Abstract:

A new class of neuraminidase inhibitor prodrugs is provided characterized by a prodrug moiety of a carboxyl group modified to form a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide or a carbonyl ethoxy tripeptide, a guanidine group modified to form a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide, a carbonyl ethoxy tripeptide: a primary alcohol modified to form an esterified single amino acid, dipeptide or tripeptide of zanamivir of the unaltered therapeutic agent. Exemplary therapeutic agents so modified to form prodrugs include zanamivir, oseltamivir and peramivir. The prodrug has increased oral bioavailability relative to the unaltered neuraminidase inhibitor and is effective in the inhibition of viral infections involving neuraminidase in the viral reproductive cycle.
PRODRUGS OF NEURAMINIDASE INHIBITORS

CROSS-REFERENCE TO RELATED APPLICATIONS

This application claims priority of United States Provisional Patent Application Serial No. 61/045,104 filed April 15, 2008, which is incorporated herein by reference.

FIELD OF THE INVENTION

The present invention in general relates to neuraminidase inhibitor prodrugs, and in particular to neuraminidase inhibitor amino acid prodrugs that provide modified bioavailability and active cellular transport relative to the drug itself.

BACKGROUND OF THE INVENTION

Numerous potentially effective therapeutic agents often exhibit poor bio-pharmaceutical properties. This problem, which can preclude the effective oral use of a potential therapeutic agent, is generally targeted with analog methodology, screening ligands, for the biopharmaceutical properties of permeability and metabolism. However, this approach can lead to less desirable drug candidates because properties that optimize biopharmaceutical properties of a molecule may not be the properties or structure that optimize its ligand binding and ultimate efficacy.

A problem associated with rendering a poorly soluble therapeutic agent orally bioavailable is that the transport and release of the active agent from a transport species are unpredictable. Amino acid and peptide transporters and identification of cells having amino acid and peptide transporter activity are known in the art. For example, PEPT1 and/or PEPT2 are known transporters as described in references [29]-[36]. Yet a robust delivery prodrug actively transported into cells bearing PEPT1 and/or PEPT2 transport receptors has remained elusive.

Thus, there exists a need for novel bioavailable drug compositions and processes for synthesis and therapeutic use of the same.

SUMMARY OF THE INVENTION

A prodrug of a neuraminidase inhibitor is provided having the formula (I):
where \( R_i \) is an amino acid residue having the formula \(-C(O)CH(R')NH_2\), a dipeptide residue having the formula \(-C(O)\left(CH_2\right)_nCH(R')N(H)C(O)\left(CH_2\right)_nCH(R''')NH_2\), a tripeptide residue having the formula

\[
\text{(corresponding to an } \alpha, \beta \text{ or } \gamma \text{ amino acid, respectively); } R_2 \text{ is a nullity or } -CR*R**, \]

\(-O \text{ or } -CR*(0H); \ R^* \text{ is } -H, -C_1-C_8 \text{ alkyl, or } -C_1-C_6 \text{ alkyl having a heteroatom substituent of hydroxyl, carboxyl, or primary amine; } R^{**} \text{ is } R^{*} \text{ or an electron of covalent bond; } R_3 \text{ is an sp}^2 \text{ hybridized C or CR*; } R_4 \text{ is CR*R** when } R_3 \text{ is CR* and an sp}^2 \text{ hybridized C when } R_3 \text{ is the sp}^2 \text{ hybridized C forming an ethylenic unsaturation therebetween, } R_4 \text{ is } -CH; \ R_5 \text{ is } -CR*R** \text{ and } R^{**} \text{ is the electron of a covalent bond when bonded to } R_2 \text{ or } R_7 \text{ to form a 5- or 6-member cyclic structure; } R_6 \text{ is } -NH-C(O)-CH_2R^*, \ R_7 \text{ is a nullity, } -CR*R** \text{ and } R_8 \text{ is }\]

\[-CR*(ORii)CR*(ORi_2)CHR*(ORi_3); \ R_n, R_{12} \text{ and } R_{13} \text{ are each independently an amino acid residue having the formula } -C(O)\left(CH_2\right)_nCH(R')NH_2, \text{ a dipeptide residue having the formula } -C(O)\left(CH_2\right)_nCH(R')N(H)C(O)\left(CH_2\right)_nCH(R''')NH_2, \text{ a tripeptide residue having the formula }\]

\[-C(O)\left(CH_2\right)_nCH(R')N(H)C(O)\left(CH_2\right)_nCH(R''')N(H)C(O)\left(CH_2\right)_nCH(R''''')NH_2, -H, \]

\(-COC(CH_3)_2CH_2R^*, \ -COCH_2CH_2R^*, \text{ or } -COCH_3; \ R_9 \text{ and } R_{10} \text{ are each} \]
independently an amino acid residue having the formula \(-C(O)\)(CH\(_2\))\(_n\)CH(R')NH\(_2\), a dipeptide residue having the formula \(-C(O)\)(CH\(_2\))\(_n\)CH(R')N(H)C(O)(CH\(_2\))\(_n\)CH(R'')NH\(_2\), a tripeptide residue having the formula \(-C(O)\)(CH\(_2\))\(_n\)CH(R')N(H)C(O)(CH\(_2\))\(_n\)CH(R'')N(H)C(O)(CH\(_2\))\(_n\)CH(R''')NH\(_2\) or -H; Li is a nullity, \(-[(CH\(_2\))\(_n\)CH(CH\(_2\)R*)O]_m\) or \(-[(CH\(_2\))\(_n\)CH\(_2\)O]_m\), with the proviso that Li is \(-[(CH\(_2\))\(_n\)CH(CH\(_2\)R*)O]_m\) or \(-[(CH\(_2\))\(_n\)CH\(_2\)O]_m\) when Ri is a single amino acid residue, a dipeptide residue or a tripeptide residue; m is 1; L\(_2\) is a nullity, -C(O)(CH\(_2\))\(_n\)CH(CH\(_2\)R*)O or -C(O)O(CH\(_2\))\(_n\)CH\(_2\)O with the proviso that L\(_2\) is \(-C(O)\)(CH\(_2\))\(_n\)CH(CH\(_2\)R*)O]_m\) or \(-C(O)O\)(CH\(_2\))\(_n\)CH\(_2\)O]_m\) when R\(_9\) or R\(_{10}\) is a single amino acid residue or a dipeptide residue; R', R'' and R''' are in each occurrence independently selected amino acid side chain; with the proviso that at least one of R\(_1\), R\(_9\), R\(_{10}\), R\(_{11}\), R\(_{12}\) or R\(_{13}\) is a single \(\alpha\), \(\beta\) or \(\gamma\) amino acid residue, a dipeptide residue or a tripeptide residue. In a specific preferred embodiment of the prodrug of formula (I) n is zero in each occurrence and R* is H in each occurrence. The prodrug has increased oral bioavailability relative to the unaltered neuraminidase inhibitor and is effective in the inhibition of viral infections involving neuraminidase in the viral reproductive cycle.

**BRIEF DESCRIPTION OF THE DRAWINGS**

Figure 1 is a bar graph showing the hydrolysis rate over the pH range 1.2-7.4 at 37\(^\circ\)C for prodrugs of the present invention valine ethoxyester of zanamivir (Zan-Val), the valine ethoxyester of guanidine oseltamivir (GOC-Val) and the isoleucine ethoxyester of guanidine oseltamivir (GOC-Ile);

Figure 2 is a bar graph showing the uptake for comparative, unmodified therapeutic agents and inventive prodrugs of GOC, 3-HPG and Zan in HeLa cells transfected to over express LPEPT1 transporter;

Figure 3 is a bar graph showing permeability in rat perfused jejenum of inventive prodrugs Zan-Val, GOC-Val and 3-HPG-Ile compared to the unmodified therapeutic agents, metoprolol is also provided as a control showing the improved properties of inventive prodrugs; and

Figure 4 is Michaelis-Menten and Lineweaver-Burk plots for the inventive prodrugs of Figure 3.
DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Prodrugs of neuraminidase inhibitors are provided according to the present invention which have the general formula (I)

where R is an amino acid residue having the formula -C(O)CH(R')NH₂, a dipeptide residue having the formula -C(O)(CH₂)ₙCH(R')N(H)C(O)(CH₂)ₙCH(R'')NH₂, a tripeptide residue having the formula

-C(O)(CH₂)ₙCH(R')N(H)C(O)(CH₂)ₙCH(R'')N(H)C(O)(CH₂)ₙCH(R'')NH₂, -H,

-COC(Chs)₂CH₂R*₉, -COCH₂CH₂R*₉ or -COCH₃; n is zero, one or two

(corresponding to an α, β or γ amino acid, respectively); R₂ is a nullity or

-CR*R**, -O or -CR*(0H); R* is -H, -Cl-C₆ alkyl, or -Cl-C₆ alkyl having a heteroatom substituent of hydroxyl, carboxyl, or primary amine; R** is R* or an electron of covalent bond; R₃ is an sp² hybridized C or CR*, R₄ is CR*R** when R₃ is CR* and an sp² hybridized C when R₃ is the sp² hybridized C forming an ethylenic unsaturation therebetween, R₄ is -CH; R₅ is -CR*R** and R** is the electron of a covalent bond when bonded to R₂ or R₃ to form a 5- or 6-member cyclic structure; R₆ is -NH-C(O)-CH₂R*, R₇ is a nullity, -CR*R** and R₈ is

