A manipulator gripper configured for gripping workpieces and fixtures is provided. The manipulator gripper includes a mounting assembly, a suction assembly, and a clamping assembly coupled to the mounting assembly. The suction assembly includes a connecting arm coupled to the mounting assembly and at least one suction cup coupled to the connecting arm. The clamping assembly includes a pressing plate coupled to the mounting assembly, a driving member mounted on the pressing plate, two clamping members pivoting on opposing ends of the pressing plate, and two connecting rods. One end of each connecting rod pivots on the driving member, and the other end of each connecting rod pivots on one of the clamping members.

FIG. 6
MANIPULATOR GRIPPER FOR WORKPIECE AND FIXTURE

FIELD

The subject matter herein generally relates to object handling, and particularly to a manipulator gripper mounted on a robot arm.

BACKGROUND

In sand blasting process, a workpiece is assembled to a fixture by a robot arm, and then the workpiece and the fixture are transported to a sand blasting apparatus. A suction assembly configured to grip the workpiece and a clamping assembly configured to clamp the fixture are positioned at two sides of the robot arm. After assembling the workpiece to the fixture, there is a need to turn the robot arm, and then the fixture with the workpiece can be clamped by the clamping assembly and transported by the robot arm.

BRIEF DESCRIPTION OF THE DRAWINGS

Implementations of the present technology will now be described, by way of example only, with reference to the attached figures.

FIG. 1 is an isometric view of an embodiment of a manipulator gripper, a workpiece, and a fixture. FIG. 2 is an exploded, isometric view of the manipulator gripper shown in FIG. 1. FIG. 3 is a cross-sectional view of the manipulator gripper of FIG. 1 taken along line III-III. FIG. 4 is an isometric view of the manipulator gripper shown in FIG. 1 in a state of gripping the workpiece. FIG. 5 is an isometric view of the manipulator gripper shown in FIG. 1 in a state of transferring the workpiece to the fixture. FIG. 6 is an isometric view of the manipulator gripper shown in FIG. 1 in a state of gripping the workpiece and the fixture.

DETAILED DESCRIPTION

It will be appreciated that for simplicity and clarity of illustration, where appropriate, reference numerals have been repeated among the different figures to indicate corresponding or analogous elements. In addition, numerous specific details are set forth in order to provide a thorough understanding of the embodiments described herein. However, it will be understood by those of ordinary skill in the art that the embodiments described herein can be practiced without these specific details. In other instances, methods, procedures, and components have not been described in detail so as not to obscure the related relevant feature being described. Also, the description is not to be considered as limiting the scope of the embodiments described herein. The drawings are not necessarily to scale and the proportions of certain parts may be exaggerated to better illustrate details and features of the present disclosure.

The term “comprising” when utilized, means “including, but not necessarily limited to”; it specifically indicates open-ended inclusion or membership in the so-described combination, group, series and the like.

The present disclosure is described in relation to a manipulator gripper mounted on a robot arm. The manipulator gripper is configured for gripping and manipulating workpieces and fixtures.
end of each connecting rod 332 can pivot on the pivot member 3312. The two clamping members 32 can rotate relative to the pressing plate 31. The two clamping members 32 can clamp or release the fixture 300 when driven by the driving member 331. In at least one embodiment, the driving member 331 can be, but is not limited to, a cylinder. The clamping members 32 can be, but are not limited to being, clamps.

The pressure switch 40 can be mounted on the side plate 12 and coupled to the vacuum generator and the suction cup 25. The pressure switch 40 can be configured to control the vacuum in the suction cups 25, thus the workpiece can be gripped by the suction cups 25.

FIG. 4 illustrates the manipulator gripper 100 in a state of use. The manipulator gripper 100 can move to the top of two workpieces 200, and the suction driver 22 can move the fixing block 23 away from the connecting arm 21, thereby the suction cups 25 coupled to the fixing block 23 can be closely attached to surfaces of the workpieces 200. The vacuum generator can start, and the suction cups 25 can grasp the workpieces 200 by suction.

