BACKGROUND

20 Microglia are resident innate immune cells in the brain and are important for the maintenance of homeostatic conditions in the central nervous system. Hickman *et al.* 2018, Li and Barres 2018. These resident macrophages express a variety of receptors that allow them to sense changes in their microenvironment and alter their phenotypes to mediate responses to invading pathogens, proteotoxic stress, cellular injury, and other infarcts that can occur in health and disease. *Id.* Microglia reside in the parenchyma of the brain and spinal
25 cord where they interact with neuronal cell bodies (Cserep *et al.* 2019), neuronal processes (Paolicelli *et al.* 2011, Ikegami *et al.* 2019) in addition to other types of glial cells (Domingues *et al.* 2016, Liddelow *et al.* 2017, Shinozaki *et al.* 2017), playing roles in a multitude of physiological processes. With the ability to rapidly proliferate in response to

stimuli, microglia characteristically exhibit myeloid cell functions such as phagocytosis, cytokine/chemokine release, antigen presentation, and migration. Colonna and Butovsky 2017. More specialized functions of microglia include the ability to prune synapses from neurons and directly communicate with their highly arborized cellular processes that survey the area surrounding the neuronal cell bodies. Hong *et al.* 2016, Sellgren *et al.* 2019.

The plasticity of microglia and their diverse states as described through single-cells RNASeq profiling are thought to arise through the integration of signaling from a diverse array of cell surface receptors. Hickman *et al.* 2013. Collectively known as the microglial “sensome,” these receptors are responsible for transducing activating or activation-suppressing intracellular signaling and include protein families such as Sialic acid-binding immunoglobulin-type lectins (“SIGLEC”), Toll-like receptors (“TLR”), Fc receptors, nucleotide-binding oligomerization domain (“NOD”) and purinergic G protein-coupled receptors. Doens and Fernandez 2014, Madry and Attwell 2015, Hickman and El Khoury 2019. Similar to other cells of the myeloid lineage, the composition of microglial sensomes is dynamically regulated and acts to recognize molecular pattern that direct phenotypic responses to homeostatic changes in the central nervous system (“CNS”). *Id.* One of the receptors selectively expressed by brain microglia is TREM2, composed of a single-pass transmembrane domain, an extracellular stalk region, and extracellular immunoglobulin variable (“IgV”)-like domain responsible for ligand interaction. Kleinberger *et al.* 2014. As TREM2 does not possess intracellular signal transduction-mediating domains, biochemical analysis has illustrated that interaction with adaptor proteins DAP10 and DAP12 mediate downstream signal transduction following ligand recognition. Peng *et al.* 2010, Jay *et al.* 2017. TREM2/DAP12 complexes in particular act as a signaling unit that can be characterized as pro-activation on microglial phenotypes in addition to peripheral macrophages and osteoclasts. Otero *et al.* 2012, Kobayashi *et al.* 2016, Jaitin *et al.* 2019. In the CNS, signaling through TREM2 has been studied in the context of ligands such as phospholipids, cellular debris, apolipoproteins, and myelin. Wang *et al.* 2015, Kober and Brett 2017, Shirotani *et al.* 2019). In mice lacking functional TREM2 expression or expressing a mutated form of the receptor, a core observation is blunted microglial responses to insults such as oligodendrocyte demyelination, stroke-induced tissue damage in the brain, and proteotoxic inclusions *in vivo*. Cantoni *et al.* 2015, Wu *et al.* 2017.

Coding variants in the *TREM2* locus has been associated with late onset Alzheimer's disease ("LOAD") in human genome-wide association studies, linking a loss-of-receptor function to a gain in disease risk. Jonsson *et al.* 2013, Sims *et al.* 2017. Genetic variation of other genes selectively expressed by microglia in the CNS, for example, CD33, PLCg2 and MS4A4A/6A have reached genome-wide significance for their association with LOAD risk. Hollingworth *et al.* 2011, Sims *et al.* 2017, Deming *et al.* 2019. Together, these genetic findings link together in a putative biochemical circuit that highlights the importance of microglial innate immune function in LOAD. Additionally, increase or elevation in the soluble form of TREM2 ("sTREM2") in the cerebrospinal fluid (CSF) of human subjects is associated with disease progression and emergence of pathological hallmarks of LOAD including phosphorylated Tau. Suarez-Calvet *et al.* 2019. Furthermore, natural history and human biology studies indicate that baseline sTREM2 levels in the CSF can stratify the rate of temporal lobe volume loss and episodic memory decline in longitudinally monitored cohorts. Ewers *et al.* 2019.

In addition to human genetic evidence supporting a role of *TREM2* in LOAD, homozygous loss-of-function mutations in *TREM2* are causal for an early onset dementia syndrome known as Polycystic lipomembranous osteodysplasia with sclerosing leukoencephalopathy ("PLOS") or Nasu-Hakola disease ("NHD"). Golde *et al.* 2013, Dardiotis *et al.* 2017. This progressive neurodegenerative disease typically manifests in the 3rd decade of life and is pathologically characterized by loss of myelin in the brain concomitant with gliosis, unresolved neuroinflammation, and cerebral atrophy. Typical neuropsychiatric presentations are often preceded by osseous abnormalities, such as bone cysts and loss of peripheral bone density. Bianchin *et al.* 2004, Madry *et al.* 2007, Bianchin *et al.* 2010). Given that osteoclasts of the myeloid lineage are also known to express TREM2, the PLOS-related symptoms of wrist and ankle pain, swelling, and fractures indicate that TREM2 may act to regulate bone homeostasis through defined signaling pathways that parallel the microglia in the CNS. Paloneva *et al.* 2003, Otero *et al.* 2012. The link between TREM2 function and PLOS has illustrated the importance of the receptor in sustaining key physiological aspects of myeloid cell function in the human body.

Efforts have been made to model the biology of TREM2 in mice prompting the creation of *TREM2* knock out ("KO") mice in addition to the LOAD-relevant TREM2 R47H

loss-of-function mutant transgenic mice. Ulland *et al.* 2017, Kang *et al.* 2018. Although unable to recapitulate the neurological manifestations of PLOSL, *TREM2* KO mice show abnormalities in bone ultrastructure. Otero *et al.* 2012. When the *TREM2* KO or mutant mice have been crossed onto familial Alzheimer's disease transgenic mouse background such as the 5XFAD amyloidogenic mutation lines, marked phenotypes have been observed. Ulrich *et al.* 2017. These *in vivo* phenotypes of *TREM2* loss-of-function in the CNS include elevated the plaque burden and lower levels of secreted microglial factors SPP1 and Osteopontin that are characteristic of the microglial response to amyloid pathology. Ulland, *et al.* 2017. Other rodent studies have demonstrated that loss of *TREM2* leads to decreased microglial clustering around plaques and emergence of less compact plaque morphology in familial AD amyloid models. Parhizkar *et al.* 2019. With regards to the Tau protein pathology that is observed in LOAD, familial tauopathy models in mice demonstrated an enhanced spreading of pathological human Tau aggregates from point of injection into mouse brain in *TREM2* KO mice. Leyns *et al.* 2019. Furthermore, single-cell RNASeq studies with the *TREM2* KO mice in aged scenarios, 5XFAD familial Alzheimer's disease model mice, and Amyotrophic Lateral Sclerosis *SOD1* mutant mouse backgrounds indicate that *TREM2* receptor function is critical for a conserved set of phenotypic transformations within microglial populations in response to CNS pathology. Keren-Shaul *et al.* 2017.

In rodent models where *TREM2* expression levels are elevated, brain amyloid pathology in the 5XFAD transgenic mice displayed reduced plaque volume and altered morphology. Lee *et al.* 2018). The changes in immunohistological markers relating to brain amyloid pathology were also accompanied by an attenuated presence of dystrophic neurites when *TREM2* was overexpressed. *Id.* Therefore, the pharmacological activation of *TREM2* is a target of interest for treating or preventing neurological, neurodegenerative and other diseases. Despite many attempts to alter disease progression by targeting the pathological hallmarks of LOAD through anti-amyloid and anti-Tau therapeutics, there is a need for activators of *TREM2* to address the genetics-implicated neuroimmune aspects of, for example, LOAD. Such *TREM2* activators may be suitable for use as therapeutic agents and remain in view of the significant continuing societal burden that remains unmitigated for diseases, such as Alzheimer's disease.

R⁵ is C₃₋₆cycloalkyl, C₅₋₈spiroalkyl, C₅₋₈tricycloalkyl, cyclopent-1-en-1-yl, cyclohex-1-en-1-yl, phenyl, 6-membered heteroaryl, aziridine-1-yl, pyrrolidine-1-yl, 3-azabicyclo[3.1.0]hexan-3-yl, piperidine-1-yl, or -OCH₂-(C₃₋₆cycloalkyl),

5 wherein the C₃₋₆cycloalkyl, C₅₋₈spiroalkyl, C₅₋₈tricycloalkyl, cyclopent-1-en-1-yl, cyclohex-1-en-1-yl, phenyl, and 6-membered heteroaryl is further optionally substituted with 1 to 4 substituents independently selected from halogen, C₁₋₃alkyl, and C₁₋₃haloalkyl, and

10 wherein the aziridine-1-yl, pyrrolidine-1-yl, 3-azabicyclo[3.1.0]hexan-3-yl, piperidine-1-yl, and -OCH₂-(C₃₋₆cycloalkyl) is further substituted with 1 to 4 substituents independently selected from halogen, C₁₋₃alkyl, C₁₋₃haloalkyl, and C₁₋₃alkoxy; and

R⁹ is methyl, ethyl or isopropyl.

30 Without wishing to be bound by any particular theory, the following is noted: TREM2 has been implicated in several myeloid cell processes, including phagocytosis,

proliferation, survival, and regulation of inflammatory cytokine production. Ulrich and Holtzman 2016. In the last few years, TREM2 has been linked to several diseases. For instance, mutations in both TREM2 and DAP12 have been linked to the autosomal recessive disorder Nasu-Hakola Disease, which is characterized by bone cysts, muscle wasting and demyelination phenotypes. Guerreiro *et al.* 2013. More recently, variants in the TREM2 gene have been linked to increased risk for Alzheimer's disease (AD) and other forms of dementia including frontotemporal dementia. Jonsson *et al.* 2013, Guerreiro, Lohmann *et al.* 2013, and Jay, Miller *et al.* 2015. In particular, the R47H variant has been identified in genome-wide studies as being associated with increased risk for late-onset AD with an overall adjusted odds ratio (for populations of all ages) of 2.3, second only to the strong genetic association of ApoE to Alzheimer's. The R47H mutation resides on the extracellular Ig V-set domain of the TREM2 protein and has been shown to impact lipid binding and uptake of apoptotic cells and Aβ (Wang *et al.* 2015; Yeh *et al.* 2016), suggestive of a loss-of-function linked to disease. Further, postmortem comparison of AD patients' brains with and without the R47H mutation are supportive of a novel loss-of-microglial barrier function for the carriers of the mutation, with the R47H carrier microglia putatively demonstrating a reduced ability to compact plaques and limit their spread. Yuan *et al.* 2016. Impairment in microgliosis has been reported in animal models of prion disease, multiple sclerosis, and stroke, suggesting that TREM2 may play an important role in supporting microgliosis in response to pathology or damage in the central nervous system. Ulrich and Holtzman 2016. In addition, knockdown of TREM2 has been shown to aggravate a-syn-induced inflammatory responses in vitro and exacerbate dopaminergic neuron loss in response to AAV-SYN in vivo (a model of Parkinson's disease), suggesting that impaired microglial TREM2 signaling exacerbates neurodegeneration by modulating microglial activation states. Guo *et al.* 2019. A variety of animal models also suggest that Toll-Like Receptor (TLR) signaling is important in the pathogenesis of Rheumatoid Arthritis (RA) via persistent expression of pro-inflammatory cytokines by macrophages. Signaling through TREM2/DAP12 inhibits TLR responses by reducing MAPK (Erk 1/2) activation, suggesting that TREM2 activation may act as a negative regulator of TLR driven RA pathogenesis. Huang and Pope 2009.

