BACKGROUND

[0003] The present invention provides compounds, pharmaceutical compositions containing one or more of those compounds or their pharmaceutically acceptable salts, which are effective in inhibiting the binding or function of various chemokines to chemokine receptors. As antagonists or modulators of chemokine receptors, the compounds and compositions have utility in treating various immune disorder conditions and diseases.

[0004] Chemokines, also known as chemotactic cytokines, are a group of small molecular-weight proteins that are released by a wide variety of cells and have a variety of biological activities. Chemokines attract various types of cells of the immune system, such as macrophages, T cells, eosinophils, basophils and neutrophils, and cause them to migrate from the blood to various lymphoid and none-lymphoid tissues. They mediate infiltration of inflammatory cells to sites of inflammation, and are responsible for the initiation and perpetuation of many inflammation diseases (reviewed in Schall, Cytokine, 3:165-183 (1991), Schall et al., Curr. Opin. Immunol., 6:865-873 (1994)).

[0005] In addition to stimulating chemotaxis, chemokines can induce other changes in responsive cells, including changes in cell shape, granule exocytosis, integrin up-regulation, formation of bioactive lipids (e.g.,
leukotrienes), respiratory burst associated with leukocyte activation, cell proliferation, resistance to induction of apoptosis and angiogenesis. Thus, chemokines are early triggers of the inflammatory response, causing inflammatory mediator release, chemotaxis and extravasation to sites of infection or inflammation. They are also stimulators of a multitude of cellular processes that bear important physiological functions as well as pathological consequences.

[0006] Chemokines exert their effects by activating chemokine receptors expressed by responsive cells. Chemokine receptors are a class of G-protein coupled receptors, also known as seven-transmembrane receptors, found on the surface of a wide variety of cell types such as leukocytes, endothelial cells, smooth muscle cells and tumor cells.

[0008] Rheumatoid arthritis is a chronic disease of the joints characterized by synovial inflammation that leads to the destruction of cartilage and bone. Although the underlying causes of the disease are unknown, it is believed that macrophages and Th-1 type T cells play a key
role in the initiation and perpetuation of the chronic inflammatory process (Vervoordeldonk et al., Curr. Rheumatol. Rep., 4:208-17 (2002)).

Chemokine receptor-mediated infiltration of macrophages in the fat tissues may also contribute to the complications arising from obesity, a condition resulting from excessive storage of fat in the body. Obesity predisposes the affected individuals to many disorders, such as non-insulin-dependent diabetes, hypertension, stroke, and coronary artery disease. In obesity, adipose tissues have altered metabolic and endocrine functions that lead to an increased release of fatty acids, hormones, and pro-inflammatory molecules. Adipose tissue macrophages are believed to be a key source of pro-inflammatory cytokines including TNF-alpha, iNOS and IL-6 (Weisberg et al., J. Clin. Invest., 112:1796-808 (2003)). Recruitment of macrophages to the adipose tissue is likely mediated by MCP-1 produced by adipocytes (Christiansen T, et al., Int J Obes (Lond). 2005 Jan;29(1):146-50; Sartipy et al., Proc. Natl. Acad. Sci. U.S.A., 100:7265-70 (2003)).

Elevated MCP-1 may induce adipocyte differentiation and insulin resistance, and contribute to pathologies associated with hyper-insulinemia and obesity. MCP-1 is over-expressed in plasma in obese mice compared to lean controls and white adipose is a major source. MCP-1 has also been shown to accelerate wound healing, and has a direct angiogenic effect on epithelial cells, and may play a direct role in the remodeling of adipose tissue.

[0012] MCP-1 plasma levels are substantially increased in Diet Induce Obesity (DIO) mice, and a strong correlation between plasma MCP-1 levels and body weight has been identified. Furthermore, elevation of MCP-1 induced by high fat diet causes changes in the CD11b positive monocyte population in DIO mice. (Takahashi K, et al., J. Biol. Chem., 46654 (2003)).

[0013] Furthermore, chronic inflammation in fat is thought to play a crucial role in the development of obesity-related insulin resistance (Xu H, et al., J Clin Invest. 2003 Dec;112(12):1821-30). It has been proposed that obesity related insulin resistance is, at least in part, a chronic inflammatory disease initiated in adipose tissue. Many inflammation and macrophage specific genes are dramatically upregulated in white adipose tissue in mouse models of genetic and high fat diet-induced obesity (DIO), and this upregulation precedes a dramatic increase in circulating insulin.

[0014] Increased expression levels of monocyte CCR2 and monocyte chemoattractant protein-1 in patients with diabetes mellitus (Biochemical and Biophysical Research Communications, 344(3):780-5 (2006)) were found in a study involving diabetic patients. Serum MCP-1 concentrations and surface expression of CCR2 on monocytes in diabetic patients were significantly higher than in non-diabetics, and the serum MCP-1 levels correlated with HbA1c, triglycerides, BMI, hs-CRP. Surface expression levels of CD36 and CD68 on monocytes were significantly increased in diabetic patients and more unregulated by MCP-1 in diabetics, augmenting uptake of ox-LDL, and hence potentially foam cell transformation. Elevated serum MCP-1 and increased monocyte CCR2, CD36, CD68 expression correlated with poor blood glucose control and potentially correlate with increased vessel wall monocyte recruitment.

[0015] MCP-1 is a potential player in negative cross talk between adipose tissue and skeletal muscle (Bianco JJ, et al., Endocrinology, 2458 (2006)). MCP-1 can significantly reduce insulin-stimulated glucose uptake, and is a prominent inducer of insulin resistance in human skeletal muscle cell.
Adipose tissue is a major secretory and endocrine active organ producing bioactive proteins regulating energy metabolism and insulin sensitivity.

[0016] CCR2 modulates inflammatory and metabolic effects of high-fat feeding (Weisberg SP, et al., J. Clin. Invest., 115 (2006)). Genetic deficiency in CCR2 reduced food intake and attenuated the development of obesity in mice fed a high fat diet. In obese mice matched for adiposity, CCR2 deficiency reduced macrophage content and inflammatory profile of adipose tissue, increased adiponectin expression, and improved glucose homeostasis and insulin sensitivity. In lean animals, no effect of CCR2 genotype on metabolic trait was found. In high-fat diet mice, CCR2 genotype modulated feeding, the development of obesity and adipose tissue inflammation. Once established, short term antagonism was shown to attenuate macrophage accumulation in adipose tissue and insulin resistance.

[0017] Chemokine and chemokine receptors are the key regulators of immune cell trafficking. MCP-1 is a potent chemoattractant of monocytes and T cells; its expression is induced under inflammatory conditions including proinflammatory cytokine stimulations and hypoxia. The interaction between MCP-1 and CCR2 mediates migration of monocytes, macrophage as well as activated T cells and play a key role in the pathogenesis of many inflammatory diseases. Inhibition of CCR2 functions using small molecule antagonists described in this invention represents a new approach for the treatments of inflammatory disorders.

[0018] Psoriasis is a chronic inflammatory disease characterized by hyperproliferation of keratinocytes and pronounced leukocyte infiltration. It is known that keratinocytes from psoriasis lesion express abundant CCR2 ligand MCP-1, particularly when stimulated by proinflammatory cytokines such as TNF-α (Vestergaard et al., Acta. Derm. Venereol., 84(5):353-8 (2004); Gillitzer et al., J. Invest. Dermatol., 101(2):127-31 (1993); Deleuran et al., J. Dermatol. Sci., 13(3):228-36 (1996)). Since MCP-1 can attract migration of both macrophages and dendritic cells expressing CCR2 to the skin, this receptor and ligand pair is believed to be important in regulating the interaction between proliferating keratinocytes and dermal macrophage during the
development of psoriasis. A small molecule antagonist may thus be useful in the treatment of psoriasis.

[0019] In addition to inflammatory diseases, chemokines and chemokine receptors have also been implicated in cancers (Broek et al., Br. J. Cancer, 88(6):855-62 (2003)). Tumor cells stimulate the formation of stroma that secretes various mediators pivotal for tumor growth, including growth factors, cytokines, and proteases. It is known that the level of MCP-1 is associated significantly with tumor-associated macrophage accumulation, and prognostic analysis reveals that high expression of MCP-1 is a significant indicator of early relapse in breast cancer (Ueno et al., Clin. Cancer Res., 6(8):3282-9 (2001)). A small molecule antagonist of a chemokine may thus be able to reduce the release of growth-stimulating cytokines by blocking accumulation of macrophages at sites of tumor formation.

