wherein said additional therapeutic agents are selected from the group consisting of anti-
obesity agents, antidiabetic agents, agents useful for treating metabolic syndrome, agents useful for treating a cardiovascular disease, cholesterol biosynthesis inhibitors, cholesterol absorption inhibitors, bile acid sequestrants, probucol derivatives, IBAT inhibitors, nicotinic acid receptor (NAR) agonists, ACAT inhibitors, cholesteryl ester transfer protein (CETP) inhibitors, low-density lipoprotein (LDL) activators, fish oil, water-soluble fibers, plant sterols, plant stanols and fatty acid esters of plant stands.

10. A method of inhibiting 11β-hydroxysteroid dehydrogenase type-I in a cell, comprising contacting said cell with an effective amount of at least one compound of the Formula I:

\[
\text{Formula I:}
\]

or a pharmaceutically acceptable salt, solvate, ester or prodrug of said compound, wherein:

- \( R^1 \) represents alkyl, cycloalkyl, alkenyl, aryl, arylalkyl, arylalkenyl, heteroaryl or heteroarylalkyl; and
- \( R^2 - R^4 \) independently represent alkyl.

11. A method for treating one or more conditions associated with expression of 11β-hydroxysteroid dehydrogenase type-I comprising administering to a patient in need thereof a therapeutically effective amount of at least one compound of Formula I:

\[
\text{Formula I:}
\]
or a pharmaceutically acceptable salt, solvate, ester or prodrug of said compound, wherein:

- $R^1$ represents alkyl, cycloalkyl, alkenyl, aryl, arylalkyl, arylalkenyl, heteroaryl or heteroarylmethyl; and
- $R^2$-$R^4$ independently represent alkyl.

12. The method according to claim 11, wherein the conditions are selected from the group consisting of metabolic syndromes, obesity, obesity-related disorders, hypertension, lipid disorders, type-II diabetes, insulin resistance and pancreatitis.

13. The method according to claim 12, wherein the condition is obesity or an obesity-related disorder.

14. The method according to claim 12, wherein the condition is type-II diabetes.

15. A method for treating one or more conditions associated with expression of 11β-hydroxysteroid dehydrogenase type-I comprising administering to a patient in need thereof a therapeutically effective amount of at least one compound selected from the group consisting of:
enantiomer 1

enantiomer 2
Enantiomer 1

Enantiomer 2

and

Enantiomer 1
or a pharmaceutically acceptable salt, solvate, ester or prodrug thereof.

16. The method according to claim 15, wherein the conditions are selected from the group consisting of metabolic syndromes, obesity, obesity-related disorders, hypertension, atherosclerosis, lipid disorders, type-II diabetes, insulin resistance and pancreatitis.

17. The method according to claim 16, wherein the condition is obesity or an obesity-related disorder.

18. The method according to claim 16, wherein the condition is type-II diabetes.

19. The method according to claim 16, wherein the condition is atherosclerosis.
