(54) Title: DERIVATIVES OF QUINOLINES AND QUINOXALINES AS PROTEIN TYROSINE KINASE INHIBITORS

(I)

(57) **Abstract:** The invention relates to compounds of Formula (I), wherein the substituents are as defined in the specification, in free form or in the form of a pharmaceutically acceptable salt, solvate, ester, N-oxide thereof; processes for the preparation thereof; to pharmaceuticals containing such compounds, in particular for the use in one or more Protein tyrosine kinase mediated diseases.

DERIVATIVES OF QUINOLINES AND QUINOXALINES AS PROTEIN TYROSINE KINASE INHIBITORS

The invention relates to quinoline/quinoxaline-carboxamide derivatives of the formula (I) given below (including its salts, solvates, esters, N-oxides); processes for the preparation thereof; pharmaceutical compositions comprising a compound of the formula (I), optionally in the presence of a combination partner; the application of a compound of formula (I) in a process for the treatment of the human or animal body, (in particular with regard to a proliferative disease); the use of a compound of formula (I) for manufacturing a medicament for the treatment of such diseases.

5 Protein kinases (PKs) are enzymes which catalyze the phosphorylation of specific serine, threonine or tyrosine residues in cellular proteins. These post-translational modifications of substrate proteins act as molecular switch regulating cell proliferation, activation and/or differentiation. Aberrant or excessive PK activity has been observed in many disease states 10 including benign and malignant proliferative disorders. In many cases, it has been possible to treat diseases *in vitro* and in many cases *in vivo*, such as proliferative disorders, by making use of PK inhibitors. The kinases fall largely into two groups, those specific for phosphorylating serine and threonine, and those specific for phosphorylating tyrosine. In 15 addition, some kinases, referred to as "dual specificity" kinases, are able to phosphorylate tyrosine as well as serine/threonine residues.

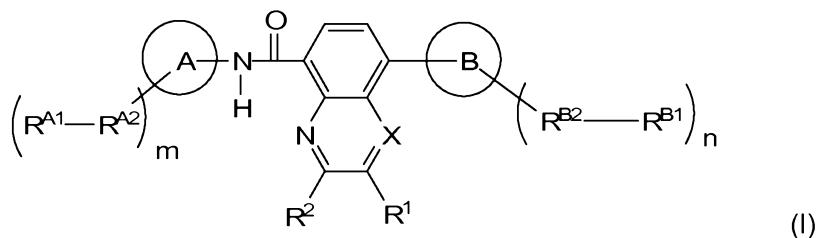

20 WO2006/000420 (in particular p.1-8) discloses details on PKs, their mode of action and relation to disorders or conditions to be treated. This document also discloses heteroaryl aryl ureas, useful for the treatment of protein kinase dependent diseases. Further, 25 WO03/023004 and WO02/102972 disclose disorders resulting from FGFR3 mutations. Further, WO05/118580 generically discloses quinoline derivatives useful as HIV inhibitors. In these documents and the references cited therein, where protein kinases are involved, the modulation of an aberrant activity (especially the inhibition of an activity of such a 30 kinase) can be expected reasonably to be useful in the diseases mentioned in this document.

Although considered active, the molecules disclosed in the above-referenced documents; they show certain disadvantages. There is thus an unmet need for improved (e.g. highly affine and/or selective) molecules capable of blocking aberrant constitutive receptor protein tyrosine kinase activity, in particular FGFR activity, thereby addressing the clinical

5 manifestations associated with the above-mentioned mutations, and modulating various biological functions. In view of the large number of protein kinase inhibitors and the multitude of proliferative and other PK-related diseases, there is an ever-existing need to provide novel classes of compounds that are useful as PK inhibitors and thus in the treatment of these Protein Tyrosine Kinase (PTK) related diseases. Particularly required are

10 new classes of pharmaceutically advantageous PK inhibiting compounds.

The invention may be more fully appreciated by reference to the following description, including the following glossary of terms and the concluding examples. As used herein, the terms "including", "containing" and "comprising" are used herein in their open, non-limiting sense.