[0020] T lymphocyte (T cell) infiltration into the small intestine and colon has been linked to the pathogenesis of Coeliac diseases, food allergies, rheumatoid arthritis, human inflammatory bowel diseases (IBD) which include Crohn's disease and ulcerative colitis. Blocking trafficking of relevant T cell populations to the intestine can lead to an effective approach to treat human IBD. More recently, chemokine receptor 9 (CCR9) has been noted to be expressed on gut-homing T cells in peripheral blood, elevated in patients with small bowel inflammation such as Crohn's disease and celiac disease. The only CCR9 ligand identified to date, TECK (thymus-expressed chemokine) is expressed in the small intestine and the ligand receptor pair is now thought to play a pivotal role in the development of IBD. In particular, this pair mediates the migration of disease causing T cells to the intestine. See for example, Zaballos et al., J. Immunol., 162(10):5671 5675 (1999); Kunkel et al., J. Exp. Med., 192(5):761-768 (2000); Papadakis et al., J. Immunol., 165(9):5069-5076 (2000); Papadakis et al., Gastroenterology, 121(2):246-254 (2001); Campbell et al., J. Exp. Med., 195(1):135-141 (2002); Wurbel et al., Blood, 98(9):2626-2632 (2001); and Uehara et al., J. Immunol., 168(6):2811-2819 (2002). In addition CCR9 bearing lymphocytes have been shown to mediate the
pathology of filariasis (lymphatic filarial disease) and inhibition of CCR9 has been correlated with reduction of the pathology associated with such conditions. See for example Babu et al., Journal of Infectious Diseases, 191: 1018-26, 2005.

heteroatom (typically 1 to 5 heteroatoms) selected from nitrogen, oxygen or 
sulfur. Preferably, these groups contain 0-5 nitrogen atoms, 0-2 sulfur atoms 
and 0-2 oxygen atoms. More preferably, these groups contain 0-3 nitrogen 
atoms, 0-1 sulfur atoms and 0-1 oxygen atoms. Heterocyclyl and heteroaryl 
groups can be substituted or unsubstituted, unless otherwise indicated. For 
substituted groups, the substitution may be on a carbon or heteroatom. For 
example, when the substitution is oxo (=O or –O), the resulting group may 
have either a carbonyl (-C(O)-) or a N-oxide (-N=O).

[0050] Suitable substituents for substituted alkyl, substituted alkenyl, and 
substituted alkynyl include halogen, -CN, -CO₂R, -C(O)R', -C(O)NR'R'', oxo 
(=O or –O'), -OR', -OC(O)R', -OC(O)NR'R''-NO₂, -NR'C(O)R', 
-NR'C(O)NR'R', -NR'R'', -NR'CO₂R'', -NR'S(O)R', -NR'S(O)₂R'', 
-NR'S(O)NR'R', -NR'S(O)₂NR'R'', -SR', -S(O)R', -S(O)₂R', -S(O)₂NR'R'', -NR'- 
C(NHR'')=NR'', -SiR'R'R'', -N₃, substituted or unsubstituted C₆₋₁₀ aryl, 
substituted or unsubstituted 5- to 10-membered heteroaryl, and substituted or 
unsubstituted 3- to 10-membered heterocyclyl. The number of possible
substituents range from zero to \((2m' + 1)\), where \(m'\) is the total number of carbon atoms in such radical.

**[0051]** Suitable substituents for substituted aryl, substituted heteroaryl and substituted heterocyclyl include halogen, -CN, -CO₂R', -C(O)R', -C(O)NR'R'', oxo \((=O \text{ or } -O')\), -OR', -OC(O)R', -OC(O)NR'R', -NO₂, -NR'C(O)R'', -NR'°C(O)NR'R', -NR'R'', -NR'°CO₂R', -NR'S(O)R', -NR'S(O)₂R', -NR'R''S(O)NR'R'', -NR'R''S(O)₂NR'R'', -SR', -S(O)R', -S(O)₂R', -S(O)₃R'', -NR'-C(NHR')=NR''°, -SiR'R''R''°, -N₃, substituted or unsubstituted \(C_{1-8}\) alkyl, substituted or unsubstituted \(C_{2-8}\) alkenyl, substituted or unsubstituted \(C_{6-10}\) aryl, substituted or unsubstituted 5- to 10-membered heteroaryl, and substituted or unsubstituted 3- to 10-membered heterocyclyl. The number of possible substituents range from zero to the total number of open valences on the aromatic ring system.

**[0052]** As used above, \(R', R''\) and \(R''°\) each independently refer to a variety of groups including hydrogen, substituted or unsubstituted \(C_{1-8}\) alkyl, substituted or unsubstituted \(C_{2-8}\) alkenyl, substituted or unsubstituted \(C_{6-10}\) aryl, substituted or unsubstituted \(C_{2-8}\) alkynyl, substituted or unsubstituted aryl, substituted or unsubstituted heteroaryl, substituted or unsubstituted heterocyclyl, substituted or unsubstituted arylalkyl, substituted or unsubstituted aryloxyalkyl. When \(R'\) and \(R''\) are attached to the same nitrogen atom, they can be combined with the nitrogen atom to form a 3-, 4-, 5-, 6-, or 7-membered ring (for example, \(-NR'R''\) includes 1-pyrrolidinyl and 4-morpholinyl). Furthermore, \(R'\) and \(R''°\), \(R''\) and \(R''°\), or \(R'\) and \(R''°\) may together with the atom(s) to which they are attached, form a substituted or unsubstituted 5-, 6-, or 7-membered ring.

**[0053]** Two of the substituents on adjacent atoms of an aryl or heteroaryl ring may optionally be replaced with a substituent of the formula \(-T\text{-C(O)}-(CH₂)ₗ\text{-U-}\), wherein \(T\) and \(U\) are independently \(-NR''°\), \(-O\), \(-CH₂\) or a single bond, and \(q\) is an integer of from 0 to 2. Alternatively, two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula \(-A'\text{-}(CH₂)ₗ\text{-B'-}\), wherein \(A'\) and \(B'\) are independently \(-CH₂\), \(-O\), \(-NR''°\), \(-S\), \(-S(O)\), \(-S(O)₂\), \(-S(O)₂NR''°\) or a single bond, and \(r\) is an integer of from 1 to 3. One of the single bonds of the new ring so formed may optionally be replaced with a double bond. Alternatively,
two of the substituents on adjacent atoms of the aryl or heteroaryl ring may optionally be replaced with a substituent of the formula -(CH₂)ₜ₋ₓ(CH₂)ₛ₋ₓ-, where 𝑠 and 𝑡 are independently integers of from 0 to 3, and 𝑥 is -O-, -NR‴-, -S-, -S(O)-, -S(O)₂-, or -S(O)₃NR‴-. R‴ in is selected from hydrogen or unsubstituted C₁₋₈ alkyl.

[0054]  "Heteroatom" is meant to include oxygen (O), nitrogen (N), sulfur (S) and silicon (Si).

[0055]  "Pharmaceutically acceptable" carrier, diluent, or excipient is a carrier, diluent, or excipient compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

[0056]  "Pharmaceutically-acceptable salt" refers to a salt which is acceptable for administration to a patient, such as a mammal (e.g., salts having acceptable mammalian safety for a given dosage regime). Such salts can be derived from pharmaceutically-acceptable inorganic or organic bases and from pharmaceutically-acceptable inorganic or organic acids, depending on the particular substituents found on the compounds described herein.

When compounds of the present invention contain relatively acidic functionalities, base addition salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired base, either neat or in a suitable inert solvent. Salts derived from pharmaceutically-acceptable inorganic bases include aluminum, ammonium, calcium, copper, ferric, ferrous, lithium, magnesium, manganic, manganous, potassium, sodium, zinc and the like. Salts derived from pharmaceutically-acceptable organic bases include salts of primary, secondary, tertiary and quaternary amines, including substituted amines, cyclic amines, naturally-occurring amines and the like, such as arginine, betaine, caffeine, choline, N,N'-dibenzylethlenediamine, diethylamine, 2-diethylaminoethanol, 2-dimethylaminoethanol, ethanolamine, ethylenediamine, N-ethylmorpholine, N-ethyipiperidine, glucamine, glucosamine, histidine, hydrabamine, isopropylamine, lysine, methylglucamine, morpholine, piperazine, piperidine, polyamine resins, procaine, purines, theobromine, triethylamine, trimethylamine, tripropylamine, tromethamine and the like. When compounds of the present invention contain relatively basic functionalities, acid addition
salts can be obtained by contacting the neutral form of such compounds with a sufficient amount of the desired acid, either neat or in a suitable inert solvent. Salts derived from pharmaceutically-acceptable acids include acetic, ascorbic, benzenesulfonic, benzoic, camphosulfonic, citric, ethanesulfonic, fumaric, gluconic, glucoronic, glutamic, hippuric, hydrobromic, hydrochloric, isethionic, lactic, lactobionic, maleic, malic, mandelic, methanesulfonic, mucic, naphthalenesulfonic, nicotinic, nitric, pamoic, pantothenic, phosphoric, succinic, sulfuric, tartaric, p-toluenesulfonic and the like.

[0057] Also included are salts of amino acids such as arginate and the like, and salts of organic acids like glucuronic or galacturonic acids and the like (see, for example, Berge, S.M. et al, "Pharmaceutical Salts", J. Pharmaceutical Science, 1977, 66:1-19). Certain specific compounds of the present invention contain both basic and acidic functionalities that allow the compounds to be converted into either base or acid addition salts.

[0058] The neutral forms of the compounds may be regenerated by contacting the salt with a base or acid and isolating the parent compound in the conventional manner. The parent form of the compound differs from the various salt forms in certain physical properties, such as solubility in polar solvents, but otherwise the salts are equivalent to the parent form of the compound for the purposes of the present invention.

