### 5-ALKYNYL-PYRIMIDINES

The present invention relates to new 5-alkynyl-pyrimidines of general formula (1)

(1),

wherein the groups R<sup>1</sup> to R<sup>4</sup> have the meanings given in the claims and specification, the  
5 isomers thereof, processes for preparing these alkynyl-pyrimidines and their use as  
medicaments.

#### **Background to the invention**

A number of protein kinases have already proved to be suitable target molecules for  
therapeutic intervention in a variety of indications, e.g. cancer and inflammatory and  
10 autoimmune diseases. Since a high percentage of the genes involved in the development of  
cancer which have been identified thus far encode kinases, these enzymes are attractive  
target molecules for the therapy of cancer in particular.

Phosphatidylinositol-3-kinases (PI3-kinases) are a subfamily of the lipid kinases which  
catalyse the transfer of a phosphate group to the 3'-position of the inositol ring of  
15 phosphoinositides.

They play an important role in numerous cell processes such as e.g. cell growth and  
differentiation processes, the control of cytoskeletal changes and the regulation of  
intracellular transport processes. On the basis of their *in vitro* specificity for certain  
phosphoinositide substrates the PI3-kinases can be divided into different categories.

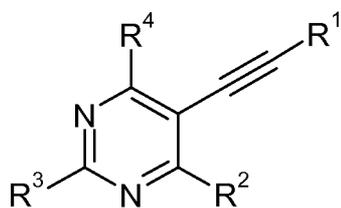

20 5-Alkynyl-pyrimidines are described for example as protein kinases inhibiting compounds  
in WO2006044823.

#### **Detailed description of the invention**

It has now surprisingly been found that compounds of general formula (1), wherein the  
groups R<sup>1</sup> to R<sup>4</sup> have the meanings given below, act as inhibitors of kinases. Thus, the

compounds according to the invention may be used for example for the treatment of diseases connected with the activity of kinases and characterised by excessive or abnormal cell proliferation.

The present invention relates to compounds of general formula (1)

5 (1),

### **Definitions**

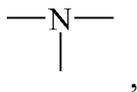

As used herein the following definitions apply, unless stated otherwise.

By alkyl substituents are meant in each case saturated, unsaturated, straight-chain or branched aliphatic hydrocarbon groups (alkyl group) and this includes both saturated alkyl  
15 groups and unsaturated alkenyl and alkynyl groups. Alkenyl substituents are in each case straight-chain or branched, unsaturated alkyl groups, which have at least one double bond. By alkynyl substituents are meant in each case straight-chain or branched, unsaturated alkyl groups, which have at least one triple bond.

The term **heteroalkyl** refers to groups which can be derived from alkyl as defined above in its broadest sense by replacing one or more of the groups  $-\text{CH}_3$  in the hydrocarbon chains  
20 independently of one another by the groups  $-\text{OH}$ ,  $-\text{SH}$  or  $-\text{NH}_2$ , one or more of the groups  $-\text{CH}_2-$  independently of one another by the groups  $-\text{O}-$ ,  $-\text{S}-$  or  $-\text{NH}-$ , one or more of the groups

25 by the group

one or more of the groups =CH- by the group =N-, one or more of the groups =CH<sub>2</sub> by the group =NH or one or more of the groups ≡CH by the group ≡N, while in all only a maximum of three heteroatoms may be present in a heteroalkyl, there must be at least one  
 5 carbon atom between two oxygen and between two sulphur atoms or between one oxygen and one sulphur atom and the group as a whole must have chemical stability.

It flows from the indirect definition/derivation from alkyl that heteroalkyl is made up of the sub-groups of saturated hydrocarbon chains with hetero-atom(s), heteroalkenyl and heteroalkynyl, while further subdivision into straight-chain (unbranched) and branched  
 10 may be carried out. If a heteroalkyl is supposed to be substituted, the substitution may take place independently of one another, in each case mono- or polysubstituted, at all the hydrogen-carrying oxygen, sulphur, nitrogen and/or carbon atoms. Heteroalkyl itself may be linked to the molecule as substituent both through a carbon atom and through a heteroatom.