-CR*(ORii)CR*(ORi)₂CH(R'')C(ORi)₃; R₉, R₁₂ and R₁₃ are each independently an amino acid residue having the formula -C(O)(CH₂)ₙCH(R')NH₂, a dipeptide residue having the formula -C(O)(CH₂)ₙCH(R')N(H)C(O)(CH₂)ₙCH(R'')NH₂, a
tripeptide residue having the formula
\[-C(O)(CH_2)_nCH(R')N(H)C(O)(CH_2)_mCH(R'')N(H)C(O)(CH_2)_nCH(R''')NH_2,\]
\[-H, -COC(CH_3)_2CH_2R^*, -COCH_2CH_2R^*, or -COCH_3; R_9 and R_{10} are each\]
independently an amino acid residue having the formula \[-C(O)(CH_2)_nCH(R')NH_2, a\]
dipeptide residue having the formula
\[-C(O)(CH_2)_nCH(R')N(H)C(O)(CH_2)_mCH(R'')N(H)C(O)(CH_2)_nCH(R''')NH_2,\]
a tripeptide residue having the formula \[-C(O)(CH_2)_nCH(R')N(H)C(O)(CH_2)_mCH(R'')N(H)C(O)(CH_2)_nCH(R''')NH_2 or -H;\]
\[Li is a nullity, \[-(CH_2)_nCH(CH_2R^*)O]_m or -(CH_2)_nCH_2O]_m, with the proviso that Li\]
is \[-(CH_2)_nCH(CH_2R^*)O]_m or -(CH_2)_nCH_2O]_m when R_1 is a single amino acid residue, a dipeptide residue or a tripeptide residue; m is 1; L_2 is a nullity,\]
\[-C(O)(CH_2)_nCH(CH_2R^*)O or -C(O)O(CH_2)_nCH_2O with the proviso that L_2 is\]
\[-C(O)(CH_2)_nCH(CH_2R^*)O]_m or -(CH_2)_nCH_2O]_m when R_9 or R_{10} is a single amino acid residue or a dipeptide residue; R', R'' and R'''' are in each occurrence independently selected amino acid side chain; with the proviso that at least one of R_i, R_\alpha, R_\beta, R_\gamma is a single \alpha, \beta or \gamma amino acid residue, a dipeptide residue or a tripeptide residue. In a specific preferred embodiment of the prodrug of formula (I) n is zero in each occurrence and R^* is H in each occurrence.\]

With respect to the formulae used herein a parenthetical group is bonded to
the immediately preceding non-hydrogen atom and not to the immediately
succeeding non-hydrogen atom. This convention as to the use of parenthetical
groups does not apply when the parenthetical group is immediately succeeded by a
subscript of n.

Prodrugs of neuraminidase inhibitors represented by formula I are
characterized by modified uptake into cells expressing an amino acid or peptide
transporter compared to a corresponding unmodified neuraminidase inhibitor. It is
appreciated that through selection of the various variable groups in formula I active
uptake to an inventive prodrug is enhanced, bioavailability increased, or a
combination thereof. It is also appreciated that often in instance when a prodrug of
formula I is optimized for enhanced active transport into a cell expressing a suitable
peptide or amino acid transporter, this transport optimization is at the expense of a
degree of bioavailability of the base drug.
Amino acid and peptide transporters and identification of cells having amino acid and peptide transporter activity are known in the art. For example, PEPT1 and/or PEPT2 are known transporters as described in references [29]-[36].

Neuraminidase amino acid prodrugs with alkoxy moieties intermediate between the base drug carbonyl carbon and the α, β or γ amino acid have been discovered that are surprisingly effective for modifying cellular transport and bioavailability relative to the base drug and often providing an increase in both cellular transport and bioavailability.

Prodrugs of neuraminidase inhibitors represented by formula I are cleaved by enzymatic and/or non-enzymatic mechanisms to produce the active neuraminidase inhibitor.

For example, prodrugs of the present invention are hydrolyzed by hydrolytic enzymes. In a particular example, prodrugs of the present invention are hydrolyzed by valacyclovirase, an alpha-amino acid ester hydrolase described in reference [11].

Prodrugs of the present invention are cleaved by proteolytic enzymes in particular embodiments. Such proteolytic enzymes are proteases endogenous to a subject treated with a prodrug, or can be viral proteases, such as an influenza virus protease or an HCMV protease.

In particular embodiments of the present invention, prodrugs of the neuraminidase inhibitors zanamivir, oseltamivir and peramivir and neuraminidase inhibitor analogs of these drugs are provided.

Prodrugs of Zanamivir

Zanamivir has been shown to be a potent inhibitor of both influenza A and influenza B and of emerging resistant strains [63]. However, the low absolute oral availability of zanamivir -2% [43], precludes oral administration.

Prodrugs of zanamivir are provided which include modified carboxyl, hydroxyl, and/or guanidine functional groups compared to the parent compound.

For reference, the parent compound zanamivir (II) is shown:
In particular embodiments of inventive prodrugs, a carboxyl, a hydroxyl, and/or a guanidine functional group of the parent compound zanamivir is modified to include a carbonyl ester alkoxy amino acid, a carbonyl ester alkoxy dipeptide or a carbonyl ester alkoxy tripeptide of the zanamivir carboxylic acid group; a carbonyl alkoxy amino acid, a carbonyl alkoxy dipeptide or a carbonyl alkoxy tripeptide on the zanamivir guanidyl group; and/or an amino acid ester, dipeptide ester and/or tripeptide ester at one or more primary alcohol sites of a zanamivir.

In preferred embodiments of inventive prodrugs, carboxyl, hydroxyl, and/or guanidyl functional group of the parent compound zanamivir is modified to include a carbonyl ester ethoxy amino acid, a carbonyl ester ethoxy dipeptide or a carbonyl ester ethoxy tripeptide derived from the carboxyl; a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide and/or a carbonyl ethoxy tripeptide derived from the guanidyl; and/or an amino acid, dipeptide ester and/or tripeptide ester at one or more primary alcohol sites of the parent compound. In this context, "ethoxy" refers to total number of carbons in the linkage (e.g., 2 carbons for ethoxy linkage $[(\text{CH}_3)\text{HC(OR)}_2]\) - the "oxy" refers to the single carbon atom attached to two oxygens (it is at the oxidation state of a carbonyl). Accordingly, the prodrugs have methylmethoxy and not ethoxy groups intermediate between core therapeutic and amino acid.
Zanamivir prodrugs according to embodiments of the present invention are represented by formula (III):

\[
\text{R}_1\text{R}_2\text{R}_3\text{R}_4\text{R}_5\text{R}_6\text{R}_7\text{R}_8\text{R}_9\text{R}_{10}\text{R}_{11}\text{R}_{12}\text{R}_{13}\text{R}_{14}\text{R}_{15}\text{R}_{16}\text{R}_{17}
\]

where \( R_{14} \) is \(-\text{CH(\(CH\_3\))OC(O)(\(CH_2\))nCH(\(R\))NH}_2\), \(-\text{CH(CH}_3\))OC(O)(\(CH_2\))nCH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))nCH(\(R\))NH2, \(-\text{CH(CH}_3\))OC(O)(\(CH_2\))nCH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))nCH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))n, \(-\text{H}\), \(-\text{COCH}_2\text{CH}_2\text{R}\ast\), or \(-\text{COCH}_2\text{CH}_2\text{R}\ast\). \( n \) is zero or one; \( R \ast \) is \(-\text{H}\), \(-\text{Ci-C}₈ \text{ alkyl}\), or \(-\text{C}₁-\text{C}₆ \text{ alkyl having a heteroatom substituent of hydroxyl, carboxyl, or primary amine}\); \( R_i \) and \( R \) are each independently \(-\text{H}\), an amino acid residue having the formula \(\text{C}(\text{O})(\text{CH}_2)_n\text{CH(\(R\))NH}_2\), a dipeptide residue having the formula \(\text{C}(\text{O})(\text{CH}_2)_n\text{CH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))n\text{CH(\(R\))NH}_2\), or a tripeptide residue \(-\text{CH(CH}_3\))OC(O)(\(CH_2\))nCH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))nCH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))n, \(-\text{H}\), \(-\text{COCH}_2\text{CH}_2\text{R}\ast\), or \(-\text{COCH}_2\text{CH}_2\text{R}\ast\); \( R_{16} \) and \( R_{17} \) are each independently \(-\text{H}\), an amino acid residue having the formula \(\text{C}(\text{O})(\text{CH}_2)_n\text{CH(\(R\))NH}_2\), a dipeptide residue having the formula \(\text{C}(\text{O})(\text{CH}_2)_n\text{CH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))n\text{CH(\(R\))NH}_2\), or a tripeptide residue \(-\text{CH(CH}_3\))OC(O)(\(CH_2\))nCH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))nCH(\(R\))N(\(H\))C(\(O\))(\(CH_2\))n, \(-\text{H}\), \(-\text{COCH}_2\text{CH}_2\text{R}\ast\), or \(-\text{COCH}_2\text{CH}_2\text{R}\ast\); \( R \ast \) is each independently selected amino acid side chain; and where at least one of \( R_{14}, R_{15}, R_{16} \) and \( R_{17} \) includes an amino acid, dipeptide or tripeptide residue.