[0059] "Salt thereof" refers to a compound formed when the hydrogen of an acid is replaced by a cation, such as a metal cation or an organic cation and the like. Preferably, the salt is a pharmaceutically-acceptable salt, although this is not required for salts of intermediate compounds which are not intended for administration to a patient.

[0060] In addition to salt forms, the present invention provides compounds which are in a prodrug form. Prodrugs of the compounds described herein are those compounds that readily undergo chemical changes under physiological conditions to provide the compounds of the present invention. Additionally, prodrugs can be converted to the compounds of the present invention by chemical or biochemical methods in an ex vivo environment. For example, prodrugs can be slowly converted to the
compounds of the present invention when placed in a transdermal patch reservoir with a suitable enzyme or chemical reagent.

[0061] "Therapeutically effective amount" refers to an amount sufficient to effect treatment when administered to a patient in need of treatment.

[0062] "Treating" or "treatment" as used herein refers to the treating or treatment of a disease or medical condition (such as a viral, bacterial or fungal infection or other infectious diseases, as well as autoimmune or inflammatory conditions) in a patient, such as a mammal (particularly a human or a companion animal) which includes ameliorating the disease or medical condition, i.e., eliminating or causing regression of the disease or medical condition in a patient; suppressing the disease or medical condition, i.e., slowing or arresting the development of the disease or medical condition in a patient; or alleviating the symptoms of the disease or medical condition in a patient.

[0063] Certain compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. In general, both solvated forms and unsolvated forms are intended to be encompassed within the scope of the present invention. Certain compounds of the present invention may exist in multiple crystalline or amorphous forms (i.e., as polymorphs). In general, all physical forms are equivalent for the uses contemplated by the present invention and are intended to be within the scope of the present invention.

[0064] It will be apparent to one skilled in the art that certain compounds of the present invention may exist in tautomeric forms, all such tautomeric forms of the compounds being within the scope of the invention. Certain compounds of the present invention possess asymmetric carbon atoms (optical centers) or double bonds; the racemates, diastereomers, geometric isomers and individual isomers (e.g., separate enantiomers) are all intended to be encompassed within the scope of the present invention. The compounds of the present invention may also contain unnatural proportions of atomic isotopes at one or more of the atoms that constitute such compounds. For example, the compounds may be radiolabeled with radioactive isotopes, such as for example tritium (³H), iodine-125 (¹²⁵I) or carbon-14 (¹⁴C). All
isotopic variations of the compounds of the present invention, whether radioactive or not, are intended to be encompassed within the scope of the present invention.

[0065] **Compounds that Modulate CCR2 or CCR9 Activity**

[0066] The present invention provides compounds that modulate at least one of CCR2 or CCR9 activity. Chemokine receptors are integral membrane proteins which interact with an extracellular ligand, such as a chemokine, and mediate a cellular response to the ligand, e.g., chemotaxis, increased intracellular calcium ion concentration, etc. Therefore, modulation of a chemokine receptor function, e.g., interference with a chemokine receptor ligand interaction, will modulate a chemokine receptor mediated response, and treat or prevent a chemokine receptor mediated condition or disease. Modulation of a chemokine receptor function includes both inducement and inhibition of the function. The type of modulation accomplished will depend on the characteristics of the compound, i.e., antagonist or full, partial or inverse agonist.

[0067] Without intending to be bound by any particular theory, it is believed that the compounds provided herein interfere with the interaction between a chemokine receptor and one or more cognate ligands. In particular, it is believed that the compounds interfere with the interaction between CCR2 and a CCR2 ligand, such as MCP-1. Compounds contemplated by the invention include, but are not limited to, the exemplary compounds provided herein and salts thereof.

[0068] For example, compounds of this invention act as potent CCR2 antagonists, and this antagonistic activity has been further confirmed in animal testing for inflammation, one of the hallmark disease states for CCR2. Accordingly, the compounds provided herein are useful in pharmaceutical compositions, methods for the treatment of CCR2-mediated diseases, and as controls in assays for the identification of competitive CCR2 antagonists.

[0069] The compounds of the invention are thought to interfere with inappropriate T-cell trafficking by specifically modulating or inhibiting a chemokine receptor function. Without intending to be bound by any particular
theory, it is believed that the compounds provided herein interfere with the interaction between a chemokine receptor and one or more cognate ligands. In particular, it is believed that the compounds interfere with the interaction between CCR9 and a CCR9 ligand, such as TECK. Compounds contemplated by the invention include, but are not limited to, the exemplary compounds provided herein and salts thereof.

[0070] For example, compounds of this invention act as potent CCR9 antagonists, and this antagonistic activity has been further confirmed in animal testing for inflammation, one of the hallmark disease states for CCR9. Accordingly, the compounds provided herein are useful in pharmaceutical compositions, methods for the treatment of CCR9-mediated diseases, and as controls in assays for the identification of competitive CCR9 antagonists.

Compositions that Modulate Chemokine activity

In another aspect, the present invention provides compositions that modulate chemokine activity, specifically CCR2 activity or CCR9 activity. Generally, the compositions for modulating chemokine receptor activity in humans and animals will comprise a pharmaceutically acceptable excipient or diluent and a compound having the formula provided above as formula (I).
The term "composition" as used herein is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts. By "pharmaceutically acceptable" it is meant the carrier, diluent or excipient must be compatible with the other ingredients of the formulation and not deleterious to the recipient thereof.

The pharmaceutical compositions for the administration of the compounds of this invention may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. All methods include the step of bringing the active ingredient into association with the carrier which constitutes one or more accessory ingredients. In general, the pharmaceutical compositions are prepared by uniformly and intimately bringing the active ingredient into association with a liquid carrier or a finely divided solid carrier or both, and then, if necessary, shaping the product into the desired formulation. In the pharmaceutical composition the active object compound is included in an amount sufficient to produce the desired effect upon the process or condition of diseases.

The pharmaceutical compositions containing the active ingredient may be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous or oily suspensions, dispersible powders or granules, emulsions and self emulsifications as described in U.S. Pat. No. 6,451,339, hard or soft capsules, or syrups or elixirs. Compositions intended for oral use may be prepared according to any method known to the art for the manufacture of pharmaceutical compositions. Such compositions may contain one or more agents selected from sweetening agents, flavoring agents, coloring agents and preserving agents in order to provide pharmaceutically elegant and palatable preparations. Tablets contain the active ingredient in admixture with other non-toxic pharmaceutically acceptable excipients which are suitable for the manufacture of tablets. These excipients may be, for example, inert diluents such as cellulose, silicon dioxide, aluminum oxide, calcium carbonate, sodium carbonate, glucose, mannitol, sorbitol, lactose, calcium phosphate or sodium phosphate;
granulating and disintegrating agents, for example, corn starch, or alginic acid; binding agents, for example PVP, cellulose, PEG, starch, gelatin or acacia, and lubricating agents, for example magnesium stearate, stearic acid or talc. The tablets may be uncoated or they may be coated enterically or otherwise by known techniques to delay disintegration and absorption in the gastrointestinal tract and thereby provide a sustained action over a longer period. For example, a time delay material such as glyceryl monostearate or glyceryl distearate may be employed. They may also be coated by the techniques described in the U.S. Pat. Nos. 4,256,108; 4,166,452; and 4,265,874 to form osmotic therapeutic tablets for control release.

Formulations for oral use may also be presented as hard gelatin capsules wherein the active ingredient is mixed with an inert solid diluent, for example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules wherein the active ingredient is mixed with water or an oil medium, for example peanut oil, liquid paraffin, or olive oil. Additionally, emulsions can be prepared with a non-water miscible ingredient such as oils and stabilized with surfactants such as mono-diglycerides, PEG esters and the like.

Aqueous suspensions contain the active materials in admixture with excipients suitable for the manufacture of aqueous suspensions. Such excipients are suspending agents, for example sodium carboxymethylcellulose, methylcellulose, hydroxypropylmethylcellulose, sodium alginate, polyvinyl-pyrrolidone, gum tragacanth and gum acacia, dispersing or wetting agents may be a naturally occurring phosphatide, for example lecithin, or condensation products of an alkylene oxide with fatty acids, for example polyoxyethylene stearate, or condensation products of ethylene oxide with long chain aliphatic alcohols, for example heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol monooleate, or condensation products of ethylene oxide with partial esters derived from fatty acids and hexitol anhydrides, for example polyethylene sorbitan monooleate. The aqueous suspensions may also contain one or more preservatives, for example ethyl, or n-propyl,
p-hydroxybenzoate, one or more coloring agents, one or more flavoring agents, and one or more sweetening agents, such as sucrose or saccharin.

[00533] Oily suspensions may be formulated by suspending the active ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut oil, or in a mineral oil such as liquid paraffin. The oily suspensions may contain a thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening agents such as those set forth above, and flavoring agents may be added to provide a palatable oral preparation. These compositions may be preserved by the addition of an anti oxidant such as ascorbic acid.

