(57) Abrégé/Abstract:

Disclosed is a configuration method for an enhanced downlink control channel, which configures K ePDCCH detection clusters for a terminal, including: independently configuring an antenna port index of a corresponding demodulation reference signal (DMRS) at the time of detection of each ePDCCH detection cluster or different transmission modes of ePDCCH detection clusters of the K ePDCCH detection clusters; and/or independently configuring a scrambling sequence index of the corresponding DMRS at the time of detection of each ePDCCH detection cluster or different transmission modes of ePDCCH detection clusters of the K ePDCCH detection clusters; and/or independently configuring the correlation between a corresponding DMRS scrambling sequence at the time of detection of each ePDCCH detection cluster or different transmission modes of ePDCCH detection clusters of the K ePDCCH detection clusters and a DMRS scrambling sequence of a physical downlink shared channel PDSCH, and the like. Disclosed at the same time are a detection method and device for an enhanced downlink control channel, a configuration device for an enhanced downlink control channel, a terminal and an evolved node B. The present invention allows an ePDCCH to have stronger stability and configuration flexibility.

ABSTRACT

Disclosed is a configuration method for an enhanced downlink control channel, which configures K ePDCCH detection clusters for a terminal, including: independently configuring an antenna port index of a corresponding demodulation reference signal (DMRS) at the time of detection of each ePDCCH detection cluster or different transmission modes of ePDCCH detection clusters of the K ePDCCH detection clusters; and/or independently configuring a scrambling sequence index of the corresponding DMRS at the time of detection of each ePDCCH detection cluster or different transmission modes of ePDCCH detection clusters of the K ePDCCH detection clusters; and/or independently configuring the correlation between a corresponding DMRS scrambling sequence at the time of detection of each ePDCCH detection cluster or different transmission modes of ePDCCH detection clusters of the K ePDCCH detection clusters and a DMRS scrambling sequence of a physical downlink shared channel PDSCH, and the like. Disclosed at the same time are a detection method and device for an enhanced downlink control channel, a configuration device for an enhanced downlink control channel, a terminal and an evolved node B. The present invention allows an ePDCCH to have stronger stability and configuration flexibility.

CONFIGURATION AND DETECTION METHOD AND DEVICE FOR ENHANCED DOWNLINK CONTROL CHANNEL, EVOLVED NODE B AND TERMINAL

TECHNICAL FIELD

5 The disclosure relates to enhanced downlink control channel configuration and detection, and in particular to a configuring and detecting method and device for an enhanced downlink control channel, an evolved Node B (eNB), and a User Equipment (UE).

BACKGROUND

10 In Long Term Evolution (LTE) Release8/9 (R8/9), a Common Reference Signal (CRS) is designed for channel quality measurement and demodulation of a received data symbol. A terminal or User Equipment (UE) may perform channel measurement through a CRS, thereby making a cell reselection decision and switching to a target cell. Channel quality measurement is performed while the UE is connected. When there is 15 a high level of interference, physical-layer disconnection may be implemented through relevant higher-layer radio link failure signaling. In LTE R10, to further increase cell average spectrum utilization, cell edge spectrum utilization, and UE throughput, two reference signals are defined respectively, namely, a Channel State Information-Reference Signal (CSI-RS) and a DeModulation Reference Signal (DMRS). The 20 CSI-RS is used for channel measurement. A Precoding Matrix Indicator (PMI), a Channel Quality Indicator (CQI) and a Rank Indicator (RI) to be fed by a UE back to an eNB may be computed through CSI-RS measurement. The DMRS is used for downlink shared channel demodulation. Demodulation with the DMRS not only may reduce interference between different receiving sides and between different cells by 25 way of a beam, but also may reduce performance degradation caused by codebook granularity, as well as reducing downlink control signaling overhead to some extent, as no PMI bit overhead has to be added in a Physical Downlink Control Channel (PDCCH).

30 In LTE R8, R9 and R10, a PDCCH mainly may be distributed over first 1, 2, or 3 Orthogonal Frequency Division Multiplexing (OFDM) symbols of a subframe. A specific distribution is to be configured in accordance with a subframe type and a CRS port number, as shown in Table 1.

Table 1

subframe	number of OFDM symbols for PDCCH with $N_{\text{RB}}^{\text{DL}} > 10$	number of OFDM symbols for PDCCH with $N_{\text{RB}}^{\text{DL}} \leq 10$
subframe 1 and subframe 6 in subframe type 2	1, 2	2
MBSFN subframe on a PDSCH supporting carrier, with a CRS port number of 1 or 2	1, 2	2
MBSFN subframe on a PDSCH supporting carrier, with a CRS port number of 4	2	2
subframe on a carrier supporting no PDSCH transfer	0	0
PRS non-MBSFN subframe (other than subframe 6 of frame structure type 2)	1, 2, 3	2, 3
subframe of any other situation	1, 2, 3	2, 3, 4

A receiving side has to perform blind detection over the first three symbols. A starting position of the blind detection and a control channel element number may depend on a Radio Network Temporary Identifier allocated to the receiving side as well as control information. In general the control information may include public control information and dedicated control information. The public control information is in general placed in a common search space of a PDCCH. The dedicated control may be placed in a common space and a dedicated search space. After blind detection, a receiving side may determine whether there is any common system message, downlink scheduling information, or uplink scheduling information in a subframe. As such downlink control information has no Hybrid Automatic Repeat Request (HARQ) feedback, a symbol error rate in detection as low as possible has to be ensured.

in an LTE R10 heterogeneous network, there is strong mutual interference between

eNBs of different types. Given interference of a Macro eNodeB to a Pico and interference of a Home eNodeB to a Macro eNodeB, it is proposed to handle mutual interference between eNBs of different types by resource muting, specifically based on a subframe such as an Almost Blank Subframe (ABS), or based on a resource element, 5 such as by CRS muting.

the muting method not only adds to resource waste, but also greatly limit scheduling. In particular, given ABS configuration of a Macro eNodeB, more Picos and more ABSs configured for the Macro eNodeB will bring greater impact on the Macro eNodeB, adding to resource waste as well as increasing a scheduling delay. Although 10 interference among control channel data resources may be reduce with a control channel in an ABS, interference between a CRS resource and a data resource cannot be solved. The CRS muting fails to handle interference among data resources, and leads to poor backward compatibility, adding to an access delay and standardization effort.

15 In LTE R11, more users may be introduced to perform sending on a Multicast Broadcast Single Frequency Network (MBSFN) subframe, which may result in insufficient PDCCH capacity of 2 OFDM symbols configured for the MBSFN. To ensure backward compatibility with an R8/R9/R10 user, a new control information transfer resource (ePDCCH for short hereinafter) has to be created with a Physical 20 Downlink Shared Channel (PDSCH) resource. With COMP introduced in R11, it is possible to handle interference between cells of different types by space division, save resource overhead, avoid resource waste caused by muting, and reduce the limit on scheduling. However, such a solution by space division cannot be implemented with a time-domain PDCCH at present. Such a time-domain PDCCH has to be kept for 25 backward compatibility with R8 and R9. In this case, in order to handle interference between control channels by space division, a new control channel, namely, an Enhanced PDCCH (ePDCCH) has to be introduced. With the ePDCCH, good space division may be implemented, reducing physical downlink control signaling interference between different nodes and increasing system PDCCH capacity.

30 Also discussed in R11 is Physical Hybird ARQ Indicator Channel (PHICH) resource insufficiency. In R11, more uplink users has to be supported. In particular, in scene 4, a number of supportable uplink users increases significantly, PHICH capacity is limited greatly. In addition, R11 discussion supports different UEs to have identical uplink

time-frequency resources /cyclic displacement allocation/CSHopping allocation/different Reference Signal (RS) sequences. Thus, conventional PHICH detecting resource allocation no longer applies, and further PHICH enhancement is required. Thus, further study on PHICH enhancement is necessary. Such an enhanced PHICH may 5 be referred to as an Enhanced Physical Hybird ARQ Indicator Channel (ePHICH).

Also discussed in an R11 conference at present is whether common search space control signaling enhancement is required, which mainly depends on whether an R10 common search space at present has limited capacity and how severe is interference between different nodes, in particular Macro (Macro cell)-Pico (Pico cell) interference. 10 With limited capacity or severe interference, it is necessary to introduce an enhanced common search space. As interference avoidance at a time-frequency resource position may be performed in a PDSCH area, a focus at present is an enhanced common search space based on a PDSCH area, referred to as an Enhanced Common Search Space (eCSS).

15 In discussion of the latest seventieth 3GPP conference, a preliminary conclusion is formed as follows.

An ePDCCH detecting cluster may consist of N Physical Resource Block (PRB) pairs.

20 The N may be 1 (N=1, centralized ePDCCH transfer mode), 2, 4, 8, 16 (distributed ePDCCH transfer mode).

In the distributed ePDCCH transfer mode, an ePDCCH performs transfer using N PRB pairs in an ePDCCH detecting cluster.

25 In the centralized ePDCCH transfer mode, transfer is performed in an ePDCCH detecting cluster. Further discussion is required to decide whether to support transfer on more than one PRB pair in the centralized ePDCCH transfer mode.

K ePDCCH clusters ($K \geq 1$) may be configured by UE dedicated higher-layer signaling.

A maximal value of K may be 2, 3, 4 or 6.

An N may be configured for each of the K clusters.

30 A total number of blind detections for each of the K clusters is independent.

A total number of blind detections for a UE should be allocated to the K clusters.

An ePDCCH detecting cluster is configured to be in either the centralized ePDCCH transfer mode or the distributed ePDCCH transfer mode.

PRB pairs of two logic ePDCCH detecting clusters may coincide with each other or partly overlap with each other, or have no overlap at all.

5 SUMMARY

In view of this, it is desired that embodiments of the disclosure provides a configuring and detecting method and device for an enhanced downlink control channel, an evolved Node B (eNB), and a User Equipment (UE), capable of providing R11 ePDCCH detecting cluster configuring information and flexibly configuring an ePDCCH 10 detecting parameter. The ePDCCH detecting cluster may include one or more frequency domain resource units for ePDCCH detection allocated in an ePDCCH detecting subframe.

To this end, a technical solution herein may be implemented as follows.