In specific embodiments, zanamivir prodrugs of the present invention include zanamivir ethoxyvaline ester, zanamivir ethoxyleucine ester, zanamivir ethoxyisoleucine ester and zanamivir ethoxyphenylalanine ester. Again, "ethoxy"
refers to total number of carbons in the linkage (e.g., 2 carbons for ethoxy linkage \[ (\text{CH}_3)\text{HC(ORi)(OR}_2\] - the "oxy" refers to the single carbon atom attached to two oxygens (it is at the oxidation state of a carbonyl).

**Prodrugs of Oseltamivir and Oseltamivir Analogs**

Oseltamivir carboxylate is a potent transition state analog inhibitor of influenza virus neuraminidase (IC\(_{50}\) = 2 nM). The guanidine analog of oseltamivir carboxylate is an approximately 2-fold more potent inhibitor in vitro (IC\(_{50}\) = 0.9 nM) but is 10 times more potent in tissue culture of influenza virus replication. However, both oseltamivir carboxylate and the guanidine analog of oseltamivir carboxylate are poorly bioavailable (-4.0%). Compound IV, oseltamivir, the ethyl ester analog of oseltamivir carboxylate exhibited good oral bioavailability (11-73 %) in rats, mice, dogs and ferrets [21]. However, the ethyl ester prodrug of the more potent guanidine analog, compound V, did not exhibit enhancement in oral bioavailability (-2%).

Prodrugs of oseltamivir and a guanidine analog of oseltamivir are provided according to embodiments of the present invention.

For reference, the base drug oseltamivir (IV) is shown along with the guanidine analog of oseltamivir (V):

![Chemical Structure](image)
Prodrugs of oseltamivir carboxylate and guanidine analogs of oseltamivir carboxylate are provided which include a modified carboxyl and/or guanidine functional group compared to the parent compounds such that one or more ethoxy esters of an amino acid, dipeptide and/or tripeptide is present at the carboxyl and/or guanidine functionalities.

In particular embodiments of inventive prodrugs, the ester and/or guanidyl functional groups of the base compounds is modified to include an alkoxy amino acid ester, an alkoxy dipeptide ester or an alkoxy tripeptide ester in place of the ethyl ester of formulae IV or V; and/or a carbonyl alkoxy amino acid, a carbonyl alkoxy dipeptide or a carbonyl alkoxy tripeptide on the guanidyl group in formula V.

In preferred embodiments of inventive prodrugs, the carboxyl and/or guanidyl functional group of the parent compound oseltamivir carboxylate or oseltamivir carboxylate guanidine analog is modified to include a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide or a carbonyl ethoxy tripeptide on the carboxyl; and/or a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide or a carbonyl ethoxy tripeptide on the guanidyl group of the parent compound.

Prodrugs of oseltamivir carboxylate according to embodiments of the present invention are represented by formula (VI):
where \( R_{18} \) is \(-\text{CH(}\text{CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(}\text{R'}\text{)NH}_2\),
\(-\text{CH(}\text{CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(}\text{R'}\text{)N(H)C(O)(CH}_2\text{nCH(}\text{R''}\text{)NH}_2,\n\(-\text{CH(}\text{CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(}\text{R'}\text{)N(H)C(O)(CH}_2\text{nCH(}\text{R''}\text{)N(H)C(O)(CH}_2\text{nCH(}\text{R''}\text{)N(H)C(O)(CH}_2\text{nCH(}\text{R''}\text{)NH}_2,\n\text{CH(}\text{R'''}\text{)NH}_2,\text{-COC(CH}_5\text{)}\text{CH}_2\text{R}, \text{-COCH}_2\text{CH}_2\text{R}, \text{or -COCH}_3, n is zero or one;}
\text{R* is -H, -Ci-C}_8\text{ alkyl, or -Ci-C}_6\text{ alkyl having a heteroatom substituent of hydroxyl,}
\text{carboxyl, or primary amine; and R', R'' and R'''}\text{ are each independently an amino}
\text{acid side chain.}

In specific embodiments, oseltamivir carboxylate prodrugs of the present
invention include oseltamivir carboxylate ethoxyvaline ester, oseltamivir carboxylate
ethoxyleucine ester, oseltamivir carboxylate ethoxyisoleucine ester and oseltamivir
carboxylate ethoxyphenylalanine ester.

Prodrugs of a guanidine analog (V) of oseltamivir carboxylate according to
embodiments of the present invention are represented by formula (VII):

\[
\text{(VII)}
\]
where $R_{19}$ is $-\text{CH(CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(R')NH}_2$, $-\text{CH(CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(R')N(H)C(O)(CH}_2\text{nCH(R'')NH}_2$, $-\text{CH(CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(R')N(H)C(O)(CH}_2\text{nCH(R'')N(H)C(O)(CH}_2\text{nCH(R'')NH}_2$, $-\text{COC(CH}_3\text{)}\text{COCH}_2\text{R}$, or $-\text{COCH}_3; n$ is zero or one; $R^*$ is $-\text{H}$, $-\text{Ci-Cs alkyl}$, or $-\text{C}_1-\text{C}_6 alkyl$ having a heteroatom substituent of hydroxyl, carboxyl, or primary amine; $R_{20}$ is in each occurrence independently $-\text{CH(CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(R')NH}_2$, $-\text{CH(CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(R')N(H)C(O)(CH}_2\text{nCH(R'')NH}_2$, $-\text{CH(CH}_3\text{)}\text{OC(O)(CH}_2\text{nCH(R')N(H)C(O)(CH}_2\text{nCH(R'')N(H)C(O)(CH}_2\text{nCH(R'')NH}_2$, or $-\text{H}; R', R''$ and $R'''$ are each an independently an amino acid side chain; and where at least one $R_{19}$ or $R_{20}$ includes an amino acid residue, dipeptide residue or tripeptide residue.

Prodrugs of oseltamivir carboxylate and guanidine analogs of oseltamivir carboxylate according to the present invention are actively transported across cell barriers by endogenous transporters and the prodrug is hydrolyzed enzymatically and/or non-enzymatically to yield the active metabolite of oseltamivir and/or guanidine oseltamivir. The prodrugs are characterized by enhanced bioavailability compared to oseltamivir carboxylate and the guanidine analog of oseltamivir carboxylate.

In specific embodiments, guanidine oseltamivir prodrugs of the present invention include oseltamivir guanidino ethoxyvaline ester, oseltamivir guanidino ethoxyleucine ester, oseltamivir guanidino ethoxyisoleucine ester and oseltamivir guanidino ethoxyphenylalanine ester.

Peramivir Prodrugs

Peramivir is a cyclopentane neuraminidase inhibitor that exhibits in vitro and in vivo activity against various influenza A and B viruses including the highly pathogenic H5N1 viruses [99-102]. Peramivir has demonstrated a good safety profile when tested in mice, rats, primates and dogs, following oral, intravenous and intramuscular administration [103]. However peramivir failed to achieve significant clinical effects in phase 2 and phase 3 clinical trials owing to its low oral bioavailability ($\leq 3\%$) [103].
Prodrugs of peramivir having enhanced bioavailability compared to the parent compound are provided according to embodiments of the present invention.

For reference, the base compound peramivir (VIII) is shown:

![Peramivir (VIII)](image)

Prodrugs of peramivir are provided which include a modified carboxyl and/or guanidine functional group compared to the parent compound such that one or more ethoxy esters of amino acids and/or dipeptides is present at the carboxyl and/or guanidyl functionalities.

In particular embodiments of inventive prodrugs, the carboxyl and/or guanidyl functional group of the parent compound peramivir is modified to include a carbonyl ethoxy amino acid or a carbonyl ethoxy dipeptide on the carboxyl; and/or a carbonyl ethoxy amino acid and/or a carbonyl ethoxy dipeptide on the guanidine.

Prodrugs of peramivir according to embodiments of the present invention are represented by formula (IX):
where $R_{2i}$ is $-\text{CH(CH}_3\text{OC(O)(CH}_2\text{)_nCH(R')NH}_2$,
$-\text{CH(CH}_3\text{OC(O)(CH}_2\text{)_nCH(R')N(H)C(O)(CH}_2\text{)_nCH(R")NH}_2$,
$-\text{CH(CH}_3\text{OC(O)(CH}_2\text{)_nCH(R')N(H)C(O)(CH}_2\text{)_nCH(R")N(H)C(O)(CH}_2\text{)_nCH(R")NH}_2$,
-CH(CH$_3$)OC(O)(CH$_2$)$_n$CH(R')NH$_2$, $-\text{H}-\text{COC(CH}_s\text{)_2C}_\text{H}_2\text{R*}, -\text{COCH}_2\text{C}_\text{H}_2\text{R*},$ or $-\text{COCH}_3$; $n$ is zero or one; $R^*$ is $-\text{H}, -\text{Ci-Cs alkyl}, \text{or } -\text{C}_1\text{-C}_6 \text{ alkyl having a heteroatom substituent of hydroxyl, carboxyl, or primary amine}$; $R_{22}$ is in each occurrence independently $-\text{CH(CH}_3\text{OC(O)(CH}_2\text{)_nCH(R')NH}_2$, $-\text{CH(CH}_3\text{OC(O)(CH}_2\text{)_nCH(R')N(H)C(O)(CH}_2\text{)_nCH(R")NH}_2$,
$-\text{CH(CH}_3\text{OC(O)(CH}_2\text{)_nCH(R')N(H)C(O)(CH}_2\text{)_nCH(R")N(H)C(O)(CH}_2\text{)_nCH(R")NH}_2$,
$-\text{H}; -\text{COCH}_2\text{CH}_2\text{R*}, -\text{COCH}_3\text{CH}_2\text{R*},$ or $-\text{COCH}_3\text{CH}_2\text{R*};$ are each an independently selected amino acid side chain; and where at least one $R_{2i}$ or $R_{22}$ includes an amino acid residue, dipeptide residue or tripeptide residue.

