(54) Title: PHOSPHONIC ACIDS DERIVATIVES AS INHIBITORS OF PTP-1B

(I)

(57) Abstract

The invention encompasses the novel class of compounds represented by formula (I) which are inhibitors of the PTP-1B enzyme. The invention also encompasses pharmaceutical compositions and methods of treating or preventing PTP-1B mediated diseases.

5 TITLE OF THE INVENTION
PHOSPHONIC ACIDS DERIVATIVES AS INHIBITORS OF PTP-1B

BACKGROUND OF THE INVENTION

10 This invention relates to a novel class of phosphonic acid derivatives as inhibitors of PTP-1B.

Protein tyrosine phosphates as (Peptizes) are a large family of transmembrane or intracellular enzymes that dephosphorylate substrates involved in a variety of regulatory processes (Fischer et al., 1991, Science 253:401-406).

15 Protein tyrosine phosphatase-1B (PTP-1B) is a ~50 kd intracellular protein present in abundant amounts in various human tissues (Charbonneau et al., 1989, Proc. Natl. Acad. Sci. USA 86:5252-5256; Goldstein, 1993, Receptor 3:1-15).

Determining which proteins are substrates of PTP-1B has been of considerable interest. One substrate which has aroused especial interest is the
20 insulin receptor. The binding of insulin to its receptor results in autophosphorylation of the receptor, most notably on tyrosines 1146, 1150, and 1151 in the kinase catalytic domain (White & Kahn, 1994, J. Biol. Chem. 269:1-4). This causes activation of the insulin receptor tyrosine kinase, which phosphorylates the various insulin receptor substrate (IRS) proteins that propagate the insulin
25 signaling event further downstream to mediate insulin's various biological effects.

Seely et al., 1996, Diabetes 45:1379-1385 (Seely) studied the relationship of PTP-1B and the insulin receptor *in vitro*. Seely constructed a glutathione S-transferase (GST) fusion protein of PTP-1B that had a point mutation in the PTP-1B catalytic domain. Although catalytically inactive, this fusion protein
30 was able to bind to the insulin receptor, as demonstrated by its ability to precipitate the insulin receptor from purified receptor preparations and from whole cell lysates derived from cells expressing the insulin receptor.

Ahmad et al., 1995, J. Biol. Chem. 270:20503-20508 used osmotic loading to introduce PTP-1B neutralizing antibodies into rat KRC-7 hepatoma cells.
35 The presence of the antibody in the cells resulted in an increase of 42% and 38%, respectively, in insulin stimulated DNA synthesis and phosphatidylinositol 3' kinase activity. Insulin receptor autophosphorylation and insulin receptor substrate-1 tyrosine phosphorylation were increased 2.2 and 2.0-fold, respectively, in the

5 antibody-loaded cells. The antibody-loaded cells also showed a 57% increase in insulin stimulated insulin receptor kinase activity toward exogenous peptide substrates.

Thus, inhibitors of PTP-1B improve insulin-sensitivity and have utility in preventing or treating Type 1 and Type 2 diabetes, improving glucose
10 tolerance and insulin-sensitivity when there is insulin-resistance. Also, the compounds are useful in treating or preventing obesity. In addition, the compounds are of use in treating or preventing cancer, neurodegenerative diseases and the like.

Utilities

25 Inhibitors of PTP-1B improve insulin-sensitivity and thus have utility in preventing or treating Type 1 and Type 2 diabetes, improving glucose tolerance and insulin-sensitivity when there is insulin-resistance and in treating or preventing obesity. The compounds also exhibit a beneficial reduction in triglycerides and lipids. The PTP-1B inhibitors thus may be useful in the treatment, prevention or control of a
30 number of conditions that accompany type 2 diabetes, including hyperlipidemia, hypertriglyceridemia, hypercholesterolemia (including raising HDL levels), atherosclerosis, vascular restenosis, irritable bowel syndrome, pancreatitis, adipose cell tumors, adipose cell carcinomas such as liposarcoma, dyslipidemia, and other disorders where insulin resistance is a component. Finally, the compounds may be
35 used to treat or prevent cancer, neurodegenerative diseases and the like.