A configuring method for an enhanced downlink control channel may include: 15 configuring, for a User Equipment (UE), K Enhanced PDCCH (ePDCCH) detecting clusters; and

independently configuring an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

20 and/or independently configuring a scrambling sequence or a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or independently configuring correspondence between a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);

and/or independently configuring a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

30 and/or independently configuring a resource element available for ePDCCH transfer in detection with an ePDCCH detecting cluster or any ePDCCH detecting

cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a starting symbol position for ePDCCH detection in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

5 and/or independently configuring a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

10 and/or independently configuring a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

15 and/or independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

20 and/or independently configuring at least one of an aggregation level, a search space starting position, and a search space position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not indicated or acquired;

25 and/or configuring two or more ePDCCH detecting subframe clusters, each with an ePDCCH detecting cluster configuration and/or with ePDCCH detection or PDCCH detection. The ePDCCH detecting cluster configuration may include at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

30 An antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be at least one of ports 107, 108, 109, and 110.

When two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are configured, one of the two or more antenna ports of the DMRS may be determined as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio Network Temporary Identitifier (C-RNTI), and a predefined rule.

The independently configuring correspondence bewteen a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH may include: when the DMRS of the PDSCH is configured with a scrambling sequence identitifier, independently configuring correspondence bewteen the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the PDSCH.

15 The CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of

a CRS port number, a CRS frequency domain position, and a CRS cell Identitifier.

20 The resource element available for ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of

the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration.

25 An ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of

a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection.

30 The independently configuring a CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include:

in configuring a CSI Process for the UE, adopting information relevant to a configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

5 The large-scale information may include at least one of
 a delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process, and an average received power corresponding to the CSI measuring process.

10 The CSI measuring process may include one of
 a measuring resource of the CSI measuring process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource.

15 The independently configuring an NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include:

20 in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

25 The large-scale information may include at least one of
 a delay expansion corresponding to the NZP CSI-RS, a path delay corresponding to the NZP CSI-RS, a Doppler shift corresponding to the NZP CSI-RS, a Doppler expansion corresponding to the NZP CSI-RS, and an average received power corresponding to the NZP CSI-RS.

30 The independently configuring a DCI Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include:

35 independently configuring the DCI Format or the DCI Format set the UE is to detect in an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

The independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include:

5 independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH and a subframe where to detect a PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations in different subframe clusters.

10 The independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include:

15 independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH dedicated search space and a subframe where to detect a PDCCH dedicated search space.

The method may further include:

20 independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, PUCCH dynamic resource position indicator signaling in HARQ feedback, instructing the UE to use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.

The transfer mode may include a centralized transfer mode and a distributed transfer mode.

25 The independently configuring a DCI Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include:

configuring a DCI Format set for a K;

30 configuring a DCI Format set for K ePDCCH detecting clusters, any ePDCCH detecting cluster with the distributed transfer mode, or any ePDCCH detecting cluster with the centralized transfer mode; and

configuring a DCI Format set for detection with an ePDCCH detecting cluster.

A method for detecting an enhanced downlink control channel may include:

detecting, by a User Equipment (UE), an enhanced downlink control channel; and

obtaining an antenna port indicator of a DeModulation Reference Signal (DMRS) in

5 detection with an Enhanced PDCCH (ePDCCH) detecting cluster or any ePDCCH detecting cluster with a transfer mode in K ePDCCH detecting clusters;

and/or obtaining a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

10 and/or obtaining correspondence bewteen a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);

15 and/or obtaining a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a resource element available for ePDCCH transfer in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

20 and/or obtaining an ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or obtaining a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

30 and/or obtaining a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

5 and/or obtaining an aggregation level and a search space starting position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

10 and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not acquired;

15 and/or when two or more ePDCCH detecting subframe clusters are obtained, for different ePDCCH detecting subframe clusters, performing detection with different ePDCCH detecting cluster configurations and/or adopting ePDCCH detection or PDCCH detection. An ePDCCH detecting cluster configuration may include at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

An antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be at least one of ports 107, 108, 109, and 110.

20 The correspondence between a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH may be independently configured by: when the DMRS of the PDSCH is configured with a scrambling sequence identifier, independently configuring correspondence 25 between the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the PDSCH.

30 The CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of a CRS port number, a CRS frequency domain position, and a CRS cell identifier.

The resource element available for ePDCCH in detection with an ePDCCH

detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration.

- 5 The ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of: a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection.
- 10 The CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: in configuring a CSI measuring process for the UE, adopting information relevant to the configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters. The large-scale information may include at least one of a delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process, and an average received power corresponding to the CSI measuring process. The CSI measuring process may include one of a measuring resource of the CSI measuring process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource;
- 15 The NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.
- 20 The DCI Format or the DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring the DCI Format or the DCI Format set the UE is to detect in an ePDCCH detecting cluster

or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

The ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH and a subframe where to detect a PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations in different subframe clusters. The ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may also be independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH dedicated search space and a subframe where to detect a PDCCH dedicated search space.

PUCCH dynamic resource position indicator signaling in HARQ feedback may be independently configured for: an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters to instruct the UE to use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.

When two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are obtained, one of the two or more antenna ports of the DMRS may be determined as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio Network Temporary Identifier (C-RNTI), and a predefined rule.

The transfer mode may include a centralized transfer mode and a distributed transfer mode.

According to the DCI Format or the DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters obtained,

- the UE may perform detection using a DCI Format set for a K;
- the UE may perform detection using a DCI Format set for K ePDCCH detecting clusters, any ePDCCH detecting cluster with the distributed transfer mode, or any ePDCCH detecting cluster with the centralized transfer mode; and
- 5 the UE may perform detection using a DCI Format set for detection with an ePDCCH detecting cluster.

A configuring device for an enhanced downlink control channel may include a first configuring unit and a second configuring unit.

10 The first configuring unit may be configured for: configuring, for a User Equipment (UE), K Enhanced PDCCH (ePDCCH) detecting clusters.

The second configuring unit may be configured for: independently configuring an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

15 and/or independently configuring a scrambling sequence or a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

20 and/or independently configuring correspondence between a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);

and/or independently configuring a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or independently configuring a resource element available for ePDCCH transfer in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

30 and/or independently configuring a starting symbol position for ePDCCH detection in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a Channel State Information (CSI) measuring

process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring at least one of an aggregation level, a search space starting position, and a search space position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not indicated or acquired;

and/or configuring two or more ePDCCH detecting subframe clusters, each with an ePDCCH detecting cluster configuration and/or with ePDCCH detection or PDCCH detection. The ePDCCH detecting cluster configuration may include at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

An antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be at least one of ports 107, 108, 109, and 110.

The independently configuring correspondence between a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH may include: when the DMRS of the PDSCH is configured with a scrambling sequence identifier, independently configuring

correspondence bewteen the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the PDSCH.

The CRS rate matching resource in detection with an ePDCCH detecting cluster or
 5 any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of a CRS port number, a CRS frequency domain position, and a CRS cell Identitifier.

The resource element available for ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration.

An ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of: a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection.

The independently configuring a CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include: in configuring a CSI measuring process for the UE, adopting information relevant to the configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters. The large-scale information may include at least one of a delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process, and an average received power corresponding to the CSI measuring process. The CSI measuring process may include one of a measuring resource of the CSI measuring process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource.

The independently configuring an NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the

K ePDCCH detecting clusters may include: in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

- 5 The independently configuring a DCI Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include: independently configuring the DCI Format or the DCI Format set the UE is to detect in an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.
- 10 The independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing 15 the UE of a subframe where to detect an ePDCCH and a subframe where to detect a PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations in different subframe clusters. The independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include:
- 15 independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH dedicated search space and a subframe where to detect a PDCCH dedicated search 20 space.
- 25 PUCCH dynamic resource position indicator signaling in HARQ feedback may be independently configured for: an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters to instruct the UE to use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.
- 30 The device may further include:
 - a determining unit configured for: when two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are configured, determining one of

the two or more antenna ports of the DMRS as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio Network Temporary Identifier (C-RNTI), and a predefined rule.

5 The transfer mode may include a centralized transfer mode and a distributed transfer mode.

The second configuring unit may be further configured for:

configuring a DCI Format set for a K;

10 configuring a DCI Format set for K ePDCCH detecting clusters, any ePDCCH detecting cluster with the distributed transfer mode, or any ePDCCH detecting cluster with the centralized transfer mode; and

configuring a DCI Format set for detection with an ePDCCH detecting cluster.

An eNodeB (eNB) may include the aforementioned configuring device.

A device for detecting an enhanced downlink control channel may include a detecting unit and an obtaining unit.

15 The detecting unit may be configured for: detecting an enhanced downlink control channel.

The obtaining unit may be configured for: obtaining an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an Enhanced PDCCH (ePDCCH) detecting cluster or any ePDCCH detecting cluster with a transfer mode in K 20 ePDCCH detecting clusters;

and/or obtaining a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or obtaining correspondence bewteen a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);

30 and/or obtaining a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a resource element available for ePDCCH transfer in detection

with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K

5 ePDCCH detecting clusters;

and/or obtaining a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a Non-Zero Power (NZP) CSI-RS configuration in detection with

10 an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

15 and/or obtaining an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an aggregation level and a search space starting position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a

20 transfer mode in the K ePDCCH detecting clusters;

and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not acquired;

25 and/or when two or more ePDCCH detecting subframe clusters are obtained, for different ePDCCH detecting subframe clusters, performing detection with different ePDCCH detecting cluster configurations and/or adopting ePDCCH detection or PDCCH detection. An ePDCCH detecting cluster configuration may include at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

An antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters

may be at least one of ports 107, 108, 109, and 110.

The correspondence bewteen a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH 5 may be independently configured by: when the DMRS of the PDSCH is configured with a scrambling sequence identitifier, independently configuring correspondence bewteen the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the PDSCH.

10 The CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of a CRS port number, a CRS frequency domain position, and a CRS cell Identitifier.

15 The resource element available for ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration.

20 The ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of: a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection.

25 The CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: in configuring a CSI measuring process for the UE, adopting information relevant to the configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters. The large-scale information may include at least one of a delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process,

and an average received power corresponding to the CSI measuring process. The CSI measuring process may include one of a measuring resource of the CSI measuring process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource.

5 The NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any
10 ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

The DCI Format or the DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring the DCI Format or the DCI Format set the UE is to detect in an ePDCCH detecting cluster
15 or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

The ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring, for
20 an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH and a subframe where to detect a PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations in different subframe clusters. The ePDCCH detecting subframe cluster in detection
25 with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may also be independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH
30 dedicated search space and a subframe where to detect a PDCCH dedicated search space.

