INHIBITORS OF VEGF RECEPTOR AND HGF RECEPTOR SIGNALING**BACKGROUND OF THE INVENTION****Field of the Invention**

[0001] This invention relates to the inhibition of VEGF receptor signaling and HGF receptor signaling. More particularly, the invention relates to compounds and methods for the inhibition of VEGF receptor signaling and HGF receptor signaling.

Summary of the Related Art

[0002] Angiogenesis is an important component of certain normal physiological processes such as embryogenesis and wound healing, but aberrant angiogenesis contributes to some pathological disorders and in particular to tumor growth.^{1,2} VEGF-A (vascular endothelial growth factor A) is a key factor promoting neovascularization (angiogenesis) of tumors.³⁻⁷ VEGF induces endothelial cell proliferation and migration by signaling through two high affinity receptors, the fms-like tyrosine kinase receptor, Flt-1, and the kinase insert domain-containing receptor, KDR.^{8,9,10} These signaling responses are critically dependent upon receptor dimerization and activation of intrinsic receptor tyrosine kinase (RTK) activity. The binding of VEGF as a disulfide-linked homodimer stimulates receptor dimerization and activation of the RTK domain¹¹. The kinase activity autophosphorylates cytoplasmic receptor tyrosine residues, which then serve as binding sites for molecules involved in the propagation of a signaling cascade. Although multiple pathways are likely to be elucidated for both receptors, KDR signaling is most extensively studied, with a mitogenic response suggested to involve ERK-1 and ERK-2 mitogen-activated protein kinases¹².

[0003] Disruption of VEGF receptor signaling is a highly attractive therapeutic target in cancer, as angiogenesis is a prerequisite for all solid tumor growth, and that the mature endothelium remains relatively quiescent (with the exception of the female reproductive system and wound healing). A number of experimental approaches to inhibiting VEGF signaling have been examined, including use of neutralizing antibodies^{13,14,15}, receptor antagonists¹⁶, soluble receptors¹⁷, antisense constructs¹⁸ and dominant-negative strategies¹⁹.

[0004] Despite the attractiveness of anti-angiogenic therapy by VEGF inhibition alone, several issues may limit this approach. VEGF expression levels can themselves be elevated by numerous diverse stimuli and perhaps most importantly, the hypoxic state of tumors resulting from VEGFr inhibition, can lead to the induction of factors that themselves promote tumor invasion and metastasis thus, potentially undermining the impact of VEGF inhibitors as cancer therapeutics²⁰.

[0005] The HGF (hepatocyte growth factor) and the HGF receptor, c-met, are implicated in the ability of tumor cells to undermine the activity of VEGF inhibition²⁰. HGF derived from either stromal fibroblasts surrounding tumor cells or expressed from the tumor itself has been suggested to play a critical role in tumor angiogenesis, invasion and metastasis^{21,22}. For example, invasive growth of certain cancer cells is drastically enhanced by tumor-stromal interactions involving the HGF/c-Met (HGF receptor) pathway^{23,24,25}. HGF, which was originally identified as a potent mitogen for hepatocytes^{26,27} is primarily secreted from stromal cells, and the secreted HGF can promote motility and invasion of various cancer cells that express c-Met in a paracrine manner^{28,29,30}. Binding of HGF to c-Met leads to receptor phosphorylation and activation of Ras/mitogen-activated protein kinase (MAPK) signaling pathway, thereby enhancing malignant behaviors of cancer cells^{30,31}. Moreover, stimulation of the HGF/c-met pathway itself can lead to the induction of VEGF expression, itself contributing directly to angiogenic activity³².

[0006] Thus, anti-tumor anti-angiogenic strategies or approaches that target both VEGF/VEGFR signaling and HGF/c-met signaling may circumvent the ability of tumor cells to overcome VEGF inhibition alone and may represent improved cancer therapeutics.

[0007] Here we describe small molecules that are potent inhibitors of both the VEGF receptor KDR and the HGF receptor c-met.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0014] The invention provides compounds and methods for inhibiting the VEGF receptor KDR and the HGF receptor c-met. The invention also provides compositions and methods for treating cell proliferative diseases and conditions. The patent and scientific literature referred to herein establishes knowledge that is available to those with skill in the art. The issued patents, applications, and references that are cited herein are hereby incorporated by reference to the same extent as if each was specifically and individually indicated to be incorporated by reference. In the case of inconsistencies, the present disclosure will prevail.

[0015] For purposes of the present invention, the following definitions will be used (unless expressly stated otherwise):

[0016] The terms "inhibitor of VEGF receptor signaling" and "inhibitor of HGF receptor signaling" are used to identify a compound having a structure as defined herein, which is capable of interacting with a HGF receptor and a VEGF receptor and inhibiting the activity of HGF and VEGF. In some preferred embodiments, such reduction of activity is at least about 50%, more preferably at least about 75%, and still more preferably at least about 90%.

[0017] For simplicity, chemical moieties are defined and referred to throughout primarily as univalent chemical moieties (*e.g.*, alkyl, aryl, etc.). Nevertheless, such terms are also used to convey corresponding multivalent moieties under the appropriate structural circumstances clear to those skilled in the art. For example, while an "alkyl" moiety generally refers to a monovalent radical (*e.g.*, $\text{CH}_3\text{-CH}_2\text{-}$), in certain circumstances a bivalent linking moiety can be "alkyl," in which case those skilled in the art will understand the alkyl to be a divalent radical (*e.g.*, $\text{-CH}_2\text{-CH}_2\text{-}$), which is equivalent to the term "alkylene." (Similarly, in circumstances in which a divalent moiety is required and is stated as being "aryl," those skilled in the art will understand that the term "aryl" refers to the corresponding divalent moiety, arylene.) All atoms are understood to have their normal number of valences for bond formation (*i.e.*, 4 for carbon, 3 for N, 2 for O, and 2, 4, or 6 for S, depending on the oxidation state of the S). On occasion a moiety may be defined, for example, as $(\text{A})_a\text{-B-}$, wherein *a* is 0 or 1. In such instances, when *a* is 0 the moiety is B- and when *a* is 1 the moiety is A-B-. Also, a number of moieties disclosed herein exist in multiple tautomeric forms, all of which are intended to be encompassed by any given tautomeric structure.