15 By way of example, the following representative compounds are listed:

### **General Procedure 1 (GP1): Iodination of Pyrimidines or Pyridines**

A solution of the pyrimidine or pyridine (1.0 eq.) in acetic acid is cooled to 0 °C and *N*-

iodosuccinimide (1.0 eq.) is added in one portion. The reaction mixture is stirred at RT until conversion of the starting material is completed (2 - 6 h). The mixture is poured on ice-cooled water and treated with a mixture of 5 % Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and 10 % NaHCO<sub>3</sub>. The precipitate is filtered off, intensely washed with water and dried under vacuum at 40°C.

5 The crude product can be used without further purification or is further purified by chromatography on silica gel using a CH<sub>2</sub>Cl<sub>2</sub>/MeOH gradient.

#### **General Procedure 2 (GP2): Sonogashira Reaction**

The halide (1.0 eq.) is dissolved in DMF or THF and PdCl<sub>2</sub>(PPh<sub>3</sub>)<sub>2</sub> (0.1 eq.) and CuI (0.1 eq.) are added. Subsequently, triethylamine (10.0 eq.) and finally the alkyne (1.5 eq.) are added and the reaction mixture is stirred at 65 °C. The reaction is monitored by LC-MS. If the iodide is not completely converted after 4 h, additional amounts of alkyne are added in small portions. The product either precipitates from the reaction mixture (and is filtered off and if necessary re-crystallized) and/or, after removal of the solvent, is purified by preparative RP-HPLC.

10

#### **General Procedure 3 (GP3): Desilylation of Alkynes**

The TMS-alkyne (1.0 eq.) is dissolved in MeOH, K<sub>2</sub>CO<sub>3</sub> (0.5 eq.) is added in one portion and the reaction mixture is stirred at RT until conversion is complete (3 – 16 h). The solvent is removed *in vacuo*, the crude product is dissolved in ethyl acetate and the organic phase is extracted with water. The organic phase is dried, filtered off and the solvent removed *in vacuo*. The product is either used without further purification or purified by chromatography on silica gel using a DCM/MeOH or (cyclo-)hexane/ethyl acetate.

20

#### **General Procedure 4 (GP4): Suzuki Coupling**

The 4-chloropyrimidine (1.0 eq.) is dissolved in DME/water (20:1 v/v), boronic acid (1.3 eq.), K<sub>2</sub>CO<sub>3</sub> (2.0 eq.) and Pd(PPh<sub>3</sub>)<sub>4</sub> (0.2 eq.) are added and the reaction mixture is stirred for 4 h under reflux. In case the conversion of the starting material is not complete, additional amounts of boronic acid and Pd-catalyst are added and the reaction is run over night under reflux. After cooling to RT water is added. The precipitate is filtered off. In cases where the product is not precipitated it is extracted with diethylether, the organic phase is dried, filtered off, and the solvent removed under reduced pressure. The obtained product can either be used without further purification or is purified by chromatography.

The Examples that follow describe the biological activity of the compounds according to the invention without restricting the invention to these Examples.

### **PC3 proliferation test**

The test is based on measurement of cellular DNA content via fluorescent dye binding.

- 5 Because cellular DNA content is highly regulated, it is closely proportional to cell number. The extent of proliferation is determined by comparing cell counts for samples treated with drugs with untreated controls.

- 10 PC3 (human prostate carcinoma cell line) cells are sown in microtitre plates and incubated overnight in culture medium at 37 °C and 5 % CO<sub>2</sub>. The test substances are diluted stepwise and added to the cells such that the total volume is 200 μL/well. Cells to which diluent, but not substance, is added serve as controls. After an incubation time of 3 days, the medium is replaced by 100 μL/well dye-binding solution and the cells are incubated at 37 °C in the dark for a further 60 min. For measuring the fluorescence, excitation takes place at a wavelength of 485 nm and the emission is measured at 530 nm.

- 15 EC<sub>50</sub> values are calculated using the GraphPad Prism program.