PUCCH dynamic resource position indicator signaling in HARQ feedback may be independently configured for: an ePDCCH detecting cluster or any ePDCCH detecting

cluster with a transfer mode in the K ePDCCH detecting clusters to instruct the UE to use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.

The device may further include:

- 5 a determining unit configured for: when two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are obtained by the obtaining unit, determining one of the two or more antenna ports of the DMRS as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio
- 10 Network Temporary Identifier (C-RNTI), and a predefined rule.

The transfer mode may include a centralized transfer mode and a distributed transfer mode.

The detecting unit may be further configured for: performing detection using a DCI Format set for a K;

- 15 performing detection using a DCI Format set for K ePDCCH detecting clusters, any ePDCCH detecting cluster with the distributed transfer mode, or any ePDCCH detecting cluster with the centralized transfer mode; and
- performing detection using a DCI Format set for detection with an ePDCCH detecting cluster.

20 A User Equipment (UE) may include the device for detecting an enhanced downlink control channel.

An eNodeB (eNB) may be configured for: notifying, using User Equipment (UE) dedicated higher-layer signaling and/or Downlink Control Information (DCI), a UE whether to assume in Enhanced PDCCH (ePDCCH) resource detection that a time-frequency resource sharing DeModulation Reference Signal (DMRS) antenna port 25 is used for ePDCCH transfer or Physical Downlink Shared Channel (PDSCH) transfer by another UE.

The eNB may be further configured for: configuring K ePDCCH detecting clusters, and independently configuring whether the UE assumes in ePDCCH resource detection 30 in the K ePDCCH detecting clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another UE.

The eNB may be further configured for: configuring K ePDCCH detecting clusters, and configuring whether the UE assumes in ePDCCH resource detection in part or all of the K ePDCCH detecting clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another UE.

5 The eNB may be further configured for: configuring X subframe clusters, and configuring whether the UE assumes in ePDCCH resource detection in part or all of the X subframe clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another UE.

10 The DMRS antenna port may include at least one of ports 107, 108, 109, and 110, wherein ports 107 and 108 share a time-frequency resource, and ports 109 and 110 share a time-frequency resource.

15 A User Equipment (UE) may be configured for: learning, by receiving User Equipment (UE) dedicated higher-layer signaling and/or Downlink Control Information (DCI), whether to assume in Enhanced PDCCH (ePDCCH) resource detection that a time-frequency resource sharing DeModulation Reference Signal (DMRS) antenna port is used for ePDCCH transfer or Physical Downlink Shared Channel (PDSCH) transfer by another UE.

20 The UE may be further configured for: obtaining, by receiving higher-layer signaling, K ePDCCH detecting clusters configured; receiving independently configured channel estimation higher-layer signaling that signals the UE whether to assume in ePDCCH resource detection in the K ePDCCH detecting clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another UE; and performing, according to the received higher-layer signaling, DMRS channel estimation.

25 The UE may be further configured for: obtaining, through UE dedicated higher-layer signaling, K ePDCCH detecting clusters configured; and learning whether the UE is configured to assume in ePDCCH resource detection in part or all of the K ePDCCH detecting clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another UE.

30 The UE may be further configured for: obtaining, through UE dedicated higher-layer signaling, X subframe clusters configured; and learning whether the UE is configured to assume in ePDCCH resource detection in part or all of the X subframe clusters that a time-frequency resource sharing DMRS antenna port is used for

ePDCCH transfer or PDSCH transfer by another UE.

The DMRS antenna port is configured for ePDCCH demodulation and may include at least one of ports 107, 108, 109, and 110, wherein ports 107 and 108 share a time-frequency resource, and ports 109 and 110 share a time-frequency resource.

5 A User Equipment (UE) may be configured for: always assuming in Enhanced PDCCH (ePDCCH) resource detection that a time-frequency resource sharing DeModulation Reference Signal (DMRS) antenna port is not used for ePDCCH transfer or Physical Downlink Shared Channel (PDSCH) transfer by another UE.

10 The DMRS antenna port may be configured for ePDCCH demodulation and may include at least one of ports 107, 108, 109, and 110. Ports 107 and 108 may share a time-frequency resource. Ports 109 and 110 may share a time-frequency resource.

15 A User Equipment (UE) may be configured for: determining, according to an Enhanced PDCCH (ePDCCH) transfer mode, whether to assume in ePDCCH resource detection that a time-frequency resource sharing DeModulation Reference Signal (DMRS) antenna port is used for ePDCCH transfer or Physical Downlink Shared Channel (PDSCH) transfer by another UE.

The UE may be configured for: with a centralized transfer mode, always assuming in ePDCCH resource detection that a time-frequency resource sharing DMRS antenna port is not used for ePDCCH transfer or PDSCH transfer by another UE.

20 The UE may be configured for: with a distributed transfer mode, assuming in ePDCCH resource detection that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another UE.

25 The DMRS antenna port may be configured for ePDCCH demodulation and may include at least one of ports 107, 108, 109, and 110. Ports 107 and 108 may share a time-frequency resource. Ports 109 and 110 may share a time-frequency resource.

30 With the disclosure, K Enhanced PDCCH (ePDCCH) detecting clusters may be configured for a UE; a DMRS antenna port indicator in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured; or a DMRS scrambling sequence indicator in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured.

Or, correspondence bewteen a DMRS scrambling sequence in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a PDSCH DMRS scrambling sequenc may be independently configured. A CRS rate matching resource in detection with an

5 ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured. An ePDCCH usable resource element in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured. An ePDCCH starting symbol position in detection with an

10 ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured. A CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured. An NZP CSI-RS configuration in detection with an ePDCCH

15 detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured. A DCI Format in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured. An ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster

20 or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured. An aggregation level and a search space starting position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured. A default value or a default behavior of an ePDCCH

25 detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be predefined or configured independently. A UE side may perform ePDCCH detection and obtain the configuration information, and implement ePDCCH parsing. With a technical solution herein, an eNB side may flexibly cofigure, for a UE, an ePDCCH detecting parameter, thereby achieving flexible

30 dynamic ePDCCH switch between multiple TPs, more flexible ePDCCH scheduling information configuration by the eNB side, and improved ePDCCH stability.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig.1 is a schematic diagram of a structure of a configuring device for an enhanced

downlink control channel according to an embodiment herein.

Fig.2 is a schematic diagram of a structure of a device for detecting an enhanced downlink control channel according to an embodiment herein.

DETAILED DESCRIPTION

5 To clearly show a technical problem to be solved, a technical solution, and beneficial effects of the present disclosure, the present disclosure is further elaborated below with reference to the drawings and embodiments.

To facilitate understanding, the disclosure is further illustrated below with embodiments. By independent configuration herein, irrelevance between different 10 ePDCCCH sets is stressed, without limiting that no configuration can be performed within a same set of signaling or that there can be no association to common PDSCH configuring signaling. Embodiments may be combined freely with each other. Separate drafting of embodiments poses no limitation to a form of combination.

Embodiment 1

15 An eNB may configure, through UE higher-layer signaling, $K(K \geq 1)$ ePDCCCH detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, a DMRS antenna port indicator in detection with an ePDCCCH detecting cluster or any ePDCCCH detecting cluster with a certain transfer mode. The UE may perform ePDCCCH reception and detection by receiving the K 20 ePDCCCH detecting clusters configured by the eNB and a DMRS antenna port independently configured.

Sub-embodiment 1 of Embodiment 1

For example, 2 ePDCCCH detecting clusters ($K=2$), namely, ePDCCCH detecting cluster 0 and ePDCCCH detecting cluster 1, may be configured.

25 ePDCCCH detecting cluster 0 may be for detection with DMRS port 7.

ePDCCCH detecting cluster 1 may be for detection with DMRS port 8.

Sub-embodiment 2 of Embodiment 1

For example, 2 ePDCCCH detecting clusters ($K=2$), namely, ePDCCCH detecting cluster 0 and ePDCCCH detecting cluster 1, may be configured.

30 ePDCCCH detecting cluster 0 may be for detection with DMRS ports 7, 8.

ePDCCH detecting cluster 1 may be for detection with DMRS ports 9, 10.

Sub-embodiment 3 of Embodiment 1

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode.

5 ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.

The distributed ePDCCH transfer mode may correspond to detection with DMRS port 7.

The centralized ePDCCH transfer mode may correspond to detection with DMRS port 8.

10 Sub-embodiment 4 of Embodiment 1

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.

15 The distributed ePDCCH transfer mode may correspond to detection with DMRS ports 7, 8.

The centralized ePDCCH transfer mode may correspond to detection with DMRS ports 9, 10.

A specific port adopted by the UE in DMRS detection will depend on an eCCE indicator and/or a C-RNTI and/or a PRB indicator.

20 Embodiment 2

An eNB may configure, through UE higher-layer signaling, K($K \geq 1$) ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, a DMRS scrambling sequence in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a certain transfer mode. The UE may perform ePDCCH reception and detection by receiving the K ePDCCH detecting clusters configured by the eNB and the DMRS scrambling sequence independently configured.

Sub-embodiment 1 of Embodiment 2

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured.

ePDCCH detecting cluster 0 may be for DMRS scrambling sequence detection with virtual cell ID X0 and Nscid = 0.

ePDCCH detecting cluster 1 may be for DMRS scrambling sequence detection with virtual cell ID X1 and Nscid = 0.

5 $c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}}.$

Xn (n=1, 2) denotes $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denotes $n_{\text{SCID}}^{\text{EPDCCH}}$.

Sub-embodiment 2 of Embodiment 2

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured.

10 ePDCCH detecting cluster 0 may be for DMRS scrambling sequence detection with virtual cell ID X0 and Nscid = 0.

ePDCCH detecting cluster 1 may be for DMRS scrambling sequence detection with virtual cell ID X1 and Nscid = 1.

$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}}.$

15 Xn (n=1, 2) denotes $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denotes $n_{\text{SCID}}^{\text{EPDCCH}}$.

Nscid may be fixed as Nscid = 0 or Nscid = 1; or both Nscid and virtual ID may be independently configured in accordance with higher-layer signaling.

Sub-embodiment 3 of Embodiment 2

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. 20 ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.

The distributed ePDCCH transfer mode may correspond to DMRS scrambling sequence detection with virtual cell ID X0 and Nscid = 0.

25 The centralized ePDCCH transfer mode may correspond to DMRS scrambling sequence detection with virtual cell ID X1 and Nscid = 0.

