2-AMINOBENZOXAZOLE CARBOXAMIDES AS 5HT3 MODULATORS

CROSS-REFERENCE TO RELATED APPLICATIONS

[0001] This application clams priority from U.S. Provisional Application Serial Number 60/821,646, filed August 7, 2006, the entire contents of which are incorporated herein by reference.

FIELD OF THE INVENTION

[0002] The invention relates to a genus of 2-aminobenzoxazole carboxamides that are useful in treating chemotherapy-induced nausea and vomiting (CINV) and in treating diarrhea-predominant Irritable Bowel Syndrome (IBS-D).

BACKGROUND OF THE INVENTION

[0003] Nausea and vomiting caused by chemotherapy remain among the most distressing side effects for patients undergoing treatment for cancer. Depending upon the chemotherapy agents or regimens given, up to 90% of patients may suffer from some form of chemotherapy-induced nausea and vomiting (CINV). Symptoms from CINV can be severely debilitating and often result in patients refusing further courses of chemotherapy, with obviously unfavorable consequences with respect to progression of the cancer. Furthermore, CINV is burdensome on the medical system, consuming time from the healthcare staff, who could otherwise attend to other patients or medical issues.

[0004] CINV is divided into two main categories: acute CINV and delayed CINV. Acute CINV occurs within the first 24 hours of treatment; delayed CINV occurs from 24 hours to 120 hours following treatment. Delayed CINV remains a highly under- treated side effect in patients undergoing chemotherapy, as healthcare providers tend to underestimate the number of patients who suffer from delayed CINV. Furthermore, delayed CINV greatly impairs patients' ability to provide care to themselves once they have been discharged.

[0005] Compounds that inhibit serotonin receptors are currently the most effective anti-emetics; they constitute the single greatest advance in the management of nausea and vomiting in patients with cancer and have had additional application in radiation-induced nausea and vomiting (RINV) and post-operative nausea and vomiting (PONV). Blocking the 5-HT3 receptor from the serotonin signal produced from chemotherapy-induced damage to the gut's enterochromaffin cells, which house the majority of the body's serotonin reserves, via either a peripheral or central mechanism appears to prevent acute emesis. Except for palonosetron (Aloxi®), 5-HT3 inhibitors have been approved for and most effective against the treatment of acute CINV. Palonosetron, which must be given intravenously, is the only 5-HT3 inhibitor currently approved for the prevention of both acute and delayed CINV. The efficacy of palonosetron against delayed emesis has been postulated to be due to its long serum half-life. Therefore persons of skill in the art accept that 5-HT3 inhibitors that have long serum half-lives will be effective therapeutic agents for both acute and delayed CINV, while those that have short half-lives will be useful to treat acute CINV. In addition, the combination of palonosetron, a 5-HT3 inhibitor, and aprepitant (EMEND®), a neurokinin antagonist, has been shown to be highly effective in preventing both acute and delayed CINV following a variety of moderately to highly emetogenic chemotherapy regimens in clinical trials. Notably, combination therapy of either NKl antagonists or 5-HT3 antagonists with corticosteroids such as dexamethasone, improve the performance of these drugs against acute or delayed emesis. To that point, EMEND® labeling indicates that the drug is dosed with a corticosteroid and a 5-HT3 antagonist.

[0006] Irritable Bowel Syndrome (IBS) generally occurs in three types: diarrhea predominant (IBS-D), constipation predominant (IBS-C) and IBS with alternating symptoms termed IBS-A or mixed-mode (IBS-M). Diarrhea predominant Irritable Bowel Syndrome is a debilitating, though seldom fatal, disease. The typical sufferer of IBS-D exhibits primary symptoms including multiple and daily explosive diarrhea attacks and severe daily abdominal cramps. The most common secondary side effects include panic attacks, depression, withdrawal from social and family activities and malnutrition.

[0007] At present, compounds that inhibit 5-HT3 receptors are the only effective treatment for IBS-D. The only drug currently approved for IBS-D is alosetron, which was introduced by Glaxo, withdrawn by the FDA because it appeared to cause ischemic colitis, then reinstated by the FDA because the demand was so great for some treatment for IBS-D. In 2002, the US Food and Drug Administration approved alosetron hydrochloride (LOTRONEX®) tablets under restricted conditions for women in whom the medical benefits outweigh the risks. The restrictions on the approval reflect the serious gastrointestinal adverse events that have been reported with the use of alosetron. A second structurally related 5-HT3 inhibitor, cilansetron, had been making its way through clinical trials and recently received a non-approvable letter from the FDA. New, structurally unrelated 5-HT3 inhibitors may be useful for the treatment of IBS-D.

[0008] Clearly there is a need for improved therapy for both CINV and IBS-D.

