(54) **Title**: DIALYSIS PRECURSOR COMPOSITION

(57) **Abstract**: The present invention concerns a dialysis acid precursor composition for use during preparation of a dialysis acid concentrate solution and for mixing with water and a bicarbonate containing concentrate into a ready-for-use dialysis solution. Said dialysis acid precursor composition consist of powder components comprising sodium chloride, at least one dry acid and at least one magnesium salt, and optionally potassium salt, calcium salt, and glucose. According to the invention said at least one magnesium salt and said optional glucose, are present as anhydrous components in said dialysis acid precursor composition.

DIALYSIS PRECURSOR COMPOSITION

TECHNICAL FIELD

The present invention concerns a dialysis acid precursor composition for use during preparation of a dialysis acid concentrate solution and for further mixing with water and a bicarbonate containing concentrate into a ready-for-use dialysis solution. The present invention further concerns a method of providing a dialysis acid concentrate solution for dilution with water and a bicarbonate concentrate to produce a ready-for-use dialysis solution.

BACKGROUND

When a person's kidney does not function properly uremia is developed. Dialysis is a well established treatment technique for uremia. Essentially, dialysis artificially replaces the functions of the kidney. There are two distinct types of dialysis, hemodialysis and peritoneal dialysis.

Hemodialysis involves withdrawing blood from the body and cleaning it in an extracorporeal blood circuit and then returning the cleansed blood to the body. The extracorporeal blood circuit includes a dialyzer which comprises a semipermeable membrane. The semipermeable membrane has a blood side and a dialysate side, and waste substances and excess fluid is removed from the blood passing on the blood side of the semipermeable membrane through the semipermeable membrane over to the dialysate side of the semipermeable membrane.

Hemodialysis may be performed in three different treatment modes, hemodialysis, hemofiltration, and hemodiafiltration. Common to all three treatment modes is that the patient is connected by a blood line to the dialysis machine, which continuously withdraws blood from the patient. The blood is then brought in contact with

the blood side of the semipermeable membrane within the dialyzer in a flowing manner.

In hemodialysis, an aqueous solution called dialysis solution is brought in contact with the opposite membrane surface, the dialysate side, in a flowing manner. Waste substances (toxins) and solutes are removed/controlled mainly by diffusion. Excess fluid is removed by applying transmembrane pressure over the semipermeable membrane. Solutes and nutrients may diffuse in the opposite direction from the dialysis solution, through the semipermeable membrane and into the blood.

In hemofiltration, no dialysis solution is brought in contact with the dialysate side of the semipermeable membrane. Instead only a transmembrane pressure is applied over the semipermeable membrane thereby removing fluid and waste substances from the blood through the semipermable membrane wall and into the dialysate side thereof (convective flow). Fluid and waste substances are then passed to drain. To replace some of the removed fluid, a correctly balanced electrolyte/buffer dialysis solution (also named infusion fluid or replacement fluid) is infused into the extracorporeal blood circuit. This infusion may be done either pre the dialyzer (pre-infusion mode) or post the dialyzer (post-infusion mode) or both.

Hemodiafiltration is a combination of hemodialysis and hemofiltration, a treatment mode that combines transport of waste substances and excess fluids through the semipermeable wall by both diffusion and convection. Thus, here a dialysis solution is brought in contact with the dialysate side of the semipermeable membrane in a continuously flowing manner, and a dialysis solution (also named infusion fluid or replacement fluid) is used for infusion into the extracorporeal blood circuit in pre-infusion mode, post-infusion mode or both.

For many patients, hemodialysis is performed for 3-5 hours, three times per week. It is usually performed at a

dialysis centre, although home dialysis is also possible. When home dialysis is performed patients are free to perform dialysis more frequently and also in more gentle treatments with longer treatment times, i.e. 4-8 hours per treatment and 5-7 treatments per week. The dose and treatment times may be adjusted due to different demand of the patients.