[0018] The term "hydrocarbyl" as employed herein refers to a straight, branched, or cyclic alkyl, alkenyl, or alkynyl, each as defined herein. A " C_0 " hydrocarbyl is used to refer to a covalent bond. Thus, " $\text{C}_0\text{-C}_3\text{-hydrocarbyl}$ " includes a covalent bond, methyl, ethyl, ethenyl, ethynyl, propyl, propenyl, propynyl, and cyclopropyl.

[0019] The term "alkyl" as employed herein refers to straight and branched chain aliphatic groups having from 1 to 12 carbon atoms, preferably 1-8 carbon atoms, and more preferably 1-6 carbon atoms, which is optionally substituted with one, two or three substituents. Preferred alkyl groups include, without limitation, methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl, pentyl, and hexyl. [0029] For simplicity, reference to a "C_n-C_m" heterocyclyl or heteroaryl means a heterocyclyl or heteroaryl having from "n" to "m" annular atoms, where "n" and "m" are integers. Thus, for example, a C₅-C₆-heterocyclyl is a 5- or 6- membered ring having at least one heteroatom, and includes pyrrolidinyl (C₅) and piperidinyl (C₆); C₆-heteroaryl includes, for example, pyridyl and pyrimidyl.

[0046] A saturated or unsaturated carboxylic and heterocyclic group may condense with another saturated or heterocyclic group to form a bicyclic group, preferably a saturated or unsaturated nine- to twelve-membered bicyclic carbocyclic or heterocyclic group. Bicyclic groups include naphthyl, quinolyl, 1,2,3,4-tetrahydroquinolyl, 1,4-benzoxanyl, indanyl, indolyl, and 1,2,3,4-tetrahydronaphthyl.

[0047] When a carbocyclic or heterocyclic group is substituted by two C₁₋₆ alkyl groups, the two alkyl groups may combine together to form an alkylene chain, preferably a C₁₋₃ alkylene chain. Carbocyclic or heterocyclic groups having this crosslinked structure include bicyclo[2.2.2]octanyl and norbornanyl.

[0048] The term "therapeutically effective amount" as employed herein is an amount of a compound of the invention, that when administered to a patient, ameliorates a symptom of a disease. The amount of a compound of the invention which constitutes a "therapeutically effective amount" will vary depending on the compound, the disease state and its severity, the age of the patient to be treated, and the like. The therapeutically effective amount can be determined routinely by one of ordinary skill in the art.

[0049] The term "patient" as employed herein for the purposes of the present invention includes humans and other animals, particularly mammals, and other organisms. Thus the

compounds, compositions and methods of the present invention are applicable to both human therapy and veterinary applications. In a preferred embodiment the patient is a mammal, and in a most preferred embodiment the patient is human.

[0050] The terms "treating" or "treatment" as used herein covers the treatment of a disease-state in a mammal, which disease-state is characterized by abnormal cellular proliferation, and invasion and includes at least one of: (i) preventing the disease-state from occurring in a mammal, in particular, when such mammal is predisposed to the disease-state but has not yet been diagnosed as having it; (ii) inhibiting the disease-state, i.e., arresting its development; and (iii) relieving the disease-state, i.e., causing regression of the disease-state. In a preferred embodiment of the present invention the mammal is a human. As is known in the art, adjustments for systemic versus localized delivery, age, body weight, general health, sex, diet, time of administration, drug interaction and the severity of the condition may be necessary, and will be ascertainable with routine experimentation by one of ordinary skill in the art.

[0051] Throughout the specification, preferred embodiments of one or more chemical substituents are identified. Also preferred are combinations of preferred embodiments. For example, paragraph [0053] describes preferred embodiments of R^7 in the compounds of the present invention and paragraph [0114] describes preferred embodiments of G in the compounds of the present invention. Thus, also contemplated as within the scope of the invention are compounds in which R^7 is as described in paragraph [0053] and G is as described in paragraph [0114]. Furthermore, compounds excluded from any one particular genus of compounds (e.g., through a proviso clause) are intended to be excluded from the scope of the invention entirely, including from other disclosed genera, unless expressly stated to the contrary.

Synthetic Schemes and Experimental Procedures

[0157] The compounds of the invention can be prepared according to the reaction schemes or the examples illustrated below utilizing methods known to one of ordinary skill in the art. These schemes serve to exemplify some procedures that can be used to make the compounds of the invention. One skilled in the art will recognize that other general synthetic procedures may be used. The compounds of the invention can be prepared from starting components that are commercially available. Any kind of substitutions can be made to the starting components to obtain the compounds of the invention according to procedures that are well known to those skilled in the art.

[0158] Thieno[3,2-*b*]pyridine based compounds of formula A-1 may be prepared according to a general procedure shown in the scheme A, via an amide coupling reaction between N-aryl(heteroaryl)-malonic acids [3-oxo-3-(arylamino)- or 3-oxo-3-(heteroarylamino)-propanoic acids] (I) and thieno[3,2-*b*]pyridine derivatives bearing an amino-group (II).

Scheme A

[0159] Acids I typically could be prepared according to the scheme B by reacting the amines IV either with 3-chloro-3-oxopropanoate (V) via the intermediate amino esters VI which have to be hydrolyzed (two-step procedure), or with 2,2-dimethyl-[1,3]dioxane-4,6-dione (Meldrum's acid) (VII) in the presence of TMSCl, to form the desired acid I in one step.

Scheme B

[0160] Thieno[3,2-*b*]pyridine derivatives bearing an amino-group (II) could be prepared in different ways depending on the nature of the substituent R on the thiophene ring of the thienopyridine bicyclic ring system. For example, when R is an amide moiety synthetic sequence shown in the Scheme C, can be employed.

Scheme C

[0161] Thus, thieno[3,2-*b*]pyridine-7-ol (**VIII**) reacting with POCl_3 is converted to the chloride **XI**. Treatment of this material with a strong base such as *n*-BuLi followed by the addition of carbon dioxide affords the carboxylate **X** which is used without purification in the next step, providing the acyl chloride **XI** upon its reaction with oxalyl chloride. The acyl chloride **XI** is used for the next step without further purification as well: upon its reaction with different primary or secondary amines the compound **XI** is converted to a variety of primary and secondary amides **XII** which can further be derivatized via a substitution of the chlorine atom of the pyridine ring. Thus, **XII** reacting with 2-fluoro-4-nitrophenol in a high boiling point solvent, such as diphenyl ether in the presence of a base such as potassium carbonate, produced the nitro derivatives **XIII** which are then reduced to the amines **II** upon treatment with a mixture $\text{NiCl}_2/\text{NaBH}_4$. The amines **II** (could be used for the next step without further purification) upon treatment with *N*-aryl(heteroaryl)-malonic acids (**I**) afford malonamides

III bearing the amido-substituents on the thiophene ring such as the ones shown in the scheme C.