SUMMARY OF THE INVENTION

[0009] It has now been found that compounds of formulae I, II and III are potent and selective inhibitors of the 5-HT3 receptor:

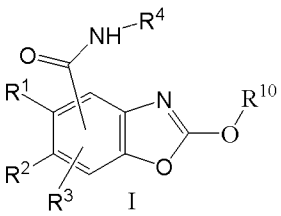
Exemplary disorders arising from inappropriate activity of the serotonin type 3 receptor or dependent upon modulation of the serotonin type 3 receptor include emesis, particularly CINV, IBS-D, post-operative induced nausea and vomiting and radiation induced nausea and vomiting. Other such disorders include psychological

disorders, obesity, substance abuse disorders, dementia associated with a neurodegenerative disease, cognition loss, pain, fibromyalgia syndrome and chronic fatigue syndrome (see US published application 2004/0204467). Serotonin type 3 receptor antagonists are also known to be useful for the prevention and treatment of bronchial asthma, bulimia nervosa, sleep apnea, pruritis and migraine (see Costall and Naylor, Current Drug Targets - CNS & Neurological Disorders, 2004:3 27-37 and Israili, Current Med. Chem. - CNS Agents, 2001:1 171-199.). Serotonin type 3 receptor antagonists are also known to be useful for the prevention and treatment of epilepsy. Application of such compounds for the treatment of epilepsy has been demonstrated in International Application Number PCT/GB2006/002733.

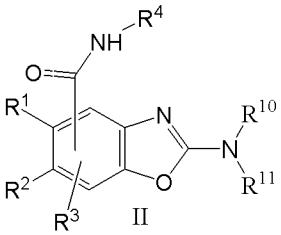
DETAILED DESCRIPTION OF THE INVENTION

[0014] Throughout this specification the substituents are defined when introduced and retain their definitions.

[0015] In a first aspect the invention relates to compounds of formula I, II, or III:



I



II

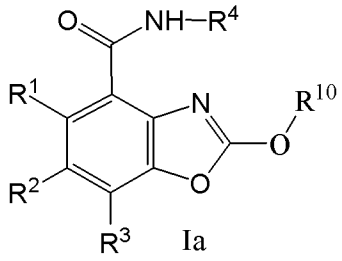
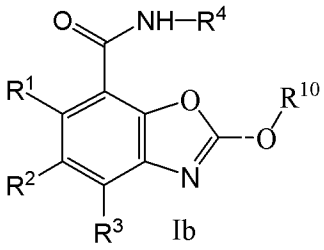
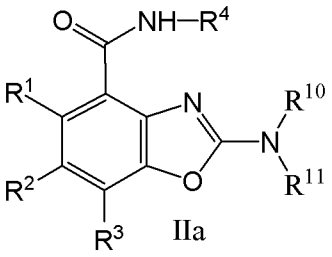
In general, it has been found that compounds of the foregoing formulae are potent and selective inhibitors of the 5-HT3 receptor. Each of the three genera may be divided into two subgenera: the 4-carboxamides (Ia, Ha, and Ilia) and the 7-carboxamides (Ib, lib, and IHb):



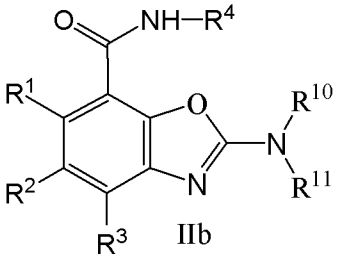
Ia



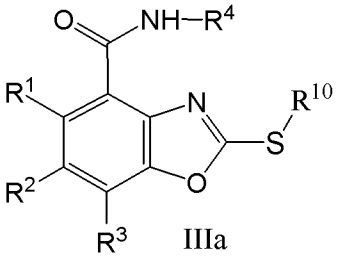
Ib



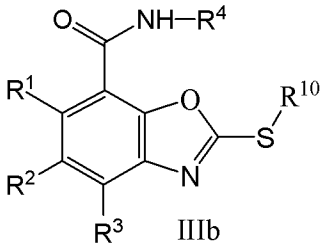
IIa



IIb

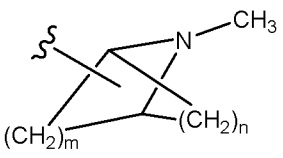


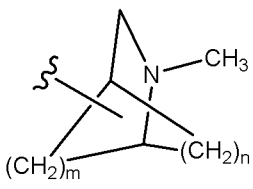
IIIa

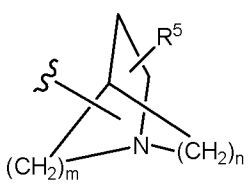


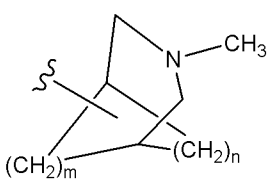
IIIb

[0016] In these compounds, R_4 represents a saturated nitrogen heterocycle or methyl-substituted saturated nitrogen heterocycle, in which the nitrogen is tertiary. A nitrogen heterocycle (also referred to as a nitrogenous heterocycle) is a heterocycle containing at least one nitrogen in the ring; it may contain additional nitrogens, as well as other heteroatoms. Nitrogenous heterocycles include piperidine, methylpiperidine, tropane, 9-azabicyclo[3.3.1]nonan-3-one, and 
, in which X is NCH3, O, S, SO or SO_2. In some embodiments, R_4 is