In specific embodiments, peramivir prodrugs of the present invention include peramivir ethoxyvaline ester, peramivir ethoxyleucine ester, peramivir ethoxyisoleucine ester and peramivir ethoxyphenylalanine ester.

In further specific embodiments, peramivir prodrugs of the present invention include peramivir guanidino ethoxyvaline ester, peramivir guanidino ethoxyleucine ester, peramivir guanidino ethoxyisoleucine ester and peramivir guanidino ethoxyphenylalanine ester.

In preferred embodiments, modification of a parent compound to produce a prodrug of the present invention enhances bioavailability of the parent compound and/or a bioactive form of the parent compound by greater than 2 fold.
Naturally occurring or non-naturally occurring amino acids are used to prepare the prodrugs of the invention. In particular, standard amino acids suitable as a prodrug moiety include valine, leucine, isoleucine, methionine, phenylalanine, asparagine, glutamic acid, glutamine, histidine, lysine, arginine, aspartic acid, glycine, alanine, serine, threonine, tyrosine, tryptophan, cysteine, and proline. Particularly preferred are L-amino acids. Without intending to be bound to a particular theory, naturally occurring amino acids are believed to facilitate active prodrug transportation in cells expressing amino acid or peptide transporters, such as those detailed herein. L-amino acids are also appreciated to be more often be kinetically faster cleavage substrates for autologous subject enzymes. As a result, D-amino acids generally are more slowly cleaved by autologous subject enzymes while tending to be more slowly driven in active cellular transport. Also, naturally occurring, non-standard amino acids are operative in the compositions and methods of the invention. For example, in addition to the standard naturally occurring amino acids commonly found in proteins, naturally occurring amino acids also illustratively include 4-hydroxyproline, γ-carboxyglutamic acid, selenocysteine, desmosine, 6-N-methyllysine, ε-N,N,N-trimethyllysine, 3-methylhistidine, O-phosphoserine, 5-hydroxyllysine, ε-N-acetylllysine, ω-N-methylarginine, N-acetylserine, γ-aminobutyric acid, citrulline, ornithine, azaserine, homocysteine, β-cyanoalanine and S-adenosylmethionine. Non-naturally occurring amino acids include phenyl glycine, meta-tyrosine, para-amino phenylalanine, 3-(3-pyridyl)-L-alanine, 4-(tnfluoromethyl)-D-phenylalanine, and the like.

In one embodiment of an inventive compound, an amino acid covalently coupled to the neuraminidase inhibitor is a non-polar amino acid such as valine, phenylalanine, leucine, isoleucine, glycine, alanine and methionine. In particular embodiments, an amino acid covalently coupled to the neuraminidase inhibitor has an aliphatic amino acid such as valine, phenylalanine, leucine and isoleucine. Without intending to be bound to a particular theory, aliphatic amino acids are believed to facilitate active prodrug transportation in cells expressing amino acid or peptide transporters. Preferably, all the amino acid side chains in an inventive prodrug are aliphatic.

It is appreciated that prodrugs according to the present invention are useful to treat a variety of diseases responsive to neuraminidase inhibition. In particular, methods of treating viral infection using prodrugs of neuraminidase inhibitors are provided by the present invention. Illustratively, infection by influenza A virus and/or influenza B virus are treated using prodrugs of neuraminidase inhibitors.

In a preferred embodiment, an inventive prodrug is formulated for administration to a human individual. However, it is appreciated that an inventive prodrug and method of treatment may be indicated in non-human applications as well. Thus, an inventive prodrug is advantageously administered to a non-human organism such as a rodent, porcine, bovine, equine, avian, canine, feline or other such species wherein the organism possesses a membrane transporter for which the prodrug is a substrate and an enzyme active to hydrolyze the prodrug.

A method of treatment according to the present invention includes administering an inventive prodrug to an organism possessing a membrane transporter for which the prodrug is a substrate and an enzyme active to hydrolyze the prodrug.

In a particular embodiment of an inventive method for delivering a pharmaceutical species to an individual the method includes the step of administering an inventive prodrug as described herein to the gastrointestinal lumen of an individual. The prodrug is transported from the gastrointestinal lumen by a specific transporter, enzymatically cleaved to yield an intermediate, and the intermediate is hydrolyzed non-enzymatically to yield the neuraminidase inhibitor, thereby delivering the neuraminidase inhibitor to the individual. It is appreciated that through selection of prodrug functionalities the cellular transport, half life of the prodrug and bioavailability of the base drug are readily controlled. These factors of prodrug functionality include, among others: amino acid side chain identity, side chain optical isomer, the total number of amino acid residues in the prodrug, the length of the alkyloxy linker, and the identity of the alkoxy linker.
Variable dosing regimens are operative in methods of treatment of the present invention. While single dose treatment is effective in producing therapeutic effects, it is noted that longer courses of treatment such as several days to weeks. While dosimetry for a given inventive prodrug will vary, dosimetry will depend on factors illustratively including target cell mass, effective active species X cellular concentration, transporter efficiency, systemic prodrug degradation kinetics, and secondary enzymatic cleavage that reduces active species lifetime. It is appreciated that conventional systemic dosimetry is not applicable to the present invention.

A prodrug is administered by a route determined to be appropriate for a particular subject by one skilled in the art. For example, the prodrug is administered orally; parentally, such as intravenously; by intramuscular injection; by intraperitoneal injection; intratumorally; transdermally; or rectally. The exact dose of prodrug required is appreciated to vary from subject to subject, depending on the age, weight and general condition of the subject, the severity of the disease being treated, the particular pharmaceutical species, the mode of administration, and the like. An appropriate dose is readily determined by one of ordinary skill in the art using only routine experimentation given the teachings herein. Generally, dosage is in the range of about 0.5-500 mg per m².

Depending on the intended mode of administration, the prodrug can be in pharmaceutical compositions in the form of solid, semi-solid or liquid dosage forms, such as, for example, tablets, suppositories, pills, capsules, powders, liquids, or suspensions, preferably in unit dosage form suitable for single administration of a precise dosage. Time release preparations are specifically contemplated as effective dosage formulations. The compositions will include an effective amount of the selected substrate in combination with a pharmaceutically acceptable carrier and, in addition, may include other medicinal agents, pharmaceutical agents, carriers, or diluents. Further, a prodrug may be formulated as a pharmaceutically acceptable salt.

For solid compositions, conventional nontoxic solid carriers include, for example, pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharine, talc, cellulose, glucose, sucrose and magnesium carbonate.
Liquid pharmaceutically administrable compositions can, for example, be prepared by dissolving or dispersing an active compound with optimal pharmaceutical adjuvants in an excipient, such as water, saline, aqueous dextrose, glycerol, or ethanol, to thereby form a solution or suspension. If desired, the pharmaceutical composition to be administered may also contain minor amounts of nontoxic auxiliary substances such as wetting or emulsifying agents, pH buffering agents, for example, sodium acetate or triethanolamine oleate. Actual methods of preparing such dosage forms are known, or will be apparent, to those skilled in this art; for example, see Remington’s The Science and Practice of Pharmacy, 21st Edition, Lippincott Williams & Wilkins, 2005.

For oral administration, fine powders or granules may contain diluting, dispersing, and/or surface active agents, and may be presented in water or in a syrup, in capsules or sachets in the dry state or in a nonaqueous solution or suspension wherein suspending agents may be included, in tablets wherein binders and lubricants may be included, or in a suspension in water or a syrup. Where desirable or necessary, flavoring, preserving, suspending, thickening, or emulsifying agents may be included. Tablets and granules are preferred oral administration forms, and these may be coated.

Parenteral administration is generally by injection. Injectables can be prepared in conventional forms, either liquid solutions or suspensions, solid forms suitable for solution or prior to injection, or as suspension in liquid prior to injection or as emulsions.

Embodyments of inventive compositions and methods are illustrated in the following examples. These examples are provided for illustrative purposes and are not considered limitations on the scope of inventive compositions and methods.

EXAMPLES

Example 1

Parent compounds, such as zanamivir can be purchased commercially or synthesized.