[00534] Dispersible powders and granules suitable for preparation of an aqueous suspension by the addition of water provide the active ingredient in admixture with a dispersing or wetting agent, suspending agent and one or more preservatives. Suitable dispersing or wetting agents and suspending agents are exemplified by those already mentioned above. Additional excipients, for example sweetening, flavoring and coloring agents, may also be present.

[00535] The pharmaceutical compositions of the invention may also be in the form of oil in water emulsions. The oily phase may be a vegetable oil, for example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or mixtures of these. Suitable emulsifying agents may be naturally-occurring gums, for example gum acacia or gum tragacanth, naturally-occurring phosphatides, for example soy bean, lecithin, and esters or partial esters derived from fatty acids and hexitol anhydrides, for example sorbitan monooleate, and condensation products of the said partial esters with ethylene oxide, for example polyoxyethylene sorbitan monooleate. The emulsions may also contain sweetening and flavoring agents.

[00536] Syrups and elixirs may be formulated with sweetening agents, for example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also contain a demulcent, a preservative, and flavoring and coloring agents. Oral solutions can be prepared in combination with, for example, cyclodextrin, PEG and surfactants.
[00537] The pharmaceutical compositions may be in the form of a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to the known art using those suitable dispersing or wetting agents and suspending agents which have been mentioned above. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example as a solution in 1,3-butane diol. Among the acceptable vehicles and solvents that may be employed are water, Ringer’s solution and isotonic sodium chloride solution. In addition, sterile, axed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of injectables.

[00538] The compounds of the present invention may also be administered in the form of suppositories for rectal administration of the drug. These compositions can be prepared by mixing the drug with a suitable non-irritating excipient which is solid at ordinary temperatures but liquid at the rectal temperature and will therefore melt in the rectum to release the drug. Such materials are cocoa butter and polyethylene glycols. Additionally, the compounds can be administered via ocular delivery by means of solutions or ointments. Still further, transdermal delivery of the subject compounds can be accomplished by means of iontophoretic patches and the like.

[00539] For topical use, creams, ointments, jellies, solutions or suspensions containing the compounds of the present invention are employed. As used herein, topical application is also meant to include the use of mouth washes and gargles.

[00540] The pharmaceutical compositions and methods of the present invention may further comprise other therapeutically active compounds as noted herein, such as those applied in the treatment of the above mentioned pathological conditions.

[00541] In one embodiment, the present invention provides a composition consisting of a pharmaceutically acceptable carrier and a compound of the invention.
[00542] Methods of Treatment
[00543] Depending on the disease to be treated and the subject's condition, the compounds and compositions of the present invention may be administered by oral, parenteral (e.g., intramuscular, intraperitoneal, intravenous, ICV, intracisternal injection or infusion, subcutaneous injection, or implant), inhalation, nasal, vaginal, rectal, sublingual, or topical routes of administration and may be formulated, alone or together, in suitable dosage unit formulations containing conventional non toxic pharmaceutically acceptable carriers, adjuvants and vehicles appropriate for each route of administration. The present invention also contemplates administration of the compounds and compositions of the present invention in a depot formulation.

[00544] In the treatment or prevention of conditions which require chemokine receptor modulation an appropriate dosage level will generally be about 0.001 to 100 mg per kg patient body weight per day which can be administered in single or multiple doses. Preferably, the dosage level will be about 0.01 to about 25 mg/kg per day; more preferably about 0.05 to about 10 mg/kg per day. A suitable dosage level may be about 0.01 to 25 mg/kg per day, about 0.05 to 10 mg/kg per day, or about 0.1 to 5 mg/kg per day. Within this range the dosage may be 0.005 to 0.05, 0.05 to 0.5, 0.5 to 5.0, or 5.0 to 50 mg/kg per day. For oral administration, the compositions are preferably provided in the form of tablets containing 1.0 to 1000 milligrams of the active ingredient, particularly 1.0, 5.0, 10.0, 15.0, 20.0, 25.0, 50.0, 75.0, 100.0, 150.0, 200.0, 250.0, 300.0, 400.0, 500.0, 600.0, 750.0, 800.0, 900.0, and 1000.0 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The compounds may be administered on a regimen of 1 to 4 times per day, preferably once or twice per day.

[00545] It will be understood, however, that the specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, hereditary characteristics, general health, sex, diet, mode
and time of administration, rate of excretion, drug combination, the severity of
the particular condition, and the host undergoing therapy.

[00546] In still other embodiments, the present methods are directed to
the treatment of allergic diseases, wherein a compound or composition of the
invention is administered either alone or in combination with a second
therapeutic agent, wherein said second therapeutic agent is an antihistamine.
When used in combination, the practitioner can administer a combination of
the compound or composition of the present invention and a second
therapeutic agent. Also, the compound or composition and the second
therapeutic agent can be administered sequentially, in any order.

[00547] The compounds and compositions of the present invention can
be combined with other compounds and compositions having related utilities
to prevent and treat the condition or disease of interest, such as inflammatory
conditions and diseases, including inflammatory bowel disease, allergic
diseases, psoriasis, atopic dermatitis and asthma, and those pathologies
noted above. Selection of the appropriate agents for use in combination
therapies can be made one of ordinary skill in the art. The combination of
therapeutic agents may act synergistically to effect the treatment or
prevention of the various disorders. Using this approach, one may be able to
achieve therapeutic efficacy with lower dosages of each agent, thus reducing
the potential for adverse side effects.

[00548] In treating, preventing, ameliorating, controlling or reducing the
risk of inflammation, the compounds of the present invention may be used in
conjunction with an anti-inflammatory or analgesic agent such as an opiate
agonist, a lipooxygenase inhibitor, such as an inhibitor of 5-lipooxygenase, a
cyclooxygenase inhibitor, such as a cyclooxygenase-2 inhibitor, an interleukin
inhibitor, such as an interleukin-1 inhibitor, an NMDA antagonist, an inhibitor
of nitric oxide or an inhibitor of the synthesis of nitric oxide, a non-steroidal
anti-inflammatory agent, or a cytokine-suppressing anti-inflammatory agent,
for example with a compound such as acetaminophen, aspirin, codeine,
biological TNF sequestrants, fentanyl, ibuprofen, indomethacin, ketorolac,
morphine, naproxen, phenacetin, piroxicam, a steroidal analgesic, sufentanil,
sulindac, tenidap, and the like.
[00549] Similarly, the compounds of the present invention may be administered with a pain reliever; a potentiator such as caffeine, an H2-antagonist, simethicone, aluminum or magnesium hydroxide; a decongestant such as pseudoephedrine; an antitussive such as codeine; a diuretic; a sedating or non-sedating antihistamine; a very late antigen (VLA-4) antagonist; an immunosuppressant such as cyclosporin, tacrolimus, rapamycin, EDG receptor agonists, or other FK-506 type immunosuppressants; a steroid; a non-steroidal anti-asthmatic agent such as a β2-agonist, leukotriene antagonist, or leukotriene biosynthesis inhibitor; an inhibitor of phosphodiesterase type IV (PDE-IV); a cholesterol lowering agent such as a HMG-CoA reductase inhibitor, sequestrant, or cholesterol absorption inhibitor; and an anti-diabetic agent such as insulin, α-glucosidase inhibitors or glitazones.

[00550] The weight ratio of the compound of the present invention to the second active ingredient may be varied and will depend upon the effective dose of each ingredient. Generally, an effective dose of each will be used. Thus, for example, when a compound of the present invention is combined with an NSAID the weight ratio of the compound of the present invention to the NSAID will generally range from about 1000:1 to about 1:1000, preferably about 200:1 to about 1:200. Combinations of a compound of the present invention and other active ingredients will generally also be within the aforementioned range, but in each case, an effective dose of each active ingredient should be used.

[00551] Methods of Treating or Preventing CCR2-mediated Conditions or Diseases

[00552] In yet another aspect, the present invention provides methods of treating or preventing a CCR2-mediated condition or disease by administering to a subject having such a condition or disease a therapeutically effective amount of any compound of formula (I) above. Compounds for use in the present methods include those compounds according to formula (I), those provided above as embodiments, those specifically exemplified in the Examples below, and those provided with specific structures herein. The
"subject" is defined herein to include animals such as mammals, including, but not limited to, primates (e.g., humans), cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice and the like. In preferred embodiments, the subject is a human.

[00553] As used herein, the phrase “CCR2-mediated condition or disease” and related phrases and terms refer to a condition or disease characterized by inappropriate, i.e., less than or greater than normal, CCR2 functional activity. Inappropriate CCR2 functional activity might arise as the result of CCR2 expression in cells which normally do not express CCR2, increased CCR2 expression (leading to, e.g., inflammatory and immunoregulatory disorders and diseases) or decreased CCR2 expression. Inappropriate CCR2 functional activity might also arise as the result of MCP-1 secretion by cells which normally do not secrete MCP-1, increased MCP-1 expression (leading to, e.g., inflammatory and immunoregulatory disorders and diseases) or decreased MCP-1 expression. A CCR2-mediated condition or disease may be completely or partially mediated by inappropriate CCR2 functional activity. However, a CCR2-mediated condition or disease is one in which modulation of CCR2 results in some effect on the underlying condition or disease (e.g., a CCR2 antagonist results in some improvement in patient well being in at least some patients). Furthermore, MCP-2, 3 and 4 are also CCR2 ligands.