5

Any formula given herein is intended to represent compounds having structures depicted by the structural formula as well as certain variations or forms. In particular, compounds of any formula given herein may have asymmetric centers and therefore exist in different enantiomeric forms. If at least one asymmetrical carbon atom is present in a compound of the formula (I), such a compound may exist in optically active form or in the form of a

10

mixture of optical isomers, e.g. in the form of a racemic mixture. All optical isomers and their mixtures, including the racemic mixtures, are part of the present invention. Thus, any given formula given herein is intended to represent a racemate, one or more enantiomeric forms, one or more diastereomeric forms, and mixtures thereof. Furthermore, certain structures

5 may exist as geometric isomers (i.e. cis and trans isomers), as tautomers, or as atropisomers. Additionally, any formula given herein is intended to represent hydrates, solvates, and polymorphs of such compounds, and mixtures thereof.

Any formula given herein is also intended to represent unlabeled forms as well as

10 isotopically labeled forms of the compounds. Isotopically labeled compounds have structures depicted by the formulas given herein except that one or more atoms are replaced by an atom having a selected atomic mass or mass number. Examples of isotopes that can be incorporated into compounds of the invention include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorous, fluorine, and chlorine, such as ^2H , ^3H , ^{11}C , ^{13}C , ^{14}C , ^{15}N , ^{18}F , ^{31}P , ^{32}P , ^{35}S , ^{36}Cl , ^{125}I respectively. Various isotopically labeled compounds of the present invention, for example those into which radioactive isotopes such as ^3H , ^{13}C , and ^{14}C are incorporated. Such isotopically labelled compounds are useful in metabolic studies (preferably with ^{14}C), reaction kinetic studies (with, for example ^2H or ^3H), detection or imaging techniques such as positron emission tomography (PET) or single-photon emission 20 computed tomography (SPECT) including drug or substrate tissue distribution assays, or in radioactive treatment of patients. In particular, an ^{18}F or labeled compound may be particularly preferred for PET or SPECT studies. Further, substitution with heavier isotopes such as deuterium (i.e., ^2H) may afford certain therapeutic advantages resulting from greater metabolic stability, for example increased in vivo half-life or reduced dosage 25 requirements. Isotopically labeled compounds of this invention and prodrugs thereof can generally be prepared by carrying out the procedures disclosed in the schemes or in the examples and preparations described below by substituting a readily available isotopically labeled reagent for a non-isotopically labeled reagent.

30 When referring to any formula given herein, the selection of a particular moiety from a list of possible species for a specified variable is not intended to define the moiety for the variable appearing elsewhere. In other words, where a variable appears more than once, the choice of the species from a specified list is independent of the choice of the species for the same variable elsewhere in the formula (where one or more up to all more general expressions in

embodiments characterized as preferred above or below can be replaced with a more specific definition, thus leading to a more preferred embodiment of the invention, respectively).

5 It goes without saying that substituents are only at positions where they are chemically possible, the person skilled in the art being able to decide (either experimentally or theoretically) without inappropriate effort which substitutions are possible and which are not. For example, amino or hydroxy groups with free hydrogen may be unstable if bound to carbon atoms with unsaturated (e.g. olefinic) bonds. Additionally, it will of course be understood 10 that the substituents as listed above may themselves be substituted by any substituent, subject to the aforementioned restriction to appropriate substitutions as recognised by the skilled man.

Where the plural form (e.g. compounds, salts) is used, this includes the singular (e.g. a 15 single compound, a single salt). "A compound" does not exclude that (e.g. in a pharmaceutical formulation) more than one compound of the formula (I) (or a salt thereof) is present.

The acid addition salt of compounds of formula (I) are preferably pharmaceutically acceptable salts. Such salts are known in the field.

30 “**Salts**” (which, what is meant by “or salts thereof” or “or a salt thereof”, can be present alone or in mixture with free compound of the formula (I) are preferably pharmaceutically acceptable salts. Such salts are formed, for example, as acid addition salts, preferably with organic or inorganic acids, from compounds of formula (I) with a basic nitrogen atom,

especially the pharmaceutically acceptable salts. Suitable inorganic acids are, for example, halogen acids, such as hydrochloric acid, sulfuric acid, or phosphoric acid. Suitable organic acids are, e.g., carboxylic acids or sulfonic acids, such as fumaric acid or methansulfonic acid. For isolation or purification purposes it is also possible to use pharmaceutically

5 unacceptable salts, for example picrates or perchlorates. For therapeutic use, only pharmaceutically acceptable salts or free compounds are employed (where applicable in the form of pharmaceutical preparations), and these are therefore preferred. In view of the close relationship between the novel compounds in free form and those in the form of their salts, including those salts that can be used as intermediates, for example in the purification
10 or identification of the novel compounds, any reference to the free compounds hereinbefore and hereinafter is to be understood as referring also to the corresponding salts, as appropriate and expedient.