Most compounds of the Examples cited have an EC<sub>50</sub> (Proliferation PC3) of less than 1 μM.

### **P-AKT measurement in PC3 cells**

- 20 P-AKT levels in PC3 cells are detected by cell-based ELISA. Cells are cultured in 96-well plates and treated with serial dilutions of test substances for 2 h. Cells to which diluent, but not substance, is added serve as controls. Subsequently, the cells are fixed rapidly to preserve protein modifications. Each well is then incubated with a primary antibody specific for Ser473-phosphorylated AKT. Subsequent incubation with secondary HRP-conjugated antibody and developing solution provides a colorimetric readout at 450 nm.

- 25 EC<sub>50</sub> values are calculated using the GraphPad Prism program.

Most compounds of the Examples cited have an EC<sub>50</sub> (P-AKT PC3) of less than 1 μM.

Examples of suitable forms for use are tablets, capsules, suppositories, solutions, in particular solutions for injection (s.c., i.v., i.m.) and infusion, syrups, emulsions or dispersible powders. In this connection, the proportion of the pharmaceutically active compound(s) should in each case be in the range of 0.1-90% by weight, preferably 0.5 - 50 % by weight, of the total composition, that is in quantities which are sufficient to achieve the dosage range which is specified below. If necessary, the doses mentioned can be given several times a day.

Appropriate tablets can be obtained, for example, by mixing the active compound(s) with known auxiliary substances, for example inert diluents, such as calcium carbonate, calcium phosphate or lactose, disintegrants, such as maize starch or alginic acid, binders, such as starch or gelatine, lubricants, such as magnesium stearate or talc, and/or agents for achieving a depot effect, such as carboxymethyl cellulose, cellulose acetate phthalate or polyvinyl acetate. The tablets can also comprise several layers.

Correspondingly, sugar-coated tablets can be produced by coating cores, which have been prepared in analogy with tablets, with agents which are customarily used in sugar coatings, for example collidone or shellac, gum arabic, talc, titanium dioxide or sugar. The core can also comprise several layers in order to achieve a depot effect or to avoid incompatibilities. In the same way, the sugar coating can also comprise several layers in order to achieve a depot effect, with it being possible to use the auxiliary substances which are mentioned above in the case of the tablets.

Syrups of the active compounds or active compound combinations according to the invention can additionally comprise a sweetening agent, such as saccharine, cyclamate,

glycerol or sugar as well as a taste-improving agent, e.g. flavouring agents such as vanillin or orange extract. They can also comprise suspension aids or thickeners, such as sodium carboxymethyl cellulose, wetting agents, for example condensation products of fatty alcohols and ethylene oxide, or protectants such as p-hydroxybenzoates.

- 5 Injection and infusion solutions are produced in a customary manner, e.g. while adding isotonizing agents, preservatives, such as p-hydroxybenzoates, or stabilizers, such as alkali metal salts of ethylenediaminetetraacetic acid, where appropriate using emulsifiers and/or dispersants, with it being possible, for example, to employ, where appropriate, organic solvents as solubilizing agents or auxiliary solvents when using water as diluent, and
- 10 aliquoted into injection bottles or ampoules or infusion bottles.

- The capsules, which comprise one or more active compounds or active compound combinations, can, for example, be produced by mixing the active compounds with inert carriers, such as lactose or sorbitol, and encapsulating the mixture in gelatine capsules. Suitable suppositories can be produced, for example, by mixing with excipients which are
- 15 envisaged for this purpose, such as neutral fats or polyethylene glycol, or their derivatives.

- Auxiliary substances which may be mentioned by way of example are water, pharmaceutically unobjectionable organic solvents, such as paraffins (e.g. petroleum fractions), oils of vegetable origin (e.g. groundnut oil or sesame oil), monofunctional or
- 20 polyfunctional alcohols (e.g. EtOH or glycerol), carrier substances such as natural mineral powders (e.g. kaolins, argillaceous earths, talc and chalk), synthetic mineral powders (e.g. highly disperse silicic acid and silicates), sugars (e.g. cane sugar, lactose and grape sugar), emulsifiers (e.g. lignin, sulphite waste liquors, methyl cellulose, starch and polyvinylpyrrolidone) and glidants (e.g. magnesium stearate, talc, stearic acid and sodium lauryl sulphate).