Scheme D

[0162] Thieno[3,2-*b*]pyridine based malonamides of formula A-1 bearing heteroaryl substituents instead of the amido moieties may be prepared using procedures illustrated in the Scheme D. Thus, treatment of the chloride **IX** with a strong base such as *n*-BuLi followed by an addition tributyltin chloride affords the tributylstannyl derivative **XIV**. This material reacting with different heteroaryl bromides in the presence of a Pd-catalyst (Stille coupling reaction) produces heteroaryl-substituted thienopyridines **XII** ($\text{R} = \text{heteroaryl}$) which can further be derivatized via a substitution of the chlorine atom of the pyridine ring of the thienopyridine ring system.

Scheme E#

[0163] Thus, **XIV** reacting with 2-fluoro-4-nitrophenol in a high boiling point solvent, such as diphenyl ether in the presence of a base such as potassium carbonate, produced the nitro derivatives **XIII** which are then reduced to the amines **II** upon treatment with iron in an acidic medium. The amines **II** (could be used for the next step without further purification) upon treatment with N-aryl(heteroaryl)-malonic acids (**I**) afford malonamides **III** bearing heteroaryl substituents on the thiophene ring such as the ones shown in the Scheme D.

[0164] Thieno[3,2-*b*]pyridine based malonamides of formula **A-1** bearing aryl substituents on the thiophene ring, particularly aryl substituents with basic moieties, may be prepared using procedures illustrated in the Scheme E. Thus, treatment of the chloride **IX** with a strong base such as *n*-BuLi followed by bromination (for instance, with elemental bromine) affords the bromide **XV**. This material reacting with 2-fluoro-4-nitrophenol in a high boiling point solvent, such as diphenyl ether in the presence of a base such as potassium carbonate, produced the

nitro-derivative **XVI** which underwent a reaction with 4-(hydroxymethyl)phenylboronic acid in the presence of a base and a Pd-catalyst (Suzuki coupling reaction) to provide aryl-substituted derivative **XVII** with a free hydroxyl group. The hydroxyl group was replaced by a halogen (for example, chloride using the thionyl chloride) to form the compound **XVIII** which upon treatment with secondary and primary amines was converted into a variety of aryl-substituted compounds **XII** (R = substituted aryl). The nitro group of these basic entities was reduced with $\text{NaBH}_4/\text{NiCl}_2$ to form the amines **II**. These intermediates (could be used for the next step without further purification) upon treatment with N-aryl(heteroaryl)-malonamic acids (**I**) afford malonamides **III** bearing aryl substituents with basic moieties, attached to the thiophene ring such as the ones shown in the Scheme E.

Scheme F

[0165] Thieno[3,2-*b*]pyridine based compounds of formula **XIX** may be prepared according to a general procedure shown in the scheme F, via an amide coupling reaction between 2-oxo-1-aryl(heteroaryl)pyrrolidine-3-carboxylic acids (**XX**) and thieno[3,2-*b*]pyridine derivatives bearing an amino-group (**II**). Acids **XX** could be prepared following the literature procedure [S. Danishefsky, R.K.Singh. JACS, 1975, 97, 3239-3241] or purchased if commercially available.

Scheme G

[0166] Thieno[3,2-*b*]pyridine based compounds of formula **XXI** could be prepared via a condensation reaction (scheme G) between amines **II** and 2-oxo-3-aryl(heteroaryl)-1-carbonyl

chlorides of a general formula **XXII**. Acyl chlorides **XXII** could be prepared following the literature procedure (*Chem. Abstr.*; 88; 6873 and P. Mayer, et al.; *J. Med. Chem.*; 2000, 43, 3653-3664) while the reaction could be carried out in aprotic solvents such as DCM, CHCl_3 , toluene, ethylene glycol dimethyl ether, MeCN, DMF, DMSO, THF, dioxane and like, in the presence of organic bases such as DIPEA, Et_3N , DBU, DMAP, N-methylmorpholine, N-methylpiperidine, and like.

Scheme H

[0167] 4,4,4-Trifluoro-*N*-aryl(heteroaryl)-3-(amino)butanamides of the general formula **XXIII** may be obtained via a short reaction sequence starting from the amines **II**. Amines **II** upon treatment with trifluoroacetaldehyde ethyl hemiacetal under acidic conditions (e.g. in the presence of 4-toluenesulfonic acid) in polar solvents such as ethanol are transformed into *N*-(1-ethoxy-2,2,2-trifluoroethyl)amines of the general structure **XXIV**. Compounds **XXIV** reacting with malonates under basic conditions form 2-(2,2,2-trifluoro-1-(amino)ethyl)malonates such as **XXV**. The amino di-esters **XXV** undergo alkaline hydrolysis to form the intermediate malonic acids (not shown in the scheme A), which are further decarboxylated, to afford 4,4,4-trifluoro-3-(amino)butanoic acids **XXVI**. Acids **XXVI** are coupled to different primary or secondary amines using standard techniques, to produce title compounds **XXIII**.

Scheme I

[0168] 4,4,4-Trifluoro-*N*-3-(cyclylamino)butanamides of the general formula XXVII may be obtained via a similar short reaction sequence as in Scheme I using the same sets of thienopyridine derivatives II and amines Ar-NH₂. Amines Ar-NH₂ upon treatment with trifluoroacetaldehyde ethyl hemiacetal under acidic conditions (e.g. in the presence of 4-toluenesulfonic acid) in polar solvents such as ethanol are transformed into *N*-(1-ethoxy-2,2,2-trifluoroethyl)arylamines of the general structure XXVIII. Compounds XXVIII reacting with malonates under basic conditions form diethyl 2-(2,2,2-trifluoro-1-(cyclylamino)ethyl)malonates such as XXIX. The amino di-esters XXIX undergo alkaline hydrolysis to form the intermediate malonic acids (not shown in the scheme I), which are further decarboxylated, to afford 4,4,4-trifluoro-3-(cyclylamino)butanoic acids XXX. Acids XXX are coupled to various amines of the general structure II, using standard techniques, to produce title compounds XXVII.