In the case of patients suffering from acute renal insufficiency, a continuous treatment, throughout a major portion of the entire day for up to several weeks, a continuous renal replacement therapy (CRRT), or intermittent renal replacement therapy (IRRT) is the indicated treatment depending on the patients status. Also here the removal of waste substances and excess fluid from the patient is effected by any or a combination of the treatment modes hemodialysis, hemofiltration and hemodiafiltration.

In a peritoneal dialysis treatment a hypertonic dialysis solution is infused into the peritoneal cavity of the patient. In this treatment solutes and water is exchanged in the capillary vessels of a patient's peritoneal membrane with said hypertonic dialysis solution. The principle of this method is diffusion of solutes transferred according to the concentration gradient and water migration due to the osmotic differences over the peritoneal membrane.

The dialysis solutions used in all the above dialysis techniques contain mainly electrolytes like sodium, magnesium, calcium, potassium, an acid/base buffer system buffers and optionally glucose or a glucose-like compound. All the components in dialysis solutions are selected to control the levels of electrolytes and the acid-base equilibrium within the blood and to remove waste materials from the blood.

Dialysis solutions are today prepared from different types of concentrates. It may be liquid concentrates of different degree of concentration, where the

acid/electrolyte part is separated from the buffer part. It may be provided in highly concentrated volumes of 1-8 L in bags for bedside use, or in more diluted concentrated volumes of 5-20 L in canisters, which still are for bedside use. Concentrates may also be prepared in central tanks in volumes of 300-1000 L.

When using bicarbonate as a buffer component in the dialysis solution, bicarbonate is often provided as a dry concentrate for on-line-preparation of saturated bicarbonate containing concentrate. The saturated bicarbonate containing concentrate is thereafter mixed with an acid/electrolyte concentrate and further diluted with purified water to produce the on-line prepared dialysis solution.

Dialysis solutions have improved in quality over the years, and the availability of concentrated precursor compositions for further dilution and mixing with other components into a ready-for-use dialysis solution have decreased the costs and improved the environmental issues.

One way to further limit the costs and improve the environmental issues would be to provide a dialysis precursor composition in which all component are dry. However, having all components as dry components adds new problems.

Firstly, dry acid and bicarbonate powder are not compatible. When small amounts of humidity is present, bicarbonate will break down to carbon dioxide.

Secondly, magnesium chloride and calcium chloride mixed with bicarbonate will provide areas were the solubility product of calcium carbonate and/or magnesium carbonate will be exceeded, which would cause precipitation thereof when water is added during preparation of a concentrate or a dialysis solution.

Thirdly, even if bicarbonate is excluded to a separate cartridge, still problems would be experienced. E.g caking and lump formation of the different components

will render the dissolution thereof more difficult or even impossible when preparing the ready-for-use dialysis solution.

Fourthly, if glucose is present, a discoloration of the precursor, and later on, the ready-for-use dialysis solution would arise as a result of glucose degradation products, which should be avoided due to toxicity and limits set by authority regulations, e.g. European Pharmacopeia.

All the problems above are due to the presence of humidity within the dry precursor compositions.

In prior art this has been solved by preparing granulates of the different components and creating different layers of the different components within each granulate, like disclosed in EP0567452 or EP1714657.

However, this still may give rise to interactions between the different layers, and it is also a time-consuming matter of providing a completely and properly dissolved granulate for the preparation of the ready-for-use dialysis solution. Further, it is difficult to ensure proper composition and concentration of the different components both within the granulate and within the prepared ready-for-use dialysis solution.

SUMMARY OF THE INVENTION

One object of the present invention is to provide a dialysis precursor composition which show further improved stability, limited chemical degradation and increased shelf life.

Another object of the present invention is to provide a dialysis precursor composition which give rise to further cost savings and further improved environmental benefits.