$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}}.$

Xn (n=1, 2) denotes $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denotes $n_{\text{SCID}}^{\text{EPDCCH}}$.

Sub-embodiment 4 of Embodiment 2

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.

5 The distributed ePDCCH transfer mode may correspond to DMRS scrambling sequence detection with virtual cell ID X0 and Nscid = 0.

The centralized ePDCCH transfer mode may correspond to DMRS scrambling sequence detection with virtual cell ID X1 and Nscid = 1.

$$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}}.$$

Xn (n=1, 2) denotes $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denotes $n_{\text{SCID}}^{\text{EPDCCH}}$.

10 Nscid may be fixed as Nscid = 0 or Nscid = 1; or both Nscid and virtual ID may be independently configured in accordance with higher-layer signaling.

Embodiment 3

An eNB may configure, through UE higher-layer signaling, K(K≥1) ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through 15 UE dedicated higher-layer signaling, correspondence between a DMRS scrambling sequence in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a certain transfer mode and a PDSCH DMRS scrambling sequence. The UE may perform ePDCCH reception and detection by receiving the K ePDCCH detecting clusters configured by the eNB and the correspondence between the DMRS 20 scrambling sequence and the PDSCH DMRS scrambling sequence independently configured.

Sub-embodiment 1 of Embodiment 3

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. PDSCH DMRS 25 scrambling sequences {X0, Nscid = 0} and {X1, Nscid = 1} may be configured.

ePDCCH detecting cluster 0 may be for DMRS scrambling sequence detection with X0 and Nscid = 0.

ePDCCH detecting cluster 1 may be for DMRS scrambling sequence detection with X1 and Nscid = 1.

30 A binding relation may be indicated through 1-bit higher-layer signaling. For

example, bit value 0 may bind X0 and Nscid = 0, and bit value 1 may bind X1 and Nscid = 1.

$$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}}.$$

Xn (n=1, 2) denotes $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denotes $n_{\text{SCID}}^{\text{EPDCCH}}$.

5 Sub-embodiment 2 of Embodiment 3

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. PDSCH DMRS scrambling sequences {X0, Nscid = 0} and {X1, Nscid = 1} may be configured.

10 ePDCCH detecting cluster 0 may be for DMRS scrambling sequence detection with X0 and Nscid = 0.

ePDCCH detecting cluster 1 may be for DMRS scrambling sequence detection with X1 and Nscid = 0.

15 A binding relation to a PDSCH DMRS sequence may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind X0, and bit value 1 may bind X1, with Nscid fixed at 0 or 1.

$$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}}.$$

Xn (n=1, 2) denotes $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denotes $n_{\text{SCID}}^{\text{EPDCCH}}$.

Sub-embodiment 3 of Embodiment 3

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. 20 ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. PDSCH DMRS scrambling sequences {X0, Nscid = 0} and {X1, Nscid = 1} may be configured.

25 The distributed ePDCCH transfer mode may correspond to DMRS scrambling sequence detection with X0 and Nscid = 0.

The centralized ePDCCH transfer mode may correspond to DMRS scrambling sequence detection with X1 and Nscid = 1.

A binding relation may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind X0 and Nscid = 0, and bit value 1 may bind X1 and Nscid

= 1.

$$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}}.$$

Xn (n=1, 2) denotes $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denotes $n_{\text{SCID}}^{\text{EPDCCH}}$.

Sub-embodiment 4 of Embodiment 3

5 For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. PDSCH DMRS scrambling sequences {X0, Nscid = 0} and {X1, Nscid = 1} may be configured.

10 The distributed ePDCCH transfer mode may correspond to DMRS scrambling sequence detection with X0 and Nscid = 0.

The centralized ePDCCH transfer mode may correspond to DMRS scrambling sequence detection with X1 and Nscid = 0.

15 A binding relation to a PDSCH DMRS sequence may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind X0, and bit value 1 may bind X1, with Nscid fixed at 0 or 1.

$$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}}.$$

Xn (n=1, 2) denotes $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denotes $n_{\text{SCID}}^{\text{EPDCCH}}$.

Embodiment 4

20 An eNB may configure, through UE higher-layer signaling, K(K≥1) ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, a CRS rate matching resource in detection with an ePDCCH detecting cluster. The UE may perform ePDCCH reception and detection by receiving the K ePDCCH detecting clusters configured by the eNB and an independently configured CRS rate matching resource.

Sub-embodiment 1 of Embodiment 4

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured.

ePDCCH detecting cluster 0 may be for detection with CRS rate matching resource

S0.

ePDCCH detecting cluster 1 may be for detection with CRS rate matching resource S1.

Sub-embodiment 2 of Embodiment 4

5 For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. PDSCH CRS rate matching resources S0 and S1 may be configured.

ePDCCH detecting cluster 0 may be for detection with CRS rate matching resource S0.

10 ePDCCH detecting cluster 1 may be for detection with CRS rate matching resource S1.

A binding relation to a PDSCH CRS rate matching resource may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind S0, and bit value 1 may bind S1.

15 Sub-embodiment 3 of Embodiment 4

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.

20 The distributed ePDCCH transfer mode may correspond to detection with CRS rate matching resource S0.

The centralized ePDCCH transfer mode may correspond to detection with CRS rate matching resource S1.

Sub-embodiment 4 of Embodiment 4

25 For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. PDSCH CRS rate matching resources S0 and S1 may be configured.

The distributed ePDCCH transfer mode may correspond to detection with CRS rate matching resource S0.

30 The centralized ePDCCH transfer mode may correspond to detection with CRS

rate matching resource S1.

A binding relation to a PDSCH CRS rate matching resource may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind S0, and bit value 1 may bind S1.

5 Embodiment 5

An eNB may configure, through UE higher-layer signaling, K($K \geq 1$) ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, an ePDCCH usable resource element (resource element available for ePDCCH transfer) in detection with an ePDCCH detecting cluster.

10 The UE may perform ePDCCH reception and detection by receiving the K ePDCCH detecting clusters configured by the eNB and the ePDCCH usable resource element independently configured.

The ePDCCH usable resource element may include at least one of
15 a CRS rate matching resource, an ZP CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a CP length configuration.

Sub-embodiment 1 of Embodiment 5

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured.

20 ePDCCH detecting cluster 0 may be for detection with usable resource element S0.
ePDCCH detecting cluster 1 may be for detection with usable resource element S1.

Sub-embodiment 2 of Embodiment 5

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. PDSCH usable resource elements S0 and S1 may be configured.

25 ePDCCH detecting cluster 0 may be for detection with usable resource element S0.
ePDCCH detecting cluster 1 may be for detection with usable resource element S1.

A binding relation to a PDSCH usable resource element may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind S0, and bit value 1 may bind S1.

30 Sub-embodiment 3 of Embodiment 5

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.

The distributed ePDCCH transfer mode may correspond to detection with usable
5 resource element S0.

The centralized ePDCCH transfer mode may correspond to detection with usable
resource element S1.

Sub-embodiment 4 of Embodiment 5

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4.
10 ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. PDSCH usable resource elements S0 and S1 may be configured.

The distributed ePDCCH transfer mode may correspond to detection with usable
resource element S0.

15 The centralized ePDCCH transfer mode may correspond to detection with usable
resource element S1.

A binding relation to a PDSCH usable resource element may be indicated through
1-bit higher-layer signaling. For example, bit value 0 may bind S0, and bit value 1 may
bind S1.

20 Embodiment 6

An eNB may configure, through UE higher-layer signaling, K($K \geq 1$) ePDCCH
detecting clusters for a UE. In addition, the eNB may independently configure, through
UE dedicated higher-layer signaling, an ePDCCH starting symbol ID in detection with an
ePDCCH detecting cluster. The UE may perform ePDCCH reception and detection by
25 receiving the K ePDCCH detecting clusters configured by the eNB and the
independently configured ePDCCH starting symbol ID.

the ePDCCH starting symbol ID in detection with an ePDCCH detecting cluster
may include at least one of

0, 1, 2, 3, 4, and an ePDCCH starting symbol ID obtained by Physical Control
30 Format Indicator Channel (PCFICH) detection.

Sub-embodiment 1 of Embodiment 6

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured.

ePDCCH detecting cluster 0 may be for detection with an ePDCCH starting symbol ID 1.

5 ePDCCH detecting cluster 1 may be for detection with an ePDCCH starting symbol ID 2.

Sub-embodiment 2 of Embodiment 6

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. PDSCH starting 10 position symbol IDs 1 and 2 may be configured.

ePDCCH detecting cluster 0 may be for detection with the starting position symbol ID 1.

ePDCCH detecting cluster 1 may be for detection with the starting position symbol ID 2.

15 A binding relation to a PDSCH starting position symbol ID may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind 1, and bit value 1 may bind 2.

Sub-embodiment 3 of Embodiment 6

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. 20 ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.

The distributed ePDCCH transfer mode may correspond to detection with an ePDCCH starting symbol ID 1.

25 The centralized ePDCCH transfer mode may correspond to detection with an ePDCCH starting symbol ID 2.

Sub-embodiment 4 of Embodiment 6

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. 30 ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.

PDSCH starting position symbol IDs 1 and 2 may be configured.

The distributed ePDCCH transfer mode may correspond to detection with the starting position symbol ID 1.

The centralized ePDCCH transfer mode may correspond to detection with the starting position symbol ID 2.

5 A binding relation to a PDSCH starting position symbol ID may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind 1, and bit value 1 may bind 2.

Embodiment 7

An eNB may configure, through UE higher-layer signaling, K($K \geq 1$) ePDCCH 10 detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, a CSI measuring process configuration in detection with an ePDCCH detecting cluster. The UE may perform ePDCCH reception and detection by receiving the K ePDCCH detecting clusters configured by the eNB and the independently configured CSI measuring process configuration.

15 Sub-embodiment 1 of Embodiment 7

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. CSI Processes 0, 1 may be configured for the UE.

ePDCCH detecting cluster 0 may correspond to CSI Process 0.

20 ePDCCH detecting cluster 1 may correspond to CSI Process 0.

Sub-embodiment 2 of Embodiment 7

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. PDSCH CSI Processes 0, 1 may be configured.

25 ePDCCH detecting cluster 0 may be for detection with PDSCH CSI Process 0.

ePDCCH detecting cluster 1 may be for detection with PDSCH CSI Process 1.

A binding relation to a PDSCH starting position symbol ID may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind PDSCH CSI Process 0, and bit value 1 may bind PDSCH CSI Process 1.

