Novel sterically hindered amine light stabilizers

The instant invention pertains to sterically hindered amine light stabilizers (HALS) with low basicity at the nitrogen atom and high thermal stability. These compounds are particularly effective in stabilizing polymers, especially thermoplastic polyolefins, against the deleterious effects of oxidative, thermal and actinic radiation. The compounds are also particularly effective in stabilizing acid catalyzed and ambient cured coatings systems. They are particularly useful when high processing temperatures are additional required.

Conventional HALS (N-H) are excluded from certain applications due to their basic secondary ring nitrogen atom. Examples are acid catalyzed crosslinked polymers or ambient cured coatings.

The present invention solves this problem by providing novel NOR HALS compounds. The compounds prepared can be used as stabilizers for plastics, coatings and home and personal care applications. They are characterized by their spiro-substitution in the 4-position of the tetramethylpiperidine ring (Spiro-NOR-HALS). The corresponding Spiro-NH-HALS are partly items of commerce and described as effective light stabilizers. The 4-spiro substitution has so far not been used in combination with the 1-NOR substitution. Only two compounds are known from DE 4 423 055, namely the N-O-octyl and the N-O-methylbenzyl compounds. Furthermore in WO 2009/049851 spiropiperidine pyrrolidine dione derivatives with a substituted phenyl group attached to the pyrrolidine dione ring have recently been reported and their use as pesticides.

The instant compounds, because of their low basicity and high temperature stability, are of particular value in the stabilization of polyolefins and automotive coating compositions where the activity of the more basic hindered amine stabilizers is significantly reduced because of interaction with the polymer substrate or acid catalysts needed for curing such substrates.

Examples of polyolefin compositions in which the instant compounds are effective include flame retardant polyolefins where acidic residues from the decomposition of the halogenated flame retardants deactivate hindered amines not having the N-OR group, greenhouse films and agricultural mulch films where acidic residues from pesticides or sulfur dioxide treatment interfere with the activity of "normal" hindered amine stabilizers, and in thermoplastic

- 2 -

polyolefins where pigment interactions with basic hindered amine stabilizers may occur. Examples of coating compositions in which the instant compounds are effective include melamine crosslinked thermoset acrylic resins, which are cured using strong acids that interact with basic hindered amine stabilizers. The instant compounds are also effective in
 5 acrylic alkyd or polyester resins with isocyanate crosslinking agents, and in epoxy resins with carboxylic acid, anhydride, or amine crosslinking agents.

Thus, current compounds are advantageously used in compositions also containing co-stabilizers, flame retardants (e.g. tris(3-bromo-2,2-bis(bromomethyl)propyl)phosphate, decabromodiphenyl oxide, ethylene bis-(tetrabromophthalimide), or ethylene bis-(dibromo-
 10 norbornanedicarboximide)), catalysts (e.g. acids like toluene sulfonic acid, metal driers or amines), fillers, fatty acid salts (e. g. calcium stearate) or in agricultural applications wherein pesticides and/or sulfur-containing acids and or metal ions (e. g. iron) come in contact with the stabilized polymer.

These metals usually have one or more than one ligand, typically oxides, halides, alcoholates, esters, ethers, amines, alkyls, alkenyls and/or aryls that may be either π - or σ -coordinated. These metal complexes may be in the free form or fixed on substrates, typically on activated magnesium chloride, titanium(III) chloride, alumina or silicon oxide. These catalysts may be soluble or insoluble in the polymerisation medium. The catalysts can be used by themselves in the polymerisation or further activators may be used, typically metal alkyls, metal hydrides, metal alkyl halides, metal alkyl oxides or metal alkyloxanes, said metals being elements of groups Ia, IIa and/or IIIa of the Periodic Table. The activators may be modified conveniently with further ester, ether, amine or silyl ether groups.