[00554] In one embodiment, the present invention provides a method of treating a CCR2-mediated condition or disease involving administering to a subject a safe and effective amount of the compound or composition of the invention.

[00555] In one embodiment, the present invention provides a method of treating a CCR2-mediated condition or disease involving administering to a subject a safe and effective amount of the compound or composition of the invention, where the CCR2-mediated condition or disease is atherosclerosis.

[00569] Methods of Treating or Preventing CCR9-mediated
Conditions or Diseases

[00570] In yet another aspect, the present invention provides methods of
treating or preventing a CCR9-mediated condition or disease by administering
to a subject having such a condition or disease a therapeutically effective
amount of any compound of formula (I) above. Compounds for use in the
present methods include those compounds according to formula (I), those
provided above as embodiments, those specifically exemplified in the Examples below, and those provided with specific structures herein. The "subject" is defined herein to include animals such as mammals, including, but not limited to, primates (e.g., humans), cows, sheep, goats, horses, dogs, cats, rabbits, rats, mice and the like. In preferred embodiments, the subject is a human.

[00571] As used herein, the phrase "CCR9-mediated condition or disease" and related phrases and terms refer to a condition or disease characterized by inappropriate, i.e., less than or greater than normal, CCR9 functional activity. Inappropriate CCR9 functional activity might arise as the result of CCR9 expression in cells which normally do not express CCR9, increased CCR9 expression (leading to, e.g., inflammatory and immunoregulatory disorders and diseases) or decreased CCR9 expression. Inappropriate CCR9 functional activity might also arise as the result of TECK secretion by cells which normally do not secrete TECK, increased TECK expression (leading to, e.g., inflammatory and immunoregulatory disorders and diseases) or decreased TECK expression. A CCR9-mediated condition or disease may be completely or partially mediated by inappropriate CCR9 functional activity. However, a CCR9-mediated condition or disease is one in which modulation of CCR9 results in some effect on the underlying condition or disease (e.g., a CCR9 antagonist results in some improvement in patient well being in at least some patients).

[00572] The term "therapeutically effective amount" means the amount of the subject compound that will elicit the biological or medical response of a cell, tissue, system, or animal, such as a human, that is being sought by the researcher, veterinarian, medical doctor or other treatment provider.

[00573] Diseases and conditions associated with inflammation, immune disorders, infection and cancer can be treated or prevented with the present compounds, compositions, and methods. In one group of embodiments, diseases or conditions, including chronic diseases, of humans or other species can be treated with inhibitors of CCR9 function. These diseases or conditions include: (1) allergic diseases such as systemic anaphylaxis or hypersensitivity responses, drug allergies, insect sting allergies and food
allergies, (2) inflammatory bowel diseases, such as Crohn's disease, ulcerative colitis, ileitis and enteritis, (3) vaginitis, (4) psoriasis and inflammatory dermatoses such as dermatitis, eczema, atopic dermatitis, allergic contact dermatitis, urticaria and pruritus, (5) vasculitis, (6) spondyloarthropathies, (7) scleroderma, (8) asthma and respiratory allergic diseases such as allergic asthma, allergic rhinitis, hypersensitivity lung diseases and the like, (9) autoimmune diseases, such as fibromyalgia, scleroderma, ankylosing spondylitis, juvenile RA, Still's disease, polyarticular juvenile RA, pauciarticular juvenile RA, polymyalgia rheumatica, rheumatoid arthritis, psoriatic arthritis, osteoarthritis, polyarticular arthritis, multiple sclerosis, systemic lupus erythematosus, type I diabetes, type II diabetes, glomerulonephritis, and the like, (10) graft rejection (including allograft rejection), (11) graft-v-host disease (including both acute and chronic), (12) other diseases in which undesired inflammatory responses are to be inhibited, such as atherosclerosis, myositis, neurodegenerative diseases (e.g., Alzheimer's disease), encephalitis, meningitis, hepatitis, nephritis, sepsis, sarcoidosis, allergic conjunctivitis, otitis, chronic obstructive pulmonary disease, sinusitis, Behcet's syndrome and gout, (13) immune mediated food allergies such as Coeliac (Celiac) disease (14) pulmonary fibrosis and other fibrotic diseases, and (15) irritable bowel syndrome.

In another group of embodiments, diseases or conditions can be treated with modulators and agonists of CCR9 function. Examples of diseases to be treated by modulating CCR9 function include cancers, cardiovascular diseases, diseases in which angiogenesis or neovascularization play a role (neoplastic diseases, retinopathy and macular degeneration), infectious diseases (viral infections, e.g., HIV infection, and bacterial infections) and immunosuppressive diseases such as organ transplant conditions and skin transplant conditions. The term "organ transplant conditions" is means to include bone marrow transplant conditions and solid organ (e.g., kidney, liver, lung, heart, pancreas or combination thereof) transplant conditions.

Preferably, the present methods are directed to the treatment of diseases or conditions selected from inflammatory bowel disease including
Crohn's disease and Ulcerative Colitis, allergic diseases, psoriasis, atopic dermatitis and asthma, autoimmune disease such as rheumatoid arthritis and immune-mediated food allergies such as Coeliac disease.

[00576] In yet other embodiments, the present methods are directed to the treatment of psoriasis where a compound or composition of the invention is used alone or in combination with a second therapeutic agent such as a corticosteroid, a lubricant, a keratolytic agent, a vitamin D₃ derivative, PUVA and anthralin.

[00577] In other embodiments, the present methods are directed to the treatment of atopic dermatitis using a compound or composition of the invention either alone or in combination with a second therapeutic agent such as a lubricant and a corticosteroid.

[00578] In further embodiments, the present methods are directed to the treatment of asthma using a compound or composition of the invention either alone or in combination with a second therapeutic agent such as a β₂-agonist and a corticosteroid.

[00597] Examples

[00598] Reagents and solvents used below can be obtained from commercial sources such as Aldrich Chemical Co. (Milwaukee, Wisconsin, USA). 1H-NMR were recorded on a Varian Mercury 400 MHz NMR spectrometer. Significant peaks are tabulated in the order: multiplicity (br, broad; s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet) and number of protons. Mass spectrometry results are reported as the ratio of mass over charge, followed by the relative abundance of each ion (in parenthesis). In tables, a single m/e value is reported for the M+H (or, as noted, M-H) ion containing the most common atomic isotopes. Isotope patterns correspond to the expected formula in all cases. Electrospray ionization (ESI) mass spectrometry analysis was conducted on a Hewlett-Packard MSD electrospray mass spectrometer using the HP1100 HPLC for sample delivery. Normally the analyte was dissolved in methanol at 0.1 mg/mL and 1 microliter was infused with the delivery solvent into the mass spectrometer, which scanned from 100 to 1500 daltons. All compounds could be analyzed in the positive ESI mode, using acetonitrile / water with 1% formic acid as the delivery solvent. The compounds provided below could also be analyzed in the negative ESI mode, using 2mM NH4OAc in acetonitrile / water as delivery system.

While the diazotization was in progress, glacial AcOH (600 mL) was placed in a 4000-mL beaker and stirred magnetically. Sulfur dioxide was introduced by a bubbler tube with a fritted end immersed below the surface of the AcOH until saturation was evident. Cuprous chloride (15 g) was added to the solution. The introduction of sulfur dioxide was continued until the yellow-green suspension becomes blue-green. The mixture was then placed in an ice bath and cooled to 10 °C. The diazotization reaction mixture was subsequently added in portions over a 30 min period to the sulfur dioxide solution, ensuring the temperature of the solution did not exceed 30 °C. After all the diazonium salt mixture was added, the mixture was poured into ice water (2 L). The resulting precipitate was filtered and re-dissolved in hexane (500 mL). The mixture was filtered through a pad of silica gel (100 g) and the filter pad was

Step 1: To a stirred solution of 5-chloro-2-iodo-3-nitro-pyridine (2.85 g, 10.01 mmol) in anhydrous THF (20 mL) at -78 °C was added 2 M phenylmagnesium chloride in THF (5.22 mL, 10.5 mmol). The reaction mixture stirred at the same temperature for 30 min and the appropriate aldehyde (15 mmol) was added in one portion (either via syringe if liquid or as solid). and the progress of the reaction was followed by LCMS. The reaction mixture was warmed to room temperature and stirred several hours (5-18 h). It was then quenched with saturated aqueous NH₄Cl (10 mL), and the aqueous layer was extracted with EtOAc. The combined extracts were washed with aqueous NaHCO₃ and brine, dried (Na₂SO₄), filtered, and concentrated under reduced pressure to afford the desired benzylic alcohol which was directly in the following reaction without further purification.

Step 2: A mixture of crude secondary alcohol and Dess-Martin periodinane (6.4 g, 15 mmol) in CH₂Cl₂ (30 mL) at room temperature was stirred for 5-10 h. A mixture of 10% aqueous Na₂S₂O₅ (20 mL) and saturated aqueous NaHCO₃ (20 mL) was then added and the biphasic mixture vigorously stirred for 30 min. The phases were then separated and the aqueous portion extracted with CH₂Cl₂. The combined organic extracts were washed with saturated aqueous NaHCO₃ and brine, dried (Na₂SO₄), and filtered. The filtrate was concentrated under reduced pressure and the residue purified by flash column chromatography over silica gel to provide the corresponding nitro ketone.