The present invention concerns a dialysis acid precursor composition for use during preparation of a dialysis acid concentrate solution and for further mixing with water and a bicarbonate containing concentrate into

a ready-for-use dialysis solution. Said dialysis acid precursor composition consists of powder components comprising sodium chloride, at least one dry acid and at least one magnesium salt, and optionally potassium salt, calcium salt, and glucose. According to the invention said at least one magnesium salt and said optional glucose, i.e. if glucose is present, are present as anhydrous components in said dialysis acid precursor composition. Further, said dialysis acid precursor composition is sealed in a moisture-resistant container with a water vapor transmission rate less than 0.3 $g/m^2/d$ at 38°C/90%RH.

The present invention further concerns a method of providing a dialysis acid concentrate solution for dilution with water and a bicarbonate containing concentrate to produce a ready-for-use dialysis solution. According to the invention this method comprises:

(a) providing a dialysis precursor composition comprising sodium chloride, at least one dry acid, and at least one magnesium salt, optionally potassium salt, calcium salt, and glucose, wherein said at least one magnesium salt and said optional glucose, i.e. if glucose is present, are present as anhydrous components in said dialysis acid precursor composition,

(b) providing said dialysis precursor composition in a sealed, moisture-resistant container with a water vapor transmission rate less than 0.3 $g/m^2/d$ at 38°C/90%RH, and

(c) adding water to said dialysis precursor composition in said container and mixing thereof, thereby providing said dialysis acid concentrate as a solution.

The present invention further concerns use of said dialysis acid precursor composition for preparing a dialysis acid concentrate solution.

Finally, the present invention concerns use of said dialysis acid precursor composition for preparing a dialysis solution.

Other embodiments of the present invention is evident from the description below and the dependent claims.

DETAILED DESCRIPTION OF THE INVENTION

A wide variety of different combinations and partitions of dry powder components of normal dialysis solutions like potassium chloride, magnesium chloride, calcium chloride, glucose, sodium chloride, sodium bicarbonate, dry acids like citric acid, glucono-δ-lactone, etc. were prepared and put in a forced stability study. Matters like caking, lump formation, discoloration and dissolution rate were investigated after 1 month, 4 months and 10 months storage time.

It was identified that, as expected, sodium bicarbonate needs to be separated from the other components due to carbon dioxide formation, calcium carbonate precipitation, and magnesium carbonate precipitation. However, when combining the remaining components of a normal dialysis solution, the crystalline water attached to magnesium chloride caused problems with caking and lump formation within the powder compositions and discoloration of glucose (if present). By replacing magnesium chloride hexahydrate with anhydrous magnesium chloride, or another magnesium salt not containing any crystalline water, the powder composition remained stable, free flowing and no discoloration evolved. Thus, in order to make sure that a stable composition is provided the container material used for storing the composition should be moisture-resistant and not allow passage of an amount equal to or above the amount which equals the crystalline water normally attached with the magnesium salt. This is achieved with a container material having a water vapor transmission rate less than 0.3 $g/m^2/d$ at 38°C/90%RH.

In another embodiment said container material has a water vapor transmission rate less than 0.2 g/m^2/d at 38°C/90%RH.

In another embodiment said container material has a water vapor transmission rate between 0.05-0.3 g/m^2/d at 38°C/90%RH.

In even another embodiment said container material has a water vapor transmission rate between 0.05-0.2 g/m^2/d at 38°C/90%RH.

In another embodiment said container material has a water vapor transmission rate between 0.1-0.3 g/m^2/d at 38°C/90%RH.

In even another embodiment said container material has a water vapor transmission rate between 0.1-0.2 g/m^2/d at 38°C/90%RH.

According to the invention said dialysis acid precursor composition consists of powder components comprising sodium chloride, at least one dry acid and at least one magnesium salt, and optionally potassium salt, calcium salt, and glucose, wherein said at least one magnesium salt and said optional glucose are present as anhydrous components in said dialysis acid precursor composition within the moisture-resistant container.