In view of the data indicating that deficits in TREM2 activity affect macrophage and microglia function, the compounds disclosed herein are of particular use in disorders, such as those described above and in the embodiments that follow and in neurodegenerative disorders more generally.

CSF1R

CSF1R is a cell-surface receptor primarily for the cytokine colony stimulating factor 1 (CSF-1), also known until recently as macrophage colony-stimulating factor (M-CSF), which regulates the survival, proliferation, differentiation and function of mononuclear phagocytic cells, including microglia of the central nervous system. CSF1R is composed of a
25 highly glycosylated extracellular ligand-binding domain, a trans-membrane domain and an intracellular tyrosine-kinase domain. Binding of CSF-1 to CSF1R results in the formation of receptor homodimers and subsequent auto-phosphorylation of several tyrosine residues in the cytoplasmic domain, notably Syk. In the brain, CSF1R is predominantly expressed in microglial cells. It has been found that microglia in CSF1R +/- patients are depleted and
30 show increased apoptosis (Oosterhof et al., 2018).

The present invention relates to the unexpected discovery that administration of a TREM2 agonist can rescue the loss of microglia in cells having mutations in CSF1R. It has been previously shown that TREM2 agonist antibody 4D9 increases ATP luminescence (a measure of cell number and activity) in a dose dependent manner when the levels of M-CSF in media are reduced to 5 ng/mL (Schlepekow et al, EMBO Mol Med., 2020) and that TREM2 agonist AL002c increases ATP luminescence when M-CSF is completely removed from the media (Wang et al, J. Exp. Med.; 2020, 217(9): e20200785). This finding suggests that TREM2 agonism can compensate for deficiency in CSF1R signaling caused by a decrease in the concentration of its ligand. In a 5xFAD murine Alzheimer's disease model of amyloid pathology, doses of a CSF1R inhibitor that almost completely eliminate microglia in the brains of wild-type animals show surviving microglia clustered around the amyloid plaques (Spangenberg et al, Nature Communications 2019). Plaque amyloid has been demonstrated in the past to be a ligand for TREM2, and it has been shown that microglial engagement with amyloid is dependent on TREM2 (Condello et al, Nat Comm., 2015). The present invention relates to the unexpected discovery that it is activation of TREM2 that rescued the microglia in the presence of the CSF1R inhibitor, and that this effect is also observed in patients suffering from loss of microglia due to CSF1R mutation. This discovery has not been previously taught or suggested in the available art.

To date, no prior study has shown that TREM2 agonism can rescue the loss of microglia in cells where mutations in the CSF1R kinase domain reduce CSF1R activity, rather than the presence of a CSF1R inhibitor or a deficiency in CSF1R ligand. Furthermore, no prior study has taught or suggested that reversal of the loss of microglia due to a CSF1R mutation through TREM2 agonism can be used to treat a disease or disorder caused by and/or associated with a CSF1R mutation.

Adult-onset leukoencephalopathy with axonal spheroids and pigmented glia (ALSP), previously recognized as hereditary diffuse leukoencephalopathy with axonal spheroids (HDLS) or pigmentary orthochromatic leukodystrophy (POLD), is an autosomal-dominant central nervous system disease that manifests in the form of variable behavioral, cognitive and motor function changes in patients suffering from the disease. ALSP is characterized by patchy cerebral white matter abnormalities visible by magnetic resonance imaging. However, the clinical symptoms and MRI changes are not specific to ALSP and are common for other

neurological conditions, including Nasu-Hakola disease (NHD) and AD, making diagnosis and treatment of ALSP very difficult.

Recent studies have discovered that ALSP is a Mendelian disorder in which patients carry a heterozygous loss of function mutation in the kinase domain of CSF1R, suggesting a reduced level of signaling on the macrophage colony-stimulating factor (M-CSF) / CSF1R axis (Rademakers et al, Nat Genet 2012; Konno et al, Neurology 2018). In one aspect, the present invention relates to the surprising discovery that activation of the TREM2 pathway can rescue the loss of microglia in CSF1R +/- ALSP patients, preventing microglia apoptosis, thereby treating the ALSP condition.

5 microglia, or brain abnormalities neurodegeneration and dysosteosclerosis (BANDDOS).

15 embodiments, the disease or disorder is caused by a heterozygous CSF1R mutation. In some embodiments, the disease or disorder is caused by a homozygous CSF1R mutation. In some embodiments, the disease or disorder is a
25 disease or disorder resulting from a decrease or cessation in the activity of CSF1R. CSF1R related activities that are changed in the disease or disorder include, but are not limited to: decrease or loss of microglia function; increased microglia apoptosis; decrease in Src signaling; decrease in Syk signaling; decreased microglial proliferation; decreased microglial response to cellular debris; decreased phagocytosis; and decreased release of cytokines in
30 response to stimuli. In some embodiments, the disease or disorder is caused by a loss-of-function mutation in CSF1R. In some embodiments, the loss-of-function mutation results in

a complete cessation of CSF1R function. In some embodiments, the loss-of-function mutation results in a partial loss of CSF1R function, or a decrease in CSF1R activity.

ABCD1

The ABCD1 gene provides instructions for producing the adrenoleukodystrophy protein (ALDP). ABCD1 (ALDP) maps to Xq28. ABCD1 is a member of the ATP-binding cassette (ABC) transporter superfamily. The superfamily contains membrane proteins that translocate a wide variety of substrates across extra- and intracellular membranes, including metabolic products, lipids and sterols, and drugs. ALDP is located in the membranes of cell structures called peroxisomes. Peroxisomes are small sacs within cells that process many types of molecules. ALDP brings a group of fats called very long-chain fatty acids (VLCFAs) into peroxisomes, where they are broken down. As ABCD1 is highly expressed in microglia, it is possible that microglial dysfunction and their close interaction with other cell types actively participates in neurodegenerative processes (Gong *et al.*, *Annals of Neurology*. 2017; 82(5):813-827.). It has been shown that severe microglia loss and damage is an early feature in patients with cerebral form of x-linked ALD (cALD) carrying ABCD1 mutations (Bergner *et al.*, *Glia*. 2019; 67: 1196–1209). It has also been shown that ABCD1-deficiency leads to an impaired plasticity of myeloid lineage cells that is reflected in incomplete establishment of anti-inflammatory responses, thus possibly contributing to the devastating rapidly progressive demyelination in cerebral adrenoleukodystrophy (Weinhor *et al.*, *BRAIN* 2018: 141; 2329–2342). These findings emphasize microglia/ monocytes/ macrophages as crucial therapeutic targets for preventing or stopping myelin destruction in patients with X-linked adrenoleukodystrophy.

The present invention relates to the unexpected discovery that administration of a TREM2 agonist can rescue the loss of microglia in cells having mutations in the ABCD1 gene. It has been previously shown that TREM2 agonist antibody 4D9 increases ATP luminescence (a measure of cell number and activity) in a dose dependent manner when the levels of M-CSF in media are reduced to 5 ng/mL (Schlepckow *et al.*, *EMBO Mol Med.*, 2020) and that TREM2 agonist AL002c increases ATP luminescence when M-CSF is completely removed from the media (Wang *et al.*, *J. Exp. Med.*; 2020, 217(9): e20200785). This finding suggests that TREM2 agonism can compensate for deficiency in ABCD1 function leading to sustained activation, proliferation, chemotaxis of microglia, maintenance of anti-inflammatory environment and reduced astrogliosis caused by a decrease in ABCD1 and accumulation of VLCFAs. The present invention relates to the unexpected discovery that

activation of TREM2 can rescue the microglia in the presence of the ABCD1 mutation and an increase in VLCFA, and that this effect may be also observed in patients suffering from loss of microglia due to ABCD1 mutation. This discovery has not been previously taught or suggested in the available art.

5 To date, no prior study has shown that TREM2 agonism can rescue the loss of microglia in cells where mutations in the ABCD1 and a VLCFA increase is present. No prior study has taught or suggested that reversal of the loss of microglia due to an ABCD1 mutation through TREM2 agonism can be used to treat a disease or disorder caused by and/or associated with an ABCD1 mutation.

Autism Spectrum Disorders

It has been found that TREM2 deficient mice exhibit symptoms reminiscent of
5 autism spectrum disorders (ASDs) (Filipello et al., *Immunity*, 2018, 48, 979-991). It has also
been found that microglia depletion of the autophagy *Aatg7* gene results in defective synaptic
pruning and results in increased dendritic spine density, and abnormal social interaction and
repetitive behaviors indicative of ASDs (Kim, et al., *Molecular Psychiatry*, 2017, 22, 1576-
1584.). Further studies have shown that increased dendritic spin density detected in post-
10 mortem ASD brains, likely caused by defective synaptic pruning, results in circuit
hypoconnectivity and behavioral defects and are a potential origin of a number of
neurodevelopmental diseases (Tang, et al., *Neuron*, 2014, 83, 1131-1143). Without intending
to be limited to any particular theory, these findings suggest that TREM2 activation can
reverse microglia depletion, and therefore correct the defective synaptic pruning that is
15 central to neurodevelopmental diseases such as ASDs. The present invention relates to the
unexpected discovery that activation of TREM2, using a compound of the present invention,
can rescue microglia in subjects suffering from an ASD. This discovery has not been
previously taught or suggested in the available art.

DEFINITIONS

The following definitions are provided to assist in understanding the scope of this disclosure.

Unless otherwise indicated, all numbers expressing quantities of ingredients, reaction conditions, and so forth used in the specification or claims are to be understood as being modified in all instances by the term “about.” Accordingly, unless indicated to the contrary, the numerical parameters set forth in the following specification and attached claims are approximations that may vary depending upon the standard deviation found in their respective testing measurements.