30 Sub-embodiment 3 of Embodiment 7

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. CSI Processes 0, 1 may be configured for the UE.

5 The distributed ePDCCH transfer mode may correspond to CSI Process 0.

The centralized ePDCCH transfer mode may correspond to CSI Process 0.

Sub-embodiment 4 of Embodiment 7

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode.

10 ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. PDSCH CSI Processes 0, 1 may be configured.

The distributed ePDCCH transfer mode may correspond to detection with PDSCH CSI Process 0.

15 The centralized ePDCCH transfer mode may correspond to detection with PDSCH CSI Process 1.

A binding relation to a PDSCH starting position symbol ID may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind PDSCH CSI Process 0, and bit value 1 may bind PDSCH CSI Process 1.

Embodiment 8

20 An eNB may configure, through UE higher-layer signaling, K(K≥1) ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, an NZP CSI-RS configuration in detection with an ePDCCH detecting cluster. The UE may perform ePDCCH reception and detection by receiving the K ePDCCH detecting clusters configured by the eNB and the independently configured NZP CSI-RS configuration.

Sub-embodiment 1 of Embodiment 8

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. NZP CSI-RS 0 and NZP CSI-RS 1 may be configured for the UE.

30 ePDCCH detecting cluster 0 may correspond to NZP CSI-RS 0.

ePDCCH detecting cluster 1 may correspond to NZP CSI-RS 1.

Sub-embodiment 2 of Embodiment 8

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. PDSCH NZP CSI-RSs 0, 1 may be configured.

5 ePDCCH detecting cluster 0 may be for detection with PDSCH NZP CSI-RS 0.

ePDCCH detecting cluster 1 may be for detection with PDSCH NZP CSI-RS 1.

A binding relation to a PDSCH starting position symbol ID may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind PDSCH NZP CSI-RS 0, and bit value 1 may bind PDSCH NZP CSI-RS 1.

10 Sub-embodiment 3 of Embodiment 8

For example, 4 ePDCCH detecting clusters may be configured, that is, $K=4$. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. NZP CSI-RS 0 and NZP CSI-RS 1 may be configured for the UE.

15 The distributed ePDCCH transfer mode may correspond to NZP CSI-RS 0.

The centralized ePDCCH transfer mode may correspond to NZP CSI-RS 1.

Sub-embodiment 4 of Embodiment 8

For example, 4 ePDCCH detecting clusters may be configured, that is, $K=4$. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. 20 ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. PDSCH NZP CSI-RSs 0, 1 may be configured.

The distributed ePDCCH transfer mode may correspond to PDSCH NZP CSI-RS 0.

The centralized ePDCCH transfer mode may correspond to PDSCH NZP CSI-RS 1.

25 A binding relation to a PDSCH starting position symbol ID may be indicated through 1-bit higher-layer signaling. For example, bit value 0 may bind PDSCH NZP CSI-RS 0, and bit value 1 may bind PDSCH NZP CSI-RS 1.

Embodiment 9

30 An eNB may configure, through UE higher-layer signaling, K ($K \geq 1$) ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through

UE dedicated higher-layer signaling, a DCI Format in detection with an ePDCCH detecting cluster. The UE may perform ePDCCH reception and detection by receiving the K ePDCCH detecting clusters configured by the eNB and an independently configured DCI Format detecting set. A DCI Format configured for an ePDCCH 5 detecting cluster may be detected in the ePDCCH detecting cluster.

Sub-embodiment 1 of Embodiment 9

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. DCI Format detecting sets 0, 1 may be configured for the UE.

10 ePDCCH detecting cluster 0 may correspond to DCI Format detecting set 0.
ePDCCH detecting cluster 1 may correspond to DCI Format detecting set 1.

Sub-embodiment 2 of Embodiment 9

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. DCI Format detecting 15 sets 0, 1 may be configured for the UE.

ePDCCH detecting cluster 0 may correspond to DCI Format detecting set 0.
ePDCCH detecting cluster 1 may correspond to DCI Format detecting set 1.

The DCI Format detecting set 0 may include DCI Formats 1A, 0.

The DCI Format detecting set 1 may include DCI Formats 2C, 4.

20 Sub-embodiment 3 of Embodiment 9

For example, 4 ePDCCH detecting clusters may be configured, that is, $K=4$. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. DCI Format detecting sets 0, 1 may be configured for the UE.

25 The distributed ePDCCH transfer mode may correspond to DCI Format detecting set 0.

The centralized ePDCCH transfer mode may correspond to DCI Format detecting set 1.

Sub-embodiment 4 of Embodiment 9

30 For example, 4 ePDCCH detecting clusters may be configured, that is, $K=4$.

ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. DCI Format detecting sets 0, 1 may be configured for the UE.

5 The distributed ePDCCH transfer mode may correspond to DCI Format detecting set 0.

The centralized ePDCCH transfer mode may correspond to DCI Format detecting set 1.

The DCI Format detecting set 0 may include DCI Formats 1A, 0.

The DCI Format detecting set 1 may include DCI Formats 2C, 4.

10 Embodiment 10

An eNB may configure, through UE higher-layer signaling, $K (K \geq 1)$ ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, a detecting subframe cluster in detection with an ePDCCH detecting cluster. The UE may perform ePDCCH reception and detection by 15 receiving the K ePDCCH detecting clusters configured by the eNB and the independently configured detecting subframe cluster. Detection may be performed in an ePDCCH detecting cluster according to a detecting subframe corresponding to the ePDCCH detecting cluster. The subframe cluster may inform the UE of a subframe for detection by ePDCCH and a subframe for detection by PDCCH, or instruct the UE to 20 use different ePDCCH detecting cluster configurations in different subframe clusters.

Sub-embodiment 1 of Embodiment 10

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. Detecting subframe clusters 0 and 1 may be configured for the UE.

25 ePDCCH detecting cluster 0 may be configured with detecting subframe cluster 0.

ePDCCH detecting cluster 1 may be configured with detecting subframe cluster 1.

Sub-embodiment 2 of Embodiment 10

For example, 4 ePDCCH detecting clusters may be configured, that is, $K=4$. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. 30 ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode. Detecting subframe clusters 0 and 1 may be configured for the UE.

The distributed ePDCCH transfer mode may be configured with detecting subframe cluster 0.

The centralized ePDCCH transfer mode may be configured with detecting subframe cluster 1.

5 Sub-embodiment 3 of Embodiment 10

For example, four subframe clusters may be configured.

Subframe cluster 0 may be configured for supporting the UE to perform detection by PDCCH.

10 The UE may be informed to perform detection by ePDCCH with ePDCCH detecting clusters 0 and 1 in subframe cluster 1.

The UE may be informed to perform detection by ePDCCH with ePDCCH detecting clusters 1 and 2 in subframe cluster 2.

The UE may be informed to perform detection by ePDCCH with ePDCCH detecting cluster 3 in subframe cluster 3.

15 A detecting cluster parameter may be configured separately for the ePDCCH detecting clusters 0, 1, 2, 3. Such a parameter may include

an aggregation level to be detected in a detecting cluster.

a resource position to be detected in the detecting cluster.

Embodiment 11

20 An eNB may configure, through UE higher-layer signaling, K($K \geq 1$) ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, a position of a PUCCH dynamic position offset indicator value in HARQ feedback in detection with an ePDCCH detecting cluster. The UE may receive the K ePDCCH detecting clusters configured by the eNB and the 25 independently configured PUCCH dynamic position offset indicator value in HARQ feedback. HARQ feedback may be performed in the ePDCCH detecting cluster in accordance with the PUCCH dynamic position offset indicator value in HARQ feedback. The PUCCH dynamic position offset indicator value in HARQ feedback may inform the UE of an uplink PUCCH dynamic resource position offset indicator value for ePDCCH 30 ACK/NACK information feedback.

Sub-embodiment 1 of Embodiment 11

For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. PUCCH starting positions α_0 and α_1 in HARQ feedback may be configured for the UE

ePDCCH detecting cluster 0 may correspond to PUCCH starting position α_0 in
5 HARQ feedback.

ePDCCH detecting cluster 1 may correspond to PUCCH starting position α_1 in HARQ feedback.

For example, for an FDD system:

for PUCCH transfer with a single antenna port,

$$10 \quad n_{\text{PUCCH}}^{(1,\bar{p})} = n_{\text{CCE}} + N_{\text{PUCCH}}^{(1)} + \alpha_n (n = 0/1);$$

for PUCCH transfer with two antenna ports,

$$n_{\text{PUCCH}}^{(1,\bar{p})} = n_{\text{CCE}} + 1 + N_{\text{PUCCH}}^{(1)} + \alpha_n (n = 0/1);$$

$n_{\text{PUCCH}}^{(1,\bar{p})}$ denotes a resource position for actual HARQ transfer, $N_{\text{PUCCH}}^{(1)}$ denotes a PUCCH starting position in HARQ feedback, α denotes the dynamic position offset
15 indicator value, and n_{CCE} denotes a lowest eCCE indicator for DCI Format transfer.

Sub-embodiment 2 of Embodiment 11

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the centralized ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the distributed ePDCCH transfer mode.
20 PUCCH starting positions α_0 and α_1 in HARQ feedback may be configured for the UE.

The distributed ePDCCH transfer mode may correspond to PUCCH starting position α_0 in HARQ feedback.

The centralized ePDCCH transfer mode may correspond to PUCCH starting
25 position α_1 in HARQ feedback.

For example, for an FDD system:

for PUCCH transfer with a single antenna port,

$$n_{\text{PUCCH}}^{(1, \tilde{p})} = n_{\text{CCE}} + N_{\text{PUCCH}}^{(1)} + \alpha_n (n = 0/1);$$

for PUCCH transfer with two antenna ports,

$$n_{\text{PUCCH}}^{(1, \tilde{p})} = n_{\text{CCE}} + 1 + N_{\text{PUCCH}}^{(1)} + \alpha_n (n = 0/1);$$

$n_{\text{PUCCH}}^{(1, \tilde{p})}$ denotes a resource position for actual HARQ transfer, $N_{\text{PUCCH}}^{(1)}$ denotes a

5 PUCCH starting position in HARQ feedback, α denotes the dynamic position offset indicator value, and n_{CCE} denotes a lowest eCCE indicator for DCI Format transfer.