- 25 Administration is effected in a customary manner, preferably orally or transdermally, in particular and preferably orally. In the case of oral use, the tablets can naturally also comprise, in addition to the abovementioned carrier substances, additives such as sodium citrate, calcium carbonate and dicalcium phosphate together with a variety of further substances such as starch, preferably potato starch, gelatine and the like. It is furthermore

also possible to use glidants, such as magnesium stearate, sodium lauryl sulphate and talc, for the tableting. In the case of aqueous suspensions, a variety of taste improvers or dyes can also be added to the active compounds in addition to the abovementioned auxiliary substances.

- 5 For parenteral administration, it is possible to employ solutions of the active compounds while using suitable liquid carrier materials. The dosage for intravenous administration is 1-1000 mg per hour, preferably between 5 and 500 mg per hour.

Despite this, it may be necessary, where appropriate, to diverge from the abovementioned quantities, depending on the body weight or the nature of the route of administration, on  
 10 the individual response to the medicament, on the nature of its formulation and on the time or interval at which the administration is effected. Thus, it may, in some cases, be sufficient to make do with less than the previously mentioned lowest quantity whereas, in other cases, the abovementioned upper limit has to be exceeded. When relatively large quantities are being administered, it may be advisable to divide these into several single  
 15 doses which are given over the course of the day.

The following formulation examples illustrate the present invention without, however, restricting its scope:

#### Pharmaceutical formulation examples

A) Tablets	per tablet
20 Active compound in accordance with formula (1)	100 mg
Lactose	140 mg
Maize starch	240 mg
Polyvinylpyrrolidone	15 mg
Magnesium stearate	<u>5 mg</u>
25	500 mg

The finely ground active compound, lactose and a part of the maize starch are mixed with each other. The mixture is sieved, after which it is moistened with a solution of polyvinylpyrrolidone in water, kneaded, wet-granulated and dried. The granular material, the remainder of the maize starch and the magnesium stearate are sieved and mixed with

each other. The mixture is pressed into tablets of suitable shape and size.

<u>B) Tablets</u>		<u>per tablet</u>
	Active compound in accordance with formula (1)	80 mg
	Lactose	55 mg
5	Maize starch	190 mg
	Microcrystalline cellulose	35 mg
	Polyvinylpyrrolidone	15 mg
	Sodium carboxymethyl starch	23 mg
	Magnesium stearate	<u>2 mg</u>
10		400 mg

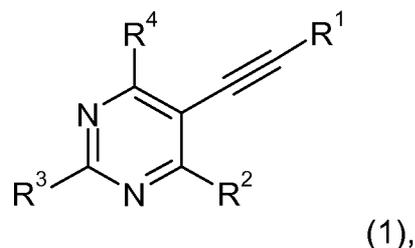

The finely ground active compound, a part of the maize starch, the lactose, microcrystalline cellulose and polyvinylpyrrolidone are mixed with each other, after which the mixture is sieved and worked, together with the remainder of the maize starch and water, into a granular material, which is dried and sieved. The sodium carboxymethyl starch and the magnesium stearate are then added to the granular material and mixed with it, and the mixture is pressed into tablets of suitable size.

<u>C) Ampoule solution</u>		
	Active compound in accordance with formula (1)	50 mg
	Sodium chloride	50 mg
20	Water for injection	5 mL

The active compound is dissolved, either at its intrinsic pH or, where appropriate, at pH 5.5-6.5, in water after which sodium chloride is added as isotonicizing agent. The resulting solution is rendered pyrogen-free by filtration and the filtrate is aliquoted, under aseptic conditions, into ampoules, which are then sterilized and sealed by melting. The ampoules contain 5 mg, 25 mg and 50 mg of active compound.