As used herein, if any variable occurs more than one time in a chemical formula, its definition on each occurrence is independent of its definition at every other occurrence. If the chemical structure and chemical name conflict, the chemical structure is determinative of the identity of the compound.

As used herein, the following definitions shall apply unless otherwise indicated. For purposes of this disclosure, the chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, Handbook of Chemistry and Physics, 101st Ed. Additionally, general principles of organic chemistry are described in “Organic Chemistry”, Thomas Sorrell, University Science Books, Sausalito: 2005, and “March’s Advanced Organic Chemistry: Reactions Mechanisms and Structure”, 8th Ed., Ed.: Smith, M.B., John Wiley & Sons, New York: 2019, the entire contents of which are hereby incorporated by reference.

Stereoisomers

The compounds of the present disclosure may contain, for example, double bonds, one or more asymmetric carbon atoms, and bonds with a hindered rotation, and therefore, may exist as stereoisomers, such as double-bond isomers (*i.e.*, geometric isomers (E/Z)), enantiomers, diastereomers, and atropoisomers. Accordingly, the scope of the instant disclosure is to be understood to encompass all possible stereoisomers of the illustrated compounds, including the stereoisomerically pure form (for example, geometrically pure,

enantiomerically pure, diastereomerically pure, and atropoisomerically pure) and stereoisomeric mixtures (for example, mixtures of geometric isomers, enantiomers, diastereomers, and atropoisomers, or mixture of any of the foregoing) of any chemical structures disclosed herein (in whole or in part), unless the stereochemistry is specifically
5 identified.

If the stereochemistry of a structure or a portion of a structure is not indicated with, for example, bold or dashed lines, the structure or portion of the structure is to be interpreted as encompassing all stereoisomers of it. If the stereochemistry of a structure or a portion of a structure is indicated with, for example, bold or dashed lines, the structure or portion of the
10 structure is to be interpreted as encompassing only the stereoisomer indicated. For example, (1R)-1-methyl-2-(trifluoromethyl)cyclohexane is meant to encompass (1R,2R)-1-methyl-2-(trifluoromethyl)cyclohexane and (1R,2S)-1-methyl-2-(trifluoromethyl)cyclohexane. A bond drawn with a wavy line indicates that both stereoisomers are encompassed. This is not to be confused with a wavy line drawn perpendicular to a bond which indicates the point of
15 attachment of a group to the rest of the molecule.

The term “stereoisomer” or “stereoisomerically pure” compound as used herein refers to one stereoisomer (for example, geometric isomer, enantiomer, diastereomer and atropoisomer) of a compound that is substantially free of other stereoisomers of that compound. For example, a stereoisomerically pure compound having one chiral center will
20 be substantially free of the mirror image enantiomer of the compound and a stereoisomerically pure compound having two chiral centers will be substantially free of the other enantiomer and diastereomers of the compound. A typical stereoisomerically pure compound comprises greater than about 80% by weight of one stereoisomer of the compound and equal or less than about 20% by weight of other stereoisomers of the compound, greater
25 than about 90% by weight of one stereoisomer of the compound and equal or less than about 10% by weight of the other stereoisomers of the compound, greater than about 95% by weight of one stereoisomer of the compound and equal or less than about 5% by weight of the other stereoisomers of the compound, or greater than about 97% by weight of one stereoisomer of the compound and equal or less than about 3% by weight of the other
30 stereoisomers of the compound.

This disclosure also encompasses the pharmaceutical compositions comprising stereoisomerically pure forms and the use of stereoisomerically pure forms of any compounds disclosed herein. Further, this disclosure also encompasses pharmaceutical compositions comprising mixtures of stereoisomers of any compounds disclosed herein and the use of said pharmaceutical compositions or mixtures of stereoisomers. These stereoisomers or mixtures thereof may be synthesized in accordance with methods well known in the art and methods disclosed herein. Mixtures of stereoisomers may be resolved using standard techniques, such as chiral columns or chiral resolving agents. *See*, for example, Jacques *et al.*, *Enantiomers, Racemates and Resolutions* (Wiley-Interscience, New York, 1981); Wilen *et al.*, *Tetrahedron* 33:2725; Eliel, *Stereochemistry of Carbon Compounds* (McGraw-Hill, NY, 1962); and Wilen, *Tables of Resolving Agents and Optical Resolutions*, page 268 (Eliel, Ed., Univ. of Notre Dame Press, Notre Dame, IN, 1972).

Tautomers

As known by those skilled in the art, certain compounds disclosed herein may exist in one or more tautomeric forms. Because one chemical structure may only be used to represent one tautomeric form, it will be understood that for convenience, referral to a compound of a given structural formula includes other tautomers of said structural formula. For example, the following is illustrative of tautomers of the compounds of Formula I, wherein Ring A together with the 6-membered ring system to which it is fused forms a

Accordingly, the scope of the instant disclosure is to be understood to encompass all tautomeric forms of the compounds disclosed herein.

Isotopically-Labelled Compounds

Further, the scope of the present disclosure includes all pharmaceutically acceptable isotopically-labelled compounds of the compounds disclosed herein, such as the compounds of Formula I, wherein one or more atoms are replaced by atoms having the same atomic number, but an atomic mass or mass number different from the atomic mass or mass number usually found in nature. Examples of isotopes suitable for inclusion in the compounds disclosed herein include isotopes of hydrogen, such as ^2H and ^3H , carbon, such as ^{11}C , ^{13}C and ^{14}C , chlorine, such as ^{36}Cl , fluorine, such as ^{18}F , iodine, such as ^{123}I and ^{125}I , nitrogen, such as ^{13}N and ^{15}N , oxygen, such as ^{15}O , ^{17}O and ^{18}O , phosphorus, such as ^{32}P , and sulphur, such as ^{35}S . Certain isotopically-labelled compounds of Formula I, for example, those incorporating a radioactive isotope, are useful in drug and/or substrate tissue distribution studies. The radioactive isotopes tritium (^3H) and carbon-14 (^{14}C) are particularly useful for this purpose in view of their ease of incorporation and ready means of detection. Substitution with isotopes such as deuterium (^2H or D) may afford certain therapeutic advantages resulting from greater metabolic stability, for example, increased *in vivo* half-life or reduced dosage requirements, and hence may be advantageous in some circumstances. Substitution with positron emitting isotopes, such as ^{11}C , ^{18}F , ^{15}O and ^{13}N , can be useful in Positron Emission Topography (PET) studies, for example, for examining target occupancy. Isotopically-labelled compounds of the compounds disclosed herein can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described in the accompanying General Synthetic Schemes and Examples using an appropriate isotopically-labelled reagent in place of the non-labelled reagent previously employed.

Solvates

As discussed above, the compounds disclosed herein and the stereoisomers, tautomers, and isotopically-labelled forms thereof or a pharmaceutically acceptable salt of any of the foregoing may exist in solvated or unsolvated forms.

The term "solvate" as used herein refers to a molecular complex comprising a compound or a pharmaceutically acceptable salt thereof as described herein and a

stoichiometric or non-stoichiometric amount of one or more pharmaceutically acceptable solvent molecules. If the solvent is water, the solvate is referred to as a “hydrate.”

5 isotopically-labelled forms thereof or a pharmaceutically acceptable salt of any of the foregoing.

General Analytical and Purification Methods

Provided in this section are descriptions of the general analytical and purification methods used to prepare the specific compounds provided herein.

5 Chromatography:

Unless otherwise indicated, crude product-containing residues were purified by passing the crude material or concentrate through either a Biotage brand silica gel column pre-packed with flash silica (SiO₂) or reverse phase flash silica (C18) and eluting the product off the column with a solvent gradient as indicated. For example, a description of silica gel
 10 (0-40% EtOAc/hexane) means the product was obtained by elution from the column packed with silica using a solvent gradient of 0% to 40% EtOAc in hexanes. In some experiments, flash chromatography was performed on Teledyne Isco instruments using pre-packaged

disposable SiO₂ stationary phase columns with eluent flow rate range of 15 to 200 mL/min, UV detection (254 and 220 nm).

Preparative HPLC Method:

Where so indicated, the compounds described herein were purified via reverse phase
5 HPLC using Waters Fractionlynx semi-preparative HPLC-MS system utilizing one of the following two HPLC columns: (a) Phenomenex Gemini column (5 micron, C18, 150x30 mm) or (b) Waters X-select CSH column (5 micron, C18, 100x30 mm).

A typical run through the instrument included: eluting at 45 mL/min with a linear
gradient of 10% (v/v) to 100% MeCN (0.1% v/v formic acid) in water (0.1% formic acid)
10 over 10 minutes; conditions can be varied to achieve optimal separations.

Preparative Chiral Supercritical Fluid Chromatography (SFC) Method:

Where so indicated, the compounds described herein were purified via chiral SFC
using one of the two following chiral SFC columns: (a) Chiralpak IG 2x25 cm, 5 μm or (b)
Chiralpak AD-H 2x15 cm, 5 μm.

15 A typical run through the instrument included: eluting with flowrates (F) of between 30 and 120 mL/min using solvent mixtures of between 30 and 80% EtOH in supercritical CO₂; conditions can be varied to achieve optimal separations.

Alternatively, some CP Analytical-SFC experiments were run on SFC Method
Station (Thar, Waters) with the following conditions: Column temperature: 40 °C,
20 Mobile phase: CO₂/ Methanol (0.2% Methanol Ammonia) = Flow: 4.0 ml/min, Back Pressure: 120 Bar, Detection wavelength: 214 nm.

In other runs, some CP Preparative-SFC experiments were run on SFC-80
(Thar, Waters) with the following conditions: Column temperature: 35 °C, Mobile
phase (example): CO₂/ Methanol (0.2% Methanol Ammonia) = Flow rate: 80 g/min,
25 Back pressure: 100 bar, Detection wavelength: 214 nm. Preparative CP Method:

Acidic reversed phase MPLC: Instrument type: Reveleris™ prep MPLC; Column: Phenomenex LUNA C18(3) (150x25 mm, 10μ); Flow: 40 mL/min; Column temp:

room temperature; Eluent A: 0.1% (v/v) Formic acid in water, Eluent B: 0.1% (v/v) Formic acid in acetonitrile; using the indicated gradient and wavelength.

Proton NMR Spectra:

Unless otherwise indicated, all ¹H NMR spectra were collected on a Bruker NMR
5 Instrument at 300, 400 or 500 Mhz or a Varian NMR Instrument at 400 Mhz. Where so characterized, all observed protons are reported as parts-per-million (ppm) downfield from tetramethylsilane (TMS) using the internal solvent peak as reference. All NMR were collected at about 25°C.