DCM (250 mL) was added to the resultant dark-brown mixture, which was then extracted with aqueous 1M HCl. The aqueous layer was collected, washed with DCM and basified with NH₄OH. The resultant cloudy mixture was extracted with DCM. The organic phase was combined, filtered; the filtrate was washed with water, dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. 1-(4-Methyl-1,2,3,4-tetrahydroquinoxaline-1-carbonyl)cyclopropanecarboxylic acid (**311**)

[0426] To a solution of cyclopropane-1,1-dicarboxylic acid (1 g, 7.69 mmol) in dry tetrahydrofuran (20 mL) at 0°C under nitrogen, was added triethylamine (1.07 mL, 7.69 mmol) and the mixture was stirred for 30 min. Thionyl chloride (0.56 mL, 7.69 mmol) was added, stirring was continued at 0°C for 30 min., 1-methyl-1,2,3,4-tetrahydroquinoxaline (**310**) (1.2 g, 8.46 mmol) [Smith R.F. et al., *J. Org. Chem.*, **24**, 1959, 205] was added and the reaction mixture was allowed to warm to room temperature. After stirring for 1 h, ethyl acetate was added and the resulting mixture was extracted twice with a 1N NaOH solution. The combined aqueous layers were acidified to pH 4-5 by addition of a 3N HCl solution and extracted 4 times with ethyl acetate. The combined organic layers were dried over anhydrous sodium sulfate and the solvent was removed under reduced pressure. The residue was purified by Biotage (Si 12M, gradient: MeOH in dichloromethane 0% to 10%) to afford title compound **311** (638 mg, 32% yield). MS (m/z): 259.0 (M-H).

3-(4-Methyl-3,4-dihydroquinoxalin-1(2H)-yl)-3-oxopropanoic acid (**312**)

[0427] To a solution of methyl 3-chloro-3-oxopropanoate (1 g, 7.32 mmol) and 1-methyl-1,2,3,4-tetrahydroquinoxaline (**310**) (1.09 g, 7.32 mmol) [Smith R.F. et al., *J. Org. Chem.*, **24**, 1959, 205] in dry dichloromethane (40 mL) at 0°C under nitrogen was slowly added *N,N*-diisopropylethylamine (2.55 mL, 14.6 mmol). The reaction mixture was slowly warmed to room temperature (over 45 min). A saturated aqueous solution of sodium bicarbonate was added and the

aqueous solution was extracted with dichloromethane. The organic layer was dried over anhydrous sodium sulfate and the solvent was removed under reduced pressure. The residue was purified by column chromatography on silica gel (eluent ethyl acetate-hexane 1:1) to afford an off-white solid (1.82 g). This solid was dissolved in tetrahydrofuran (40 mL) and water (20 mL), lithium hydroxide monohydrate (615 mg, 14.7 mmol) and the reaction mixture was stirred 16 h at room temperature. The solution was acidified to pH 4 with a 1N HCl solution and extracted 4 times with ethyl acetate. The combined organic layers were dried over anhydrous sodium sulfate and the solvent was removed under reduced pressure. The residue was purified by Biotage (Si 25M, gradient: MeOH in dichloromethane 0% to 10%) and trituration in a mixture of ethyl ether-hexane to afford title compound **312** (1.27 g, 74%) as a white solid. MS (m/z): 235.1 (M+H).

3-Methyl-2-oxo-1-phenylpyrrolidine-3-carboxylic acid (**313**)

[0428] To a stirred solution of 1-phenyl-2-oxo-3-pyrrolidinecarboxylic acid (**205**) (200 mg, 0.975 mmol) in dry tetrahydrofuran (5 mL) at -78°C was added LDA (1.5M solution in cyclohexane, 1.63 mL, 2.44 mmol) and the mixture was stirred for 40 min. Iodomethane (152 µL, 2.44 mmol) was added and the reaction mixture was allowed to warm to room temperature and stirring was continued for 16 h. Water and ethyl acetate were added. The aqueous layer was collected, acidified to pH 4 with a 1N HCl solution and extracted twice with ethyl acetate. The combined organic layers were dried over anhydrous sodium sulfate and the solvent was removed under reduced pressure. The residue was purified by column chromatography on silica gel (eluent methanol-dichloromethane 2:98) to afford title compound **313** (170 mg, 80% yield) as a yellow solid. ¹H NMR (400 MHz, DMSO-*d*₆) δ (ppm): 7.67 (dd, J = 8.8, 1.2 Hz, 2H), 7.39 (dd, J = 8.8, 7.2 Hz, 2H), 7.16 (tt, J = 7.2, 1.2 Hz, 1H), 3.92-3.80 (m, 2H), 2.54-2.46 (m, 1H), 2.08-1.98 (m, 1H), 1.34 (s, 3H).

Example 195

*N*¹-(4-(2-(1-(2-(Dimethylamino)ethyl)-6-oxo-1,6-dihydropyridin-3-yl)thieno[3,2-*b*]pyridin-7-yloxy)-3-fluorophenyl)-*N*³-(2-methoxyphenyl)malonamide (**417**)

Step 1. 7-Chloro-2-(6-methoxypyridin-3-yl)thieno[3,2-*b*]pyridine (**418**)

[0489] To a solution of tributyltin derivative **6** (2.00g, 4.36mmol) (scheme 91) in toluene (10 mL) was added Ph(PPh₃)₄ (0.503 g, 0.436 mmol) followed by 5-bromo-2-methoxypyridine (0.62 mL, 4.8 mmol). Nitrogen gas was bubbled directly into the reaction mixture for 30 minutes before it was heated to reflux for 16 h. The reaction mixture was then cooled to room temperature and the yellow precipitate was collected by filtration and washed with hexanes. The material was then further purified by flash chromatography (eluent 20 to 50% ethyl acetate in hexanes) to afford the titled compound **418** as a fluffy white solid (0.752g, 62% yield). MS (*m/z*): 277.0 (M+H).

Step 2. 7-(2-Fluoro-4-nitrophenoxy)-2-(6-methoxypyridin-3-yl)thieno[3,2-*b*]pyridine (**419**)

[0490] A suspension of **418** (0.638 g, 2.31 mmol), 2-fluoro-4-nitrophenol (0.725 g, 4.61 mmol) and potassium carbonate (0.638 g, 4.61 mmol) in diphenyl ether (6mL) was heated to 170 °C for 8 h in a pressure tube. The resulting dark solution was cooled to room temperature, diluted with CH₂Cl₂ and then filtered. The filtrate was concentrated and the residue was purified by flash chromatography (eluent 100% hexanes to 50/50 ethyl acetate/hexanes) to produce title compound **419** as a yellow solid (0.395g, 43% yield). MS (*m/z*): 398.0 (M+H).