Step 3: To a stirred suspension of Fe (4-5 equiv.) in glacial AcOH at 80 °C was added a solution of nitropyridyl ketone (1 equiv.) in AcOH (5 mL) over 15 minutes. After complete addition, the mixture was stirred at the same temperature for 1-2 h. The reaction mixture was cooled to room temperature, and diluted with EtOAc and filtered through a pad of Celite. The filtrate was concentrated under reduced pressure and residue was partitioned between NaHCO₃ and EtOAc. The organic layer was separated and the aqueous portion was extracted with EtOAc. The combined extracts were dried (Na₂SO₄), filtered, and concentrated under reduced pressure. The residue was purified by flash column chromatography on silica gel to provide the corresponding aniline.

Step 1: N-(2-Bromo-5-chloro-pyridin-3-yl)-4-chloro-N-methoxymethyl-3-(trifluoromethyl)benzenesulfonamide (0.5 g, 1.0 mmol) was placed in a dry 100 mL round-bottom flask sealed with septa. The flask was evacuated and purged with nitrogen, followed by the addition of dry THF (30 mL). The homogeneous solution was cooled to 0 °C and iPrMgCl (1.25 mL, 2.0 M) was added dropwise. Upon completion of the addition, the mixture was stirred at 0 °C for 60 min, followed by the slow addition of benzo[b][1,4]oxazin-3(4H)-one Weinreb amide (208 mg, 1 mmol). The reaction mixture was stirred at 0 °C for 3h. The reaction was quenched with NH₄Cl (sat) and extracted with EtOAc, washed with brine, dried over MgSO₄, and concentrated under reduced pressure. The residue was further purified through automated normal-phase chromatography to afford 4-chloro-N-(5-chloro-2-(3-oxo-3,4-dihydro-2H-benzoyl)[b][1,4]oxazine-8-carbonyl)pyridin-3-yl)-N-(methoxymethyl)-3-(trifluoromethyl)benzenesulfonamide (0.5 g, 85%) (which was used directly for the next step).

Step 2: The above 4-chloro-N-(5-chloro-2-(3-oxo-3,4-dihydro-2H-benzoyl)[b][1,4]oxazine-8-carbonyl)pyridin-3-yl)-N-(methoxymethyl)-3-(trifluoromethyl)benzenesulfonamide was treated with (4.0 M HCl in dioxane) (10 mL, 40 mmol) and H₂O (4 mL), and then stirred at 110 °C for 6 h. The mixture was diluted with EtOAc. The resultant organics were washed with NaHCO₃ (sat), and brine; dried (MgSO₄), and concentrated under reduced pressure and was purified through automated normal-phase chromatography to afford the title compound: ¹H NMR (400 MHz, CDCl₃) δ 10.90 (s, 1H), 8.25 (d, 1H), 8.16 (d, 2H), 7.96 (m, 2H), 7.63 (d, 1H), 7.08 (m, 1H), 6.92 (m, 2H), 4.38 (s, 2H); MS (ES) (M+H)⁺ expected 546.0, found 546.0.

The mixture was then stirred for 30 min at 0 °C followed by the addition of 6-fluoro-2-oxo-2,3-dihydro-benzooxazole-7-carbaldehyde (Javier et al., Heterocycles, 1999, 1563.) (35 mg). The mixture was warmed to room temperature, stirred an additional 30 min and quenched by saturated aqueous NH₄Cl solution (1 mL). The organic layer was separated and the aqueous layer was extracted by EtOAc (2 x 1 mL). The combined organic layers were dried (Na₂SO₄), filtered and evaporated in vacuo. The residue was used directly in the next step.

[001169] Step 2: The residue from the last step was dissolved in CH₂Cl₂ (1 mL) and Dess-Martin periodinane (127 mg) was added. The mixture was stirred at room temperature for 12 h and was concentrated in vacuo. The residue was purified by flash chromatography (silica) to afford 4-chloro-N-{5-chloro-2-[(6-fluoro-2-oxo-2,3-dihydro-benzooxazol-7-yl)-hydroxy-methyl]-pyridin-3-yl}-N-methoxymethyl-3-trifluoromethyl-benzenesulfonamide as a pale yellow solid.
[001170] Step 3: The yellow solid from last step was dissolved in a mixture of H2O (6 mL) and HCl in dioxane (4 M, 3 mL) and heated to 100 °C for 12 h. The mixture was cooled to room temperature and concentrated in vacuo. The residue was dissolved in EtOAc (10 mL) and washed by saturated aqueous NaHCO3 solution (2 mL). [001672] Measuring Efficacy of Chemokine Modulators

[001673] In Vitro Assays

[001674] A variety of assays can be used to evaluate the compounds provided herein, including signaling assays, migration assays, ligand binding assays, and other assays of cellular response. Chemokine receptor signaling assays can be used to measure the ability of a compound, such as a potential CCR2 antagonist, to block CCR2 ligand- (e.g. MCP-1)-induced signaling or a potential CCR9 antagonist, to block CCR9 ligand- (e.g. TECK)-induced signaling. A migration assay can be used to measure the ability of a compound of interest, such as a possible chemokine antagonist, to block chemokine-mediated cell migration in vitro. The latter is believed to resemble chemokine-induced cell migration in vivo. A ligand binding assay can be used to measure the ability of a compound, such as a potential CCR2 antagonist, to block the interaction of MCP-1 with its receptor or a potential CCR9 antagonist, to block the interaction of TECK with its receptor.

[001675] In a suitable assay, a chemokine protein (whether isolated or recombinant) is used which has at least one property, activity, or functional characteristic of a mammalian chemokine protein. The property can be a binding property (to, for example, a ligand or inhibitor), a signaling activity
(e.g., activation of a mammalian G protein, induction of rapid and transient increase in the concentration of cytosolic free calcium ion), cellular response function (e.g., stimulation of chemotaxis or inflammatory mediator release by leukocytes), and the like.

[001676] The assay can be a cell-based assay that utilizes cells stably or transiently transfected with a vector or expression cassette having a nucleic acid sequence that encodes the chemokine receptor. Cell lines naturally expressing the chemokine can also be used. The cells are maintained under conditions appropriate for expression of the receptor and are contacted with a putative agent under conditions appropriate for binding to occur. Binding can be detected using standard techniques. For example, the extent of binding can be determined relative to a suitable control (for example, relative to background in the absence of a putative agent, or relative to a known ligand). Optionally, a cellular fraction, such as a membrane fraction, containing the receptor can be used in lieu of whole cells.

[001677] Detection of binding or complex formation can be detected directly or indirectly. For example, the putative agent can be labeled with a suitable label (e.g., fluorescent label, chemiluminescent label, isotope label, enzyme label, and the like) and binding can be determined by detection of the label. Specific and/or competitive binding can be assessed by competition or displacement studies, using unlabeled agent or a ligand (e.g., MCP-1 or TECK) as a competitor.

[001678] Binding inhibition assays can be used to evaluate the present compounds. In these assays, the compounds are evaluated as inhibitors of ligand binding using, for example, MCP-1 or TECK. In one embodiment, the CCR2 receptor is contacted with a ligand such as MCP-1 and a measure of ligand binding is made. The receptor is then contacted with a test agent in the presence of a ligand (e.g., MCP-1) and a second measurement of binding is made. In another embodiment, the CCR9 receptor is contacted with a ligand such as TECK and a measure of ligand binding is made. The receptor is then contacted with a test agent in the presence of a ligand (e.g., TECK) and a second measurement of binding is made. A reduction in the extent of ligand binding is indicative of inhibition of binding by the test agent. The binding
inhibition assays can be carried out using whole cells which express the chemokine, or a membrane fraction from cells which express the chemokine.

[001679] The binding of a G protein coupled receptor by, for example, an agonist, can result in a signaling event by the receptor. Accordingly, signaling assays can also be used to evaluate the compounds of the present invention and induction of signaling function by an agent can be monitored using any suitable method. For example, G protein activity, such as hydrolysis of GTP to GDP, or later signaling events triggered by receptor binding can be assayed by known methods (see, for example, PCT/US97/15915; Neote et al., Cell, 72:415425 (1993); Van Riper et al., J. Exp. Med., 177:851-856 (1993) and Dahinden et al., J. Exp. Med., 179:751-756 (1994)).

[001680] Chemotaxis assays can also be used to assess receptor function and evaluate the compounds provided herein. These assays are based on the functional migration of cells in vitro or in vivo induced by an agent, and can be used to assess the binding and/or effect on chemotaxis of ligands, inhibitors, or agonists. A variety of chemotaxis assays are known in the art, and any suitable assay can be used to evaluate the compounds of the present invention. Examples of suitable assays include those described in PCT/US97/15915; Springer et al., WO 94/20142; Berman et al., Immunol. Invest., 17:625-677 (1988); and Kavanaugh et al., J. Immunol., 146:4149-4156 (1991).