Mass Spectra (MS)

10 Unless otherwise indicated, all mass spectral data for starting materials, intermediates and/or exemplary compounds are reported as mass/charge (m/z), having an [M+H]⁺ molecular ion. The molecular ion reported was obtained by electrospray detection method (commonly referred to as an ESI MS) utilizing a Waters Acquity UPLC/MS system or a Gemini-NX UPLC/MS system. Compounds having an isotopic atom, such as bromine and
15 the like, are generally reported according to the detected isotopic pattern, as appreciated by those skilled in the art.

The mixture was
- 10 heated at 90 °C for 12 h. The mixture was diluted with EtOAc (200 mL) and washed 2x with brine. The organic layer was dried over MgSO₄ and concentrated. The residue was purified

by silica gel chromatography (0%-100% EtOAc/EtOH = 3/1 blend in 10% DCM in heptane) to afford (S)-4-(6,7-dimethyl-4-(5,8-dioxaspiro[3.4]octan-2-yl)pteridin-2-yl)-2-(1-methyl-1H-pyrazol-4-yl)morpholine (298 mg, 0.681 mmol, 15.48 % yield) as a red solid. ¹H NMR (Chloroform-d, 500 MHz) δ 7.58 (s, 1H), 7.47 (s, 1H), 5.0-5.1 (m, 1H), 4.8-4.9 (m, 1H), 4.62 (dd, 1H, J=2.8, 10.2 Hz), 4.4-4.5 (m, 1H), 4.1-4.1 (m, 1H), 4.0-4.1 (m, 2H), 3.9-4.0 (m, 2H), 3.9-3.9 (m, 3H), 3.9-3.9 (m, 3H), 3.8-3.8 (m, 1H), 3.3-3.4 (m, 1H), 3.2-3.3 (m, 1H), 2.8-2.9 (m, 2H), 2.7-2.8 (m, 3H), 2.7-2.7 (m, 3H), 2.6-2.7 (m, 3H)

Step 2: (S)-3-(6,7-dimethyl-2-(2-(1-methyl-1H-pyrazol-4-yl)morpholino)pteridin-4-yl)cyclobutan-1-one. Example 165: 4-(trans-4-chlorocyclohexyl)-6,7-dimethyl-2-((2S)-2-(1-methyl-1H-pyrazol-4-yl)-4-morpholinyl)pteridine

Example 165

- 5 **Step 1: (2S)-4-(4-(4-((tert-butyldimethylsilyl)oxy)cyclohex-1-en-1-yl)-6,7-dimethylpteridin-2-yl)-2-(1-methyl-1H-pyrazol-4-yl)morpholine.** To a 50-mL round-bottomed flask was added 4-(4-(4-((tert-butyldimethylsilyl)oxy)cyclohex-1-en-1-yl)-2-chloro-6,7-dimethylpteridine (Intermediate 50) (0.35 g, 0.864 mmol) and (S)-2-(1-methyl-1H-pyrazol-4-yl)morpholine (Enamine, Monmouth Jct., NJ, USA) (0.159 g, 0.951 mmol) in
- 10 DMSO(20 mL), and N-ethyl-N-isopropylpropan-2-amine (0.223 g, 1.728 mmol). The reaction was stirred at 100 °C for 2 h (monitored by TLC) then diluted with H_2O (30 mL) and extracted with DCM (3 x 50 mL). The combined organic layers were washed with brine, dried over anhydrous Na_2SO_4 and concentrated to give a yellow oil. The crude material was

purified by silica gel chromatography (1 % to 3% MeOH in DCM) to provide (2S)-4-(4-(4-((tert-butyldimethylsilyl)oxy)cyclohex-1-en-1-yl)-6,7-dimethylpteridin-2-yl)-2-(1-methyl-1H-pyrazol-4-yl)morpholine (0.3 g, 0.560 mmol, 64.8 % yield) as a yellow oil.

Step 2: (S)-4-(4-(4-((tert-butyldimethylsilyl)oxy)cyclohexyl)-6,7-dimethylpteridin-2-yl)-2-(1-methyl-1H-pyrazol-4-yl)morpholine. To a 10-mL round-bottomed flask was added (2S)-4-(4-(4-((tert-butyldimethylsilyl)oxy)cyclohex-1-en-1-yl)-6,7-dimethylpteridin-2-yl)-2-(1-methyl-1H-pyrazol-4-yl)morpholine (0.05 g, 0.093 mmol) in 1-butanol (1.5 mL). The reaction mass was flushed under N₂ for 15 min. then to this was added palladium(II) hydroxide (0.013 g, 0.093 mmol) and the reaction was stirred at 80°C for 4 h. The reaction mixture was filtered through celite and the filtrate diluted with H₂O (3 mL) and extracted with DCM (2 x 5 mL). The combined organic layers were dried over Na₂SO₄ and concentrated under reduced pressure to obtain (S)-4-(4-(4-((tert-butyldimethylsilyl)oxy)cyclohexyl)-6,7-dimethylpteridin-2-yl)-2-(1-methyl-1H-pyrazol-4-yl)morpholine (0.030 g, 0.056 mmol, 59.8 % yield) as a light yellow material that was used in the next step without further purification.

Step 3: (S)-4-(6,7-dimethyl-2-(2-(1-methyl-1H-pyrazol-4-yl)morpholino)pteridin-4-yl)cyclohexan-1-ol. To a 50-mL round-bottomed flask was added (S)-4-(4-(4-((tert-butyldimethylsilyl)oxy)cyclohexyl)-6,7-dimethylpteridin-2-yl)-2-(1-methyl-1H-pyrazol-4-yl)morpholine (0.28 g, 0.521 mmol) in THF (5 mL). The reaction mixture was cool to 0 °C and a solution of HCl in dioxane (1.302 mL, 5.21 mmol) was added drop-wise. The reaction was allowed to warm to RT and stirred for 1.5 h (monitored by LCMS). After completion of the reaction, H₂O (10 mL) was added and extracted with DCM (15 mL x 2). The combined organic layers were dried over a generous amount of Na₂SO₄, filtered and concentrated under reduced pressure to obtain crude compound. The crude material was absorbed onto a plug of silica gel and purified by chromatography through a Redi-Sep pre-packed silica gel column (4 g), eluting with 100 % EtOAc, to provide (S)-4-(6,7-dimethyl-2-(2-(1-methyl-1H-pyrazol-4-yl)morpholino)pteridin-4-yl)cyclohexan-1-ol (0.15 g, 0.354 mmol, 68.0 % yield) as a yellow oil that was used in the next step without further purification.

Step 4: 4-(trans-4-chlorocyclohexyl)-6,7-dimethyl-2-((2S)-2-(1-methyl-1H-pyrazol-4-yl)-4-morpholinyl)pteridine. To a 100-mL round-bottomed flask was added (S)-

4-(6,7-dimethyl-2-(2-(1-methyl-1H-pyrazol-4-yl)morpholino)pteridin-4-yl)cyclohexan-1-ol (0.150 g, 0.354 mmol) and perchloroethane (1.677 g, 7.08 mmol) followed by addition of tetrabutylammonium iodide (0.654 g, 1.771 mmol) and triphenylphosphine (0.464 g, 1.771 mmol) in 1,2-dichloroethane (20 mL). The reaction was stirred at 60°C for 5 h (monitored by LCMS). After completion, the reaction mixture was allowed to cool to room temperature, poured into H₂O and extracted with DCM (2 x 30 mL). The organic extract was washed with sat. NaCl (50 x mL) and dried over Na₂SO₄. The solution was concentrated to give the crude material as a yellow oil. The crude material was purified by silica gel chromatography (40% of EtOAc in Petroleum ether) to provide crude product which was further purified by preparative HPLC to provide 4-(trans-4-chlorocyclohexyl)-6,7-dimethyl-2-((2S)-2-(1-methyl-1H-pyrazol-4-yl)-4-morpholinyl)pteridine (0.017 g, 0.038 mmol, 10.86 % yield) (7:2 mixture of isomers) as light yellow colored solid. ¹H NMR (400 MHz, DMSO-*d*₆) δ ppm 7.76 (s, 1H), 7.47 (d, *J* = 3.3 Hz, 1H), 5.79 (s, 2H), 4.59 – 4.80 (m, 2H), 4.51 (dt, *J* = 10.2, 2.4 Hz, 2H), 3.19 – 3.24 (s, 3H), 3.91 – 4.10 (m, 2H), 3.78 (s, 2H), 2.54 – 2.73 (m, 6H), 2.15 – 2.7 (m, 1H), 2.17 – 2.38 (m, 3H), 1.71 – 1.98 (m, 3H). *m/z* (ESI, +ive ion): 442.3 (M+H)⁺.

To a 10 mL vial was added xantphos Pd G3 (1.46 mg, 0.023 mmol) and 2-chloro-6,7-dimethyl-4-(trans-3-(trifluoromethyl)cyclobutyl)pteridine (Intermediate 59) (89.6 mg, 0.283 mmol). The vial was evacuated and filled with N₂ 3 times. 0.2 mL THF was added followed by (2-(1-methyl-1H-pyrazol-4-yl)tetrahydro-2H-pyran-4-yl)zinc(II) bromide (Intermediate 74, 1476 μL, 0.339 mmol). The mixture was stirred at 50 °C for 5 h, and the suspension became a brown solution. The mixture was concentrated, DCM was added, and the mixture quenched with H₂O and 2N HCl. The aqueous layer was extracted with DCM, and the combined organics were concentrated. Silica gel chromatography (2%-60% EtOAc/EtOH 3/1 blend in 10% DCM in Heptane) afforded 6,7-dimethyl-2-((2R,4R)-2-(1-methyl-1H-pyrazol-4-yl)tetrahydro-2H-pyran-4-yl)-4-(trans-3-(trifluoromethyl)cyclobutyl)pteridine (28 mg, 0.063

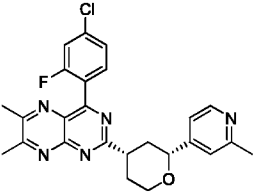

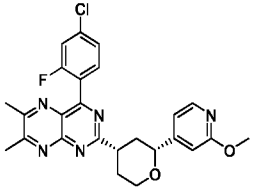

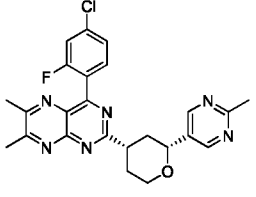

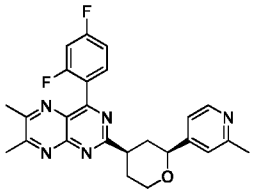

mmol, 22.17 % yield) as a mixture of diastereomers. The mixture was purified by SFC (Chiralpak IG 2x25 cm, 5 μ m column; 30% EtOH, F = 80mL/min) to provide 2 of 4 possible diastereomers:

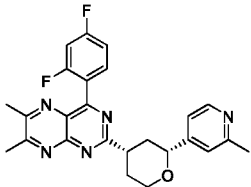

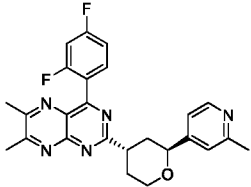

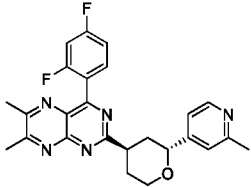

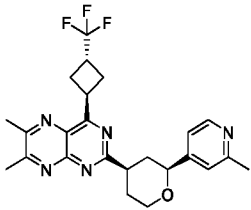

5 Peak 1: 6,7-dimethyl-2-((2R,4R)-2-(1-methyl-1H-pyrazol-4-yl)tetrahydro-2H-pyran-4-yl)-4-(trans-3-(trifluoromethyl)cyclobutyl)pteridine (3.45mg, ee >99%). ¹H NMR (Chloroform-d, 400 MHz) δ 7.5-7.6 (m, 1H), 7.42 (s, 1H), 4.9-5.0 (m, 2H), 3.9-4.0 (m, 5H), 3.69 (quin, 1H, J=5.5 Hz), 3.1-3.3 (m, 1H), 2.6-2.8 (m, 11H), 2.4-2.6 (m, 1H), 2.3-2.4 (m, 1H), 2.1-2.3 (m, 1H). *m/z* (ESI, +ive ion): 447.0 (M+H)⁺. 15 **Example 402: 8-(4-chloro-2-fluorophenyl)-6-(2-(1-cyclopropyl-1H-pyrazol-4-yl)tetrahydro-2H-pyran-4-yl)-2,3-dimethylpyrido[2,3-*b*]pyrazine**

Step 1: To a solution of 6,8-dichloro-2,3-dimethylpyrido[2,3-*b*]pyrazine (1 g, 4.4 mmol) in dioxane (20 mL) and H₂O (4 mL) was added 1-cyclopropyl-4-(4-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-5,6-dihydro-2H-pyran-2-yl)-1H-pyrazole (1.4 g, 4.4 mmol) and K₂CO₃ (1.8 g, 13 mmol) and the reaction mixture was purged with nitrogen. Then

Pd(dppf)Cl₂·DCM (0.29 g, 0.36 mmol) was added and the reaction mixture was heated at 80°C for 5h. The reaction mixture was then cooled to RT and monitored by LCMS. After completion, the aqueous layer was extracted with ethyl acetate (3 x 200ml) and the combined organic layers were dried over anhydrous sodium sulphate and concentrated under reduced pressure to get the crude residue. The residue was purified via column chromatography on silica gel (PE : EA = 1:1) to afford 8-chloro-6-(6-(1-cyclopropyl-1H-pyrazol-4-yl)-3,6-dihydro-2H-pyran-4-yl)-2,3-dimethylpyrido[2,3-b]pyrazine (1.3 g, 76%) as a purple solid. LCMS: (M+H)⁺ = 382.0;

Step 2: To a 250 mL round-bottomed flask was added 4-chloro-2-fluoro-1-iodobenzene (2.2 g, 8.6 mmol) in THF (40 mL). The mixture was cooled to -40 °C and iPrMgCl (4.7 mL, 9.5 mmol) (2 M solution in THF) was added dropwise and stirred for 30 min at -40 °C, then the reaction mixture was cooled to -78 °C. ZnCl₂ (4.3 mL, 8.6 mmol) (2 M solution in THF) was then added dropwise and the reaction mixture was allowed to warm to RT and 40 mL of THF was added and stirred for 10 min to give (4-chloro-2-fluorophenyl)zinc(II) iodide, which was used in the next reaction directly.

Into a 250-mL 3-necked round-bottom flask purged and maintained with N₂, was placed 8-chloro-6-(6-(1-cyclopropyl-1H-pyrazol-4-yl)-3,6-dihydro-2H-pyran-4-yl)-2,3-dimethylpyrido[2,3-b]pyrazine (1.1 g, 2.9 mmol) and PdCl₂(Atmpos)₂ (0.1 g, 0.14 mmol) in THF (10 mL). The reaction mixture was stirred and (4-chloro-2-fluorophenyl)zinc(II) iodide (2.2 g, 8.6 mmol) was added. The reaction mixture was stirred at room temp for 40 min and monitored by LCMS. After completion, the reaction mixture was quenched with H₂O (200 ml). The aqueous layer was extracted with EA (3 x 200ml) and the combined organic layers were dried over anhydrous sodium sulphate, and then concentrated under reduced pressure to get the crude residue. The residue was purified via column chromatography on silica gel (PE : EA = 1:1) to afford 8-(4-chloro-2-fluorophenyl)-6-(6-(1-cyclopropyl-1H-pyrazol-4-yl)-3,6-dihydro-2H-pyran-4-yl)-2,3-dimethylpyrido[2,3-b]pyrazine (900 mg, 64%) as a white solid. LCMS: (M + H)⁺ = 476.0.

Step 3: To a solution of 8-(4-chloro-2-fluorophenyl)-6-(6-(1-cyclopropyl-1H-pyrazol-4-yl)-3,6-dihydro-2H-pyran-4-yl)-2,3-dimethylpyrido[2,3-b]pyrazine (400 mg, 0.84 mmol) in THF (8 mL) was added Rh(cod)dppf.BF₄ (122 mg, 0.17 mmol) and the reaction mixture was purged with hydrogen for 3h at room temp. The reaction was monitored by

LCMS. After completion the reaction mixture was evaporated under reduced pressure to get the crude residue. The residue was purified by silica gel chromatography (PE : EA = 1:2) to afford 8-(4-chloro-2-fluorophenyl)-6-(2-(1-cyclopropyl-1H-pyrazol-4-yl)tetrahydro-2H-pyran-4-yl)-2,3-dimethylpyrido[2,3-b]pyrazine (123 mg, 31%) as a white solid. Table 8B. Additional Compounds

The compounds disclosed below in Table 8B were made by a method of the present disclosure or a similar method. The appropriate reagents, starting materials and conditions necessary for synthesizing the compounds of Table 8B would be apparent to a person of ordinary skill in the art. Compounds designated with “(+/-)” were isolated as a mixture of diastereomers sharing the same relative stereochemistry (*ie.* cis or trans). Compounds designated with “(rac)” were isolated as a mixture of all possible stereoisomers of the shown compound. Compounds lacking either designation were isolated with the specific

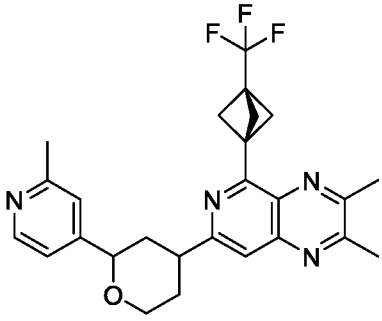

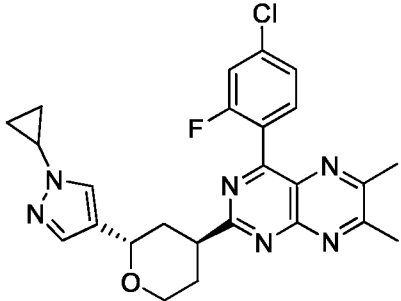

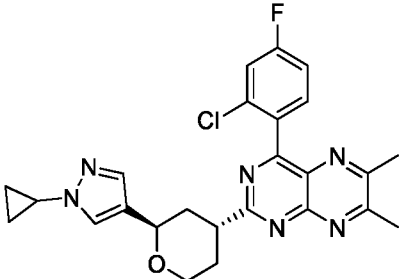

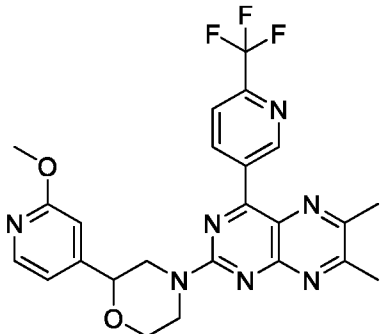

stereochemistry shown, such that the specific stereoisomer shown made up at least 90% of the isolated product.

Synthesis of Intermediates

Method 11

Intermediate 1: 5,7-dichloro-2,3-dimethylpyrido[3,4-b]pyrazine

Intermediate 1

- 5 A 500 mL round bottom flask was charged with 3,4-diamino-2,6-dichloropyridine (27 g, 152 mmol) and 2,3-butanedione (15.99 mL, 182 mmol). EtOH (152 mL) was added to the flask and the mixture was heated to 70 °C. After 5 h, the mixture was filtered through a fritted funnel and the eluent was concentrated to about 75 mL under reduced pressure. H₂O (150 mL) was added to the solution and the resulting solid was filtered off. The combined
- 10 solid from both filtrations was washed with H₂O 3 times and was allowed to dry on the filter under air to afford 5,7-dichloro-2,3-dimethylpyrido[3,4-b]pyrazine as a light brown solid (34.5g, 152 mmol). LC/MS (ESI⁺) m/z = 228.0 [M+H]⁺ ¹H NMR (500 MHz, Chloroform-d) δ ppm 7.82 (s, 1H), 2.83 (s, 3H), 2.80 (s, 3H).

Method 12

- 15 **Intermediate 2: 6,8-dichloro-2,3-dimethylpyrido[2,3-b]pyrazine**

Intermediate 2

- 4,6-dichloropyridine-2,3-diamine (30 g, 169 mmol) and butane-2,3-dione (16.12 mL, 185 mmol) were combined in a 1 L round bottom flask. EtOH (600 mL) was added and the mixture was heated to 80 °C for 5 h. After cooling, the solvent was removed under reduced
- 20 pressure. The resulting solid was triturated with diethyl ether and was filtered to afford 6,8-dichloro-2,3-dimethylpyrido[2,3-b]pyrazine as a light brown solid (36.5 g, 160 mmol).

LC/MS (ESI⁺) $m/z = 228.0$ [M+H]⁺ ¹H NMR (400 MHz, DMSO-d₆): δ ppm 8.21 (s, 1 H), 2.76 (s, 6 H)

Method 13

Intermediate 3: 2,4-dichloro-6,7-dimethylpteridine

In a 100 mL round bottom flask 2,6-dichloropyrimidine-4,5-diamine (5 g, 27.9 mmol) and butane-2,3-dione (2.91 mL, 33.5 mmol) were combined in EtOH (27.9 mL) and the mixture was stirred at 30 °C for 18 h. After cooling, the solvent was removed under reduced pressure. The resulting solid was triturated with diethyl ether and filtered to afford 2,4-dichloro-6,7-dimethylpteridine (6.02 g, 26.3 mmol) as a light brown solid. LC/MS (ESI⁺) $m/z = 229.0$ [M+H]⁺ ¹H NMR (500 MHz, Chloroform-*d*) δ ppm 2.88 (s, 3 H), 2.87 (s, 3 H).