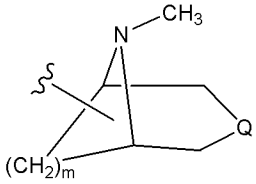








and



in which m is 1, 2, 3 or 4; n is 0, 1, 2, 3 or 4; Q is N(CHs) or -O-; and R_5 is hydrogen or methyl. For example, R_4 may be quinuclidine, tropane, azabicyclo[3.3.1]nonane, methyl azabicyclo[3.3.1]nonane, dimethyl diazabicyclo[3.3.1]nonane, methylpiperidine or methyl-3-oxa-9-azabicyclo[3.3.1]nonane.

[0017] In some embodiments, R_1, R_2, and R_3 are hydrogen; in others one of R_1, R_2, and R_3 is halogen.

[0018] In some embodiments of the parent genus, Rio is chosen from the group consisting of hydrogen and (Ci to C3)alkyl. In other embodiments of the genus II, Rn is H or CH3 and Rio is chosen from the group consisting of phenyl, substituted phenyl, (Ci-C6)alkyl, 4 to 7-membered monocyclic nitrogenous heterocycle, 4 to 10 carbon bicyclic nitrogenous heterocycle, 4 to 7-membered monocyclic nitrogenous heterocycle substituted with one or more (Ci-C6)alkyl , 4 to 10 carbon bicyclic nitrogenous heterocycle substituted with one or more (Ci-C6)alkyl, dimethylamino(Ci-C6)alkyl, 4 to 7-membered monocyclic nitrogenous heterocyclyl(Ci-C_6)alkyl, (C_1-C_6)alkoxy(C_1-C_6)alkyl, hydroxy(Ci-C_6)alkyl, and dialkylaminocarbonyl(Ci-C_6)alkyl.

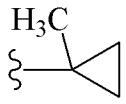
[0019] In other embodiments, Rio and Rn, taken together, form a nitrogenous heterocycle or substituted nitrogenous heterocycle. Examples include morpholine, piperazine, piperidine, diazepane, tetrahydroquinoxaline, azabicyclo[3.3.1]nonane, triazolopyrazine, diazabicyclo[2.2.1]heptane, or any of the foregoing substituted with one, two or three substituents chosen independently from (Ci-C6)alkyl, (C_1-C_6)haloalkyl , (Ci-C_6)alkoxy phenyl, heteroaryl, substituted heteroaryl, heterocyclyl, and substituted heterocyclyl.

[0020] Compounds falling within the foregoing parent genus and its subgenera are useful as 5-HT3 inhibitors. It may be found upon examination that compounds that are not presently excluded from the claims are not patentable to the

inventors in this application. In that case, the exclusion of species and genera in applicants' claims are to be considered artifacts of patent prosecution and not reflective of the inventors' concept or description of their invention. The invention, in a composition aspect, is all compounds of formulae I, II and III, except (a) those compounds that are in the public's possession, and (b) the single species of example 55, falling within the subgenus Ha, in which Ri_0, Rn and nitrogen form a morpholine ring and R_4 appears (based on NMR data) to be *endo* 3,9-dimethyl-3,9-diazabicyclo[3.3.1]nonan-7-yl. This compound has not exhibited the level of potency established as the threshold for the screen.

DEFINITIONS

[0021] Alkyl is intended to include linear, branched, or cyclic hydrocarbon structures and combinations thereof. Lower alkyl refers to alkyl groups of from 1 to 6 carbon atoms. Examples of lower alkyl groups include methyl, ethyl, propyl, isopropyl, butyl, s-and t-butyl and the like. Preferred alkyl groups are those OfC_2Oor below. Cycloalkyl is a subset of alkyl and includes cyclic hydrocarbon groups of from 3 to 8 carbon atoms. Examples of cycloalkyl groups include c-propyl, c-butyl, c-pentyl, norbornyl and the like. Certain moieties require explicit mention. The statement that alkyl is intended to include linear, branched, or cyclic hydrocarbon structures and combinations thereof means that the following combination of linear and cyclic structural elements



(and similar combinations) is considered an "alkyl" group. Ci to C_20 hydrocarbon includes alkyl, cycloalkyl, alkenyl, alkynyl, aryl and combinations thereof. Examples include phenethyl, cyclohexylmethyl, camphoryl and naphthylethyl.