Step 3. 5-(7-(2-Fluoro-4-nitrophenoxy)thieno[3,2-*b*]pyridin-2-yl)pyridin-2(1*H*)-one (**420**)

[0491] To a flask containing a suspension of **419** (0.299 g, 0.753mmol) in acetonitrile (8mL) was added chlorotrimethylsilane (0.095 mL, 0.748 mmol) followed by sodium iodide (0.112 g, 0.748 mmol). The mixture was then heated to between 70 to 100°C over 24 hours. Over this time four additional portions of chlorotrimethylsilane (0.095 mL each portion) and sodium iodide (0.112 g each portion) were added. The reaction mixture was then cooled to room temperature and the formed precipitate was collected by filtration, washed with NH₄OH and water, and dried to provide title compound **420** as a brown solid (0.283g, 98%). MS (*m/z*): 284.0(M+H), 406.0 (M+Na).

Step 4. 1-(2-(Dimethylamino)ethyl)-5-(7-(2-fluoro-4-nitrophenoxy)thieno[3,2-*b*]pyridin-2-yl)pyridin-2(1*H*)-one (**421**)

[0492] The pyridinone **420** (0.283g, 0.739mmol), 2-chloro-*N,N*-dimethylethanamine (0.128 g, 0.887 mmol), cesium carbonate (0.547 g, 1.68 mmol) and sodium iodide (0.132 g, 0.88 mmol) were heated in DMF (10mL) at 70 °C for 3 days. An additional portion of 2-chloro-*N,N*-

dimethylethanamine (64 mg, 0.44 mmol) and cesium carbonate (0.289 g, 0.887 mmol) were added. The reaction mixture was heated for additional 8 hours, cooled to room temperature and evaporated under reduced pressure. The residue was partitioned between water (50mL) and 5% ethanol/dichloromethane. The organic phase was collected, dried over anhydrous Na₂SO₄, filtered and concentrated. The residue was then purified by silica gel chromatography using a 25M Biotage column and a gradient of 3 to 20% methanol in dichloromethane with 1% acetic acid, to provide title compound **421** as a solid material (0.108 g, 32% yield). MS (*m/z*): 228.0 ([M+2H]/2), 455.0(M+H), 477.0 (M+Na).

Step 5. 5-(7-(4-Amino-2-fluorophenoxy)thieno[3,2-*b*]pyridin-2-yl)-1-(2-(dimethylamino)ethyl)pyridin-2(1*H*)-one (**422**)

[0493] To a solution of the nitro compound **421** (0.103 g, 0.227 mmol) in methanol (2 mL) and THF (2 mL) at 0°C was added nickel chloride hexahydrate (0.162 g, 0.681 mmol) followed by sodium borohydride (28 mg, 0.749 mmol). After one hour of stirring at 0°C another portion of nickel chloride hexahydrate (0.108 g, 0.458 mmol) and sodium borohydride (19 mg, 0.50 mmol) were added. The reaction mixture was then stirred at room temperature for 5 hours before it was concentrated and treated with 1N HCl(aq) and dichloromethane. The mixture was stirred for 10 minutes and then basified to pH 10 by the addition of NH₄OH. The basified solution was then extracted with dichloromethane. The extract was dried over anhydrous Na₂SO₄, filtered and concentrated. The residue was purified by flash chromatography (eluent a gradient of 10 to 100% methanol in ethyl acetate) to give the title compound **422** as yellow solid (26 mg, 27% yield). MS (*m/z*): 425.0(M+H).

Step 6. *N*¹-(4-(2-(1-(2-(Dimethylamino)ethyl)-6-oxo-1,6-dihydropyridin-3-yl)thieno[3,2-*b*]pyridin-7-yloxy)-3-fluorophenyl)-*N*³-(2-methoxyphenyl)malonamide (**417**)

[0494] To a solution of compound **422** (25 mg, 0.059 mmol) in DMF (0.5mL) was added the acid **27** (25mg, 0.12mmol), hydroxybenzotriazole (11 mg, 0.071 mmol), then EDC (23 mg, 0.12 mmol). The reaction mixture was stirred at room temperature for 6 hours before the addition of saturated NaHCO₃ (8 mL). The mixture was then extracted with dichloromethane; the extract was dried over anhydrous Na₂SO₄, filtered and concentrated. The residue was then purified by flash chromatography (eluent a gradient of 0 to 20% methanol in dichloromethane) to give title compound **417** as a white solid (19 mg, 53% yield). ¹H NMR: (DMSO-*d*₆) δ(ppm): 10.58 (s, 1H), 9.62 (s, 1H), 8.45 (d, *J* = 5.6Hz, 1H), 8.28 (d, *J* = 2.8Hz, 1H), 8.05 (d, *J* = 8.4Hz, 1H), 7.95 (dd, *J* = 2.8, 9.6Hz, 1H), 7.88-7.84 (m, 2H), 7.45 (t, *J* = 8.8Hz, 1H), 7.43-7.40 (m, 1H), 7.07-7.03 (m, 2H),

6.92-6.88 (m, 1H), 6.60 (d, J = 5.6Hz, 1H), 6.51 (d, J = 9.6Hz 1H), 4.05 (t, J = 6.0Hz, 2H), 3.84 (s, 3H), 3.62 (s, 2H), 2.53 (t, J = 6.4Hz, 2H), 2.47 (s, 6H). MS (*m/z*): 308.5 ([M+2H]/2), 616.1 (M+H).

Pharmaceutical Compositions

[0496] In a third aspect, the invention provides pharmaceutical compositions comprising an inhibitor of VEGF receptor signaling and HGF receptor signaling according to the invention and a pharmaceutically acceptable carrier, excipient, or diluent. Compositions of the invention may be formulated by any method well known in the art and may be prepared for administration by any route, including, without limitation, parenteral, oral, sublingual, transdermal, topical, intranasal, intratracheal, or intrarectal. In certain preferred embodiments, compositions of the invention are administered intravenously in a hospital setting. In certain other preferred embodiments, administration may preferably be by the oral route.