Reaction was set up in two batches using 20 g and 25 g of 2,6-dichloropyridine-3,4-diamine (45 g, 252 mmol total). To a 50 mL round bottom flask were added 2,6-dichloropyridine-3,4-diamine (25 g, 140 mmol) and 2-oxopropanal (30.4 g, 169 mmol) in EtOH (250 mL). The reaction mixture was heated at 85 °C for 2 h. The reaction flask was

cooled to room temperature. The mixture was diluted with H₂O and the resulting solids were filtered and washed with H₂O. The solid material was dissolved in DCM, dried over Na₂SO₄, filtered and concentrated under reduced pressure to furnish the reaction crude. This crude material was combined with 2,6-dichloropyridine-3,4-diamine from the second batch and both absorbed onto a plug of silica gel and purified by chromatography through a silica gel column, eluting with a gradient of 100% DCM, to provide 5,7-dichloro-2-methylpyrido[3,4-b]pyrazine (25.57 g, 119 mmol) as an off-white solid and 7.8 g of mixture of 2 isomers. Major isomer: LC/MS (ESI⁺) m/z = 213.9 [M+H]⁺ ¹H NMR (400 MHz, DMSO-d₆): δ ppm 9.06 (s, 1 H), 8.11 (s, 1H), 2.79 (s, 3 H). Minor isomer: LC/MS (ESI⁺) m/z = 214.0 [M+H]⁺ ¹H NMR (400 MHz, DMSO-d₆): δ ppm 9.16 (s, 1 H), 8.20 (s, 1H), 2.79 (s, 3 H).

Method 15

Intermediate 5: 5,7-dichloro-2,3-dimethyl-1,8-naphthyridine and

Intermediate 6: 2,4-dichloro-7-ethyl-1,8-naphthyridine

A screw-capped vial was charged with 2-amino-4,6-dichloronicotinaldehyde (0.5 g, 2.62 mmol) and methyl ethyl ketone (2.62 mL). To this solution was added KOH (0.147 g, 2.62 mmol). The reaction was stirred overnight at room temperature. H₂O was added and the aqueous phase was neutralized to a pH of 7 using 1N aqueous HCl. The aqueous phase was extracted with DCM. The organic phase was separated using a phase separator and was concentrated under reduced pressure. The crude material was purified by silica gel chromatography (0-10% MeOH (+1% NH₃) in DCM) to afford 5,7-dichloro-2,3-dimethyl-1,8-naphthyridine (0.284 g, 1.25 mmol, 47.7 %). LC/MS (ESI⁺) m/z = 227.0 [M+H]⁺ and 2,4-dichloro-7-ethyl-1,8-naphthyridine (0.18 g, 0.79 mmol) LC/MS (ESI⁺) m/z = 227.0 [M+H]⁺.

Method 16**Intermediate 7: 5,7-dichloro-2-methyl-1,6-naphthyridine**

To a 50 mL vial were added 4-amino-2,6-dichloronicotinaldehyde (1.91 g, 10 mmol, JW Pharmed) and KOH (0.84 g, 15.0 mmol) in acetone (10 mL). The reaction was stirred at rt for 30 min and a precipitate formed. The reaction mixture was diluted with EtOAc, dried, and concentrated. The crude material was purified via chromatography (0-30% EtOAc in DCM) to yield 1.65g (71%) of 5,7-dichloro-2-methyl-1,6-naphthyridine as an off-white solid.

Method 17**10 Intermediate 8: 2,4-dichloro-7-methyl-1,8-naphthyridine**

To a 50 mL vial were added 2-amino-4,6-dichloronicotinaldehyde (0.3507 g, 1.836 mmol) and acetone (1.836 mL). To this solution was added KOH (0.155 g, 2.75 mmol). The reaction was stirred at room temperature for 30 minutes. H₂O was added and the aqueous phase was extracted with DCM. The organic phase was separated using a phase separator and was concentrated under reduced pressure to afford 2,4-dichloro-7-methyl-1,8-naphthyridine (0.317 g, 1.49 mmol). LC/MS (ESI⁺) m/z = 213.0 [M+H]⁺

Method 18

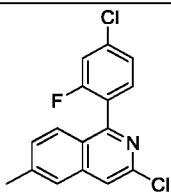

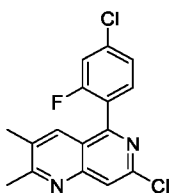

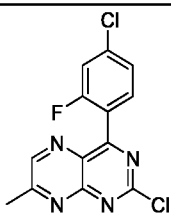

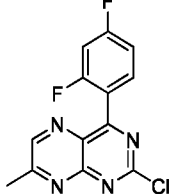

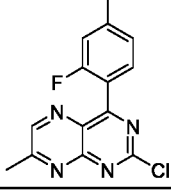

Intermediate 9: 7-chloro-5-(4-chloro-2-fluorophenyl)-2-methyl-1,6-naphthyridine

5,7-dichloro-2-methyl-1,6-naphthyridine (Intermediate 7, 0.852 g, 4 mmol), (1,1'-bis(diphenyl-phosphino)ferrocene)dichloropalladium (0.146 g, 0.200 mmol), (4-chloro-2-fluorophenyl)-boronic acid (0.697 g, 4.00 mmol) and Cs₂CO₃ (3.91 g, 12.00 mmol) were combined in a 50 mL vial. Intermediate 59: 2-chloro-6,7-dimethyl-4-((trans)-3-(trifluoromethyl)cyclobutyl)pteridine and

Intermediate 60: 2-chloro-6,7-dimethyl-4-((cis)-3-(trifluoromethyl)cyclobutyl)pteridine

5

Step 1: (3-(trifluoromethyl)cyclobutyl)zinc(II) chloride. Magnesium (0.190 g, 7.82 mmol) was cleaned with a crystal of iodine then suspended in dry THF (3 mL) under N₂. 1-bromo-3-(trifluoromethyl)cyclobutane (1.25 g, 6.16 mmol) was added and the mixture stirred at rt. The mixture was stirred at ambient temperature for ~60 minutes and became a milky suspension. Zinc chloride solution in 2-MeTHF (2.92 mL, 5.54 mmol) was added dropwise and the mixture was stirred for 30 minutes. A white precipitate formed. The mixture was centrifuged for 10 min and the resulting dark yellow supernatant solution was used without further manipulation.

Step 2: 2-chloro-6,7-dimethyl-4-(3-(trifluoromethyl)cyclobutyl)pteridine. To a 40 mL vial was added bis(di-tert-butyl(4-dimethylaminophenyl)phosphine)-dichloropalladium(ii) (0.354 g, 0.500 mmol) and 2,4-dichloro-6,7-dimethylpteridine (Intermediate 3) (1.145 g, 5.00 mmol, Syngene) under N₂, 2.0 mL THF was added at rt, followed by ((1R,3R)-3-(trifluoromethyl)cyclobutyl)zinc(II) bromide in THF (1.0 eq). The solution turned purple and was stirred at 45 for 40 min. The reaction was concentrated, diluted with DCM (20 mL), quenched with H₂O (10 mL) and HCl (2N, 3 mL) and extracted with DCM. The DCM extracts were combined, washed with brine, dried over MgSO₄ and concentrated. The residue was purified via silica gel chromatography (0%-40% EtOAc/EtOH in 10% DCM in Heptane) to afford 2-chloro-6,7-dimethyl-4-(3-(trifluoromethyl)cyclobutyl)pteridine (1.51 g, 4.77 mmol, 95 % yield) as a yellow solid (~

2.5/1 ratio of the cis/trans isomer). The compound was repurified via silica gel chromatography (0%-80% EtOAc in 10% DCM in Heptane) to afford:

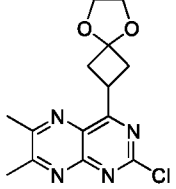

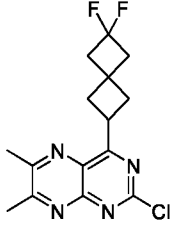

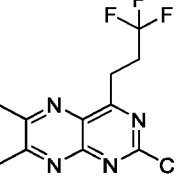

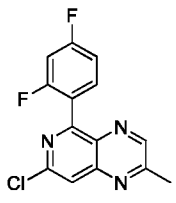

Peak 1 : 2-chloro-6,7-dimethyl-4-(trans-3-(trifluoromethyl)cyclobutyl)-pteridine (0.864 g, 2.73 mmol, 54.6 % yield) as a yellow solid. ¹H NMR (500 MHz, Chloroform-*d*) δ ppm 4.89 - 4.98 (m, 1 H), 3.08 - 3.29 (m, 1 H), 2.66 - 2.88 (m, 10 H), ¹⁹F NMR (Chloroform-*d*, 471 MHz) δ ppm -74.03 (s); m/z (ESI, +ve ion): 317.0 (M+H)⁺

Method 20

Intermediate 71: 2-chloro-6,7-dimethyl-4-(3-(trifluoromethyl)bicyclo[1.1.1]pentan-1-yl)pteridine

Step 1: (3-(trifluoromethyl)bicyclo[1.1.1]pentan-1-yl)zinc(II) chloride. To an oven-dried 40 mL vial was added magnesium (122 mg, 5.04 mmol) and a small piece of I₂ (~5 mg). The vial was evacuated and filled with N₂ 3 times and 1.0 mL THF was added. The vial was sonicated for 1 min and stirred at rt for 5 min. The mixture became a dark red/purple suspension. Then 1-iodo-3-(trifluoromethyl)bicyclo[1.1.1]pentane (1200 mg, 4.58 mmol) in 1 mL THF was added dropwise at room temperature. The purple I₂ color disappeared quickly, but no further exotherm was noticed. The vial was sealed and heated at 74 °C. The mixture quickly turned clear and gradually became cloudy again. The mixture was heated for another 30 min until minimal Mg was left. An aliquot of the mixture was taken and subject to H and F NMR analysis, which showed >90% conv. to the Grignard reagent [Product: ¹⁹F NMR (Chloroform-d, 471 MHz) δ -73.99 (s, 1F); Substrate: ¹⁹F NMR (Chloroform-d, 471 MHz) δ -71.81 (s, 1F)]. The reaction mixture was cooled to room temperature. Zinc chloride solution in 2-Me THF (2290 μL, 4.58 mmol) was added dropwise with an ice-H₂O bath. The mixture was warmed to rt and stirred for 30 minutes. A white precipitate formed, and the mixture was left to settle overnight. The clear supernatant solution was used without further manipulation. Titration with I₂ confirmed organozinc formation (12.3 mg I₂, 0.115 mL solution, 0.42 M solution in THF). Approximately 6.5 mL was able to be taken out (2.7 mmol, 59% yield).