FIG. 5 illustrates that the manipulator gripper 100 can transfer the workpieces 200 to the top of the fixture 300. FIG. 6 illustrates that the manipulator gripper 100 can assemble the workpieces 200 to the fixture 300. At this time, the pressing plate 31 can press the fixture 300. The driving member 331 can move the two connecting rods 332 away from the pressing plate 31, thus the clamping members 32 can rotate relative to the pressing plate 31, and two sides of the fixture 300 can be clamped tightly by the clamping members 32. The manipulator gripper 100 can then transfer the fixture 300 and the workpieces 200 to a processing mechanism (not shown), without turning the manipulator gripper 100. As the workpieces 200 are gripped by the suction assembly 20, and the fixture 300 can be clamped by the clamping assembly 30, the workpieces 200 and the fixture 300 will not fall or slip out when the manipulator gripper 100 moves.

When the driving member 331 moves the two connecting rods 332 toward the pressing plate 31, the connecting rods 332 can rotate the clamping members 32 and the clamping members 32 can release the fixture 300. When the vacuum generator is turned off, the suction cups 25 release the workpieces 200.

In at least one embodiment, each suction driver 22 can be coupled to one fixing block 23. In other embodiments, each suction driver 22 can be coupled to a plurality of fixing blocks 23.

In at least one embodiment, each suction assembly 20 can include a suction driver 22 configured for driving the fixing block 23. In other embodiments, each suction assembly 20 can include a plurality of suction drivers 22, each suction driver 22 can be coupled to a fixing block 23. At this time, each suction assembly 20 can grip a plurality of workpieces 200.

In other embodiments, the clamping assembly 30 can include the pressing plate 31, two driving members (not shown) coupled to the two ends of the pressing plate 31, and the clamping members 32 coupled to the two driving members, as long as the clamping members 32 can clamp or release the fixture 300 when driven by the driving members.

In other embodiments, the clamping assembly 30 can include two driving members and two clamping members coupled to the two driving members, and each driving member can be coupled to one end of the connecting arm. The manipulator gripper 100 of this disclosure can include the suction assemblies 20 and the clamping assembly 30 mounted at the same side of the fixing plate 11. The manipulator gripper 100 need not be turned when transferring the workpieces 200 and the fixture 300, thus operation time and production cost can be saved.

The embodiments shown and described above are only examples. Many details are often found in the art such as the other features of a manipulator gripper. Therefore, many such details are neither shown nor described. Even though numerous characteristics and advantages of the present technology have been set forth in the foregoing description, together with details of the structure and function of the present disclosure, the disclosure is illustrative only, and changes may be made in the detail, especially in matters of shape, size, and arrangement of the parts within the principles of the present disclosure, up to and including the full extent established by the broad general meaning of the terms used in the claims. It will therefore be appreciated that the embodiments described above may be modified within the scope of the claims.

What is claimed is:

1. A manipulator gripper configured for gripping and manipulating workpieces and fixtures, the manipulator gripper comprising:
   - a mounting assembly, the mounting assembly comprising a fixing plate and two side plates, the two side plates extending perpendicularly from opposing sides of the fixing plate;
   - a suction assembly comprising:
     - a connecting arm coupled to the mounting assembly;
     - and at least one suction cup coupled to the connecting arm and configured for gripping the workpiece by suction;
   - and
   - a clamping assembly comprising:
     - a pressing plate coupled to the mounting assembly;
     - a driving member mounted on the pressing plate;
     - two clamping members, one of the clamping members pivoting on a first end of the pressing plate, and the other clamping member pivoting on a second end of the pressing plate, and
     - two connecting rods, wherein one end of each connecting rod pivots on the driving member, and the other end of each connecting rod pivots on one of the clamping members;
     - wherein the connecting arm is coupled to one of the side plates, the pressing plate is coupled to one end of the side plates away from the fixing plate, and the driving member is positioned between the two side plates.