The synthesis of zanamivir is shown in Scheme 1. The starting material used for zanamivir synthesis is sialic acid 1, which was converted to the methyl ester 2, in
presence of Dowex H+ as described in detail in reference 104. The hydroxyl groups of 2 are protected with acetyl groups to give compound 3, which was then converted to the oxazoline derivative 4 in the presence of trimethyltrifluoromethanesulfonate as described in detail in reference 105. Azide 5 was synthesized from 4 in presence of azidotrimethylsilane as described in detail in reference 105. The azide is reduced to the corresponding amine 6 by using Lindlar’s catalyst, and the amine is in turn converted to the guanidine derivative 7 as described in detail in reference 106. The final step involves the deprotection of the methyl ester and acetyl groups in the presence of methanolic sodium hydroxide to give Boc-protected zanamivir 8 as described in detail in reference 106. 8. 1H NMR (CD$_3$OD) δ (ppm) 5.6 (d, J = 2.0 Hz, IH), 5.01 (dd, J = 9.6, 2.1 Hz, IH), 4.25 (dd, J = 10.8, 1.1 Hz, IH), 4.18 (dd, J = 10.6, 9.6 Hz, IH), 3.89 (ddd, J = 9.4, 6.2, 2.7 Hz, IH), 3.84 (dd, J = 11.3, 2.8 Hz, IH), 3.67 (dd, J = 11.3, 5.8 Hz, IH), 3.57 (d, J = 9.3 Hz, IH), 1.9 (s, 3H), 1.55 (s, 9H), 1.50 (s, 9H); ESI-MS: 533 (M+H)+.

Example 2
Ethoxyester derivatives of zanamivir

Synthetic steps for ethoxyester derivatives of zanamivir are summarized in Scheme 2. Intermediate 10 was synthesized from intermediate 8 and α-chloro methylester of respective R group as described in detail in reference 107. The alkyl α-chloro methylester was synthesized from respective carbonyl chloride in the presence of zinc chloride and acetaldehyde as described in detail in reference 107. For the compounds with amino acid substitution instead of an alkyl group, the α-chloro methylester was synthesized from the cesium salt of respective Boc-protected amino acid in presence of 1-chloro-l-bromoethane as described in detail in reference 108. Compound 11 is synthesized from 10 using coupling conditions. The final step involves the deprotection of the Boc-protecting group to give final compounds 4 a-x.

Zanamivir-Valine (Zan-Val), 1H NMR (CD$_3$OD) δ (ppm) 6.9 (q, 1H), 5.8(d, J = 2.0 Hz, 1H), 5.2(m, 1H), 4.9 (m, 1H), 4.2(m, 2H), 4.02(m, 2H), 3.9(m, 1H), 3.7(m, 1H), 2.14(m, 1H), 2.08(s, 3H), 2.01(s, 3H), 0.98(d, J = 6.8 Hz, 3H), 0.90(d, J = 6.5 Hz, 3H); ESI-MS: 476 (M+H)+. The synthesis is also functional in the β and γ amino acid analogs of Val, He, Leu and Phe with comparable yields to those detailed above. D-alanine, α-amino acid, D-methionine α-amino acid and L-phenyl glycine are also prepared in good yield.
Scheme 2

Example 3

Amino acid ester prodrugs of zanamivir

L-valine, L-leucine, L-isoleucine and L-phenylalanine ester prodrugs of zanamivir, shown below, are synthesized. For comparison, the free carboxylic group of zanamivir is esterified with an ethyl group initially, and the effect of the higher alcohol esters on the permeability properties is determined. The synthesis is also functional in the β and γ amino acid analogs of Val, He, Leu and Phe with comparable yields to those detailed above. D-alanine, α-amino acid, D-methionine α-amino acid and L-phenyl glycine are also prepared in good yield.
Example 4

Synthesis of ethoxy amino acid esters of guanidine oseltamivir

The synthetic scheme for ethoxy amino acid esters of guanidine oseltamivir is shown in Scheme 3.

Ethoxyl amino acid esters of guanidine oseltamivir, such as GOC-Val, are synthesized as per Scheme 3. Compound 2 is functionalized with a guanidino group by treatment with N,N'-bis(tert-butyloxycarbonyl)thiourea in the presence of mercury (II) chloride to yield 8 as described in detail in reference 109. Ethyl ester 8 is hydrolyzed using 1N LiOH in aqueous THF to yield free acid 9 as described in detail in reference 106. In a separate flask, cesium salts of Boc-protected amino acids (Boc-L-Val, Boc-L-Leu, Boc-L-Ile) are alkylated using 1-bromo-1-chloroethane and 1-bromo-2-chloroethane to afford 16a-d as described in detail in reference 108. 16a-d are condensed with the free acid 9 as described in detail in reference 107 and further Boc-deprotected with trifluoro acetic acid to afford the final compounds 7a-d as described in detail in reference 106. GOC-Val, $^1$H NMR (CD$_3$OD) $\delta$ (ppm) 0.87-1.03(m, 12H), 1.49-1.54(m, 6H), 1.80-1.84(m, 4H), 1.94(m, 1H), 2.10(m, 1H), 3.16(d, IH, J = 12.1), 3.37-3.41(m, 1H), 3.78(d, IH, J = 4.55), 4.05(m, 1H), 4.17-4.25(m, 1H), 5.00-5.02(m, 1H), 6.55-6.61(m, 1H); ESI-MS: 470 (M+H)+.
Example 5
Synthesis of guanidino prodrugs of zanamivir

The guanidine functionality of zanamivir is modified to make guanidine amino acid prodrugs of zanamivir. A scheme for synthesis of guanidine derivatives is shown generally in Scheme 4.
Analogs 10 a-d are synthesized as follows: Cesium salts of Boc-protected amino acids (Boc-L-Val, Boc-L-Leu, Boc-L-Ile, Boc-L-Phe) are alkylated using 1-bromoethyl chloroformate to obtain ethoxyethyl carbonochloridates 17a-d as described in detail in reference 108. A dichloromethane solution of 17a-d is stirred with saturated aqueous sodium bicarbonate solution of commercially available S-methylthiourea sulfate to give 18a-d as described in detail in reference 110. Reactive chloro intermediates 18a-d are obtained by reaction of 17a-d with sulfuryl chloride as described in detail in reference 110. These reactive intermediates are condensed with oseltamivir carboxylate at room temperature and subsequently Boc-deprotected to yield 10 a-d as guanidino prodrugs as described in detail in reference 110.

**Example 6**

Synthesis of guanidino prodrugs of guanidine oseltamivir

The synthetic steps for guanidino prodrugs of guanidine oseltamivir are shown in Scheme 5.

**Example 7**

Synthesis of guanidino prodrugs of peramivir

Guanidino prodrugs of peramivir are synthesized generally as shown in Scheme 4.

The structures of particular L-valine, L-leucine, L-isoleucine and L-phenylalanine peramivir guanidino prodrugs are shown below. The synthesis is also functional in the β and γ amino acid analogs of Val, He, Leu and Phe with comparable yields to those detailed above. D-alanine, α-amino acid, D-methionine α-amino acid and L-phenyl glycine are also prepared in good yield.
Example 8
Activation of Prodrugs

The hydrolysis of prodrugs of the present invention in buffer was studied over the pH range 1.2-7.4 at 37°C. Results of analysis of the valine ethoxyester of zanamivir (Zan-Val), the valine ethoxyester of guanidine oseltamivir (GOC-Val) and the isoleucine ethoxyester of guanidine oseltamivir (GOC-IIe) shown in Figure 1. Zan-Val, GOC-Val, and GOC-IIe show pH dependent hydrolysis. At pH >4, the prodrugs undergo base catalyzed hydrolysis leading to generation of the active metabolite and corresponding amino acid analog. The half-life is >4 hours at pH 4 and >2 hours at pH 5.5 (the pH of the upper small intestine). Prodrugs are more stable at lower pH (> 4 hours at pH 1.2). These results indicate that the prodrugs are sufficiently stable to be absorbed in the upper small intestine.

Example 9
Transport Inhibition and Uptake Results with Prodrugs

The affinity of zanamivir, GOC, 3-hydroxyphenylglycine (3-HPG) and prodrugs thereof for particular transporters is evaluated using [3H]Gly-Sar uptake inhibition in Caco-2 cells and in HeLa/hPEPT1 cells. Valacyclovir, a known substrate of hPEPT1, was used as positive control (Table 1). Parent compounds Zanamivir, GOC, and 3-HPG exhibited poor affinity for the transporter in both Caco-2 cells and in HeLa/hPEPT1. The valyl and isoleucyl prodrugs of zanamivir, GOC, and 3-HPG have higher affinity for hPEPT1 than the parent compounds.
Table 1. IC$_{50}$ of $[^{3}]$H Gly-Sar uptake inhibition study in HeLa/hPEPT1 cells (mean ± sd, n=2).

Figure 2 shows prodrug uptake in HeLa cells transfected to overexpress hPEPT1. The prodrugs exhibited a 3- to 5-fold higher uptake in cells overexpressing hPEPT1 compared to the corresponding parent drug and up to 20-fold higher cells compared to control (control data not shown in the Figure). Good stability is observed in the donor compartment. Further, the parent drugs were the predominant species observed to be present in the cells incubated with the prodrugs, indicating rapid cellular hydrolysis of the prodrugs to yield the parent compounds.

Example 10

Jejunal Permeability

Improved permeability of prodrugs Zan-Val, GOC-Val, and 3-HPG-Ile compared to the parent compounds is observed in the rat perfused jejunum, as shown in Figure 3. As expected, the parent compounds, zanamivir, GOC, and 3-HPG, have a very low, essentially zero permeability in the jejunum, consistent with the known very low absorption. In contrast, the prodrugs, Zan-Val, GOC-Val and 3-HPG-Ile, show a high permeability, higher than that of metoprolol, a drug with >95% absorption.

These results demonstrate the transport and activation of the prodrugs of the present invention, improving the membrane permeability of the polar, poorly absorbed antiviral parent compounds.