In other embodiments of the present invention said at least one dry acid is selected from the group comprising of lactic acid, citric acid, gluconic acid, glucono-δ-lactone, N-acetyl cystein and α-lipoic acid. Thus, a combination of dry acids may be used within said dialysis acid precursor composition, and by providing a combination of different dry acids, other functions and effects, apart from said acidic function, may be provided, like for instance antioxidative effects (as with citric acid, gluconic acid, glucono-δ-lactone, N-acetyl cystein and α-lipoic acid), anticoagulation effects (as with citric acid) and so forth.

In even further embodiments said at least one magnesium salt in said dialysis acid precursor

composition, is selected from the group comprising of anhydrous magnesium chloride, magnesium gluconate, magnesium citrate (trimagnesium dicitrate), magnesium lactate and magnesium α-ketoglutarate. Also here a combination of different magnesium salts may be used in order to tailor specific add-on features, like antioxidative effects from magnesium gluconate, or anticoagulation effects from magnesium citrate, and so forth.

In one embodiment said at least one magnesium salt in said dialysis acid precursor composition is selected from the group comprising of magnesium gluconate, magnesium citrate and magnesium lactate.

In other embodiments, in which calcium salt is present, said calcium salt in said dialysis acid precursor composition, is at least one chosen from the group comprising of calcium chloride dihydrate, calcium chloride monohydrate, anhydrous calcium chloride, calcium gluconate, calcium citrate, calcium lactate, and calcium α-ketoglutarate. Thus, also here a combination of different calcium salts may be used.

In another embodiment, said calcium salt is at least one chosen from the group comprising of anhydrous calcium chloride, calcium gluconate, calcium citrate, calcium lactate, and calcium α-ketoglutarate.

In another embodiment, said calcium salt is at least one chosen from the group comprising of calcium gluconate, calcium citrate and calcium lactate.

In one embodiment said dialysis precursor composition is provided in a specific amount and is configured to be mixed with a prescribed volume of water within said moisture-resistant container to provide a dialysis acid concentrate solution. Thus, said moisture-resistant container is configured to receive and dispense solutions up to said prescribed volume.

In one embodiment said prescribed volume may be within the range of from 1 to 8 L.

In another embodiment said prescribed volume may be within the range of from 5-20 L.

In even another embodiment said prescribed volume may be within the range of 300-1000 L.

Further, in one embodiment said dialysis acid concentrate solution is configured and provided to be diluted within the range of 1:30 to 1:50 with water and a bicarbonate concentrate.

The present invention further concerns a method of providing a dialysis acid concentrate solution. Said dialysis acid concentrate solution is further intended to be mixed with additional water and a bicarbonate concentrate to produce a ready-for-use dialysis solution. According to the invention such a method comprises (a) providing a dialysis precursor composition comprising sodium chloride, at least one dry acid, and at least one magnesium salt, optionally potassium salt, calcium salt, and glucose, wherein said at least one magnesium salt and said optional glucose are present as anhydrous components in said dialysis acid precursor composition, (b) providing said dialysis precursor composition in a sealed, moisture-resistant container with a water vapor transmission rate less than 0.3 $g/m^2/d$ at 38°C/90%RH, and (c) adding a prescribed volume of water to said dialysis precursor composition in said container and mixing thereof, thereby providing said dialysis acid concentrate as a solution.

Sodium chloride is provided in such a quantity in said moisture-resistant container that a concentration within the range of 2.55-5.5 M sodium chloride is provided in the dialysis acid concentrate solution when a prescribed volume of water has entered into said moisture-resistant container.

Said dry acid is provided in such a quantity in said moisture-resistant container that a concentration within the range of 60-200 mEq/L H^+ (acid) is provided in the dialysis acid concentrate solution when a prescribed

volume of water has entered into said moisture-resistant container.

Further, said at least one magnesium salt is provided in such a quantity in said moisture-resistant container that a concentration within the range of 7.5-50 mM magnesium ions is provided in the dialysis acid concentrate solution when a prescribed volume of water has entered into said moisture-resistant container.