[001681] Calcium signaling assays measure calcium concentration over time, preferably before and after receptor binding. These assays can be used to quantify the generation of a receptor-signaling mediator, Ca^{++}, following receptor binding (or absence thereof). These assays are useful in determining the ability of a compound, such as those of the present invention, to generate the receptor signaling mediator by binding to a receptor of interest. Also, these assays are useful in determining the ability of a compound, such as those of the present invention, to inhibit generation of the receptor signaling mediator by interfering with binding between a receptor of interest and a ligand.

[001682] In calcium signaling assays used to determine the ability of a compound to interfere with binding between a chemokine receptor and a
known chemokine ligand, chemokine receptor-expressing cells (CCR2-expressing cells such as THP-1 cells or CCR9-expressing cells such as T cell line MOLT-4 cells) are first incubated with a compound of interest, such as a potential chemokine antagonist, at increasing concentrations. The cell number can be from $10^5$ to $5 \times 10^5$ cells per well in a 96-well microtiter plate. The concentration of the compound being tested may range from 0 to 100 μM. After a period of incubation (which can range from 5 to 60 minutes), the treated cells are placed in a Fluorometric Imaging Plate Reader (FLIPR®) (available from Molecular Devices Corp., Sunnyvale, CA) according to the manufacturer's instruction. The FLIPR® system is well known to those skilled in the art as a standard method of performing assays. The cells are then stimulated with an appropriate amount of the chemokine ligand (MCP-1 for CCR2 or TECK for CCR9) at 5-100 nM final concentration, and the signal of intracellular calcium increase (also called calcium flux) is recorded. The efficacy of a compound as an inhibitor of binding between the chemokine and the ligand can be calculated as an IC₅₀ (the concentration needed to cause 50% inhibition in signaling) or IC₉₀ (at 90% inhibition).

In vitro cell migration assays can be performed (but are not limited to this format) using the 96-well microchamber (called ChemoTX®). The ChemoTX® system is well known to those skilled in the art as a type of chemotactic/cell migration instrument. In this assay, CCR2-expressing cells (such as THP-1) or CCR9-expressing cells (such as MOLT-4) are first incubated with a compound of interest, such as a possible CCR2 or CCR9 antagonist, respectively, at increasing concentrations. Typically, fifty thousand cells per well are used, but the amount can range from $10^3$-10⁶ cells per well. The chemokine ligand (for example, CCR2 ligand MCP-1, typically at 0.1 nM (but can range from 5-100 nM); or CCR9 ligand TECK, typically at 50 nM (but can range from 5-100 nM)), is placed at the lower chamber and the migration apparatus is assembled. Twenty microliters of test compound-treated cells are then placed onto the membrane. Migration is allowed to take place at 37 °C for a period of time, typically 1.5 hours for CCR2 or 2.5 hours for CCR9. At the end of the incubation, the number of cells that migrated across the membrane into the lower chamber is then quantified. The efficacy
of a compound as an inhibitor of chemokine-mediated cell migration is calculated as an IC$_{50}$ (the concentration needed to reduce cell migration by 50%) or IC$_{90}$ (for 90% inhibition).

[001684] In vivo efficacy models for human IBD
[001685] T cell infiltration into the small intestine and colon have been linked to the pathogenesis of human inflammatory bowel diseases which include Coeliac disease, Crohn's disease and ulcerative colitis. Blocking trafficking of relevant T cell populations to the intestine is believed to be an effective approach to treat human IBD. CCR9 is expressed on gut-homing T cells in peripheral blood, elevated in patients with small bowel inflammation such as Crohn's disease and Coeliac disease. CCR9 ligand TECK is expressed in the small intestine. It is thus believed that this ligand-receptor pair plays a role in IBD development by mediating migration of T cells to the intestine. Several animal models exist and can be used for evaluating compounds of interest, such as potential CCR9 antagonists, for an ability to affect such T cell migration and/or condition or disease, which might allow efficacy predictions of antagonists in humans.

[001686] Animal models with pathology similar to human ulcerative colitis
[001687] A murine model described by Panwala and coworkers (Panwala et al., J Immunol., 161(10):5733-44 (1998)) involves genetic deletion of the murine multi-drug resistant gene (MDR). MDR knockout mice (MDR/-) are susceptible to developing a severe, spontaneous intestinal inflammation when maintained under specific pathogen-free facility conditions. The intestinal inflammation seen in MDR/- mice has a pathology similar to that of human inflammatory bowel disease (IBD) and is defined by Th1 type T cells infiltration into the lamina propria of the large intestine.

[001688] Another murine model was described by Davidson et al., J. Exp. Med., 184(1):241-51(1986). In this model, the murine IL-10 gene was deleted and mice rendered deficient in the production of interleukin 10 (IL-10/-). These mice develop a chronic inflammatory bowel disease (IBD) that predominates in the colon and shares histopathological features with human IBD.
Another murine model for IBD has been described by Powrie et al., Int Immunol., 5(11):1461-71 (1993), in which a subset of CD4+ T cells (called CD45RB(high)) from immunocompetent mice are purified and adoptively transferred into immunodeficient mice (such as C.B-17 scid mice). The animal restored with the CD45RBhighCD4+ T cell population developed a lethal wasting disease with severe mononuclear cell infiltrates in the colon, pathologically similar with human IBD.

Murine models with pathology similar to human Crohn's disease

The TNF ARE(-/-) model. The role of TNF in Crohn's disease in human has been demonstrated more recently by success of treatment using anti-TNF alpha antibody by Targan et al., N. Engl. J. Med., 337(15):1029-35 (1997). Mice with aberrant production of TNF-alpha due to genetic alteration in the TNF gene (ARE/-) develop Crohn's-like inflammatory bowel diseases (see Kontoyiannis et al., Immunity, 10(3):387-98 (1999)).

The SAMP/yit model. This is model described by Kosiewicz et al., J. Clin. Invest., 107(6):695-702 (2001). The mouse strain, SAMP/Yit, spontaneously develops a chronic inflammation localized to the terminal ileum. The resulting ileitis is characterized by massive infiltration of activated T lymphocytes into the lamina propria, and bears a remarkable resemblance to human Crohn's disease.

Examples of in vitro assays

Reagents

THP-1 cells and MOLT-4 cells were obtained from the American Type Culture Collection (Manassas, VA) and cultured in RPMI tissue culture medium supplemented with 10% fetal calf serum (FCS) in a humidified 5% CO2 incubator at 37 °C. Recombinant human chemokine proteins MCP-1 and TECK were obtained from R&D Systems (Minneapolis, MN). 125I-labeled MCP-1 protein was obtained from Amersham (Piscataway, NJ). ChemoTX® chemotaxis microchambers were purchased from Neuro Probe (Gaithersburg, MD). CyQUANT® cell proliferation kits were purchased from Molecular Probes (Eugene, Oregon). Calcium indicator dye Fluo-4 AM was purchased from Molecular Devices (Mountain View, CA).
Conventional migration assay

Conventional migration assay was used to determine the efficacy of potential receptor antagonists in blocking migration mediated through chemokines (such as CCR2 or CCR9). This assay was routinely performed using the ChemoTX® microchamber system with a 5-μm pore-sized polycarbonate membrane. To begin such an assay, chemokine expressing cells (such as THP-1 cells for CCR2 assay or MOLT-4 cells for CCR9 assay) were harvested by centrifugation of cell suspension at 1000 RPM on a GS-6R Beckman centrifuge. The cell pellet was resuspended in chemotaxis buffer (HBSS with 0.1% BSA) at 10x10^6 cells/mL for CCR2 assay (5 x 10^6 cells/mL for CCR9 assay). Test compounds at desired concentrations were prepared from 10 mM stock solutions by serial dilutions in chemotaxis buffer. An equal volume of cells and compounds were mixed and incubated at room temperature for 15 minutes. Afterwards, 20 μL of the mixture was transferred onto the porous membrane of a migration microchamber, with 29 μL of chemokine ligand (0.1 nM chemokine MCP-1 protein for CCR2 assay or 50 nm chemokine TECK protein for CCR9 assay) placed at the lower chamber. Following an incubation at 37 °C (90-minute for CCR2; 150-minute for CCR9), during which cells migrated against the chemokine gradient, the assay was terminated by removing the cell drops from atop the filter. To quantify cells migrated across the membrane, 5 μL of 7X CyQUANT® solution was added to each well in the lower chamber, and the fluorescence signal measured on a Spectrafluor Plus fluorescence plate reader (TECAN, Durham, NC). The degree of inhibition was determined by comparing migration signals between compound-treated and untreated cells. IC_{50} calculation was further performed by non-linear squares regression analysis using Graphpad Prism (Graphpad Software, San Diego, CA).