2. The manipulator gripper as claimed in claim 1, wherein the driving member comprises a main body and a pivot member slidably coupled to the main body, and the connecting rods are pivotable on the pivot member; and
   - wherein the two clamping members are capable of rotating relative to the pressing plate, thereby clamping the fixture when driven by the driving member.

3. The manipulator gripper as claimed in claim 1, wherein the suction assembly further comprises a fixing block coupled to the connecting arm, and the at least one suction cup is coupled to the fixing block.

4. The manipulator gripper as claimed in claim 1, wherein the fixing plate comprises a first surface and a second surface, and the two side plates are coupled to the second surface of the fixing plate.
The manipulator gripper as claimed in claim 4, wherein the mounting assembly further comprises a connecting member coupled to the two side plates.

6. The manipulator gripper as claimed in claim 4, wherein the manipulator gripper further comprises a connecting terminal and a cover positioned on the first surface of the fixing plate, and the connecting terminal is received in the cover.

7. The manipulator gripper as claimed in claim 1, wherein the suction assembly further comprises a suction driver, the suction driver is mounted on the connecting arm and coupled to the fixing block, and the suction driver is configured to move the at least suction cup toward or away from the connecting arm.

8. The manipulator gripper as claimed in claim 4, wherein the manipulator gripper comprises two suction assemblies, and two connecting arms of the two suction assemblies are coupled to the two side plates.

9. The manipulator gripper as claimed in claim 4, wherein the pressing plate extends perpendicularly to the two connecting arms.

10. A manipulator gripper configured gripping and manipulating workpieces and fixtures, the manipulator gripper comprising:

   a mounting assembly comprising:
   
   a fixing plate, and
   
   two side plates extending perpendicularly from opposing sides of the fixing plate;
   
   two suction assemblies coupled to two sides of the mounting assembly, each of the suction assemblies comprising:
   
   a connecting arm coupled to one of the side plates; and
   
   at least one suction cup coupled to the connecting arm and configured for gripping the workpiece by suction; and
   
   a clamping assembly comprising:
   
   a pressing plate coupled to the mounting assembly; a driving member mounted on the pressing plate; two clamping members, one of the clamping members pivoting on a first end of the pressing plate, and the other clamping member pivoting on a second end of the pressing plate, and
   
   two connecting rods, wherein one end of each connecting rod pivots on the driving member, and the other end of each connecting rod pivots on one of the clamping members.

11. The manipulator gripper as claimed in claim 10, wherein the driving member comprises a main body and a pivot member slidably coupled to the main body, and the connecting rods are pivoted on the pivot member; and

   wherein the two clamping members are capable of rotating relative to the pressing plate, thereby clamping the fixture when driven by the driving member.

12. The manipulator gripper as claimed in claim 10, wherein the pressing plate extends perpendicularly to the two connecting arms.

13. The manipulator gripper as claimed in claim 10, wherein each of the suction assemblies further comprises a fixing block coupled to the connecting arm, and the at least one suction cup is coupled to the fixing block.

14. The manipulator gripper as claimed in claim 10, wherein the fixing plate comprises a first surface and a second surface opposing to the first surface, and the two side plates are coupled to the second surface of the fixing plate.

15. The manipulator gripper as claimed in claim 14, wherein the mounting assembly further comprises a connecting member coupled to the two side plates.

16. The manipulator gripper as claimed in claim 14, wherein the manipulator gripper further comprises a connecting terminal and a cover positioned on the first surface of the fixing plate, and the connecting terminal is received in the cover.

17. The manipulator gripper as claimed in claim 10, wherein the pressing plate is coupled to one end of the side plates away from the fixing plate, and the driving member is positioned between the two side plates.

18. The manipulator gripper as claimed in claim 17, wherein the suction assembly further comprises a driving member, the driving member is mounted on the connecting arm and coupled to the fixing block, and the driving member is configured to move the at least suction cup toward or away from the connecting arm.