[0022] Alkoxy or alkoxyl refers to groups of from 1 to 8 carbon atoms of a straight, branched, cyclic configuration and combinations thereof attached to the parent structure through an oxygen. Examples include methoxy, ethoxy, propoxy,

isopropoxy, cyclopropyloxy, cyclohexyloxy and the like. Lower-alkoxy refers to groups containing one to four carbons.

[0023] Oxaalkyl refers to alkyl residues in which one or more carbons has been replaced by oxygen. Examples include methoxypropoxy, 3,6,9-trioxadecyl and the like.

[0024] Acyl refers to groups of from 1 to 8 carbon atoms of a straight, branched, cyclic configuration, saturated, unsaturated and aromatic and combinations thereof, attached to the parent structure through a carbonyl functionality. One or more carbons in the acyl residue may be replaced by nitrogen, oxygen or sulfur as long as the point of attachment to the parent remains at the carbonyl. Examples include acetyl (Ac), benzoyl, propionyl, isobutyryl, t-butoxycarbonyl, benzyloxycarbonyl and the like. Lower-acyl refers to groups containing one to four carbons.

[0025] Aryl and heteroaryl mean a 5- or 6-membered aromatic or heteroaromatic ring containing 0-3 heteroatoms selected from O, N, or S; a bicyclic 9- or 10-membered aromatic or heteroaromatic ring system containing 0-3 heteroatoms selected from O, N, or S; or a tricyclic 13- or 14-membered aromatic or heteroaromatic ring system containing 0-3 heteroatoms selected from O, N, or S. The aromatic 6- to 14-membered carbocyclic rings include, e.g., benzene, naphthalene, indane, tetralin, and fluorene and the 5- to 10-membered aromatic heterocyclic rings include, e.g., imidazole, pyridine, indole, thiophene, benzopyranone, thiazole, furan, benzimidazole, quinoline, isoquinoline, quinoxaline, pyrimidine, pyrazine, tetrazole and pyrazole.

[0026] Arylalkyl refers to a residue in which an aryl moiety is attached to the parent through an alkyl. Examples are benzyl, phenethyl and the like. Tolyl is not arylalkyl; tolyl is alkylaryl. Hetero arylalkyl means a heteroaryl residue attached to the parent via alkyl. Examples include, e.g., pyridinylmethyl, pyrimidinyl ethyl and the like.

[0027] Heterocycle means a cycloalkyl or aryl residue of one to three rings in which from one to four carbons is replaced by a heteroatom selected from the group consisting of N, O and S. The nitrogen and sulfur hetero atoms may optionally be oxidized, and the nitrogen heteroatom may optionally be quaternized. Examples of heterocycles include pyrrolidine, pyrazole, pyrrole, indole, quinoline, isoquinoline, tetrahydroisoquinoline, benzofuran, benzodioxan, benzodioxole (commonly referred to as methylenedioxyphenyl, when occurring as a substituent), tetrazole, morpholine, thiazole, pyridine, pyridazine, pyrimidine, thiophene, furan, oxazole, oxazoline, isoxazole, dioxane, tetrahydrofuran and the like. Nitrogen heterocycles are heterocycles containing at least one nitrogen. They may additionally include other heteroatoms and multiple nitrogens. Examples include quinuclidine, tropane, piperidine, piperazine, morpholine, quinoline, benzo[b][l,4]oxazine, 1,2,4-triazolo[4,3-a]pyrazine, perhydroquinoxaline and thiazole. It is to be noted that heteroaryl is a subset of heterocycle in which the heterocycle is aromatic. Dihydroheteroaryl are, as the name implies, heteraryl residues formally reduced by one mole of hydrogen. An example of a dihydroheteroaryl residue is 2,3-dihydrobenzofuran.

[0028] Substituted alkyl, aryl, cycloalkyl, heterocyclyl etc. refer to alkyl, aryl, cycloalkyl, or heterocyclyl wherein up to four H atoms in each residue are replaced with halogen, haloalkyl, hydroxy, loweralkoxy, carboxy, alkoxycarbonyl (COOR), oxo, carboxamido (-$CONR_2$), sulfonamido (-SO2NR2), cyano, carbonyl, nitro, amino, alkylamino, dialkylamino, mercapto, alkylthio, sulfoxide, sulfone, acylamino, amidino, phenyl, benzyl, heterocyclyl, heterocycylylcarbonyl, phenoxy, benzyloxy, or hetero aryloxy. In the foregoing listing, R is hydrogen or alkyl.

[0029] The term "halogen" means fluorine, chlorine, bromine or iodine.