[0497] The characteristics of the carrier will depend on the route of administration. As used herein, the term "pharmaceutically acceptable" means a non-toxic material that is compatible with a biological system such as a cell, cell culture, tissue, or organism, and that does not interfere with the effectiveness of the biological activity of the active ingredient(s). Thus, compositions according to the invention may contain, in addition to the inhibitor, diluents, fillers, salts, buffers, stabilizers, solubilizers, and other materials well known in the art. The preparation of

pharmaceutically acceptable formulations is described in, e.g., Remington's Pharmaceutical Sciences, 18th Edition, ed. A. Gennaro, Mack Publishing Co., Easton, Pa., 1990.

[0498] As used herein, the term pharmaceutically acceptable salts refers to salts that retain the desired biological activity of the above-identified compounds and exhibit minimal or no undesired toxicological effects. Examples of such salts include, but are not limited to, salts formed with inorganic acids (for example, hydrochloric acid, hydrobromic acid, sulfuric acid, phosphoric acid, nitric acid, and the like), and salts formed with organic acids such as acetic acid, oxalic acid, tartaric acid, succinic acid, malic acid, ascorbic acid, benzoic acid, tannic acid, palmoic acid, alginic acid, polyglutamic acid, naphthalenesulfonic acid, naphthalenedisulfonic acid, methanesulfonic acid, p-toluenesulfonic acid and polygalacturonic acid. The compounds can also be administered as pharmaceutically acceptable quaternary salts known by those skilled in the art, which specifically include the quaternary ammonium salt of the formula $--NR^+Z^-$, wherein R is hydrogen, alkyl, or benzyl, and Z is a counterion, including chloride, bromide, iodide, $--O-alkyl$, toluenesulfonate, methylsulfonate, sulfonate, phosphate, or carboxylate (such as benzoate, succinate, acetate, glycolate, maleate, malate, citrate, tartrate, ascorbate, benzoate, cinnamate, mandelate, benzyloate, and diphenylacetate).

[0499] The active compound is included in the pharmaceutically acceptable carrier or diluent in an amount sufficient to deliver to a patient a therapeutically effective amount without causing serious toxic effects in the patient treated. The effective dosage range of the pharmaceutically acceptable derivatives can be calculated based on the weight of the parent compound to be delivered. If the derivative exhibits activity in itself, the effective dosage can be estimated as above using the weight of the derivative, or by other means known to those skilled in the art.

Inhibition of VEGF Receptor Signaling and HGF Receptor Signaling

[0500] In a fourth aspect, the invention provides a method of inhibiting VEGF receptor signaling and HGF receptor signaling in a cell, comprising contacting a cell in which inhibition of VEGF receptor signaling and HGF receptor signaling is desired with an inhibitor of VEGF receptor signaling and HGF receptor signaling according to the invention. Because compounds of the invention inhibit VEGF receptor signaling and HGF receptor signaling, they are useful research tools for *in vitro* study of the role of VEGF receptor signaling and HGF receptor signaling in biological processes.

[0501] Preferably, the method according to the fourth aspect of the invention causes an inhibition of cell proliferation of the contacted cells. The phrase "inhibiting cell proliferation" is used to denote an ability of an inhibitor of VEGF receptor signaling and HGF receptor signaling to retard the growth of cells contacted with the inhibitor as compared to cells not contacted. An assessment of cell proliferation can be made by counting contacted and non-contacted cells using a Coulter Cell Counter (Coulter, Miami, Fla.) or a hemacytometer. Where the cells are in a solid growth (e.g., a solid tumor or organ), such an assessment of cell proliferation can be made by measuring the growth with calipers and comparing the size of the growth of contacted cells with non-contacted cells.

[0502] Preferably, growth of cells contacted with the inhibitor is retarded by at least 50% as compared to growth of non-contacted cells. More preferably, cell proliferation is inhibited by 100% (i.e., the contacted cells do not increase in number). Most preferably, the phrase "inhibiting cell proliferation" includes a reduction in the number or size of contacted cells, as compared to non-contacted cells. Thus, an inhibitor of VEGF receptor signaling and HGF receptor signaling according to the invention that inhibits cell proliferation in a contacted cell may induce the contacted cell to undergo growth retardation, to undergo growth arrest, to undergo programmed cell death (i.e., to apoptose), or to undergo necrotic cell death.

[0503] In some preferred embodiments, the contacted cell is a neoplastic cell. The term "neoplastic cell" is used to denote a cell that shows aberrant cell growth. Preferably, the aberrant cell growth of a neoplastic cell is increased cell growth. A neoplastic cell may be a hyperplastic cell, a cell that shows a lack of contact inhibition of growth *in vitro*, a benign tumor cell that is incapable of metastasis *in vivo*, or a cancer cell that is capable of metastasis *in vivo* and that may recur after attempted removal. The term "tumorigenesis" is used to denote the induction of cell proliferation that leads to the development of a neoplastic growth.

[0504] In some preferred embodiments, the contacted cell is in an animal. Thus, the invention provides a method for treating a cell proliferative disease or condition in an animal, comprising administering to an animal in need of such treatment a therapeutically effective amount of a VEGF receptor signaling and HGF receptor signaling inhibitor of the invention. Preferably, the animal is a mammal, more preferably a domesticated mammal. Most preferably, the animal is a human.

[0505] The term "cell proliferative disease or condition" is meant to refer to any condition characterized by aberrant cell growth, preferably abnormally increased cellular proliferation. Examples of such cell proliferative diseases or conditions amenable to inhibition and treatment

include, but are not limited to, cancer. Examples of particular types of cancer include, but are not limited to, breast cancer, lung cancer, colon cancer, rectal cancer, bladder cancer, leukemia and renal cancer. In particularly preferred embodiments, the invention provides a method for inhibiting neoplastic cell proliferation in an animal comprising administering to an animal having at least one neoplastic cell present in its body a therapeutically effective amount of a VEGF receptor signaling and HGF receptor signaling inhibitor of the invention.

ASSAY EXAMPLES

Assay Example 1

Inhibition of c-met and VEGF Activity

[0506] The following protocols were used to assay the compounds of the invention.

In Vitro Receptor Tyrosine Kinase Assays (c-Met/HGF receptor and VEGF receptor KDR)

[0507] These tests measure the ability of compounds to inhibit the enzymatic activity of recombinant human c-Met/HGF receptor and VEGF receptor enzymatic activity.

