UNITED STATES PATENT OFFICE.

JACOB TIM, OF NEW YORK, N. Y.

CAP.

1,061,884.

Specification of Letters Patent.

Patented May 13, 1913.

Application filed November 24, 1911. Serial No. 662,130.

To all whom it may concern:

Be it known that I, JACOB TIM, a subject of the Czar of Russia, and a resident of the city of New York, borough of Manhattan, in the county and State of New York, have invented a new and Improved Cap, of which the following is a full, clear, and exact description.

My invention relates generally to caps and more particularly is directed to women's caps, such as are worn in cold weather.

The principal object of my invention is to provide a woman's cap of the knitted class; with a muffler as a part thereof, the construction and arrangement being such that the muffler may be secured in position around the neck or may be held secured on the cap when so desired.

A further object of my invention is to provide a woman's cap of new and improved construction, the cap embodying as part of its structure a muffler secured at an intermediate portion thereof to an edge portion of the cap so that the muffler may be secured in place around the neck when the cap is worn, the muffler being also adapted to be secured on the cap proper when so desired, thereby providing an article of this class which will be serviceable as well as pleasing in its appearance.

Other objects and advantages of the invention will appear as the description thereof proceeds, all of which is particularly pointed out and included in the appended claim.

Reference is to be had to the accompanying drawings forming a part of this specification, in which similar characters of reference denote corresponding parts in all the views, and in which—

Figure 1 is a perspective view showing the cap in position on the head and with the muffler secured around the neck; Fig. 2 is a top plan view of the cap showing the muffler ends secured thereto; Fig. 3 is a side view of the cap.

The cap to which my invention may be applied may be of any desired size or construction and may be made of any suitable material, the one shown in the drawings being a woolen cap suitably knitted; it is obvious that departures may be made from what is shown in size, color, and shape without involving a departure from the inventive idea disclosed.

Referring particularly to Figs. 2 and 3, it will be noted that the lower portion of the cap 1 is provided, adjacent its front, with an up-turned portion 2 which is designed to be worn as shown in Fig. 1, the rear portion of the cap being provided with a muffler 3, the muffler being secured intermediate of its ends, as at 4, to an edge portion of the cap. When the cap is worn with the muffler not in use, the muffler is secured around the cap by providing the ends thereof with button-holes adapted for engagement with buttons 5, secured on opposite sides of the up-turned portion 2; when the muffler is worn, the ends thereof are disengaged from the buttons 5 and the muffler turned down into the position shown in Fig. 1, one end of the muffler being provided with a suitable buttonhole for engagement with the button 6 secured to the side of the muffler and adjacent the other end, thereby providing for keeping the same in position to cover the neck.

The upturned portion 2 at the front of the cap may be dispensed with if so desired, in which event, the button 5 will be secured directly on the outside of the cap; in order, however, to provide an article which shall be pleasing in its appearance, the use of the upturned portion is preferable. It is also clear that in place of the button and buttonholes described and shown other fastening devices may be used, such as the snap-catches that are used on gloves or pieces of ribbon or, in fact, any device, the function of which is the same as that of buttons.

The muffler may be made integral with the cap in the manufacture thereof or it may be made separately therefrom or secured thereto afterward in any desired manner, such a modification not involving a departure from the spirit of my invention.

Having thus described my invention, I claim as new, and desire to secure by Letters Patent:—

As a new article of manufacture a knitted cap of a size to extend down over the ears of the wearer and provided at its front with an upturned portion extending approximately to the lower edge of the cap and at its rear with a muffler of a width about equal to the width of the upturned portion of the cap and secured at one edge to the lower edge of the cap, the upturned portion of the cap being provided with a button at each side and the muffler with a button hole at

each end and a button adjacent to one end, whereby when the muffler is not in use it may be turned up against the cap and its ends engaged with the buttons on the upturned
5 portion, to form therewith a band-like portion for said cap.

In testimony whereof I have signed my

name to this specification in the presence of two subscribing witnesses.

JACOB TIM.