[0030] Some of the compounds described herein may contain one or more asymmetric centers and may thus give rise to enantiomers, diastereomers, and other stereoisomeric forms that may be defined, in terms of absolute stereochemistry, as (R)- or (S)-. The present invention is meant to include all such possible isomers, as well as, their racemic and optically pure forms. Optically active (R)- and (S)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using

conventional techniques. When the compounds described herein contain olefinic double bonds or other centers of geometric asymmetry, and unless specified otherwise, it is intended that the compounds include both E and Z geometric isomers. Likewise, all tautomeric forms are also intended to be included. The configuration of any carbon-carbon double bond appearing herein is selected for convenience only and is not intended to designate a particular configuration; thus a carbon-carbon double bond depicted arbitrarily herein as trans may be Z, E or a mixture of the two in any proportion.

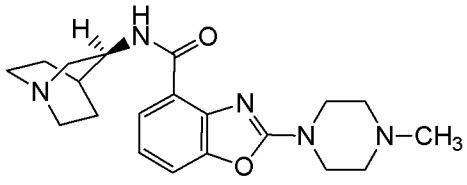
[0031] It will be recognized that the compounds of this invention can exist in radiolabeled form, i.e., the compounds may contain one or more atoms containing an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Radioisotopes of hydrogen, carbon, phosphorous, fluorine, chlorine and iodine include ^{3}H, ^{14}C, ^{35}S, ^{18}F, ^{36}Cl and ^{125}I, respectively. Compounds that contain those radioisotopes and/or other radioisotopes of other atoms are within the scope of this invention. Tritiated, i.e. ^{3}H, and carbon-14, i.e., ^{14}C, radioisotopes are particularly preferred for their ease in preparation and detectability. Radiolabeled compounds of this invention can generally be prepared by methods well known to those skilled in the art. Conveniently, such radiolabeled compounds can be prepared by carrying out the procedures disclosed in the Examples and Schemes by substituting a readily available radiolabeled reagent for a non-radiolabeled reagent.

[0032] Terminology related to "protecting", "deprotecting" and "protected" functionalities occurs throughout this application. Such terminology is well understood by persons of skill in the art and is used in the context of processes, which involve sequential treatment with a series of reagents. In that context, a protecting group refers to a group, which is used to mask a functionality during a process step in which it would otherwise react, but in which reaction is undesirable. The protecting group prevents reaction at that step, but may be subsequently removed to expose the original functionality. The removal or "deprotection" occurs after the completion of the reaction or reactions in which the functionality would interfere. Thus, when a sequence of reagents is specified, as it is in the processes of the invention, the person of ordinary skill can readily envision those groups that would be suitable as "protecting groups". Suitable groups for that purpose are discussed in standard

textbooks in the field of chemistry, such as Protective Groups in Organic Synthesis by T.W. Greene [John Wiley & Sons, New York, 1991], which is incorporated herein by reference.

[0033] The term "preventing" as used herein refers to administering a medicament beforehand to forestall or obtund an attack. The person of ordinary skill in the medical art (to which the present method claims are directed) recognizes that the term "prevent" is not an absolute term. In the medical art it is understood to refer to the prophylactic administration of a drug to substantially diminish the likelihood or seriousness of a condition, and this is the sense intended herein. Indeed, the 2006 edition of the Physician's Desk Reference, which is the standard text in the field, employs the term "prevent", or "prevention" not less than 10 times in its description of the indications for palonosetron.

[0034] The graphic representations of racemic, ambiscalemic and scalemic or enantiomerically pure compounds used herein are taken from Maehr J. Chem. Ed. 62, 114-120 (1985): solid and broken wedges are used to denote the absolute configuration of a chiral element; wavy lines indicate disavowal of any stereochemical implication which the bond it represents could generate; solid and broken bold lines are geometric descriptors indicating the relative configuration shown but denoting racemic character; and wedge outlines and dotted or broken lines denote enantiomerically pure compounds of indeterminate absolute configuration. A simple solid line implies nothing about stereochemistry. For example, a solid line is shown in the graphic for example 2 in the table below, but the compound of the example is actually a single enantiomer of the S configuration and could have been accurately depicted as



[0035] As used herein, and as would be understood by the person of skill in the art, the recitation of "a compound" is intended to include salts, solvates and

inclusion complexes of that compound. The term "solvate" refers to a compound of Formula I in the solid state, wherein molecules of a suitable solvent are incorporated in the crystal lattice. A suitable solvent for therapeutic administration is physiologically tolerable at the dosage administered. Examples of suitable solvents for therapeutic administration are ethanol and water. When water is the solvent, the solvate is referred to as a hydrate. In general, solvates are formed by dissolving the compound in the appropriate solvent and isolating the solvate by cooling or using an antisolvent. The solvate is typically dried or azeotroped under ambient conditions. Inclusion complexes are described in Remington: The Science and Practice of Pharmacy 19th Ed. (1995) volume 1, page 176-177, which is incorporated herein by reference. The most commonly employed inclusion complexes are those with cyclodextrins, and all cyclodextrin complexes, natural and synthetic, are specifically encompassed within the claims.