Example 11

Testing for Activation of a Prodrug

Prodrugs of the present invention are tested for susceptibility to enzymatic hydrolysis using the prototype activation enzyme - VACVase. VACVase is isolated
as described in Kim et al. (Kim I. et al., J Biol Chem., 2003, 278(28):25348-56). A solution containing 1 mM of a prodrug compound is incubated with the VACVase enzyme at 25°C. The reaction is stopped by the addition of 5% trifluoroacetic acid and the amount of parent compound is determined by HPLC analysis.

Results of analysis of hydrolysis of the prodrugs Zan-Val, GOC-Val, and the specific substrate (3-HPG-Val) by VACVase are shown in Figure 4 and Table 2.

Example 12

Determination of Binding Affinity of Prodrugs for the Intestinal Peptide Transporter HPEPT1

Prodrugs are tested for their interaction with the transporter, HPEPT1, using tissue culture cells that are engineered to overexpress HPEPT1. In this example, the cells that overexpress HPEPT1, termed DC5, are a human meduloblastoma cell line that is stably transfected with a eukaryotic expression vector encoding HPEPT1. In this assay, the ability of the prodrug to competitively inhibit the uptake of a known substrate of HPEPT1 is measured. The known substrate is the dipeptide Glycine-Sarcosine (Gly-Sar) that has a radioactive label. DC5 cells are plated at a density of 12,000 cells/well in 96-well tissue culture plates and allowed to grow for 2 days. The cells are washed once with 200 microliters of uptake buffer and aspirated. The plates are cooled to 4°C and 25 microliters of uptake buffer containing 125 nanomoles Gly-Sar (at a specific activity of 1 microcurie/micromole) is added. The uptake buffer also contains the prodrugs to be tested at concentrations ranging from 10 micromolar to 20 millimolar. The assay is initiated by placing the plate in a shaking water bath at 37°C and is terminated after 10 min by rapid washing with multiple changes of 4°C phosphate buffered saline (PBS). The radioactive Gly-Sar
peptide that is transported by the HPEPT1 is extracted from the cell layer with 200 microliters of a one to one mixture of methanol and water and is counted in 4 ml of CytoScint EST scintillation cocktail (ICN). The data are plotted as % Gly-Sar uptake of control (no competitive substrate) versus the competitive substrate concentration. The IC₅₀, defined as that concentration which inhibits 50% of the uptake of the Gly-Sar uptake, indicates the degree of affinity that the test prodrug has for the HPEPT1. Typically, values that are below 10 mM indicate that the drug interacts with transporter.

Example 13

Determination of Prodrug Uptake Mediated by an Intestinal Transporter

HeLa cells that overexpress HPEPT1 are incubated with a prodrug at a concentration of 50 micromolar in pH 6.0 uptake buffer for 45 minutes. The uptake reaction is stopped by washing of the cells with ice cold PBS three times. The cell layers are collected, the cells lysed, and the amounts of parent and prodrug in the cell lysate are determined by high performance liquid chromatography (HPLC). The uptake experiments are repeated in control cultures that do not overexpress the HPEPT1. The ratio of the test versus control values provides a measure of uptake efficiency for the prodrug by the HPEPT1 transporter.

Example 14

Testing for Activation of Prodrugs with Intestinal Cell Lysates and Plasma.

Confluent Caco-2 cells are washed with phosphate buffer saline (PBS, pH 7.4) and are harvested with 0.05% Trypsin-EDTA at 37°C for 5-10 min. Trypsin was neutralized by adding DMEM. The cells are washed off the plate and spun down by centrifugation. The pelleted cells are washed twice with pH 7.4 phosphate buffer (10 mM). and resuspended in pH 7.4 phosphate buffer (10 mM) to obtain a final concentration of approximately 4.70 x 10⁶ cells/mL. The cells are lysed with one volume 0.5% Triton-X 100 solution. The cell lysate is homogenized by vigorous pipeting and total protein is quantified with the BioRad DC Protein Assay using bovine serum albumin as a standard. The hydrolysis reactions are carried out in 96-well plates (Corning, Corning, NY). Caco-2 cell suspension (230 microliters) is placed in triplicate wells and the reactions are started with the addition of substrate
and incubated at 37°C. At various time points, 40 microliter aliquots are removed and added to two volumes of 10% ice-cold TFA. The mixtures are centrifuged for 10 min at 1800 rcf and 4°C and the supernatant filtered through a 0.45 micron pore size filter. The recovered filtrate is analyzed by HPLC.

To test stability in human plasma, 230 microliters of undiluted plasma is added to each well in triplicate and 40 microliters of substrate is added to start the reactions which are conducted at 37°C for up to 4 hours. At various predetermined time points, 40 microliter aliquots are removed and added to two volumes of 10% ice-cold TFA. The mixtures are centrifuged for 10 min at 1800 rcf at 4°C and the supernatant is filtered through a 0.45 micron pore size filter. The recovered filtrate is analyzed by HPLC.

The estimated half-lives (t_{1/2}) of the prodrugs are obtained from linear regression of pseudo-first-order plots of prodrug concentration vs time.

**Example 15**

**Synthesis of GOC L Val prodrug**

The synthesis of GOC L Val prodrug is shown in Scheme 6.
Synthesis of B:

N^-Di-Boc-lH-pyrazole-1-carboxamidine and proper amine are added to Oseltamivir monophosphate (A) in THF. The reaction mixture is stirred until no more starting material is observed. The volatile components are removed by rotary evaporator. The residue is redissolved in EtOAc and subjected to flash chromatography for purification.

Synthesis of C:

Compound B is dissolved in mixture of 9:1 Methanol and water. Potassium carbonate is added. The reaction mixture is stirred for one hour before several drops of acetic acid is added to neutralize the solution. After removal of the volatile components, the residue is re-dissolved in EtOAc and subject to flash chromatography for purification.
Synthesis of E:
Phthalic anhydride is added to L-valine (D) in toluene with presence of triethyl amine. After reflux for 24 hours, the solvent is removed by evaporation and the residue is purified by recrystallization from ethanol.

5 Synthesis of G:
Oxalyl chloride is added to solution of E in DCM. After refluxing for 30 minutes, the volatile components are evaporated and the residue is purified by recrystallization from DMC and hexane under argon environment. The product (F) is dried overnight under high vacuum before it can react with aldehyde by catalyzing with ZnCl in DCM at 0 degree C. At the end of reaction, the reaction mixture is passed through a plug of Al₂O₃ to obtain product G with purity at 95%. No further purification is necessary.

Synthesis of H:
Compound G and C are dissolved in DCM. Triethyl amine is added with stirring. After 4 hours reaction, solid precipitate is removed by filtration. The filtrate is concentrated by rotary evaporator. The residue is re-dissolved in EtOAc and subjected to flash chromatography for purification.

Synthesis of I:
To the solution of Compound H in DCM, 2N methyamine in methanol is added. The reaction mixture is stirred for 5 minutes. Then all volatile components are removed by rotary evaporator. Dry-ice/acetone trapper is used to collect methyamine to prevent environmental hazard. The residue is re-dissolved in H₂O and dioxane. Boc-ON is added followed with triethylamine. The mixture is stirred overnight and extracted with EtOAc (2 X 100 mL). The organic phase is dried over anhydrous Na₂SO₄, filtered, and concentrated. After purification via column chromatography, the product is dissolved in TFA/DCM (1:4). The mixture is stirred for 4 hours. TFA and DCM are removed by rotavapor. Diythelether is added to the residue to solidify the product that is further purified with preparative HPLC.

Example 16

30 Synthesis of GOC 1-Me PG L Val prodrug

The synthesis of GOC 1-Me PG L Val is shown in Scheme 7.
Synthesis of B:

N^'-Di-Boc-lH-pyrazole-l-carboxamidine and proper amine are added to Oseltamivir monophosphate (A) in THF. The reaction mixture is stirred until no more starting material is observed. The volatile components are removed by rotary evaporator. The residue is re-dissolved in EtOAc and subjected to flash chromatography for purification.

Synthesis of C:

Compound B is dissolved in mixture of 9:1 Methanol and water. Potassium carbonate is added. The reaction mixture is stirred for one hour before several drops of acetic acid is added to neutralize the solution. After removal of the volatile components, the residue is re-dissolved in EtOAc and subject to flash chromatography for purification.
Synthesis of E:

To a solution of 1,2-propenyldiol in DMF is added TBDMSi and DMAP, followed with triethylamine. White precipitate is formed immediately. After stirring for 18 hours, N-Boc-L-valine and DCC are added. After another stirring of 12 hours, white precipitate is removed by filtration. The filtrate is concentrated by rotary evaporator. The residue is re-dissolved in EtOAc and purified via flash chromatography.

Synthesis of F

To compound E is added 1M TBAF in THF and one mole equivalent AcOH. After stirring for 45 minutes, the mixture is filtered through a silica gel plug. The filtrate is concentrated. The residue is re-dissolved in EtOAc and purified via flash chromatography.

Synthesis of G:

DCC and DMAP are added to solution of compound F and C in DMF. After stirring for 14 hours, the white precipitate is filtered off. The filtrate is concentrated by rotary evaporator. The residue is re-dissolved in EtOAc and subjected to flash chromatography for purification.

Synthesis of H:

The compound G is dissolved in TFA/DCM (1:4). The mixture is stirred for 4 hours. TFA and DCM are removed by rotavapor. Diethylether is added to the residue to solidify the product that is further purified with preparative HPLC.