Step 2: 2-chloro-6,7-dimethyl-4-(3-(trifluoromethyl)bicyclo[1.1.1]pentan-1-yl)pteridine. To a 40 mL vial was added bis(di-tert-butyl(4-dimethylaminophenyl)phosphine)-dichloro-palladium(ii) (49.6 mg, 0.070 mmol) and 2,4-dichloro-6,7-dimethylpteridine (Intermediate 3) (160 mg, 0.700 mmol, Syngene). The vial was evacuated and filled with N₂ 3 times. 0.5 mL THF was added at rt, followed with (3-(trifluoromethyl)bicyclo[1.1.1]pentan-1-yl)zinc(II) chloride (1.0 eq). The solution gradually turned purple and was stirred at 45 °C. After 40 min, reaction reached ~90% conv. No change was observed after 2 h. The reaction was concentrated, diluted with DCM (8 mL), quenched with H₂O (4 mL) and HCl (2 N, 0.4 mL), and extracted with DCM (10 mL X 3). The DCM extracts were separated with a phase separator, concentrated, and purified with column chromatography (RediSep 12 g, 0%-40% EA/EtOH = 3/1 blend in 10% DCM in Heptane) to afford 2-chloro-6,7-dimethyl-4-(3-(trifluoromethyl)bicyclo[1.1.1]pentan-1-yl)pteridine (174 mg, 0.529 mmol, 76 % yield) as a yellow solid. ¹H NMR (500 MHz,

Chloroform-d) δ ppm 2.82 (m, 6 H), 2.69 (s, 6 H). ^{19}F NMR (471 MHz, Chloroform-d) δ ppm -73.11 (s). m/z (ESI, +ve ion): 329.0 (M+H) $^+$.

To a 40 mL vial was added bis(di-tert-butyl(4-dimethylaminophenyl)phosphine)-dichloro-palladium(ii) (99 mg, 0.140 mmol) and 2,4-dichloro-7-dimethylpteridine (300 mg, 1.395 mmol, WuXi). The vial was evacuated and filled with N₂ 3 times. 3.5 mL THF was added at rt, followed with (3-(trifluoromethyl)bicyclo[1.1.1]pentan-1-yl)zinc(II) chloride (3671 μL, 1.395 mmol, 1.0 equiv., see Method 20, step 1). The solution gradually turned purple and was stirred at 45 °C overnight. The reaction was quenched with NH₄Cl and EtOAc and extracted into EtOAc. The combined organic extracts were dried over MgSO₄, filtered and concentrated to give the crude product. The crude material was purified by column chromatography to yield the desired product. m/z (ESI, +ve ion): 315.0 (M+H)⁺.

Method 21

Step 1: Tert-butyl 4,4-difluoro-3-(1-methyl-1H-pyrazol-4-yl)piperidine-1-carboxylate. To a 100-mL round-bottomed flask was added tert-butyl 3-(1-methyl-1H-pyrazol-4-yl)-4-oxopiperidine-1-carboxylate (1 g, 1.647 mmol) in DCM (40 mL) and DAST (2.2 mL, 16.47 mmol) at 0 °C. The reaction mixture was warmed to room temperature, stirred for 48 h, quenched with 10 % sodium bicarbonate (50mL) and extracted with DCM

The mixture was cooled to 0 °C and HCl in dioxane (0.5 mL, 2.000 mmol) was added. The reaction mixture was 10 warmed to room temperature, stirred for 2h, then concentrated in vacuo to give the crude product which was washed with diethyl ether to provide 4,4-difluoro-3-(1-methyl-1H-pyrazol-4-yl)piperidine hydrochloride (25 mg, 0.124 mmol, 62.4 % yield) as white solid (hygroscopic). ¹H NMR (400 MHz, DMSO-d₆): δ ppm 9.36 (d, J=25.1 Hz, 2 H), 7.73 (s, 1 H), 7.41 (s, 1 H), 3.82 (s, 4 H), 3.57 (s, 2 H), 3.18 (d, J=5.1 Hz, 1 H), 2.39 (d, J=11.9 Hz, 2 15 H).

Method 22

To the flask was added hydrogen bromide-acetic acid (6.88 g, 5.08 mL, 28.1 mmol) in one portion. After 1 h, the crude
5 reaction was carefully quenched with saturated NaHCO₃ solution and washed with EtOAc. The combined organic layer was dried over Na₂SO₄ and was filtered, and concentrated. The resulting crude material was purified by silica gel chromatography, eluting with 0% to 40% EtOAc/EtOH (3:1) in heptane, to provide 4-(4-bromotetrahydro-2H-pyran-2-yl)-1-methyl-1H-pyrazole (1.31 g, 5.33 mmol, 57 % yield) as a light yellow oil as an ~3:1 mixture of
10 cis/trans diastereomers. A second silica gel column provided the pure cis (0.85g) and trans (0.27) isomers. If desired, the major (cis) diastereomers can be separated by SFC (Chiralpak AY-H 2x25 cm, 5 μm columns; mobile phase = 10% EtOH, F = 60mL/min).

Minor diastereomer (trans isomers): ¹H NMR (500 MHz, Chloroform-*d*) δ ppm 7.46 (s, 1 H), 7.35 (s, 1 H), 4.93 (dd, *J*=10.0, 2.9 Hz, 1 H), 4.79 (quin, *J*=3.1 Hz, 1 H), 4.12 (td, *J*=11.6, 2.1 Hz, 1 H), 3.92 - 3.99 (m, 1 H), 3.89 (s, 3 H), 2.16 - 2.29 (m, 3 H), 1.93 - 2.02 (m, 20 1 H). *m/z* (ESI, +ve ion): 245.0 [M+H]⁺.

Step 2: (2-(1-methyl-1H-pyrazol-4-yl)tetrahydro-2H-pyran-4-yl)zinc(II) bromide. To an oven-dried 50 mL flask was added Zn (0.320 g, 4.90 mmol), which was evacuated and backfilled with N₂ 3 times and the flask was capped with a rubber septum. Then a thermocouple probe was inserted and lithium chloride solution 0.5 M in anhydrous
25 THF (3.26 mL, 1.632 mmol) was added. 1,2-dibromoethane (0.015 g, 7.03 μL, 0.082 mmol) was then added and the mixture was heated to an internal temp of 50 °C and held for 20 min. The flask was removed from the heating block and cooled to room temperature. internal temperature of 50 °C and the temperature held for 20 min. While still hot, 4-bromotetrahydro-2H-pyran-2-yl)-1-methyl-1H-pyrazole (3:1 cis/trans mixture, 0.4 g, 1.632 mmol) was added as a THF solution (1.5 mL) and the resulting mixture was stirred at 50 °C overnight. The reaction solution was cooled to room temperature as the zinc powder was
 5 allowed to settle to provide a yellow solution of (2-(1-methyl-1H-pyrazol-4-yl)tetrahydro-2H-pyran-4-yl)zinc(II) bromide.

25 **BIOLOGICAL EVALUATION**

Provided in this section is the biological evaluation of the specific examples provided herein. See Examples A1-A4, Tables 19-22, and FIGs. 1-3.

Example A1.***In vitro* Measurement of Triggering Receptor Expressed on Myeloid Cells 2 activity using cellular phosphorylation of Spleen Tyrosine Kinase (“Syk”) Assays used for Examples 1-305**

5 Pharmacological measurements of TREM2 signaling through DAP12 were made with TREM2 and DAP12 overexpressing HEK293 cells stable cell lines that had been single-cell cloned (“TREM2/DAP12-HEK”). The readout of the TREM2 signaling utilized Perkin Elmer AlphaScreen/AlphaLISA technology monitoring the phosphorylation levels of the Syk kinase. TREM2/DAP12-HEK cell lines were cultured in DMEM-F12 (Corning 10-092-CM) 10 supplemented with 1X Penicillin/Streptomycin (Corning 30-002-CI), 1X GlutaMAX (Gibco 35050-061), and 10% Fetal Bovine Serum (Life Technologies 10099) referred to as “HEK Culture Medium”. Suspensions of TREM2/DAP12-HEK cells were prepared in HEK Culture Medium and dispensed into 384-well poly-D-lysine coated microplates (Corning 354661) at a density of 20,000 cells/well using a Multidrop Combi peristaltic microplate 15 dispenser (Thermo), 25 μ L volume of cell suspension/well. Plates containing cells were then incubated for 20 hours in a humidified cell culture incubator at 37°C with 5% CO₂ (Thermo). After incubation, culture medium was removed from all wells of each microplate and replaced with 20 μ L of “Assay Buffer” comprised of DMEM-F12 (Corning 10-092-CM) supplemented with 1X Penicillin/Streptomycin (Corning 30-002-CI) and 0.1% Pluronic F-68 20 Polyol (MP Biomedical 092750049) using a Bravo 384-well pipette-based liquid handling system (Agilent). Assay Buffer contained diluted test articles (in 1% final DMSO concentration for compounds) or 100 nM anti-human/mouse TREM2 antibody (R&D Systems MAB17291) as a positive control, or 100 nM or rat IgG2B isotype Ab as a negative control (R&D Systems MAB0061). The plates were incubated with test articles and controls 25 for 45 minutes at room temperature and then the medium was aspirated/removed from each well of the plates. A Multidrop Combi peristaltic liquid handler (Thermo) was used to dispense 15 μ L/well of “Cell Lysis Immunoassay Buffer”. The Cell Lysis Immunoassay Buffer contained M-PER Mammalian Protein Extraction Reagent (Pierce/ThermoFisher 78505), 1X Halt Phosphatase Inhibitor Cocktail (ThermoFisher # 78427), 0.1875 nM anti-phospho-Syk (Tyr525/526) (C87C1) rabbit mAb (Cell Signaling Technologies catalog # 30

2710), and 1.5 nM biotinylated Mouse anti-human Syk (4D10) antibody (BD Biosciences, catalog #624008). Plates were incubated for 1 hour at room temperature after the addition of the Cell Lysis Immunoassay Buffer. The Multidrop Combi liquid handler was used to dispense 15 μ L of AlphaScreen Acceptor Bead Solution containing 7.5 μ g/mL anti-rabbit IgG (Fc specific) AlphaLISA Acceptor Beads (Perkin Elmer AL104R) in 1X Immunoassay buffer (Perkin Elmer AL000F) to each well of the microplates. The plates were incubated for 2 hours at room temperature. Following the incubation with the AlphaLISA Acceptor Bead Solution, a Multidrop Combi liquid handler (Thermo) was used to dispense 15 μ L of AlphaScreen Donor Bead Solution containing 30 μ g/mL of AlphaScreen Streptavidin Donor beads (Perkin Elmer 6760002B) in 1X Immunoassay buffer (Perkin Elmer AL000F) to each well of the microplates. Microplates were incubated for 2 hours protected from light sources as the AlphaScreen reagents are light sensitive. Once the final incubation was completed, an AlphaScreen signal was acquired from the donor and acceptor beads using an Envision high throughput multi-modal microplate reader (Perkin Elmer) calibrated to the plate type with the AlphaScreen mirror and filter-set in 384-well mode, 680 nanometer excitation wavelength. The total measurement time per well was 550 milliseconds with a 180 millisecond excitation time.