[0036] The term "pharmaceutically acceptable salt" refers to salts prepared from pharmaceutically acceptable non-toxic acids or bases including inorganic acids and bases and organic acids and bases. When the compounds of the present invention are basic, salts may be prepared from pharmaceutically acceptable non-toxic acids including inorganic and organic acids. Suitable pharmaceutically acceptable acid addition salts for the compounds of the present invention include acetic, benzenesulfonic (besylate), benzoic, camphorsulfonic, citric, ethenesulfonic, fumaric, gluconic, glutamic, hydrobromic, hydrochloric, isethionic, lactic, maleic, malic, mandelic, methanesulfonic, mucic, nitric, pamoic, pantothenic, phosphoric, succinic, sulfuric, tartaric acid, p-toluenesulfonic, and the like. When the compounds contain an acidic side chain, suitable pharmaceutically acceptable base addition salts for the compounds of the present invention include metallic salts made from aluminum, calcium, lithium, magnesium, potassium, sodium and zinc or organic salts made from lysine, N,N'-dibenzylethylenediamine, chloroprocaine, choline, diethanolamine, ethylenediamine, meglumine (N-methylglucamine) and procaine.

[0037] A comprehensive list of abbreviations utilized by organic chemists appears in the first issue of each volume of the Journal of Organic Chemistry. The list, which is typically presented in a table entitled "Standard List of Abbreviations" is incorporated herein by reference.

[0050] General Procedure (GP-C2) for amidation:

[0051] A mixture of the carboxylic acid or lithium carboxylate salt A3 (1 eq), an appropriate amine (e.g. mio-3-amino-9-methyl-9-azabicyclo[3.3.1]nonane dihydrochloride) (1 eq), and HBTU (1.3-2 eq) in DMF was stirred at room temperature for 5 min, then triethylamine (2 to 4 eq) was added. The resulting reaction mixture was stirred at room temperature for 12 h. The mixture was diluted with dichloro methane, and then washed with a saturated solution of sodium bicarbonate. The aqueous layer was further extracted with dichloromethane. The combined organics were dried (Na_2SO_4), filtered and concentrated. The crude material was purified by silica gel chromatography (typical eluents ethyl acetate/hexanes, ethyl acetate/methanol, dichloromethane, dichloromethane/methanol or dichloromethane/methanol/concentrated ammonium hydroxide) to afford the desired carboxamide A4. The product structure was verified by ^{1}H NMR.

[0052] General Procedure (GP-Dl) for conversion to the HCl salt:

[0053] To an ice-cold solution of the carboxamide A4 (1 eq) in dichloromethane and ethyl ether was added hydrogen chloride (2 eq) in methanol. The mixture was stirred at room temperature for 5 min, and then diluted with anhydrous ethyl ether. The mixture was left at room temperature for 2 h, and then the resulting precipitate was collected by filtration and washed with ethyl ether. The solid was dried under vacuum to afford the desired A4 hydrochloride salt. The product was verified by mass analysis and ^{1}H NMR.

[0054] General Procedure (GP-D2) for conversion to the HCl salt:

[0055] An ice-cold solution of the Boc-protected carboxamide from GP-C (1 eq) was treated with an excess of either TFA or HCl (in diethyl ether, dioxane or methanol) in dichloromethane. The crude salt was diluted with methanol and loaded onto a cation exchange resin (Isolute SCX-2, 1Og Column). The column was washed with methanol (50 mL) and the product then eluted with 2 N ammonium hydroxide in methanol (50 mL). The solution was concentrated under reduced pressure. The crude material was purified by silica gel chromatography (typical eluents

dichloromethane/methanol, dichloromethane/methanol/concentrated ammonium hydroxide) to afford the desired carboxamide. The carboxamide was subsequently treated with HCl (1-2 equivalents) in dichloromethane and concentrated under reduced pressure. The amorphous hydrochloride salt was lyophilized from acetonitrile/water (6:1) to afford the desired A4 hydrochloride salt. The product was verified by mass analysis and ^{1}H NMR.