Example 17

Synthesis of GOC GlyOH L Val prodrug

The synthesis of GOC GlyOH L Val prodrug is shown in Scheme 8.
Scheme 8

Synthesis of B:

N^α-Di-Boc-lH-pyrazole-l-carboxamidine and proper amine are added to Oseltamivir monophosphate (A) in THF. The reaction mixture is stirred until no more starting material be observed. The volatile components are removed by rotary evaporator. The residue is re-dissolved in EtOAc and subjected to flash chromatography for purification.

Synthesis of C:

Compound B is dissolved in mixture of 9:1 Methanol and water. Potassium carbonate is added. The reaction mixture is stirred for one hour before several drops of acetic acid is added to neutralize the solution. After removal of the volatile components, the residue is re-dissolved in EtOAc and subject to flash chromatography for purification.
Synthesis of E:
To a solution of ethanolamine in DMF is added TBDMSi and DMAP, followed with triethylamine. White precipitate is formed immediately. After stirring for 18 hours, N-Boc-L-valine and DCC are added. After another stirring of 12 hours, white precipitate is removed by filtration. The filtrate is concentrated by rotary evaporator. The residue is re-dissolved in EtOAc and purified via flash chromatography.

Synthesis of F:
To compound E is added 1M TBAF in THF and one mole equivalent AcOH. After stirring for 45 minutes, the mixture is filtered through a silica gel plug. The filtrate is concentrated. The residue is re-dissolved in EtOAc and purified via flash chromatography.

Synthesis of G:
DCC and DMAP are added to solution of compound F and C in DMF. After stirring for 14 hours, the white precipitate is filtered off. The filtrate is concentrated by rotavapor. The residue is re-dissolved in EtOAc and subjected to flash chromatography for purification.

Synthesis of H:
The compound G is dissolved in TFA/DCM (1:4). The mixture is stirred for 4 hours. TFA and DCM are removed by rotavapor. Diethylether is added to the residue to solidify the product that is further purified with preparative HPLC.

Example 18
Bioavailability of GOC Prodrugs
10 mg-equivalent/kg of GOC or GOC prodrugs were directly injected to duodenum segment of fasted rats. 1 mg/kg of GOC was intravenously injected to calculate oral bioavailability of prodrugs. Appropriate volume of blood samples was taken from the jugular vein at the predetermined time points.

Rat plasma samples were analyzed for GOC prodrug and GOC using LCMSMS following solid phase extraction sampling preparation. A reverse phase solid-phase cartridge (HLB. 30 mg/1 cc, Waters) was activated with 1.0 mL of methanol and equilibrated with 1.0 mL of water. A 250 ul aliquot of rat plasma was
acidified with 250 uL of 1% TFA solution and loaded on to the cartridges. After washing with 1.0 ml water, the compounds are eluted with 1 ml of 2% acetic acid solution. The eluted solvent was evaporated under nitrogen stream in TurboVap and the residue was reconstituted in 250 ul of mobile phase.

Samples were analyzed using a LC/MS/MS system (Micromass Quattro II, HP 1100). The HPLC system consisted of a HPII00 system (Hewlett Packard, CA). 10 ul of sample was separated with a C18 column (2.1 x 150 mm) using a mobile phase of 10-30 % acetonitrile:water containing 0.1 % formic acid. Quattro II triple quadrupole mass spectrometer (Micromass, Beverly, MA) interfaced with the HPLC via electropray source was used for the mass analysis and detection. The data acquisition software was MassLynx (version 4.0). Calibration curves were constructed by weighted (1/x) least square regression of peak area versus concentrations of the calibration standards.

Bioavailability of prodrugs following open gut direct injection are summarized in Table 3. GOC L-Val showed 16.2 % of bioavailability among the prodrugs tested, at least 4 fold increase compared to GOC. Bioavailability of Gilead GOC neuraminidase prodrugs are summarized for reference in Table 4. Bioavailability calculation is based on the AUCO-4 hrs. GOC L-Val is breaking down completely to GOC and GOC is the major metabolite in the plasma. Only a trace amount of GOC is detected in the plasma following GOC GlyOH L-Val dose. Majority of the dose is detected in prodrug form.
Table 3. AUC and bioavailability following administration of IV injection (1 mg/kg) of GOC or direct injection (OGI) of 10 mg-eq/kg of GOC or GOC prodrugs to rat duodenum.

Any patents or publications mentioned in this specification are incorporated herein by reference to the same extent as if each individual publication is specifically and individually indicated to be incorporated by reference.

The compositions and methods described herein are presently representative of preferred embodiments, exemplary, and not intended as limitations on the scope of the invention. Changes therein and other uses will occur to those skilled in the art.

Such changes and other uses can be made without departing from the scope of the invention as set forth in the claims.
1. A prodrug of a neuraminidase inhibitor having the formula (I):

\[
\text{(I)}
\]

where \(R_i\) is an amino acid residue having the formula \(-\text{C(O)}\text{CH}(\text{R'})\text{NH}_2\), a dipeptide residue having the formula \(-\text{C(O)}(\text{CH}_2)_n\text{CH}(\text{R'})\text{N}(\text{H})\text{C}(\text{O})(\text{CH}_2)_n\text{CH}(\text{R''})\text{NH}_2\), a tripeptide residue having the formula
\[
\text{-C(O)(CH}_2)_n\text{CH}(\text{R'})\text{N}(\text{H})\text{C(O)(CH}_2)_n\text{CH}(\text{R''})\text{NH}_2, -\text{H}, \quad -\text{COC(CH}_3)_2\text{CH}_2\text{R*}, \quad -\text{COCH}_2\text{CH}_2\text{R* Or-COCH}_3; \ n \text{ is zero, one or two}
\]
(corresponding to an \(\alpha\), \(\beta\) or \(\gamma\) amino acid, respectively); \(R_2\) is a nullity or \(-\text{CR*R**}, -\text{O} \text{ or -CR*}(0\text{H}); \ R^* \text{ is } -\text{H}, -\text{C}_1\text{-C}_8 \text{ alkyl, or } -\text{C}_1\text{-C}_6 \text{ alkyl having a heteroatom substituent of hydroxyl, carboxyl, or primary amine; } R^{**} \text{ is } R^* \text{ or an electron of covalent bond; } R_3 \text{ is an sp}^2 \text{ hybridized C or CR*; } R_4 \text{ is CR*R** when } R_3 \text{ is CR* and an sp}^2 \text{ hybridized C when } R_3 \text{ is the sp}^2 \text{ hybridized C forming an ethylenic unsaturation therebetween, } R_4 \text{ is } -\text{CH; } R_5 \text{ is } -\text{CR*R**} \text{ and } R^{**} \text{ is the electron of a covalent bond when bonded to } R_2 \text{ or } R_7 \text{ to form a 5- or 6-member cyclic structure; } R_6 \text{ is } -\text{NH-C(O)-CH}_2\text{R*}, R_7 \text{ is a nullity, -CR*R** and } R_8 \text{ is } -\text{CR*} (\text{OR}ii)\text{CR*}(\text{ORi}_2)\text{CHR*}(\text{ORi}_3); R_n, \text{ R}_{i_2} \text{ and } R_{i_3} \text{ are each independently an amino acid residue having the formula } -\text{C(O)} (\text{CH}_2)_n\text{CH}(\text{R'})\text{NH}_2 \text{, a dipeptide residue having the formula } -\text{C(O)}(\text{CH}_2)_n\text{CH}(\text{R'})\text{N}(\text{H})\text{C}(\text{O})(\text{CH}_2)_n\text{CH}(\text{R''})\text{NH}_2, \text{ a tripeptide residue having the formula}
-C(O)(CH₂)ₙCH(R')N(H)C(O)(CH₂)ₙCH(R'')NH₂ -H, -COC(CH₃)₂CH₂R*, -COCH₂CH₂R*, or -COCH₃; R₉ and R₁₀ are each independently an amino acid residue having the formula -C(O)(CH₂)ₙCH(R')NH₂, a dipeptide residue having the formula -C(O)(CH₂)ₙCH(R')N(H)C(O)(CH₂)ₙCH(R'')NH₂ or -H; Li is a nullity, -[(CH₂)ₙCH(CH₂R*)O]ₘ or -[(CH₂)ₙCH₂O]ₘ, with the proviso that Li is -[(CH₂)ₙCH(CH₂R*)O]ₘ or -[(CH₂)ₙCH₂O]ₘ when Ri is a single amino acid residue, a dipeptide residue or a tripeptide residue; m is 1; L₂ is a nullity, -C(O)(CH₂)ₙCH(CH₂R*)O or -C(O)O(CH₂)ₙCH₂O with the proviso that L₂ is -C(O)[(CH₂)ₙCH(CH₂R*)O]ₘ or -C(O)O[(CH₂)ₙCH₂O]ₘ, when R₉ or R₁₀ is a single amino acid residue or a dipeptide residue; R', R'' and R''' are in each occurrence independently selected amino acid side chain; with the proviso that at least one of R₁, R₉, R₁₁, R₁₂ or R₁₃ is a single α, β or γ amino acid residue, a dipeptide residue or a tripeptide residue. In a specific preferred embodiment of the prodrug of formula (I) n is zero in each occurrence and R* is H in each occurrence.