Pharmaceutical Compositions

5 For the treatment of any of these PTP-1B-mediated diseases compound
A or A₁ may be administered orally, topically, parenterally, by inhalation spray or
rectally in dosage units containing conventional pharmaceutically acceptable carriers.
The term parenteral as used herein includes subcutaneous, intravenous, intramuscular
and intrasternal injection and infusion techniques. In addition to the treatment of
10 warm-blooded animals such as mice, rats, horses, cattle, sheep, dogs, cats, etc., the
compounds of the invention are useful for the treatment of humans.

 The pharmaceutical compositions containing the active ingredient may
be in a form suitable for oral use, for example, as tablets, troches, lozenges, aqueous
or oily suspensions, dispersible powders or granules, emulsions, hard or soft capsules,
15 or syrups or elixirs. Compositions intended for oral use may be prepared according to
any method known to the art for the manufacture of pharmaceutical compositions and
such compositions may contain one or more agents selected from the group consisting
of sweetening agents, flavouring agents, colouring agents and preserving agents in
order to provide pharmaceutically elegant and palatable preparations. Tablets contain
20 the active ingredient in admixture with pharmaceutically acceptable excipients which
are suitable for the manufacture of tablets. These excipients may be for example, inert
diluent, such as calcium carbonate, sodium carbonate, lactose, calcium phosphate or
sodium phosphate; granulating and disintegrating agents, for example, corn starch, or
alginic acid; binding agents, for example starch, gelatin or acacia, and lubricating
25 agents, for example, magnesium stearate, stearic acid or talc. The tablets may be
uncoated or they may be coated by known techniques to delay disintegration and
absorption in the gastrointestinal tract and thereby provide a sustained action over a
longer period. For example, a time delay material such as glyceryl monostearate or
glyceryl distearate may be employed. They may also be coated by the technique
30 described in the U.S. Patent 4,256,108; 4,166,452; and 4,265,874 to form osmotic
therapeutic tablets for control release.

 Formulations for oral use may also be presented as hard gelatin
capsules wherein the active ingredient is mixed with an inert solid diluent, for
example, calcium carbonate, calcium phosphate or kaolin, or as soft gelatin capsules
35 wherein the active ingredients is mixed with water or miscible solvents such as
propylene glycol, PEGs and ethanol, or an oil medium, for example peanut oil, liquid
paraffin, or olive oil.

5 Aqueous suspensions contain the active material in admixture with
excipients suitable for the manufacture of aqueous suspensions. Such excipients are
suspending agents, for example sodium carboxymethylcellulose, methylcellulose,
hydroxy-propylmethycellulose, sodium alginate, polyvinyl-pyrrolidone, gum
tragacanth and gum acacia; dispersing or wetting agents may be a naturally-occurring
10 phosphatide, for example lecithin, or condensation products of an alkylene oxide with
fatty acids, for example polyoxyethylene stearate, or condensation products of
ethylene oxide with long chain aliphatic alcohols, for example
heptadecaethyleneoxycetanol, or condensation products of ethylene oxide with partial
esters derived from fatty acids and a hexitol such as polyoxyethylene sorbitol
15 monooleate, or condensation products of ethylene oxide with partial esters derived
from fatty acids and hexitol anhydrides, for example polyethylene sorbitan
monooleate. The aqueous suspensions may also contain one or more preservatives,
for example ethyl, or n-propyl, p-hydroxybenzoate, one or more colouring agents, one
or more flavouring agents, and one or more sweetening agents, such as sucrose,
20 saccharin or aspartame.

Oily suspensions may be formulated by suspending the active
ingredient in a vegetable oil, for example arachis oil, olive oil, sesame oil or coconut
oil, or in mineral oil such as liquid paraffin. The oily suspensions may contain a
thickening agent, for example beeswax, hard paraffin or cetyl alcohol. Sweetening
25 agents such as those set forth above, and flavouring agents may be added to provide a
palatable oral preparation. These compositions may be preserved by the addition of
an anti-oxidant such as ascorbic acid.

Dispersible powders and granules suitable for preparation of an
aqueous suspension by the addition of water provide the active ingredient in
30 admixture with a dispersing or wetting agent, suspending agent and one or more
preservatives. Suitable dispersing or wetting agents and suspending agents are
exemplified by those already mentioned above. Additional excipients, for example
sweetening, flavouring and colouring agents, may also be present.