Embodiment 12

An eNB may configure, through UE higher-layer signaling, K(K≥1) ePDCCH detecting clusters for a UE. No DMRS scrambling sequence in detection with an 10 ePDCCH detecting cluster or any ePDCCH detecting cluster with a certain transfer mode is independently configured by the eNB through UE dedicated higher-layer signaling. The UE may receive the K ePDCCH detecting clusters configured by the eNB.

Sub-embodiment 1 of Embodiment 12

15 For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the distributed ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the centralized ePDCCH transfer mode. It may be predefined that by default the distributed ePDCCH transfer mode corresponds to the PDSCH DMRS scrambling sequence X0 and Nscid = 0. It may be predefined 20 that by default the centralized ePDCCH transfer mode corresponds to the PDSCH DMRS scrambling sequence X1 and Nscid = 0.

$$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}},$$

with X_n ($n=1, 2$) denoting $n_{\text{ID}}^{\text{EPDCCH}}$, and Nscid denoting $n_{\text{SCID}}^{\text{EPDCCH}}$.

Sub-embodiment 2 of Embodiment 12

25 For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured. It may be predefined that by default the ePDCCH detecting cluster 0 corresponds to the PDSCH DMRS scrambling sequence X0 and Nscid = 0, and ePDCCH detecting cluster 1 corresponds to the PDSCH DMRS scrambling sequence X1 and Nscid = 0.

$$c_{\text{init}} = (\lfloor n_s / 2 \rfloor + 1) \cdot (2n_{\text{ID}}^{\text{EPDCCH}} + 1) \cdot 2^{16} + n_{\text{SCID}}^{\text{EPDCCH}},$$

with X_n ($n=1, 2$) denoting $n_{\text{ID}}^{\text{EPDCCH}}$, and N_{SCID} denoting $n_{\text{SCID}}^{\text{EPDCCH}}$.

Embodiment 13

An eNB may configure, through UE higher-layer signaling, $K (K \geq 1)$ ePDCCH detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, an aggregation level in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a certain transfer mode. The UE may perform ePDCCH detection by receiving the K ePDCCH detecting clusters configured by the eNB and aggregation levels independently configured.

10 Sub-embodiment 1 of Embodiment 13

For example, 4 ePDCCH detecting clusters may be configured, that is, $K=4$. ePDCCH detecting clusters 0 and 1 may be in the distributed ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the centralized ePDCCH transfer mode.

15 The distributed ePDCCH transfer mode may correspond to the aggregation level X_0 .

The centralized ePDCCH transfer mode may correspond to the aggregation level X_1 .

Sub-embodiment 2 of Embodiment 13

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting 20 cluster 0 and ePDCCH detecting cluster 1, may be configured.

ePDCCH detecting cluster 0 may correspond to the aggregation level X_0 .

ePDCCH detecting cluster 1 may correspond to the aggregation level X_1 .

Embodiment 14

An eNB may configure, through UE higher-layer signaling, $K (K \geq 1)$ ePDCCH 25 detecting clusters for a UE. In addition, the eNB may independently configure, through UE dedicated higher-layer signaling, a search space position or a search space starting position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a certain transfer mode. The UE may receive the K ePDCCH detecting clusters configured by the eNB and one or more search space positions or search 30 space starting positions independently configured.

Sub-embodiment 1 of Embodiment 14

For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the distributed ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the centralized ePDCCH transfer mode.

5 The distributed ePDCCH transfer mode may correspond to search space position or search space starting position X0.

The centralized ePDCCH transfer mode may correspond to search space position or search space starting position X1.

Sub-embodiment 2 of Embodiment 14

10 For example, 2 ePDCCH detecting clusters (K=2), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured.

ePDCCH detecting cluster 0 may correspond to search space position or search space starting position X0.

15 ePDCCH detecting cluster 1 may correspond to search space position or search space starting position X1.

Embodiment 15

An eNB may configure, through UE higher-layer signaling, K($K \geq 1$) ePDCCH detecting clusters for a UE. In addition, when K is given a special value, the eNB may independently configure, through UE dedicated higher-layer signaling, a DCI Format 20 detecting set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a certain transfer mode. The UE may receive the K ePDCCH detecting clusters configured by the eNB and one or more search space positions or search space starting positions independently configured.

Sub-embodiment 1 of Embodiment 15

25 For example, 4 ePDCCH detecting clusters may be configured, that is, K=4. ePDCCH detecting clusters 0 and 1 may be in the distributed ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the centralized ePDCCH transfer mode.

The distributed ePDCCH transfer mode may correspond to a DCI Format detecting set X0.

30 The centralized ePDCCH transfer mode may correspond to a DCI Format detecting set X1.

Sub-embodiment 2 of Embodiment 15

For example, 2 ePDCCH detecting clusters ($K=2$), namely, ePDCCH detecting cluster 0 and ePDCCH detecting cluster 1, may be configured.

ePDCCH detecting cluster 0 may correspond to a DCI Format detecting set X0.

5 ePDCCH detecting cluster 1 may correspond to a DCI Format detecting set X1.

Embodiment 16

An eNB may configure, through UE higher-layer signaling, $K(K \geq 1)$ ePDCCH detecting clusters for a UE. In addition, when K is given a special value and the number of ePDCCH detecting clusters in the distributed ePDCCH transfer mode is 10 proportional to that in the centralized ePDCCH transfer mode, the eNB may independently configure, through UE dedicated higher-layer signaling, a DCI Format detecting set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a certain transfer mode. The UE may receive the K ePDCCH detecting clusters configured by the eNB and one or more search space positions or search 15 space starting positions independently configured.

Sub-embodiment 1 of Embodiment 16

For example, 4 ePDCCH detecting clusters may be configured, that is, $K=4$. ePDCCH detecting clusters 0 and 1 may be in the distributed ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the centralized ePDCCH transfer mode.

20 That is, the ratio of the number of ePDCCH detecting clusters in the distributed ePDCCH transfer mode to that in the centralized ePDCCH transfer mode is 2:2.

The distributed ePDCCH transfer mode may correspond to a DCI Format detecting set X0.

25 The centralized ePDCCH transfer mode may correspond to a DCI Format detecting set X1.

Sub-embodiment 2 of Embodiment 16

For example, 4 ePDCCH detecting clusters may be configured, that is, $K=4$. ePDCCH detecting clusters 0 and 1 may be in the distributed ePDCCH transfer mode. ePDCCH detecting clusters 2 and 3 may be in the centralized ePDCCH transfer mode.

30 That is, the ratio of the number of ePDCCH detecting clusters in the distributed ePDCCH transfer mode to that in the centralized ePDCCH transfer mode is 2:2.

ePDCCH detecting cluster 0 may correspond to a DCI Format detecting set X0.

ePDCCH detecting cluster 1 may correspond to a DCI Format detecting set X0.

ePDCCH detecting cluster 2 may correspond to a DCI Format detecting set X1.

ePDCCH detecting cluster 3 may correspond to a DCI Format detecting set X1.

5 Embodiment 17

An eNB may notify, through UE dedicated higher-layer signaling and/or physical layer signaling, an ePDCCH UE whether to assume that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another user.

10 The UE may learn, by receiving UE dedicated higher-layer signaling and/or physical layer signaling, whether to assume in ePDCCH resource detection that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another user.

15 The DMRS antenna port may include ports 107, 108, 109, and 110. Ports 107 and 108 share a time-frequency resource, and ports 109 and 110 share a time-frequency resource.

Sub-embodiment 1 of Embodiment 17

20 By configuring K ePDCCH detecting clusters, the eNB may independently configure whether the UE assumes in the K ePDCCH detecting clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another user.

25 The UE may obtain, by receiving UE higher-layer signaling, the K ePDCCH detecting clusters configured; receive independently configured channel estimation higher-layer signaling that signals the UE whether to assume in ePDCCH resource detection in the K ePDCCH detecting clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another user; and perform, according to the received higher-layer signaling, DMRS channel estimation.

Sub-embodiment 2 of Embodiment 17

30 By configuring K ePDCCH detecting clusters, the eNB may configure whether the UE assumes in part or all of the K clusters that a time-frequency resource sharing

DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another user.

The UE may obtain, through UE dedicated higher-layer signaling, K ePDCCH detecting clusters configured; and learn whether the UE is configured to assume in ePDCCH resource detection in part or all of the K ePDCCH detecting clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another UE.

5 Sub-embodiment 3 of Embodiment 17

The eNB may configure X subframe clusters, and configure whether the UE assumes in part or all of the X subframe clusters that a time-frequency resource sharing 10 DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another user.

The UE may obtain, through UE dedicated higher-layer signaling, X ($X > 0$) subframe clusters configured; and learn whether the UE is configured to assume in ePDCCH resource detection in part or all of the X subframe clusters that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer 15 by another user.

Embodiment 18

In ePDCCH resource detection, a UE may always assume that a time-frequency resource sharing DMRS antenna port is not used for ePDCCH transfer or PDSCH transfer by another user.

20 The DMRS antenna port may be configured for ePDCCH demodulation and may include ports 107, 108, 109, and 110. Ports 107 and 108 share a time-frequency resource. Ports 109 and 110 share a time-frequency resource.

Embodiment 19

A UE may determine, according to an ePDCCH transfer mode, whether to assume 25 in ePDCCH resource detection that a time-frequency resource sharing DMRS antenna port is used for ePDCCH transfer or PDSCH transfer by another UE.

With a centralized transfer mode, the UE may always assume in ePDCCH resource detection that a time-frequency resource sharing DMRS antenna port is not used for ePDCCH transfer or PDSCH transfer by another UE.

30 With a distributed transfer mode, the UE has to assume in ePDCCH resource detection that a time-frequency resource sharing DMRS antenna port is used for

ePDCCH transfer or PDSCH transfer by another UE.

The DMRS antenna port may be configured for ePDCCH demodulation and may include ports 107, 108, 109, and 110. Ports 107 and 108 share a time-frequency resource. Ports 109 and 110 share a time-frequency resource.

5 With a configuring and detecting method for an enhanced downlink control channel provided herein, an eNB side may flexibly configure, for a UE, an ePDCCH detecting parameter, enabling flexible dynamic ePDCCH switch between multiple TPs, more flexible ePDCCH scheduling information configuration by the eNB side, and improved ePDCCH stability.

10 Fig.1 is a schematic diagram of a structure of a configuring device for an enhanced downlink control channel according to an embodiment herein. As shown in Fig.1, a configuring device for an enhanced downlink control channel may include a first configuring unit 10 and a second configuring unit 11.