BiRAM Assay

The primary screen to identify chemokine antagonists was carried out using BiRAM assay (WO 02101350, US2004023286), which detects potential hits by their ability to activate cell migration under inhibitory
chemokine concentration. To begin such an assay, chemokine expressing cells (such as THP-1 cells for CCR2 assay or MOLT-4 cells for CCR9 assay) were harvested by centrifugation of cell suspension at 1000 RPM on a GS-6R Beckman centrifuge. The cell pellet was resuspended in chemotaxis buffer (HBSS/0.1% BSA) at 10 x 10^6 cells/mL for CCR2 assay (5 x 10^6 cells/mL for CCR9 assay). Twenty-five microliters of cells was mixed with an equal volume of a test compound diluted to 20 μM in the same buffer. Twenty microliters of the mixture was transferred onto the filter in the upper chemotaxis chamber, with 29 μL of chemokine solution containing chemokine ligand (100 nM chemokine MCP-1 and MIP-1α protein for CCR2 assay or 500 nm chemokine TECK protein for CCR9 assay) was placed in the lower chamber. Following an incubation at 37 °C (90-minute for CCR2; 150-minute for CCR9), the assay was terminated by removing the cell drops from atop the filter. To quantify cells migrated across the membrane, 5 μL of 7X CyQUANT® solution was added to each well in the lower chamber, and the fluorescence signal measured on a Spectrafluor Plus fluorescence plate reader (TECAN, Durham, NC).

[001700] For selection of potential hits, the level of migration activation was calculated as a RAM index—the ratio between the signal of a particular well and the median signal of the whole plate. Compounds with a RAM index of greater than 1.5 for CCR2 assay (1.8 for CCR9 assay) were regarded as RAM positive, and were selected for IC_{50} determinations in conventional functional assays.

[001701] Calcium flux assay
[001702] Calcium flux assay measures an increase in intracellular calcium following ligand-induced receptor activation. In the screen of chemokine antagonists, it was used as a secondary assay carried out on a FLIPR® machine (Molecular Devices, Mountain View, CA). To begin an assay, chemokine expressing cells (such as THP-1 cells for CCR2 assay or MOLT-4 cells for CCR9 assay) were harvested by centrifugation of cell suspension, and resuspended to 1.5 x 10^6 cells/mL in HBSS (with 1% fetal calf serum). Cells were then labeled with a calcium indicator dye Fluo-4 AM for 45 minutes.
at 37 °C with gentle shaking. Following incubation, cells were pelleted, washed once with HBSS and resuspended in the same buffer at a density of 1.6 x 10^6 cells/mL. One hundred microliters of labeled cells were mixed with 10 µL of test compound at the appropriate concentrations on an assay plate. Chemokine protein (MCP-1 at a final concentration of 0.1 nM for CCR2 assay or TECK at a final concentration of 25 nM for CCR9 assay) to activate the receptor. The degree of inhibition was determined by comparing calcium signals between compound-treated and untreated cells. IC_{50} calculations were further performed by non-linear squares regression analysis using Graphpad Prism (Graphpad Software, San Diego, CA).

[001703] **Ligand binding assay**

Ligand binding assay was used to determine the ability of potential CCR2 antagonists to block the interaction between CCR2 and its ligand MCP-1. CCR2 expressing THP-1 cells were centrifuged and resuspended in assay buffer (20 mM HEPES pH 7.1, 140 mM NaCl, 1 mM CaCl_2, 5 mM MgCl_2, and with 0.2% bovine serum albumin) to a concentration of 2.2 x 10^5 cells/mL. Binding assays were set up as follows. First, 0.09 mL of cells (1 x 10^5 THP-1 cells/well) was added to the assay plates containing the compounds, giving a final concentration of ~2-10 µM each compound for screening (or part of a dose response for compound IC_{50} determinations). Then 0.09 mL of ^{125}I labeled MCP-1 (obtained from Amersham; Piscataway, NJ) diluted in assay buffer to a final concentration of ~50 pM, yielding ~30,000 cpm per well, was added, the plates sealed and incubated for approximately 3 hours at 4 °C on a shaker platform. Reactions were aspirated onto GF/B glass filters pre-soaked in 0.3% polyethyleneimine (PEI) solution, on a vacuum cell harvester (Packard Instruments; Meriden, CT). Scintillation fluid (50 µL; Microscint 20, Packard Instruments) was added to each well, the plates were sealed and radioactivity measured in a Top Count scintillation counter (Packard Instruments). Control wells containing either diluent only (for total counts) or excess MCP-1 (1 µg/mL, for non-specific binding) were used to calculate the percent of total inhibition for compound. The computer program Prism from GraphPad, Inc. (San Diego, Ca) was used to calculate
IC$_{50}$ values. IC$_{50}$ values are those concentrations required to reduce the binding of labeled MCP-1 to the receptor by 50%.

[001705] Discovery of chemokine antagonists

[001706] The discovery of chemokine antagonists was carried out in two steps: First, BiRAM assay was used to screen a compound library in a high-throughput manner. The assay detected compounds by their ability to cause a positive migration signal under BiRAM condition. Secondly, BiRAM positive compounds were tested to determine their IC$_{50}$ values using the conventional migration, calcium flux assays and ligand binding assays.

[001707] For instance, in a screen of approximately 100,000 compounds, 2000 individual wells representing approximately 2% of total compounds showed a desired RAM index (greater than 1.5 for CCR2; greater than 1.8 for CCR9). These compounds were cheery-picked and retested in duplicate wells by RAM assay. A total of 156 compounds were confirmed BiRAM positives.

[001708] Since a BiRAM positive signal indicates only the presence of a receptor antagonist and not how strongly it blocks receptor functions, the BiRAM positive compounds were further tested for potency in conventional migration, calcium flux and ligand binding assays. IC$_{50}$ determinations on this subset discovered several compounds with an IC$_{50}$ less than 1 $\mu$M and that did not inhibit other chemokine receptors examined at significant levels.

[001709] In Vivo Efficacy

[001710] A 17-day study of type II collagen-induced arthritis is conducted to evaluate the effects of a modulator on arthritis-induced clinical ankle swelling. Rat collagen-induced arthritis is an experimental model of polyarthritis that has been widely used for preclinical testing of numerous anti-arthritic agents (see Trentham et al., J. Exp. Med., 146(3):857-868 (1977), Bendele et al., Toxicologic Pathol., 27:134-142 (1999), Bendele et al., Arthritis Rheum., 42:498-506 (1999)). The hallmarks of this model are reliable onset and progression of robust, easily measurable polyarticular inflammation, marked cartilage destruction in association with pannus formation and mild to moderate bone resorption and periosteal bone proliferation.
Female Lewis rats (approximately 0.2 kilograms) are anesthetized with isoflurane and injected with Freund's Incomplete Adjuvant containing 2 mg/mL bovine type II collagen at the base of the tail and two sites on the back on days 0 and 6 of this 17-day study. The test modulator is dosed daily by sub-cutaneous injection from day 9 to day 17 at a dose of 100 mg/kg and a volume of 1 mL/kg in the following vehicle (24.5% Cremaphore EL, 24.5% common oil, 1% Benzylalcohol and 50% Distilled water). Caliper measurements of the ankle joint diameter are taken daily, and reducing joint swelling is taken as a measure of efficacy.

The MDR1a-knockout mice, which lack the P-glycoprotein gene, spontaneously develop colitis under specific pathogen-free condition. The pathology in these animals has been characterized as Th1-type T cell-mediated inflammation similar to ulcerative colitis in humans. Disease normally begins to develop at around 8-10 weeks after birth. However the ages at which disease emerges and the ultimate penetrance level often vary considerably among different animal facilities.

In a study using the MDR1a-knockout mice, a CCR9 antagonist is evaluated by prophylactic administration for its ability to delay disease onset. Female mice (n=34) are dosed with 50 mg/kg twice a day by subcutaneous injections for 14 consecutive weeks starting at age 10 weeks. The study is evaluated for IBD-associated growth retardation.

Evaluation of a test modulator in a rat model of thioglycollate-induced peritoneal inflammation

A 2-day study of thioglycollate-induced inflammation is conducted to evaluate the effects of the test modulator. The hallmarks of this model are reliable onset and progression of robust, easily measurable inflammatory cellular infiltrate. For the induction of inflammatory peritonitis in Lewis rats, Brewer-Thioglycollate (1.0 mL, 4% solution in distilled water) is injected intra peritoneal (i.p.). Before this injection, the treatment group received test modulator or vehicle and the control group received the same volume of PBS as i.p. injection. After 2 days, a peritoneal lavage ias performed with ice-cold PBS containing 1 mM EDTA. The recovered cells are
counted with a cell counter (Coulter Counter; Coulter Pharmaceutical, Palo Alto, CA) and monocytes/macrophages were identified by flow cytometry using light-scatter properties.

[001716] Evaluation of a test modulator in a mouse model of bacterial infection

[001717] A 1-day study of streptococcus pneumoniae infection is conducted to evaluate the effects of the test modulator. The model measures bacterial infection and spread in an animal following pulmonary infection with live bacterial cultures, measured by inflammatory cellular infiltrate, and assessment of bacterial burden. C57/B6 mice are inoculated intra nasally with LD50 400 CFU at day 0. Groups are either test modulator or vehicle control treated 1 day prior to bacterial inoculation and twice daily throughout the study. Bacterial burden is measured at 24 hours by plating serial dilutions of homogenized lung tissue on agar plates and counting colonies.