The pharmaceutical compositions of the invention may also be in the
35 form of an oil-in-water emulsions. The oily phase may be a vegetable oil, for
example olive oil or arachis oil, or a mineral oil, for example liquid paraffin or
mixtures of these. Suitable emulsifying agents may be naturally-occurring
phosphatides, for example soy bean, lecithin, and esters or partial esters derived from

5 fatty acids and hexitol anhydrides, for example sorbitan monooleate, and
condensation products of the said partial esters with ethylene oxide, for example
polyoxy-ethylene sorbitan monooleate. The emulsions may also contain sweetening
and flavouring agents.

Syrups and elixirs may be formulated with sweetening agents, for
10 example glycerol, propylene glycol, sorbitol or sucrose. Such formulations may also
contain a demulcent, a preservative and flavouring and colouring agents. The
pharmaceutical composition may be in the form of a sterile injectable aqueous or
oleagenous suspension. This suspension may be formulated according to the known
art using those suitable dispersing or wetting agents and suspending agents which
15 have been mentioned above. The sterile injectable preparation may also be a sterile
injectable solution or suspension in a parenterally-acceptable diluent or solvent, for
example as a solution in 1,3-butanediol. Examples of vehicles and solvents include
water, Ringer's solution and isotonic sodium chloride. Cosolvents such as ethanol,
propylene glycol or polyethylene glycols may also be used. In addition, sterile, fixed
20 oils are conventionally employed as a solvent or suspending medium. For this
purpose any bland fixed oil may be employed including synthetic mono- or
diglycerides. In addition, fatty acids such as oleic acid find use in the preparation of
injectables.

The compounds may also be administered in the form of suppositories.
25 These compositions can be prepared by mixing the drug with a suitable non-irritating
excipient which is solid at ordinary temperatures but molten at the body temperature
and will therefore release the drug. Such materials include cocoa butter and
polyethylene glycols.

For topical use, creams, ointments, gels, solutions or suspensions
30 containing the compound are employed. (For purposes of this application, topical
application includes mouth washes and gargles.) Topical formulations may include
cosolvents, emulsifiers, penetration enhancers, preservatives, emollients and the like.

The pharmaceutical composition may also be further comprised of a
second anti-diabetic or anti-obesity effective compound.

35

Dose Ranges

Dosage levels of the order of from about 0.01 mg to about 100 mg/kg
of body weight per day are useful in the treatment of the above-indicated conditions,

5 or alternatively about 0.5 mg to about 7 g per patient per day. For example, the diseases and conditions described herein may be effectively treated by the administration of from about 0.01 to 50 mg of the compound per kilogram of body weight per day, or alternatively about 0.5 mg to about 3.5 g per patient per day.

The active ingredient is typically combined with the carrier to produce
10 a dosage form suitable for the particular patient being treated and the particular mode of administration. For example, a formulation intended for the oral administration of humans may contain from about 0.5 mg to about 5 g of the active agent, compounded with an appropriate and convenient amount of carrier material which may vary from about 5 to about 95 percent of the total composition. Representative dosage forms
15 will generally contain between from about 1 mg to about 500 mg of an active ingredient, typically 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg, 500 mg, 600 mg, 800 mg, or 1000 mg.

It is understood that the specific dose level for any particular patient will depend upon a variety of factors including the age, body weight, general health,
20 sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing therapy.

Combinations with Other Drugs

In further aspects, the invention encompasses pharmaceutical
25 compositions for treating PTP-1B-mediated diseases as defined above comprising an effective amount of the compound of Formula A or A₁ as defined above and one or more ingredients such as insulin, sulfonyl ureas, PPAR alpha and/or -gamma ligands, and antiobesity drugs.

Thus, the methods of treatment or prevention described herein may
30 further be comprised of administering to said patient a second anti-diabetic compound in an amount effective to treat or prevent diabetes.

Similarly, the methods of treatment of diabetes may comprise the administration of a cholesterol biosynthesis inhibitor, particularly an HMG-CoA reductase inhibitor, such as lovastatin, simvastatin, pravastatin, fluvastatin,
35 atorvastatin and rivastatin, in an amount effective to improve the lipid profile. In combination with a PTP-1B inhibitor, this may be beneficial in treating or preventing atherosclerosis and other conditions that often are associated with Type 2 diabetes.