15 The first configuring unit 10 may be configured for: configuring, for a UE, K ePDCCH detecting clusters.

The second configuring unit 11 may be configured for: independently configuring an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

20 and/or independently configuring a scrambling sequence or a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or independently configuring correspondence between a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);

and/or independently configuring a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

30 and/or independently configuring a resource element available for ePDCCH transfer in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a starting symbol position for ePDCCH detection in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

5 and/or independently configuring a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

10 and/or independently configuring a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

15 and/or independently configuring a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

20 and/or independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or independently configuring at least one of an aggregation level, a search space starting position, and a search space position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

30 and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not indicated or acquired;

35 and/or configuring two or more ePDCCH detecting subframe clusters, each with an ePDCCH detecting cluster configuration and/or with ePDCCH detection or PDCCH detection; the ePDCCH detecting cluster configuration including at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

40 An antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be at least one of ports 107, 108, 109, and 110.

45 The correspondence between a scrambling sequence of a DMRS in detection with

an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH may be configured independently by: when the DMRS of the PDSCH may be configured with a scrambling sequence identifier, independently configuring correspondence between the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the PDSCH.

The CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of a CRS port number, a CRS frequency domain position, and a CRS cell identifier.

The resource element available for ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration.

An ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of: a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection.

A CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: in configuring a CSI measuring process for the UE, adopting information relevant to the configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters. The large-scale information may include at least one of a delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process, and an average received power corresponding to the CSI measuring process. The CSI measuring process may include one of a measuring resource of the CSI measuring

process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource.

An NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

A DCI Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring the DCI Format or the DCI Format set the UE may be to detect in an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

An ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster. The ePDCCH detecting subframe cluster may inform the UE of a subframe where to detect an ePDCCH and a subframe where to detect a PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations in different subframe clusters. An ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster. The ePDCCH detecting subframe cluster may inform the UE of a subframe where to detect an ePDCCH dedicated search space and a subframe where to detect a PDCCH dedicated

clusters may be independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster. The ePDCCH detecting subframe cluster may inform the UE of a subframe where to detect an ePDCCH dedicated search space and a subframe where to detect a PDCCH dedicated search space.

PUCCH dynamic resource position indicator signaling in HARQ feedback may be independently configured for: an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters to instruct the UE to

use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.

Based on what shown in Fig.1, the device may further include:

5 a determining unit (not shown in Fig.1) configured for: when two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are configured, determining one of the two or more antenna ports of the DMRS as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio Network Temporary Identifier (C-RNTI), and a predefined rule.

10 Those skilled in the art will know that the determining unit is set only as an option for optimizing the configuring device for an enhanced downlink control channel herein.

A transfer mode may include a centralized transfer mode and a distributed transfer mode.

15 The second configuring unit 11 may be further configured for: configuring a DCI Format set for a K;

configuring a DCI Format set for K ePDCCH detecting clusters, any ePDCCH detecting cluster with the distributed transfer mode, or any ePDCCH detecting cluster with the centralized transfer mode; and

configuring a DCI Format set for detection with an ePDCCH detecting cluster.

20 Those skilled in the art will know that function of a unit of the configuring device shown in Fig.1 may be understood referring to description for the configuring and detecting method. Those skilled in the art will know that function of a unit of the configuring device shown in Fig.1 may be implemented through a program run on a processor, or through a specific logic circuit.

25 Further disclosed herein is an eNB, including the configuring device for an enhanced downlink control channel shown in Fig.1.

Fig.2 is a schematic diagram of a structure of a device for detecting an enhanced downlink control channel according to an embodiment herein. As shown in Fig.2, the device for detecting an enhanced downlink control channel may include a detecting unit 30 20 and an obtaining unit 21.

The detecting unit 20 may be configured for: detecting an enhanced downlink

control channel.

The obtaining unit 21 may be configured for: obtaining an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an Enhanced PDCCH (ePDCCH) detecting cluster or any ePDCCH detecting cluster with a transfer mode in K 5 ePDCCH detecting clusters;

and/or obtaining a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining correspondence bewteen a scrambling sequence of a DMRS in 10 detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);

and/or obtaining a Common Reference Signal (CRS) rate matching resource in 15 detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a resource element available for ePDCCH transfer in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an ePDCCH starting symbol ID set in detection with an ePDCCH 20 detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or obtaining a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a Downlink Control Information (DCI) Format or a DCI Format set 30 in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an ePDCCH detecting subframe cluster in detection with an

ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an aggregation level and a search space starting position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not acquired;

and/or when two or more ePDCCH detecting subframe clusters are obtained, for different ePDCCH detecting subframe clusters, performing detection with different ePDCCH detecting cluster configurations and/or adopting ePDCCH detection or PDCCH detection. An ePDCCH detecting cluster configuration may include at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

An antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be at least one of ports 107, 108, 109, and 110.

The correspondence between a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH may be independently configured by: when the DMRS of the PDSCH is configured with a scrambling sequence identifier, independently configuring correspondence between the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the PDSCH.

The CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of a CRS port number, a CRS frequency domain position, and a CRS cell identifier.

The resource element available for ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K

ePDCCH detecting clusters may include at least one of the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration.

The ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster 5 or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may include at least one of: a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection.

The CSI measuring process configuration in detection with an ePDCCH detecting 10 cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: in configuring a CSI measuring process for the UE, adopting information relevant to the configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters. The large-scale information may include at least one of a 15 delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process, and an average received power corresponding to the CSI measuring process. The 20 CSI measuring process may include one of a measuring resource of the CSI measuring process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource;

The NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting 25 clusters may be independently configured by: in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters.

The DCI Format or the DCI Format set in detection with an ePDCCH detecting 30 cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring the DCI Format or the DCI Format set the UE is to detect in an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting

clusters.

The ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring, for 5 an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster. An ePDCCH detecting subframe cluster may inform the UE of a subframe where to detect an ePDCCH and a subframe where to detect a PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations in different subframe clusters. The 10 ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters may be independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster. An ePDCCH 15 detecting subframe cluster may inform the UE of a subframe where to detect an ePDCCH dedicated search space and a subframe where to detect a PDCCH dedicated search space.

PUCCH dynamic resource position indicator signaling in HARQ feedback may be independently configured for: an ePDCCH detecting cluster or any ePDCCH detecting 20 cluster with a transfer mode in the K ePDCCH detecting clusters to instruct the UE to use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.

Based on what shown in Fig.2, the device for detecting an enhanced downlink control channel may further include:

25 a determining unit (not shown in Fig.2) configured for: when two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are obtained by the obtaining unit, determining one of the two or more antenna ports of the DMRS as a detecting port according to one or more of an enhanced control Channel unit eCCE, a 30 Cell Radio Network Temporary Identifier (C-RNTI), and a predefined rule.

Those skilled in the art will know that the determining unit is set only as an option for optimizing the device for detecting an enhanced downlink control channel.

A transfer mode may include a centralized transfer mode and a distributed transfer

mode.

The detecting unit 20 may be further configured for: performing detection using a DCI Format set for a K;

5 performing detection using a DCI Format set for K ePDCCH detecting clusters, any ePDCCH detecting cluster with the distributed transfer mode, or any ePDCCH detecting cluster with the centralized transfer mode; and

performing detection using a DCI Format set for detection with an ePDCCH detecting cluster.

Those skilled in the art will know that function of a unit of the device for detecting an enhanced downlink control channel shown in Fig.2 may be understood referring to description for the configuring and detecting method. Those skilled in the art will know that function of a unit of the device for detecting an enhanced downlink control channel shown in Fig.2 may be implemented through a program run on a processor, or through a specific logic circuit.

15 Also disclosed is a UE, including the device for detecting an enhanced downlink control channel shown in Fig.2.

Apparently, Those skilled in the art will know that modules or steps in embodiments of the disclosure may be realized using a universal computing device, and may be integrated in a single computing device or distributed in a network formed by multiple computing devices. Optionally, they may be realized using computing device executable program codes, and thus may be stored in a storage device and executed by a computing device. The steps may each be made into an Integrated Circuit module. Multiple modules or steps herein may be realized by being made into a single Integrated Circuit module. Thus, an embodiment of the disclosure is not limited to a 25 specific combination of hardware and software.

What described are merely embodiments of the disclosure, and are not intended to limit the scope of the present disclosure.

Industrial Applicability

With a technical solution herein, an eNB side may flexibly configure, for a UE, an ePDCCH detecting parameter, enabling flexible dynamic ePDCCH switch between multiple TPs, more flexible ePDCCH scheduling information configuration by the eNB side, and improved ePDCCH stability.

What is claimed is:

1. A configuring method for an enhanced downlink control channel, comprising: configuring, for a User Equipment (UE), K Enhanced PDCCH (ePDCCH) detecting clusters; and
 - 5 independently configuring an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;
 - 10 and/or independently configuring a scrambling sequence or a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;
 - 15 and/or independently configuring correspondence bewteen a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);
 - 20 and/or independently configuring a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;
 - 25 and/or independently configuring a resource element available for ePDCCH transfer in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;
 - 30 and/or independently configuring a starting symbol position for ePDCCH detection in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;
 - 35 and/or independently configuring a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;
 - 40 and/or independently configuring a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;
 - 45 and/or independently configuring a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH

detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

5 and/or independently configuring at least one of an aggregation level, a search space starting position, and a search space position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

10 and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not indicated or acquired;

15 and/or configuring two or more ePDCCH detecting subframe clusters, each with an ePDCCH detecting cluster configuration and/or with ePDCCH detection or PDCCH detection; the ePDCCH detecting cluster configuration comprising at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

2. The method according to claim 1, wherein an antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is at least one of ports 107, 108, 109, and 110.

3. The method according to claim 2, wherein when two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are configured, 25 determining one of the two or more antenna ports of the DMRS as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio Network Temporary Identifier (C-RNTI), and a predefined rule.

4. The method according to claim 1, wherein the CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of 30 a CRS port number, a CRS frequency domain position, and a CRS cell Identifier.

5. The method according to claim 1, wherein the resource element available for

ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of

5 the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration.

6. The method according to claim 1, wherein an ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of

10 a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection.

7. The method according to claim 1, wherein the independently configuring an NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters 15 comprises:

in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters,

20 wherein the large-scale information comprises at least one of

a delay expansion corresponding to the NZP CSI-RS, a path delay corresponding to the NZP CSI-RS, a Doppler shift corresponding to the NZP CSI-RS, a Doppler expansion corresponding to the NZP CSI-RS, and an average received power corresponding to the NZP CSI-RS.