If present, said calcium salt is provided in such a quantity in said moisture-resistant container that a concentration within the range of 30-125 mM calcium ions is provided in the dialysis acid concentrate solution when a prescribed volume of water has entered into said moisture-resistant container.

If present, potassium salt is provided in such a quantity in said moisture-resistant container that a concentration within the range of 0-200 mM potassium ions is provided in the dialysis acid concentrate solution when a prescribed volume of water has entered into said moisture-resistant container.

If present, glucose is provided in such a quantity in said moisture-resistant container that a concentration within the range of 0-100 g/L is provided in the dialysis acid concentrate solution when a prescribed volume of water has entered into said moisture-resistant container.

In one embodiment said dry dialysis acid precursor composition comprises the different components in such an amount that when said dry dialysis acid precursor composition has been dissolved and mixed with water and bicarbonate it provides a ready-for-use dialysis solution comprising from about 130-150 mM of sodium ions, from about 0 to 4 mM of potassium ions, from about 1-2.5 mM of calcium ions, from about 0.25 to 1 mM of magnesium ions, from about 0 to 2 % (g/l) glucose from about 85 to 134 mM chloride ions, from about 2 to 4 mEq/L acid, and from about 20 to 40 mEq/L bicarbonate ions.

Thus, the present invention provides a prepackaged container with a dry dialysis acid precursor composition for use during preparation of a dialysis acid concentrate solution and for mixing with water and a bicarbonate containing concentrate into a ready-for-use dialysis solution, wherein said dialysis acid precursor composition consist of powder components comprising sodium chloride, at least one dry acid and at least one magnesium salt. Optionally said dialysis acid precursor composition further comprises potassium salts, calcium salts, and glucose. According to the invention said at least one magnesium salt is present as anhydrous component in said dialysis acid precursor composition and said dialysis acid precursor composition is sealed in a moisture-proof container with a water vapor transmission rate less than 0.3 $g/m^2/d$ at 38°C/90%RH.

By using anhydrous magnesium chloride powder in a dry dialysis acid precursor composition, the anhydrous component will act as desiccants if any water would be transported into the bag.

EXAMPLES

By way of example, and not limitation, the following examples identify a variety of dialysis acid precursor compositions pursuant to embodiments of the present invention.

In examples 1-5, the tables show the content of dialysis acid precursor compositions for dilution 1:35. The prescribed volume of each dialysis acid concentrate solution (DACS in tables below) is 5.714 L, and the final volume of each ready-for-use dialysis solution (RFUDS in tables below) is 200 L.

Example 1:

Ingredient	Amount (g)	Conc in DACS(mM)	Conc in RFUDS(mM)
Sodium chloride	1169	3500	100
Potassium chloride	29.81	70	2
Magnesium gluconate	41.46	17.5	0.5
Calcium chloride dihydrate	44.10	52.5	1.5
Citric acid	38.42	35	1
Glucose anhydrous	200	194.4	5.55

Example 2:

Ingredient	Amount (g)	Conc in DACS (mM)	Conc in RFUDS (mM)
Sodium chloride	1169	3500	100
Potassium chloride	29.81	70	2
Magnesium lactate	20.24	17.5	0.5
Calcium gluconate	129.1	52.5	1.5
Citric acid	38.42	35	1
Glucose anhydrous	200	194.4	5.55

5

Example 3:

Ingredient	Amount (g)	Conc in DACS (mM)	Conc in RFUDS (mM)
Sodium chloride	1169	3500	100
Potassium chloride	29.81	70	2
Trimagnesium dicitrate	15.04	5.83	0.167
Calcium gluconate	129.1	52.5	1.5
Citric acid	38.42	35	1
Glucose anhydrous	200	194.4	5.55

Example 4:

Ingredient	Amount (g)	Conc in DACS (mM)	Conc in RFUDS (mM)
Sodium chloride	1169	3500	100
Potassium chloride	29.81	70	2
Trimagnesium dicitrate	15.04	5.83	0.167
Calcium chloride dihydrate	44.10	52.5	1.5
Glucono-delta-lactone	35.63	35	1
Citric acid	30.73	28	0.8
Glucose anhydrous	200	194.4	5.55

Example 5:

Ingredient	Amount (g)	Conc in DACS (mM)	Conc in RFUDS (mM)
Sodium chloride	1169	3500	100
Potassium chloride	29.81	70	2
Trimagnesium dicitrate	15.04	5.83	0.167
Calcium chloride anhydrous	33.30	52.5	1.5
Glucono-delta-lactone	142.5	140	4
Glucose anhydrous	200	194.4	5.55

In example 6-10, the tables show the content of a dry acid precursor composition for dilution 1:45. The prescribed volume of each dialysis acid concentrate solution (DACS in tables below) is 5,33 L, and the final volume of each ready-for-use dialysis solution (RFUDS in tables below) is 240 L.

Example 6:

Ingredient	Amount (g)	Conc in DACS(mM)	Conc in RFUDS(mM)
Sodium chloride	1401.7	4500	100
Potassium chloride	71.57	180	4
Magnesium gluconate	49.75	22.5	0.5
Calcium chloride dihydrate	61.74	78.75	1.75
Citric acid	46.10	45	1
Glucose anhydrous	240	250	5.55

Example 7:

Ingredient	Amount (g)	Conc in DACS (mM)	Conc in RFUDS (mM)
Sodium chloride	1401.7	4500	100
Potassium chloride	53.68	135	3
Magnesium lactate	24.29	22.5	0.5
Calcium gluconate	129.12	56.25	1.25
Citric acid	46.10	45	1

Example 8:

Ingredient	Amount (g)	Conc in DACS (mM)	Conc in RFUDS (mM)
Sodium chloride	1401.7	4500	100
Trimagnesium dicitrate	18.04	7.50	0.167
Calcium gluconate	180.77	78.75	1.75
Citric acid	46.10	45	1
Glucose anhydrous	240	250	5.55

Example 9:

Ingredient	Amount (g)	Conc in DACS (mM)	Conc in RFUDS (mM)
Sodium chloride	1401.7	4500	100
Potassium chloride	35.78	90	2
Magnesium lactate	24.29	22.5	0.5
Calcium chloride dihydrate	52.92	67.5	1.5
Glucono-delta-lactone	42.75	45	1
Citric acid	36.88	36	0.8
Glucose anhydrous	240	250	5.55

Example 10:

Ingredient	Amount (g)	Conc in DACS (mM)	Conc in RFUDS (mM)
Sodium chloride	1401,7	4500	100
Potassium chloride	71.57	180	4
Magnesium gluconate	49.75	22.5	0.5
Calcium chloride anhydrous	26.64	45	1
Citric acid	46.10	45	1
Glucose anhydrous	240	250	5.55

TESTS

Tests has been performed to study the stability of different dry powder compositions, both according to embodiments of the present invention as well as comparisons. Parameters like caking, lumping and discoloration were evaluated.

Methods

Plastic films was welded into bags with 1 compartment.

Composition 1

The amount of powder components of potassium chloride, anhydrous magnesium chloride, calcium chloride dihydrate, anhydrous glucose, citric acid, and sodium chloride necessary to produce 230 L of dialysis fluid were filled into the plastic bags, with a water vapor transmission rate of 0.11 g/m2/d at 38°C/90%RH. The bags were sealed and incubated in 30°C, 65%RH, and in 40°C, 75% RH, respectively.

Composition 2

The amount of powder components of potassium chloride, anhydrous magnesium chloride, anhydrous calcium chloride, anhydrous glucose, citric acid, and sodium chloride necessary to produce 230 L of dialysis fluid were filled into the plastic bags, with a water vapor transmission rate of 0.11 g/m2/d at 38°C/90%RH. The bags were sealed and incubated in 30°C, 65%RH, and in 40°C, 75% RH, respectively.