- 5 Similarly, the methods of treatment or prevention described herein may further be comprised of administering to said patient a second anti-obesity compound in an amount effective to treat or prevent obesity.

Methods of Synthesis

- 10 The compounds of the present invention can be prepared according to the following methods.

Method A

- 15 Di-tert-butyl phosphite can be deprotonated with a base such as $\text{LiN}(\text{TMS})_2$ and reacted with a tolualdehyde to provide alcohol 2, which may be oxidized with MnO_2 or under Swern's conditions to give phosphonoketone 3. 5

Method H

Bis(sulfonyl)methane 31 can be sequentially alkylated with two identical or different properly protected alkylating agents to give compound 33. A deprotection procedure may be required to liberate the desired functional groups from X^{1'} and X^{2'}.

10

5

Method I

Sulphone **34** can be sequentially alkylated with two identical or different properly protected alkylating agents to give compound **36**. A deprotection procedure may be required to liberate the desired functional groups from $\text{X}^{1'}$ and $\text{X}^{2'}$.

5

Method J

Dimethyl malonate can be alkylated sequentially with 4-bromobenzyl bromide and 1-(bromomethyl)-4-(diethoxymethyl)benzene under basic conditions to provide 38. IC₅₀ Binding Assay Protocol:

Compounds (ligands) which potentially inhibit the binding of a radioactive ligand to the specific phosphatase are screened in a 96-well plate format as follows:

- 20 To each well is added the following solutions @ 25°C in the following chronological order:
1. 110 µl of assay buffer.
 2. 10 µl. of 50 nM tritiated BzN-EJJ-CONH₂ in assay buffer (1X) @ 25°C.
 - 25 3. 10 µl. of testing compound in DMSO at 10 different concentrations in serial dilution (final DMSO, about 5% v/v) in duplicate @ 25°C.
 4. 10 µl. of 3.75 µg/ml purified human recombinant GST-PTP-1B in enzyme dilution buffer.
 - 30 5. The plate is shaken for 2 minutes.
 6. 10 µl. of 0.3 µg/ml anti-glutathione S-transferase (anti-GST) rabbit IgG (Molecular Probes) diluted in antibody dilution buffer @ 25°C.
 7. The plate is shaken for 2 minutes.
 8. 50 µl. of protein A-PVT SPA beads (Amersham) @ 25°C.
 - 35 9. The plate is shaken for 5 minutes. The binding signal is quantified on a Microbeta 96-well plate counter.
 10. The non-specific signal is defined as the enzyme-ligand binding in the absence of anti-GST antibody.

- 5 11. 100% binding activity is defined as the enzyme-ligand binding in the presence of anti-GST antibody, but in the absence of the testing ligands with the non-specific binding subtracted.
12. Percentage of inhibition is calculated accordingly.
13. IC₅₀ value is approximated from the non-linear regression
- 10 fit with the 4-parameter/multiple sites equation (described in: "Robust Statistics", New York, Wiley, by P.J. Huber (1981) and reported in nM units.
14. Test ligands (compounds) with larger than 90% inhibition at 10 μ M are defined as actives.

PHARMACOKINETICS IN RATS

Per Os Pharmacokinetics in Rats

15 **PROCEDURE:**

The animals are housed, fed and cared for according to the Guidelines of the Canadian Council on Animal Care.

Male Sprague Dawley rats (325-375 g) are fasted overnight prior to each PO blood level study.

- 20 The rats are placed in the restrainer one at a time and the box firmly secured. The zero blood sample is obtained by nicking a small (1 mm or less) piece off the tip of the tail. The tail is then stroked with a firm but gentle motion from the top to the bottom to milk out the blood. Approximately 1 mL of blood is collected into a heparinized vacutainer tube.

- 25 Compounds are prepared as required, in a standard dosing volume of 10mL/kg, and administered orally by passing a 16 gauge, 3" gavaging needle into the stomach.

- 30 Subsequent bleeds are taken in the same manner as the zero bleed except that there is no need to nick the tail again. The tail is cleaned with a piece of gauze and milked/stroked as described above into the appropriately labelled tubes.

Immediately after sampling, blood is centrifuged, separated, put into clearly marked vials and stored in a freezer until analysed.