2. The prodrug of a neuraminidase inhibitor of claim 1, having formula (III):

![Diagram](image-url)
where \( R_{14} \) is \(-\text{CH(CH}_3\text{)}\text{OC(O)(CH}_2\text{)}_n\text{CH(R')}\text{NH}_2\),
\(-\text{CH(CH}_3\text{)}\text{OC(O)(CH}_2\text{)}_n\text{CH(R')}\text{N(H)C(O)(CH}_2\text{)}_n\text{CH(R'')}\text{NH}_2\),
\(-\text{CH(TH}_3\text{)}\text{OC(O)(CH}_2\text{)}_n\text{CH(R')}\text{N(H)C(O)(CH}_2\text{)}_n\text{CH(R'')}\text{NH}_2\),
\(-\text{COCH}_2\text{CH}_3\text{R}^*\), or \(-\text{COCH}_3\); \( n \) is zero or one; \( R^* \) is \(-\text{H}, -\text{Ci-Cs alkyl, or -C}_1\text{-C}_6 \text{ alkyl having a heteroatom substituent of hydroxyl, carbosyl, or primary amine; \( R_{14} \) is in each occurrence independently} \)
\(-\text{C(O)OC(TH}_3\text{)}\text{OC(O)(TH}_2\text{)}_n\text{CH(R')}\text{NH}_2\), \(-\text{C(O)OCH(TH}_3\text{)}\text{OC(O)(TH}_2\text{)}_n\text{CH(R')}\text{N(H)C(O) (TH}_2\text{)}_n\text{CH(R'')}\text{NH}_2\), \(-\text{CH(TH}_3\text{)}\text{O- C(O) (TH}_2\text{)}_n\text{CH(R')}\text{N(H)C(O)(TH}_2\text{)}_n\text{CH(R'')}\text{NH}_2\), \(-\text{COC(TH}_3\text{)}\text{2CH}_3\text{R}^*\),
\(-\text{COCH}_2\text{CH}_3\text{R}^*\), or \(-\text{COCH}_3\); \( R_{16} \) and \( R_n \) are each independently \(-\text{H}, an amino acid residue having the formula C(O)(TH}_2\text{)_nCH(R')NH}_2\), a dipeptide residue having the formula C(O)(TH}_2\text{)_nCH(R')N(H)C(O)(TH}_2\text{)_nCH(R'')NH}_2\), or a tripeptide residue
\(-\text{CH(TH}_3\text{)}\text{O- C(O) (TH}_2\text{)_nCH(R')N(H)C(O)(TH}_2\text{)_nCH(R'')N(H)C(O) (TH}_2\text{)_n}\text{CH(R')NH}_2\), \(-\text{CH(TH}_3\text{)}\text{O- C(O) (TH}_2\text{)_nCH(R')N(H)C(O)(TH}_2\text{)_nCH(R'')N(H)C(O) (TH}_2\text{)_n}\text{CH(R')NH}_2\),
\(-\text{COC(TH}_3\text{)}\text{2CH}_3\text{R}^*\), \(-\text{COCH}_2\text{CH}_3\text{R}^*\), \(-\text{COCH}_3\); \( n \) is zero or one;

3. The prodrug of a neuraminidase inhibitor of claim 1, having formula

\[ (\text{VI}) \]

where \( R_{18} \) is \(-\text{CH(TH}_3\text{)}\text{OC(O)(TH}_2\text{)_nCH(R')NH}_2\),
\(-\text{CH(TH}_3\text{)}\text{OC(O)(TH}_2\text{)_nCH(R')N(H)C(O)(TH}_2\text{)_nCH(R'')NH}_2\),
\(-\text{CH(TH}_3\text{)}\text{OC(O)(TH}_2\text{)_nCH(R')N(H)C(O)(TH}_2\text{)_nCH(R'')N(H)C(O) (TH}_2\text{)_n}\text{CH(R')NH}_2\),
\(-\text{COC(TH}_3\text{)}\text{2CH}_3\text{R}^*\), \(-\text{COCH}_2\text{CH}_3\text{R}^*\), or \(-\text{COCH}_3\); \( n \) is zero or one;
R* is -H, -C1-Cg alkyl, or -Ci-C6 alkyl having a heteroatom substituent of hydroxyl, carboxyl, or primary amine; and R', R'' and R''' are each independently an amino acid side chain.

4. The prodrug of a neuraminidase inhibitor of claim 1, having formula (VII):

\[
\text{where } R_{19} \text{ is } -\text{CH(CH}_3\text{)OC(O)(CH}_2\text{)nCH}(R')\text{NH}_2, \\
-\text{CH(CH}_3\text{)OC(O)(CH}_2\text{)nCH}(R')\text{N(H)C(O)(CH}_2\text{)nCH}(R'')\text{NH}_2, \\
\text{CH}(R'''\text{)}\text{NH}_2. \\
-\text{COCH}_2\text{CH}_2\text{R*}, \text{ or } -\text{COCH}_3; n \text{ is zero or one; } R* \text{ is } -\text{H}, \text{-Ci-Cs alkyl, or } -\text{Ci-C}_6 \text{ alkyl having a heteroatom substituent of hydroxyl, carboxyl, or primary amine; } R_{20} \text{ is in each occurrence independently } \\
-\text{CH(CH}_3\text{)OC(O)(CH}_2\text{)nCH}(R')\text{NH}_2, \\
\text{CH}(R''\text{)}\text{NH}_2. \\
-\text{COCH}_2\text{CH}_2\text{R*}, \text{ or } -\text{COCH}_3; n \text{ is zero or one; } R* \text{ is } -\text{H}, \text{-Ci-Cs alkyl, or } -\text{Ci-C}_6 \text{ alkyl having a heteroatom substituent of hydroxyl, carboxyl, or primary amine; } R_{20} \text{ is in each occurrence independently } \\
-\text{CH(CH}_3\text{)OC(O)(CH}_2\text{)nCH}(R')\text{NH}_2, \\
\text{CH}(R''\text{)}\text{NH}_2, \text{ or } -\text{H}; R', R'' \text{ and } R''' \text{ are each independently an amino acid side chain; and where at least one } R_{19} \text{ or } R_{20} \text{ includes an amino acid residue, dipeptide residue or tripeptide residue.}
\]
5. The prodrug of a neuraminidase inhibitor of claim 1, having formula (IX)

\[
\text{(IX)}
\]

where \( R_{21} \) is \(-\text{CH(CH}_3\text{)OC(O)(CH}_2\text{)}_n\text{CH(R')NH}_2 \), 
\(-\text{CH(CH}_3\text{)OC(O)(CH}_2\text{)}_n\text{CH(R')}\text{N(H)}\text{C(O)(CH}_2\text{)}_n\text{CH(R'')}\text{NH}_2 \), 
\(-\text{CH(CH}_3\text{)OC(O)(CH}_2\text{)}_n\text{CH(R')}\text{N(H)}\text{C(O)}\text{(CH}_2\text{)}_n\text{CH(R'')}\text{NH}_2 \), 
\(-\text{H}, -\text{COC(CH}_3\text{)}_2\text{C}_n\text{H}_2\text{R*}, -\text{COCH}_2\text{CH}_3\text{R*}, \text{or -COCH}_3\); \( n \) is zero or one; \( \text{R*} \) is \(-\text{H}, -\text{C}_1\text{-C}_6 \text{ alkyl, or -C}_1\text{-C}_6 \text{ alkyl having a heteroatom substituent of } \text{hydroxyl, carboxyl, or primary amine; } R_{22} \) is in each occurrence independently 

6. A prodrug comprising:

- a prodrug moiety of: a carboxyl group modified to form, a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide, a carbonyl ethoxy tripeptide, a guanidine group modified to form a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide, or a carbonyl ethoxy tripeptide of a therapeutic agent of zanavimir, oseltamivir, or peramivir.
7. The prodrug of claim 6 wherein the prodrug moiety is the guanidine group modified to form the carbonyl ethoxy amino acid and the therapeutic agent is oseltamivir.

8. The prodrug of claim 6 wherein the prodrug moiety is the carboxyl group modified to form the carbonyl ethoxy amino acid and the therapeutic agent is oseltamivir.

9. A prodrug of zanamivir, comprising:
   a prodrug moiety of: a carboxyl group modified to form a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide or a carbonyl ethoxy tripeptide, a guanidine group modified to form a carbonyl ethoxy amino acid, a carbonyl ethoxy dipeptide, a carbonyl ethoxy tripeptide; a primary alcohol modified to form an esterified single amino acid, dipeptide or tripeptide of zanamivir.

10. The use of a prodrug having the formula (I) as claimed in any one of claims 1 through 8 to as a neuraminidase inhibitor.

11. The use of a prodrug of formula (I) in the manufacture of a medicament for treatment of a viral infection.

12. Use of zanamivir, oseltamivir, or peramivir for preparing a prodrug of formula (I) for the treatment of a viral infection.

13. A commercial package comprising a prodrug having the formula (I) according to claim 1 as an active ingredient together with instructions for the use thereof as a neuraminidase inhibitor.

14. A method of inhibiting a viral infection in a subject, comprising:
   administering a neuraminidase inhibitor prodrug of claim 1 to a subject.
15. The method of claim 14 wherein the viral infection is an influenza virus infection.

16. The method of claim 14 wherein the subject is human.
