To all whom it may concern:

Be it known that I, Joseph T. Norman, residing at Nanticoke, in the county of Luzerne and State of Pennsylvania, have invented a new and improved Combined Bath Robe and Towel, of which the following is a specification.

In the use of the ordinary forms of bath robes, the robe is usually not donned until after the bather has, to some extent, used the bath towel for drying, and frequently, particularly when taking hot baths, the bather is subjected more or less to danger of being chilled.

My invention seeks to provide a robe made of the usual bath towel material, so designed that it can be donned immediately on leaving the bath and conveniently utilized as a towel for drying off.

My invention, therefore, embodies a combined bath robe and towel in which the robe is especially designed, so that parts thereof, while the robe is applied in the usual way, may be easily grasped by the hand and used as a towel, and in which special provision is also made by easily drying the back, the robe also including a special form of hood for drying the head and protecting the same while the user is drying other portions of the body.

In its more subordinate features, my invention consists in certain details of construction set forth in the following description, specifically pointed out in the appended claims and illustrated in the accompanying drawing, in which:

Figure 1 is a view that illustrates my combined bath robe and towel as operatively applied.

Figure 2 is a rear elevation, parts being in perspective, of my bath robe and towel, and

Figure 3 is a view that illustrates the manner in which the robe-towel is used for rubbing and drying the back.

In carrying out my invention, the robe body is made up of the usual Turkish bath towel material and the said body is of sufficient length to inclose the entire body, as desired.

The robe also includes a hood member 2 which includes lateral extensions 20, that constitute neck bands for closing up under the cheeks and chin of the user directly after leaving the bath, as indicated in Figure 1 of the drawing.

3-3 designates the robe sleeves, and these, in my construction of robe have their open end especially designed, as is clearly shown in Figures 1 and 2 of the drawing, from which it will be noticed that the said ends of the sleeves are each formed with an extension 30, in the nature of a loop having a closed end 31, the said loop being so made that they produce, as it were, pockets 32 into which the hands may be easily projected and in such a manner that the closed ends 31 and the extensions proper may be readily gripped by the hands and used as rubbers, see Figure 1, for drying off the body in a manner the same as is done with an ordinary towel, it being understood that by having the sleeve ends formed as stated and shown, the user can easily reach all parts of the body as readily as can be done by gripping portions of the ordinary towel, and using the said sleeve ends as rubbing portions.

Additional provision is made in my form of robe-towel for reaching and drying off the back, and, to that end, hand loops 6-6 are secured to the back side of the robe and, at such points, that the user may readily grasp them, see Figure 1, and in such manner that the parts of the robe-towel adjacent the loops 6-6 may be conveniently manipulated as rubbing portions, readily movable across and up and down while in the act of drying the back.

After drying, in case the user desires to keep the robe on, the hands may be readily slipped out through the openings 33 for ordinary uses.

My invention is exceedingly simple and in shaping the robe in the manner stated, it adds practically nothing to the expense of making the robe per se.

The advantage in the use of my robe-towel is of special importance to those who are susceptible of readily catching cold after bathing and for invalids who need a protecting covering for the body while in the act of drying off.

It is understood since the body of the robe is made up of towel material, any portion thereof may be grasped by the user for drying purposes while the robe is on the body or when taken off.

What I claim is:

1. A robe-towel having sleeves, the ends of which are formed with pocket like extensions adapted for receiving the hands of the user and for serving as rubbing portions, said sleeve where it joins with said
2. A robe-towel having hand holds at the back, whereby the back portions may be readily manipulated as rubbing members for drying off the back of the user.

3. As a new article, a bath robe made of bath towel material, which includes sleeves having loop like extensions at the lower ends that form pockets for receiving the hands and which serve as rubbing portions when the hands are in the said pockets, and loop members attached to the back of the body adapted for being grasped by the hands, whereby the said back of the robe may be used as a towel.

5. As a new article, a bath robe-towel consisting of a robe of bath towel material, the said robe including sleeves having loop like extensions that form pockets for the hands and which serve as rubbers, a hood member having portions for extending under the cheeks and chin of the user and loops attached to the back of the robe and adapted for being grasped by the user when the hands are extended through the sleeves of the robe and for utilizing the back portion of the robe as a towel.

JOSEPH T. NORMAN.
