(54) **WINDOW CLEANING/WINDOW CLEANER**

(76) Inventor: **Thomas Bruff**

Thomas Bruff

Letters Patent

The Schedule referred to in these Letters Patent and making part of the same, containing a description in the words of the said Thomas Bruff himself of his apparatus for the mode of cleaning windows.

This apparatus consists of two Brushes and a large Syringe the first Brush with a short curved handle of sheet iron, for the purpose of making it thin and a little elastic. This brush has a thin back and the length of the bristles are adapted to the thickness of the sash, being designed to clean a part of the top row of glass in the lower sash and on the out side next the top. The other Brush has softer bristles formed a little like a white washing Brush, but stiffer and stands horizontally to the glass. it has a short handle with a ferrid of sheet iron at the end, not brazed, but left open to spring and to receive another handle to elevate it to the top of the upper sash, and will apply as well to the inside as out, and in the same way. The Syringe differs from others in size and contains two or three quarts of water, also in the length and form of its pipe which is about three feet long turning a little backward near the end so as to cast the water with force to the top or any part of the window by applying it against the breast. It has handles to the sides to draw it by, and a broad knob at the top of the staff to rest against the breast in applying it