[0508] A 1.3-kb cDNA corresponding to the intracellular domain of c-Met or c-Met IC (Genbank accession number NP000236-1 amino acid 1078 to 1337) was cloned into the BamHI/XhoI sites of the pBlueBacHis2A vector (Invitrogen) for the production of a histidine-tagged version of that enzyme. This construct was used to generate recombinant baculovirus using the Bac-N-Blue™ system according to the manufacturer's instructions (Invitrogen).

[0509] The c-Met IC protein was expressed in Hi-5 cells (*Trichoplusia Ni*) upon infection with recombinant baculovirus construct. Briefly, Hi-5 cells grown in suspension and maintained in serum-free medium (Sf900 II supplemented with gentamycin) at a cell density of about 2×10^6 cells/ml were infected with the above-mentioned viruses at a multiplicity of infection (MOI) of 0.2 during 72 hours at 27°C with agitation at 120 rpm on a rotary shaker. Infected cells were harvested by centrifugation at 398g for 15 min. Cell pellets were frozen at -80°C until purification was performed.

[0510] All steps described in cell extraction and purification were performed at 4°C. Frozen Hi-5 cell pellets infected with the C-Met IC recombinant baculovirus were thawed and gently resuspended in Buffer A (20mM Tris pH 8.0, 10% glycerol, 1µg/ml pepstatin, 2µg/ml Aprotinin and leupeptin, 50µg/ml PMSF, 50µg/ml TLCK and 10µM E64, 0.5mM DTT and 1mM Levamisole) using 3 ml of buffer per gram of cells. The suspension was Dounce homogenized

after which it was centrifuged at 22500g, 30 min., 4°C. The supernatant (cell extract) was used as starting material for purification of c-Met IC.

[0511] The supernatant was loaded onto a QsepharoseFF column (Amersham Biosciences) equilibrated with Buffer B (20mM Tris pH 8.0, 10% glycerol) supplemented with 0.05M NaCl. Following a ten column volume (CV) wash with equilibration buffer, bound proteins were eluted with a 5 CV salt linear gradient spanning from 0.05 to 1M NaCl in Buffer B. Typically, the conductivity of selected fractions ranked between 6.5 and 37 mS/cm. This Qsepharose eluate had an estimated NaCl concentration of 0.33M and was supplemented with a 5M NaCl solution in order to increase NaCl concentration at 0.5M and also with a 5M Imidazole (pH 8.0) solution to achieve a final imidazole concentration of 15mM. This material was loaded onto a HisTrap affinity column (GE Healthcare) equilibrated with Buffer C (50mM NaPO₄ pH 8.0, 0.5M NaCl, 10% glycerol) supplemented with 15mM imidazole. After a 10 CV wash with equilibration buffer and an 8 CV wash with buffer C + 40mM imidazole, bound proteins were eluted with an 8 CV linear gradient (15 to 500mM) of imidazole in buffer C. C-Met IC enriched fractions from this chromatography step were pooled based on SDS-PAGE analysis. This pool of enzyme underwent buffer exchange using PD-10 column (GE Healthcare) against buffer D (25mM HEPES pH 7.5, 0.1M NaCl, 10% glycerol and 2mM β-mercaptoethanol) Final C-Met IC protein preparations concentrations were about 0.5 mg/ml with purity approximating 80%. Purified c-Met IC protein stocks were supplemented with BSA at 1mg/ml, aliquoted and frozen at -80°C prior to use in enzymatic assay.

[0512] In the case of VEGF receptor KDR a 1.6-kb cDNA corresponding to the catalytic domain of VEGFR2 or KDR (Genbank accession number AF035121 amino acid 806 to 1356) was cloned into the Pst I site of the pDEST20 Gateway vector (Invitrogen) for the production of a GST-tagged version of that enzyme. This construct was used to generate recombinant baculovirus using the Bac-to-Bac™ system according to the manufacturer's instructions (Invitrogen).

[0513] The GST-VEGFR2₈₀₆₋₁₃₅₆ protein was expressed in Sf9 cells (*Spodoptera frugiperda*) upon infection with recombinant baculovirus construct. Briefly, Sf9 cells grown in suspension and maintained in serum-free medium (Sf900 II supplemented with gentamycin) at a cell density of about 2 X 10⁶ cells/ml were infected with the above-mentioned viruses at a multiplicity of infection (MOI) of 0.1 during 72 hours at 27°C with agitation at 120 rpm on a rotary shaker. Infected cells were harvested by centrifugation at 398g for 15 min. Cell pellets were frozen at -80°C until purification was performed.

[0514] All steps described in cell extraction and purification were performed at 4°C. Frozen Sf9 cell pellets infected with the GST-VEGFR₂₈₀₆₋₁₃₅₆ recombinant baculovirus were thawed and gently resuspended in Buffer A (PBS pH 7.3 supplemented with 1µg/ml pepstatin, 2µg/ml Aprotinin and leupeptin, 50µg/ml PMSF, 50µg/ml TLCK and 10µM E64 and 0.5mM DTT) using 3 ml of buffer per gram of cells. Suspension was Dounce homogenized and 1% Triton X-100 was added to the homogenate after which it was centrifuged at 22500g, 30 min., 4°C. The supernatant (cell extract) was used as starting material for purification of GST-VEGFR₂₈₀₆₋₁₃₅₆.

[0515] The supernatant was loaded onto a GST-agarose column (Sigma) equilibrated with PBS pH 7.3. Following a four column volume (CV) wash with PBS pH 7.3 + 1% Triton X-100 and 4 CV wash with buffer B (50mM Tris pH 8.0, 20% glycerol and 100mM NaCl), bound proteins were step eluted with 5 CV of buffer B supplemented with 5mM DTT and 15mM glutathione. GST-VEGFR₂₈₀₆₋₁₃₅₆ enriched fractions from this chromatography step were pooled based on U.V. trace i.e. fractions with high O.D.₂₈₀. Final GST-VEGFR₂₈₀₆₋₁₃₅₆ protein preparations concentrations were about 0.7 mg/ml with purity approximating 70%. Purified GST-VEGFR₂₈₀₆₋₁₃₅₆ protein stocks were aliquoted and frozen at -80°C prior to use in enzymatic assay.