Comparison composition 3

The amount of powder components of potassium chloride, anhydrous magnesium chloride, calcium chloride dehydrate, anhydrous glucose, citric acid, and sodium chloride necessary to produce 230 L of dialysis fluid were filled into the plastic bags, with a water vapor transmission rate of 2.7 g/m2/d at 38°C/90%RH. The bags were sealed and incubated in 30°C, 65%RH, and in 40°C, 75% RH, respectively.

Results

Compositions 1 and 2 have proven to stay stable for at least 6 months, while comparison composition 3 failed due to formation of brown lumps after less than 1 month.

It should be understood that various changes and modifications to the embodiments described herein will be apparent to those skilled in the art. Such changes and modifications may be made without departing from the spirit and scope of the present invention and without diminishing its attendant advantages. It is therefore intended that such changes and modifications be covered by the appended claims.

CLAIMS

1. A dialysis acid precursor composition for use during preparation of a dialysis acid concentrate solution and for mixing with water and a bicarbonate containing concentrate into a ready-for-use dialysis solution, wherein said dialysis acid precursor composition consist of powder components comprising sodium chloride, at least one dry acid and at least one magnesium salt, and optionally potassium salt, calcium salt, and glucose, wherein said at least one magnesium salt and said optional glucose are present as anhydrous components in said dialysis acid precursor composition and wherein said dialysis acid precursor composition is sealed in a moisture-resistant container with a water vapor transmission rate less than 0.3 $g/m^2/d$ at 38°C/90%RH.

2. The dialysis precursor composition according to claim 1, wherein said at least one dry acid is selected from the group consisting of lactic acid, citric acid, gluconic acid, glucono-δ-lactone, N-acetyl cystein and α-lipoic acid.

3. The dialysis precursor composition according to claim 1 or 2, wherein said at least one magnesium salt in said dialysis acid precursor composition is selected from the group consisting of anhydrous magnesium chloride, magnesium gluconate, magnesium citrate, magnesium lactate, and magnesium α-ketoglutarate.

4. The dialysis precursor composition according to any one of claims 1 to 3, wherein said calcium salt in said dialysis acid precursor composition, is at least one selected from the group consisting of calcium chloride dihydrate, calcium chloride monohydrate, anhydrous calcium chloride, calcium gluconate, calcium citrate, calcium lactate, and calcium α-ketoglutarate.

5. The dialysis precursor composition according to any one of claims 1 to 4, wherein said moisture-resistant container has a water vapor transmission rate of less than 0.2 $g/m^2/d$ at 38°C/90%RH.

6. The dialysis precursor composition according to any one of claims 1 to 5, wherein said moisture-resistant container has a water vapor transmission rate of more than 0.1 g/m^2/d at 38°C/90%RH.

7. The dialysis precursor composition according to any one of claims 1 to 6, wherein said dialysis precursor composition is configured to be mixed with water within said moisture-resistant container to provide a dialysis acid concentrate solution.

8. A method of providing a dialysis acid concentrate solution for dilution with water and a bicarbonate containing concentrate to produce a ready-for-use dialysis solution, comprising:

(a) providing a dialysis precursor composition comprising sodium chloride, at least one dry acid, and at least one magnesium salt, optionally potassium salt, calcium salt, and glucose, wherein said at least one magnesium salt and said optional glucose are present as anhydrous components in said dialysis acid precursor composition,

(b) providing said dialysis precursor composition in a sealed, moisture-resistant container with a water vapor transmission rate less than 0.3 g/m^2/d at 38°C/90%RH, and

(c) adding water to said dialysis precursor composition in said container and mixing thereof, thereby providing said dialysis acid concentrate as a solution.

9. Use of the dialysis acid precursor composition according to any one of claims 1 to 7 for preparing a dialysis acid concentrate solution.