25 8. A method for detecting an enhanced downlink control channel, comprising:

detecting, by a User Equipment (UE), an enhanced downlink control channel; and

obtaining an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an Enhanced PDCCH (ePDCCH) detecting cluster or any ePDCCH detecting cluster with a transfer mode in K ePDCCH detecting clusters;

30 and/or obtaining a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the

K ePDCCH detecting clusters;

and/or obtaining correspondence bewteen a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a

5 DMRS of a Physical Downlink Shared Channel (PDSCH);

and/or obtaining a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a resource element available for ePDCCH transfer in detection
10 with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

15 and/or obtaining a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in
20 the K ePDCCH detecting clusters;

and/or obtaining a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an ePDCCH detecting subframe cluster in detection with an
25 ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an aggregation level and a search space starting position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

30 and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting

cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not acquired;

and/or when two or more ePDCCH detecting subframe clusters are obtained, for different ePDCCH detecting subframe clusters, performing detection with different 5 ePDCCH detecting cluster configurations and/or adopting ePDCCH detection or PDCCH detection; an ePDCCH detecting cluster configuration comprising at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

9. The method according to claim 8, wherein an antenna port of the DMRS in 10 detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is at least one of ports 107, 108, 109, and 110;

the correspondence bewteen a scrambling sequence of a DMRS in detection with 15 an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH is independently configured by: when the DMRS of the PDSCH is configured with a scrambling sequence identitifier, independently configuring correspondence bewteen the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the 20 PDSCH;

the CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of a CRS port number, a CRS frequency domain position, and a CRS cell Identitifier;

25 the resource element available for ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration;

30 the ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of: a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator

Channel (PCFICH) detection;

the CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: in configuring a CSI measuring process for the UE, adopting information relevant to the configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, wherein the large-scale information comprises at least one of a delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process, and an average received power corresponding to the CSI measuring process; and the CSI measuring process comprises one of a measuring resource of the CSI measuring process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource;

the NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

the DCI Format or the DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: independently configuring the DCI Format or the DCI Format set the UE is to detect in an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

the ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH and a subframe where to detect a PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations

in different subframe clusters; or the ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH dedicated search space and a subframe where to detect a PDCCH dedicated search space; and

PUCCH dynamic resource position indicator signaling in HARQ feedback is independently configured for: an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters to instruct the UE to use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.

10. The method according to claim 9, wherein when two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are obtained, determining one of the two or more antenna ports of the DMRS as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio Network Temporary Identifier (C-RNTI), and a predefined rule.

15. A configuring device for an enhanced downlink control channel, comprising a first configuring unit and a second configuring unit, wherein

the first configuring unit is configured for: configuring, for a User Equipment (UE), K Enhanced PDCCH (ePDCCH) detecting clusters; and

20. the second configuring unit is configured for: independently configuring an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a scrambling sequence or a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring correspondence between a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting

cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);

5 and/or independently configuring a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a resource element available for ePDCCH transfer in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

10 and/or independently configuring a starting symbol position for ePDCCH detection in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

15 and/or independently configuring a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

20 and/or independently configuring a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or independently configuring at least one of an aggregation level, a search space starting position, and a search space position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

30 and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not indicated or acquired;

and/or configuring two or more ePDCCH detecting subframe clusters, each with an ePDCCH detecting cluster configuration and/or with ePDCCH detection or PDCCH detection; the ePDCCH detecting cluster configuration comprising at least one of a number of detecting clusters, an aggregation level to be detected in a detecting cluster,
5 and a resource position to be detected in the detecting cluster.

12. The device according to claim 11, wherein an antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is at least one of ports 107, 108, 109, and 110;

10 the independently configuring correspondence between a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH comprises: when the DMRS of the PDSCH is configured with a scrambling sequence identifier, independently configuring
15 correspondence between the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the PDSCH;

the CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of a CRS port number, a CRS frequency domain position, and a CRS cell identifier;
20

the resource element available for ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of the CRS rate matching resource,
25 a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration;

an ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of: a set {0, 1, 2, 3, 4} or a set consisting of one or
30 more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection;

the independently configuring a CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer

mode in the K ePDCCH detecting clusters comprises: in configuring a CSI measuring process for the UE, adopting information relevant to the configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH 5 detecting clusters, wherein the large-scale information comprises at least one of a delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process, and an average received power corresponding to the CSI measuring process; and the CSI 10 measuring process comprises one of a measuring resource of the CSI measuring process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource;

the independently configuring an NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the 15 K ePDCCH detecting clusters comprises: in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

the independently configuring a DCI Format or a DCI Format set in detection with 20 an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises: independently configuring the DCI Format or the DCI Format set the UE is to detect in an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

the independently configuring an ePDCCH detecting subframe cluster in detection 25 with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH and a subframe where to detect a 30 PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations in different subframe clusters; or the independently configuring an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises:

5 independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH dedicated search space and a subframe where to detect a PDCCH dedicated search space;

10 PUCCH dynamic resource position indicator signaling in HARQ feedback is independently configured for: an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters to instruct the UE to use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.

13. The device according to claim 12, further comprising:

15 a determining unit configured for: when two or more antenna ports of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are configured, determining one of the two or more antenna ports of the DMRS as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio Network Temporary Identifier (C-RNTI), and a predefined rule.

14. A device for detecting an enhanced downlink control channel, comprising a detecting unit and an obtaining unit, wherein

20 the detecting unit is configured for: detecting an enhanced downlink control channel,

25 the obtaining unit is configured for: obtaining an antenna port indicator of a DeModulation Reference Signal (DMRS) in detection with an Enhanced PDCCH (ePDCCH) detecting cluster or any ePDCCH detecting cluster with a transfer mode in K ePDCCH detecting clusters;

and/or obtaining a scrambling sequence indicator of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

30 and/or obtaining correspondence bewteen a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a Physical Downlink Shared Channel (PDSCH);

and/or obtaining a Common Reference Signal (CRS) rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

5 and/or obtaining a resource element available for ePDCCH transfer in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

10 and/or obtaining a Channel State Information (CSI) measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

15 and/or obtaining a Non-Zero Power (NZP) CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining a Downlink Control Information (DCI) Format or a DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

20 and/or obtaining an ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

and/or obtaining an aggregation level and a search space starting position in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

25 and/or independently predefining or independently configuring a default parametric value or a default behavior of an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters when the parameter or behavior is not acquired;

30 and/or when two or more ePDCCH detecting subframe clusters are obtained, for different ePDCCH detecting subframe clusters, performing detection with different ePDCCH detecting cluster configurations and/or adopting ePDCCH detection or PDCCH detection; an ePDCCH detecting cluster configuration comprising at least one

of a number of detecting clusters, an aggregation level to be detected in a detecting cluster, and a resource position to be detected in the detecting cluster.

15. The device according to claim 14, wherein an antenna port of the DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a
5 transfer mode in the K ePDCCH detecting clusters is at least one of ports 107, 108, 109, and 110;

the correspondence bewteen a scrambling sequence of a DMRS in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters and a scrambling sequence of a DMRS of a PDSCH
10 is independently configured by: when the DMRS of the PDSCH is configured with a scrambling sequence identitifier, independently configuring correspondence bewteen the scrambling sequence of the DMRS in detection with an ePDCCH detecting cluster in the K ePDCCH detecting clusters and the scrambling sequence of the DMRS of the PDSCH;

15 the CRS rate matching resource in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of a CRS port number, a CRS frequency domain position, and a CRS cell Identitifier;

20 the resource element available for ePDCCH in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of the CRS rate matching resource, a Zero Power (ZP) CSI-RS rate matching resource, an ePDCCH starting symbol, a special subframe configuration, and a cyclic prefix (CP) length configuration;

25 the ePDCCH starting symbol ID set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters comprises at least one of: a set {0, 1, 2, 3, 4} or a set consisting of one or more ePDCCH starting symbol IDs obtained by Physical Control Format Indicator Channel (PCFICH) detection;

30 the CSI measuring process configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: in configuring a CSI measuring process for the UE, adopting information relevant to the configured CSI measuring process as large-scale information required in detection with an ePDCCH detecting

cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, wherein the large-scale information comprises at least one of a delay expansion corresponding to the CSI measuring process, a path delay corresponding to the CSI measuring process, a Doppler shift corresponding to the CSI measuring process, a Doppler expansion corresponding to the CSI measuring process, and an average received power corresponding to the CSI measuring process; and the CSI measuring process comprises one of a measuring resource of the CSI measuring process, a measuring resource configured for: a CSI measuring subframe cluster and the CSI measuring process, and an NZP CSI-RS measuring resource;

10 the NZP CSI-RS configuration in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: in configuring a measuring set for the UE, adopting information relevant to a NZP CSI-RS in a configured measuring set as large-scale information required in detection with an ePDCCH detecting cluster or any 15 ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

the DCI Format or the DCI Format set in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: independently configuring the DCI Format or the DCI Format set the UE is to detect in an ePDCCH detecting cluster or any 20 ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters;

the ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters is independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the 25 K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH and a subframe where to detect a PDCCH, or instructing the UE to use different ePDCCH detecting cluster configurations in different subframe clusters; or the ePDCCH detecting subframe cluster in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer 30 mode in the K ePDCCH detecting clusters is independently configured by: independently configuring, for an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters, an ePDCCH detecting subframe cluster, informing the UE of a subframe where to detect an ePDCCH

dedicated search space and a subframe where to detect a PDCCH dedicated search space; and

PUCCH dynamic resource position indicator signaling in HARQ feedback is independently configured for: an ePDCCH detecting cluster or any ePDCCH detecting 5 cluster with a transfer mode in the K ePDCCH detecting clusters to instruct the UE to use independently configured PUCCH dynamic resource position indicator signaling in downlink data HARQ feedback indicated in an ePDCCH.

16. The device according to claim 15, wherein the device further comprising:

a determining unit configured for: when two or more antenna ports of the DMRS 10 in detection with an ePDCCH detecting cluster or any ePDCCH detecting cluster with a transfer mode in the K ePDCCH detecting clusters are obtained by the obtaining unit, determining one of the two or more antenna ports of the DMRS as a detecting port according to one or more of an enhanced control Channel unit eCCE, a Cell Radio Network Temporary Identifier (C-RNTI), and a predefined rule.

15 17. A User Equipment (UE), comprising the device according to any one of claims 14-16.