After reading the AlphaScreen signal for each well of the microplates, on a plate-by-plate basis, each raw test article well value (x) was normalized to a Percent of Control (“POC”) value using the following formula: $POC = ((x - \mu_n)/(\mu_p - \mu_n)) * 100$ where (μ_n) is the mean negative control well signal for the given plate and (μ_p) is the mean positive control TREM2 antibody signal for the given plate. Each plate contained 12 of each type of control wells that were used to generate the mean values. For concentration response curve analysis with test articles tested at various concentrations, the % of activation values were analyzed with 4 Parameter Logistic or Sigmoidal Dose-Response Models using GeneData Screener (GeneData, AG) or GraphPad Prism 7 (Graphpad Software, Inc.). The potency of the test item was expressed as EC50 corresponding to the test item concentration able to activate the phospho-Syk AlphaScreen signal to 50% of the maximal response.

For pharmacological assessment of TREM2 signaling in cellular systems natively expressing TREM2, human monocyte-derived macrophages were utilized. CD14⁺ monocytes positively selected from large-scale apheresis on healthy human donors (Lonza) were

differentiated into macrophages in low-attachment bioprocess bags (Saint-Gobain Performance Plastics) for 9 days in RPMI-1640 medium (Gibco 11875093) supplemented with 10% Fetal Bovine Serum (Gibco 10082139), 10 mM HEPES (Gibco 15630080), 1X Penicillin-Streptomycin (Gibco 15140122), 1X Non-essential amino acids (Gibco 11140050),
5 1 mM Sodium Pyruvate (Gibco 11360070), 1X GlutaMAX (Gibco 35050-061), and 50 ng/mL M-CSF (Promocell C-60442A). After differentiation, macrophages were harvested and cryopreserved in BamBanker (Wako/GC LYMPHOTEC 302-14681/CS-02-001) in addition to undergoing quality control for expression of cell surface markers including TREM2 using flow cytometry. Batches utilized for phospho-Syk assays were approximately
10 80-90% TREM2⁺ by flow cytometry.

After cryorecovering macrophages, live cell suspensions of 100,000 cells/mL in “Macrophage pSyk Assay Medium” were prepared, composed of RPMI-1640 with GlutaMAX medium (Gibco 61870036) supplemented with 10% Fetal Bovine Serum (Gibco 10082139), 10 mM HEPES (Gibco 15630080), 1X Penicillin-Streptomycin (Gibco
15 15140122), 1X Non-essential amino acids (Gibco 11140050), 1 mM Sodium Pyruvate (Gibco 11360070), and 10 ng/mL M-CSF (Promocell C-60442A). A Multidrop Combi peristaltic liquid handling instrument (Thermo) was used to dispense 50 µL/well of cell suspension (5,000 cells/well) into poly-d-lysine coated 384-well plates (Corning 354661). After a 30 minute incubation at room temperature, plates were incubated in a humidified cell
20 culture incubator at 37°C with 5% CO₂ (Thermo) for 16 hours. To initiate the assay with test articles, medium in each well of the assay plates was aspirated and replaced with 20 µL Assay Buffer containing diluted test articles (in 1% final DMSO concentration for compounds) or Assay Buffer containing 1% DMSO for as a negative control. The remainder of the macrophage AlphaScreen phospho-Syk assay followed the procedure detailed above for the
25 HEK cell lines.

After reading the AlphaScreen signal for each well of the microplates containing macrophages, on a plate-by-plate basis, each raw test article well value (x) was background subtracted from the mean negative control well signal for the given plate. Each plate contained 12-24 negative control wells that were used to generate the mean value for
30 background subtraction. For concentration response curve analysis with the test articles tested at various concentrations, the values were analyzed with a 4 Parameter Logistic curve

fit using GraphPad Prism 7 (Graphpad Software, Inc.). The potency of each test item was expressed as EC50 corresponding to the test item concentration able to activate the background subtracted phospho-Syk AlphaScreen signal to 50% of the maximal response.

Example A2.***In vitro* Measurement of Triggering Receptor Expressed on Myeloid Cells 2 activity using cellular phosphorylation of Spleen Tyrosine Kinase (“Syk”) Assays used for Examples 306-429**

5 Measurement of TREM2 agonist potency was done using a HEK cell line expressing human TREM2 and DAP12 (HEK293T-hTREM2 cells). Binding of small molecules to, and activation of, TREM2 increases the phosphorylation of Syk. The resultant levels of Syk phosphorylation were measured using a commercial AlphaLisa reagent kit. To perform the assay, HEK-hTREM2 cells were plated at 14,000 cells per well in a 384 well plate, in 25 μ L
10 of complete growth media and incubated at 37 °C, 5% CO₂ for 20-24 hours. Prior to the assay, test compounds were diluted in the 384 well plates in assay buffer and allowed to equilibrate for 30 minutes. Growth media was removed from cell plates by inversion on blotting paper, and 25 μ L of test compounds in assay buffer was added to cells. Cells were incubated for 45 minutes at room temperature. After 45 minutes, assay buffer was removed
15 and 10 μ L of lysis buffer was added. Plates were shaken for 20 minutes at 350 RPM at room temperature. After complete lysis, AlphaLisa reagents were added to the lysate, and fluorescence intensity was measured using a Perkin Elmer Envision plate reader. Intensities were used to generate a standard curve, and % activation was calculated. Curve fitting was performed using Prism v9 software, log(agonist) vs response – variable slope (four
20 parameters), and EC50s were calculated from the curve fit.

The results presented in **Table 20** have been generated with the *in vitro* assay described above for Examples 306-429. This assay may be used to test any of the compounds described herein to assess and characterize a compound's ability to act as an agonist of TREM2.

25 Compounds designated as “A” demonstrated an EC50 of $\leq 0.05 \mu$ M. Compounds designated as “B” demonstrated an EC50 $> 0.05 \mu$ M and $\leq 0.5 \mu$ M. Compounds designated as “C” demonstrated an EC50 $> 0.5 \mu$ M and $\leq 3.0 \mu$ M. Compounds designated as “D” demonstrated an EC50 $> 3.0 \mu$ M and $\leq 100 \mu$ M. Compounds designated as “-” had not been tested as of the filing of the present application, but can be tested using the methods
30 described herein.

Example A3.**IP-10 expression in the brain and plasma of mice after administration of Example 192 and a TREM2 agonist antibody**

5 To test TREM2 target engagement in an acute dosing paradigm using the compound of Example 192 (5-(4-chloro-2-fluorophenyl)-2,3-dimethyl-7-((2R,4S)-2-(1-methyl-1H-pyrazol-4-yl)tetrahydro-2H-pyran-4-yl)pyrido[3,4-b]pyrazine), hTREM2-CV knock-in transgenic mice were dosed using oral gavage (PO) twice a day (0 and 10h) followed by sample collection at 24 hours. 6 animals received the compound of Example 192 at 50
10 mg/kg, and 6 animals received vehicle only (2% Hydroxypropyl Methylcellulose, 1% Tween-80 in PBS). In the same experiment, an anti-hTREM2 Antibody Ab-1 was dosed intraperitoneally (IP) at 100 mg/kg (control was a non-binding matched IgG isotype control). Ab-1 is a murinized version of a human TREM2 agonist antibody, first described as an engineered variant of antibody 13E7 in PCT Application Publication WO2018/195506A1.
15 Ab-1 has an HC according to SEQ ID NO:9, an LC according to SEQ ID NO:10, and exemplifies an anti-TREM2 antibody having the CDRs according to SEQ ID NOS:1-6. Twenty-four hours following the zero-hour dose, mice were humanely euthanized for blood collection prior to cardiac perfusion with PBS and brain harvest. Brains were micro

dissected into right and left regions of interest (including the cortex and hippocampus) for independent processing of cytokine and mRNA expression profiles. Whole blood was collected into EDTA-containing vials to prevent coagulation, and centrifuged to isolate the plasma fraction before storage at -80°C. Right and left hemisphere cortices were flash frozen
5 in liquid nitrogen and stored at -80°C before lysis and homogenization.

Plasma and brain lysates were analyzed for IP-10 (CXCL10) and CCL2 (MCP1) expression using a Meso Scale Discovery (MSD) multi-array reader and V-PLEX kits per manufacturer's protocols. Both IP-10 and CCL2 are chemotactic cytokines involved in the regulation of monocyte infiltration, and both appear to be upregulated in response to TREM2
10 engagement in microglia.

Both the compound of Example 192 and Ab-1 induced upregulation of IP-10 and CCL2 in cortical lysates compared to vehicle-treated animals (FIGs. 1 and 2). The upregulation of IP-10 was more robust, and so IP-10 levels were analyzed in plasma from the same experiment. This analysis of peripheral IP-10 levels in the plasma fraction showed no
15 apparent cytokine upregulation, indicating a brain compartment-specific effect of the compound of Example 192. These results indicate that CNS TREM2 is responsible for increased IP-10 (FIG. 3), ruling out a peripheral IP-10 increase and transfer to the brain. These results demonstrate TREM2 brain target engagement using the compound of Example 192 *in vivo*.

20 **Example A4.**

Nanostring analysis of gene expression profiles after administration of Example 192 and a TREM2 agonist antibody in a mouse model

To assess the impact of TREM2 agonism on cellular processes and pathways, the right hemisphere hippocampi from the acute dosing of the compound of Example 192 and
25 Ab-1, as described in Example A3, were analyzed for gene expression changes. Cells from frozen hippocampi were lysed, and RNA was isolated. Key gene expression profiles were analyzed using the nCounter Murine Neuroinflammation panel of 770 genes related to inflammation in the CNS. Results of individual gene expression changes relative to the mean

of several housekeeper genes were grouped in pathways of interest and assigned a relative score using the nSolver analysis software.

Nanostring nSolver software includes a module for Cell Type Profiling that identifies genes linked to cell type in an experiment. Analysis using this module revealed an increase in microglia score (microglial-associated genes) with treatment with the compound of Example 5 192 and Ab-1, but no change in neuron or astrocyte scores, indicating microglial-specific effects of TREM2 agonism by both treatments, as expected with TREM2 activation. **Table 21** reports the Cell Type Profiling scores for microglia, neuron and astrocyte genes, showing that microglia genes were upregulated by treatment with the compound of Example 192 and 10 Ab-1. Pathway analysis was also performed. Genes associated with the adaptive immune response, innate immune response, microglia function, cytokine signalling, and cell cycle were all increased in hippocampi from animals treated with the compound of Example 192 and Ab-1. **Table 22** reports the effects of the compound of Example 192 and Ab-1 on these genes, where the values reflect PC1 scores from principal component analysis of the gene set. 15 These results support the finding of TREM2 target engagement on microglia using the compound of Example 192 and Ab-1.