[0056] General procedure (GP-E) for acylation of e«<io-N-(9-methyl-9-azabicyclo[3.3.1]nonan-3-yl)-2-((25',65)-2,6-dimethyl-piperazin-l-yl)benzoxazole-4-carboxamide:

[0057] To an ice-cold mixture of e«<io-N-(9-methyl-9-azabicyclo[3.3.1]nonan-3-yl)-2-((25',65)-2,6-dimethylpiperazin-l-yl)benzoxazole-4-carboxamide and triethylamine in CH_2Cl_2 was added the appropriate acyl chloride, chloroformate, or sulfonyl chloride. The mixture was allowed to warm to ambient temperature and then stirred for up to an additional 24 h. The reaction was quenched with CH_3OH/brine and the resulting mixture extracted with dichloromethane (2x). The combined organic layers were washed successively with 10% citric acid and brine, then dried (Na_2SO_4), filtered, and concentrated under reduced pressure. Purification by column chromatography (silica gel, 9:1 CH_2Cl_2ZCH$_3$OH to 90:9:1 CH_2C 1$_2$/CH_3OH/NH_4OH) afforded the corresponding e«<io-N-(9-methyl-9-azabicyclo[3.3.1]nonan-3-yl)-2-((25',65)-2,6-dimethyl-4-acylpiperazin-l-yl)benzoxazole-4-carboxamide.

The reaction was cooled in an ice-bath and excess hydride reagent was quenched by careful, dropwise addition of H2O (5 mL), 15% sodium hydroxide (5 mL) and H_2O (15 mL). The resulting mixture was stirred at room temperature for 1 h and the reaction mixture was filtered through a pad of Celite and the pad rinsed with EtOAc (100 mL). [00697] Compound Affinity for the human 5-HT3 Receptor (Assay A)

[00698] Compounds were tested by MDS Pharma Services - Taiwan Ltd., 158 Li-The Road, Peitou, Taipei, Taiwan 112 R.O.C. In order to evaluate the relative affinity of the various compounds for the human 5-HT3 receptor, N1E-155 cell lines were developed to express the target protein. For binding, these cells were homogenized, centrifuged and washed with buffer (20 mM HEPES, 150 mM NaCl, pH 7.4) then suspended in 0.5mL of buffer and [3H]-GR65630 added at a concentration of 3.5x10-10 M. An initial single concentration of 10 -7 M of the test compound was then added. Incubation was carried out at room temperature for 60 minutes at 25 oC then was terminated by rapid removal of the incubation medium.

Radioactivity was assessed using liquid scintillation spectrophotometry after exposure to scintillation cocktail for at least three hours. Compounds displaying greater than 75% inhibition of radioligand binding at 10 -7 M were then resubmitted to the above protocol using the following range of test compound concentrations: 10-9 M, 10-8 M, 3x10-8 M, 10-7 M, 3x10-7 M and 10-6 M. Competition curves were then plotted and IC50 determinations made using non-linear regression analysis. Ki values were then calculated from the Cheng-Prusoff equation. In all of the above binding studies the non-specific determinant was MDL-72222 (1.0 μM).

[00699] Compound Affinity for the human 5-HT3 Receptor (Assay **B)**

[00700] The relative affinity of the various compounds for the human 5-HT3 receptor was measured in a radioligand binding assay, using a scintillation proximity assay (SPA) format. Test compounds were dissolved to 10 mM in 100% DMSO, then serially diluted at 10x assay concentrations in 100% DMSO in 96-well polypropylene plates and further diluted to 4x assay concentrations with the assay buffer. Samples were incubated in 50 mM Tris-HCl, pH 7.5, 3 mM MgC12, 1 mM EDTA and 10% DMSO with 10 nM [9-methyl-3H]BRL-43694 (Perkin Elmer), 3 μg of human 5-HT3 receptor membranes (Perkin Elmer) and 0.5 mg/mL SPA beads (WGA PVT, Amersham Biosciences) in a final volume of 0.2 mL. Binding reactions were set up in wells of PicoPlates-96 (Perkin Elmer) by adding consecutively 50 μL of each competing compound or buffer, SPA beads, the radioligand and 5-HT3 receptor membranes. After 60-min incubation at room temperature on a Nutator mixer, plates were centrifuged for 15 min at 1,500 rpm, followed by incubation in the dark for 30 min. Radioactivity was counted in the TopCount microplate counter (Perkin Elmer) for 5 min. Total binding control contained buffer only; nonspecific binding was determined in the presence of 30 μM MDL-72222. Specific binding was determined by subtracting nonspecific binding from total binding. All experiments were performed in duplicate using ten concentrations of a competing ligand, with ondansetron included as a control in every run. IC50 values were determined from specific binding data using XLfit4.1 curve fitting software from IDBS Ltd. Ki values were then calculated from the Cheng-Prusoff equation.