Typical time points for determination of rat blood levels after PO dosing are:

- 35 0, 15min, 30min, 1h, 2h, 4h, 6h

After the 4 hr time point bleed, food is provided to the rats *ad libitum*. Water is provided at all times during the study.

WO 00/17211

5 Vehicles:

The following vehicles may be used in PO rat blood level determinations:

- PEG 200/300/400: restricted to 2 mL/kg
 10 Methocel 0.5% - 1.0%: 10mL/kg
 Tween 80: 10mL/kg

Compounds for PO blood levels can be in suspension form. For better dissolution, the solution can be placed in a sonicator for approximately 5
 15 minutes.

For analysis, aliquots are diluted with an equal volume of acetonitrile and centrifuged to remove protein precipitate. The supernatant is injected directly onto a C-18 HPLC column with UV detection. Quantitation is done relative to a clean blood sample spiked with a known quantity of drug. Bioavailability (F) is
 20 assessed by comparing area under the curve (AUC) i.v. versus p.o.

$$F = \frac{AUC_{po}}{AUC_{iv}} \times \frac{DOSE_{iv}}{DOSE_{po}} \times 100\%$$

25 Clearance rates are calculated from the following relation:

$$CL = \frac{DOSE_{iv}(mg/kg)}{AUC_{iv}}$$

30 The units of CL are mL/h•kg (milliliters per hour kilogram)

Intravenous Pharmacokinetics in Rats

PROCEDURE:

35 The animals are housed, fed and cared for according to the Guidelines of the Canadian Council on Animal Care.

Male Sprague Dawley (325-375 g) rats are placed in plastic shoe box cages with a suspended floor, cage top, water bottle and food.

WO 00/17211

PCT/CA99/00864

5 The compound is prepared as required, in a standard dosing volume of 1 mL/kg.

 Rats are bled for the zero blood sample and dosed under CO₂ sedation. The rats, one at a time, are placed in a primed CO₂ chamber and taken out as soon as they have lost their righting reflex. The rat is then placed on a
10 restraining board, a nose cone with CO₂ delivery is placed over the muzzle and the rat restrained to the board with elastics. With the use of forceps and scissors, the jugular vein is exposed and the zero sample taken, followed by a measured dose of compound which is injected into the jugular vein. Light digital pressure is applied to the injection site, and the nose cone is removed. The time is noted. This
15 constitutes the zero time point.

 The 5 min bleed is taken by nicking a piece (1-2 mm) off the tip of the tail. The tail is then stroked with a firm but gentle motion from the top of the tail to the bottom to milk the blood out of the tail. Approximately 1 mL of blood is collected into a heparinized collection vial. Subsequent bleeds are taken in the same
20 fashion, except that there is no need to nick the tail again. The tail is cleaned with a piece of gauze and bled, as described above, into the appropriate labelled tubes.

 Typical time points for determination of rat blood levels after I.V. dosing are either:

25 0, 5 min, 15min, 30min, 1h, 2h, 6h
 or 0, 5 min, 30min, 1h, 2h, 4h, 6h.

Vehicles:

30 The following vehicles may be used in IV rat blood level determinations:

Dextrose:	1mL/kg
2-Hydroxypropyl- β -cyclodextrin	1mL/kg
35 DMSO (dimethylsulfoxide):	Restricted to a dose volume of 0.1 mL per animal
PEG 200:	Not more than 60% mixed with 40% sterile water - 1mL/kg

5 With Dextrose, either sodium bicarbonate or sodium carbonate can be added if the solution is cloudy.

For analysis, aliquots are diluted with an equal volume of acetonitrile and centrifuged to remove protein precipitate. The supernatant is injected directly onto a C-18 HPLC column with UV detection. Quantitation is done relative to a
 10 clean blood sample spiked with a known quantity of drug. Bioavailability (F) is assessed by comparing area under the curve (AUC) i.v. versus p.o.

$$F = \frac{AUC_{po}}{AUC_{iv}} \times \frac{DOSE_{iv}}{DOSE_{po}} \times 100\%$$

15

Clearance rates are calculated from the following relation:

$$CL = \frac{DOSE_{iv}(mg/kg)}{AUC_{iv}}$$

20

The units of CL are mL/h•kg (milliliters per hour kilogram)