[0516] Inhibition of c-Met/HGF receptor and VEGFR/KDR was measured in a DELFIA™ assay (Perkin Elmer). The substrate poly(Glu₄,Tyr) was immobilized onto black high-binding polystyrene 96-well plates. The coated plates were washed and stored at 4 °C. During the assay, enzymes were pre-incubated with inhibitor and Mg-ATP on ice in polypropylene 96-well plates for 4 minutes, and then transferred to the coated plates. The subsequent kinase reaction took place at 30 °C for 10-30 minutes. ATP concentrations in the assay were 10 uM for C-Met (5X the K_m) and 0.6 uM for VEGFR/KDR (2X the K_m). Enzyme concentration was 25 nM (C-Met) or 5 nM (VEGFR/KDR). After incubation, the kinase reactions were quenched with EDTA and the plates were washed. Phosphorylated product was detected by incubation with Europium-labeled anti-phosphotyrosine MoAb. After washing the plates, bound MoAb was detected by time-resolved fluorescence in a Gemini SpectraMax reader (Molecular Devices). Compounds were evaluated over a range of concentrations and IC₅₀'s (concentration of compounds giving 50% inhibition of enzymatic activity) were determined.

C-Met phosphorylation cell-based assay

[0517] This test measures the ability of compounds to inhibit HGF stimulated auto-phosphorylation of the c-Met/HGF receptor itself in a whole cell system.

[0518] MNNGHOS cell line expressing TPR-MET fusion protein were purchased from ATCC. The TPR-MET is the product of a chromosomal translocation placing the TPR locus on chromosome 1 upstream of the MET gene on chromosome 7 encoding for its cytoplasmic region catalytic domain. Dimerization of the M_r 65,000 TPR-Met oncoprotein through a leucine zipper motif encoded by the TPR portion leads to constitutive activation of the met kinase. Constitutive autophosphorylation occurs on residues Tyr361/365/366 of TPR-Met. These residues are homologous to Tyr1230/1234/1235 of MET which become phosphorylated upon dimerization of the receptor upon HGF binding.

[0519] Inhibitor of c-Met formulated as 30 mM stocks in DMSO. For MNNGHOS treatments, cells, compounds were added to tissue culture media at indicated doses for 3 hours prior to cell lysis. Cells were lysed in ice-cold lysis buffer containing 50 mM HEPES (pH 7.5), 150 mM NaCl, 1.5 mM MgCl₂, 10 % glycerol, 1 % Triton X-100, 1 mM 4-(2-Aminoethyl)benzenesulfonyl fluoride hydrochloride, 200 μM sodium orthovanadate, 1 mM sodium fluoride, 10 μg/ml of leupeptin, 10 μg/ml of aprotinin/ml, 1 ug/ml of pepstatin and 50ug/ml Na-p-Tosyl-L-lysine chloromethyl ketone hydrochloride.

[0520] Lysate were separated on 5-20% PAGE-SDS and immunoblots were performed using Immobilon P polyvinylidene difluoride membranes (Amersham) according to the manufacturer's instructions for handling. The blots were washed in Tris-buffered saline with 0.1% Tween 20 detergent (TBST). Tyr361/365/366 of TPR-Met were detected with polyclonal rabbit antibodies against tyrosine phosphorylated Met (Biosource International) and secondary antibodies anti-rabbit -horseradish peroxidase (Sigma) by chemiluminescence assays (Amersham, ECL) were performed according to the manufacturer's instructions and followed by film exposure. Signal was quantitated by densitometry on Alpha-Imager. IC₅₀ values were defined as the dose required to obtain 50% inhibition of the maximal HGF stimulated phosphorylated c-Met levels.

In Vivo Solid Tumor Disease Model

[0521] This test measures the capacity of compounds to inhibit solid tumor growth.

[0522] Tumor xenografts are established in the flank of female athymic CD1 mice (Charles River Inc.), by subcutaneous injection of 1×10^6 U87, A431 or SKLMS cells/mouse. Once established, tumors are then serially passaged s.c. in nude mice hosts. Tumor fragments from these host animals are used in subsequent compound evaluation experiments. For compound evaluation experiments female nude mice weighing approximately 20g are implanted s.c. by surgical implantation with tumor fragments of ~30 mg from donor tumors. When the tumors are approximately 100 mm³ in size (~7-10 days following implantation), the animals are randomized and separated into treatment and control groups. Each group contains 6-8 tumor-bearing mice, each of which is ear-tagged and followed individually throughout the experiment.

[0523] Mice are weighed and tumor measurements are taken by calipers three times weekly, starting on Day 1. These tumor measurements are converted to tumor volume by the well-known formula $(L+W/4)^2 \times \pi / 3$. The experiment is terminated when the control tumors reach a size of approximately 1500 mm³. In this model, the change in mean tumor volume for a compound treated group / the change in mean tumor volume of the control group (non-treated or vehicle treated) x 100 ($\Delta T / \Delta C$) is subtracted from 100 to give the percent tumor growth inhibition (%TGI) for each test compound. In addition to tumor volumes, body weight of animals is monitored twice weekly for up to 3 weeks.

[0524] The activities of a number of compounds according to the invention measured by various assays are displayed in Table 21 and Table 22. In these tables, "a" indicates inhibitory activity at a concentration of less than 50 nanomolar; "b" indicates inhibitory activity at a concentration ≥ 50 but < 250 nanomolar, "c" indicates inhibitory activity at ≥ 250 but < 500 and "d" indicates inhibitory activity at a concentration of ≥ 500 nanomolar; and "e" indicates no activity as measured by that assay.

[0525] HGF has well known activity in terms of inducing scattering and migration (wound healing) (Wells et al., Cell Motil Cytoskeleton. 2005 Nov 62(3):180-94; Miura et al., Urology 2001 Dec 58(6):1064-9; Nishimura et al., Int J Urol. 1998 May 5(3):276-81; Wang et al., Mol Cancer Ther. 2003 Nov;2(11):1085-92; and Christensen et al., Cancer Res. 2003 Nov 1;63(21):7345-55). Assays to evaluate inhibitor ability to block these HGF dependent activities have been employed and follow the methods employed in Christensen et al. For Table 22, for columns directed to A549 wound healing inhibition and DU145 scattering inhibition, IC₅₀ values are in mM, with "A" indicating IC₅₀ of less than 1 mM, "B" indicating IC₅₀ of ≥ 1 mM but < 5 mM, "C" indicating IC₅₀ of ≥ 5 mM but < 10 mM, and "D" indicating IC₅₀ of ≥ 10 mM.

[0526] In Table 23 "a" indicates % TGI in the range of 75-100; "b" indicates % TGI in the range of 50-74; "c" indicates % TGI in the range of 25-49, and "d" indicates % TGI in the range of 0-24. Regimen of administration was once daily.