The non-specific binding determinant was MDL 72222. Compounds were tested at a single concentration of 100 nM in duplicate. Percent inhibition is reported. In order to evaluate the relative affinity of the various compounds for the 5-HT3 receptor, NlE-155 cell lines were developed to express the target protein. For binding, these cells were homogenized, centrifuged and washed with buffer (20 mM HEPES, 150 mM NaCl, pH 7.4) then suspended in 0.5mL of buffer and [3H]-GR65630 added at a concentration of 3.5x10-10 M. An initial single concentration of 10 -7 M of the test compound was then added. Incubation was carried out at room temperature for 60 minutes at 25 oC then was terminated by rapid removal of the incubation medium. Radioactivity was assessed using liquid scintillation spectrophotometry after exposure to scintillation cocktail for at least three hours. Compounds displaying greater than 75% inhibition of radioligand binding at 10 -7 M were then resubmitted to the above protocol using the following range of test compound concentrations: 10-9 M, 10-8 M, 3x10-8 M, 10-7 M, 3x10-7 M and 10-6 M. Competition curves were then plotted and IC50 determinations made using non-linear regression analysis. Ki values were then calculated from the Cheng-Prusoff equation. In all of the above binding studies the non-specific determinant was MDL-72222 (1.0 μM).

[00704] Bezold-Jarisch Assay *in vivo.* In order to demonstrate functional antagonism of 5-HT_3 receptors, compounds (see below) were evaluated for their ability to inhibit serotonin induced bradycardia *in vivo* in the mouse [Saxena, P.R. and Lawang, A. A comparison of cardiovascular and smooth muscle effects of 5-hydroxytryptamine and 5-carboxamidotryptamine, a selective agonist of 5-HTi receptors. Arch. Int. Pharmacodyn. 277: 235-252, 1985]. Test substances and vehicle

[2 %Tween 80] were each administered orally (0.3 to 3 mg/kg) to a group of 5 male or female CD-I(CrI.) mice each weighing 24 ± 2 g. A dosing volume of 10 mL/kg was used. Sixty minutes later, 5-HT (0.1 mg/kg IV)-induced bradycardia was recorded in urethane (2225-2500 mg/kg IP, given 10 minutes before 5-HT)-anesthetized animals.

[00706] The compounds of the invention may be administered orally or via injection at a dose from 0.001 to 2500 mg/kg per day. The dose range for adult humans is generally from 0.005 mg to 10 g/day. Tablets or other forms of presentation provided in discrete units may conveniently contain an amount of compound of the invention which is effective at such dosage or as a multiple of the same, for instance, units containing 5 mg to 500 mg, usually around lOmg to 200mg. The precise amount of compound administered to a patient will be the responsibility of the attendant physician. However, the dose employed will depend on a number of factors, including the age and sex of the patient, the precise disorder being treated, and its severity. Also, the route of administration may vary depending on the condition and its severity.

[00707] While it may be possible for the compounds of formulas I and II to be administered as the raw chemical, it is preferable to present them as a pharmaceutical composition. According to a further aspect, the present invention provides a pharmaceutical composition comprising a compound of formula I or II or a pharmaceutically acceptable salt or solvate thereof, together with one or more pharmaceutically carriers thereof and optionally one or more other therapeutic ingredients. The carrier(s) must be "acceptable" in the sense of being compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

[00708] The formulations include those suitable for oral, parenteral (including subcutaneous, intradermal, intramuscular, intravenous and intraarticular), rectal and topical (including dermal, buccal, sublingual and intraocular) administration. The most suitable route may depend upon the condition and disorder of the recipient. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing into association a compound of formula I or II or a pharmaceutically acceptable salt or solvate thereof ("active ingredient") with the carrier which

constitutes one or more accessory ingredients. In general, the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both and then, if necessary, shaping the product into the desired formulation. Preferred unit dosage formulations are those containing an effective dose or an appropriate fraction thereof, of the active ingredient.

[00709] Formulations of the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste.

[00710] A tablet may be made by compression or molding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder, lubricant, inert diluent, lubricating, surface active or dispersing agent. Molded tablets may be made by molding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide sustained, delayed or controlled release of the active ingredient therein.

[00711] Formulations for parenteral administration include aqueous and non-aqueous sterile injection solutions, which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient. Formulations for parenteral administration also include aqueous and non-aqueous sterile suspensions, which may include suspending agents and thickening agents. The formulations may be presented in unit-dose of multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilized) condition requiring only the addition of a sterile liquid carrier, for example saline, phosphate-buffered saline (PBS) or the like, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

[00712] Formulations for rectal administration may be presented as a suppository with the usual carriers such as cocoa butter or polyethylene glycol.

[00713] Formulations for topical administration in the mouth, for example buccally or sublingually, include lozenges comprising the active ingredient in a flavored basis such as sucrose and acacia or tragacanth, and pastilles comprising the active ingredient in a basis such as gelatin and glycerin or sucrose and acacia.

[00714] It should be understood that in addition to the ingredients particularly mentioned above, the formulations of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavoring agents.

[00715] Although the foregoing invention has been described in some detail for purposes of illustration, it will be readily apparent to one skilled in the art that changes and modifications may be made without departing from the scope of the invention described herein.