The terms "**co-administration**" or "**combined**
20 **administration**" or the like as utilized herein are meant to encompass administration of the selected combination partner to a single subject in need thereof (e.g. a patient), and are intended to include treatment regimens in which the agents are not necessarily administered by the same route of administration or at the same time. The term "**pharmaceutical combination**" as used herein means a product that results from the

The term "**fixed combination**" means that the active ingredients, e.g. a compound of formula (I) and a combination partner, are both administered to a patient simultaneously in the form of a single entity or dosage. 25 The invention further relates to pharmaceutically acceptable prodrugs of a compound of formula (I).

The invention further relates to pharmaceutically acceptable metabolites of a compound of formula (I).

30 The invention further relates to protected derivatives of a compound of formula (I).

The invention relates especially to the compounds of the formula (I) given in the Examples, as well as the methods of manufacture described therein.

The invention also provides, **in a second aspect**, pharmacological uses of compounds of formula (I). The compounds of formula (I) have valuable pharmacological properties, as described hereinbefore and hereinafter. They inhibit various protein kinases, such as tyrosine kinases, for example VEGFR2 (KDR), PDGFR, cKIT, LCK, cAbl, RET and FGFR 5 kinases, especially FGFR1, FGFR2, FGFR3, FGFR4.

In vitro experiments

The efficacy of the compounds of formula (I) as inhibitors of protein kinase activity can be demonstrated according to known procedures; in particular according to the assays 10 described in the experimental part below. Generally, the activity of a protein kinase is assayed in the presence or absence of inhibitor by measuring the phosphorylation of a synthetic substrate by purified N-terminally His- or GST-tagged kinase domains, in the presence of selected concentrations of ATP and using the appropriate assay technology: Time-Resolved Fluorescence Resonance Energy Transfer (TR-FRET) (LanthaScreen™) or 15 microfluidic Caliper system.

In vivo experiments

There are also experiments to demonstrate the antitumor activity of compounds of the formula (I) *in vivo* according to methods known in the field (e.g. as described herein).

20 The *in vivo* antitumor activity is tested, for example, using bladder carcinoma cell lines, such as the human urinary bladder transitional cell carcinoma RT112 cell line (DSMZ ACC # 418).

25 Tumors are obtained after subcutaneous injection of the respective cells (minimum 1×10^6 cells in 100 ml phosphate buffered physiological saline) into the carrier mice or rat. The treatment is started, as soon as the tumor has reached an average size of 100 mm^3 . Tumor growth is determined three times weekly and 24 h after the last treatment by measurement 30 of the perpendicular diameter. In case of tumors, tumor volumes are determined according to the Formula $L \times D \times p/6$ (see Evans, B.D., Smith, I.E., Shorthouse, A.J. and Millar, J.J., Brit. J. Cancer, 45: 466-468, 1982). The antitumor activity is expressed as T/C% (average increase of the tumor volume of treated animals divided by the average increase of tumor volume in control animals multiplied by 100). Tumor regression (%) represents the smallest

- 20 -

mean tumor volume compared to the mean tumor volume at the beginning of the treatment. Each animal in which the tumor reaches a diameter of more than 1,5 to 2 cm³ is sacrificed.

Clinical Studies

5 The pharmacological activity of a compound of formula (I) may, for example, be demonstrated in a clinical study or in a test procedure according to methods generally accepted in the field; e.g. as essentially described hereinafter.

Suitable clinical studies are, for example, open label non-randomized, dose escalation stu-

10 dies in patients with one of the tumor diseases mentioned above. The beneficial effects on proliferative diseases can be determined directly through the results of these studies or by changes in the study design which are known as such to a person skilled in the art. The effi-
15 cacy of the treatment can be determined in such studies, e.g., in case of tumors after 18 or 24 weeks by radiologic evaluation of the tumors every 6 weeks, in case of a leukemia e.g. by determination of the count of aberrant white blood cells, and by staining mononuclear cells and/or by means of determining minimum residual disease (MRD) e.g. by FACS-LPC
20 MRD or PCR.

Alternatively, a placebo-controlled, double blind study can be used in order to prove the

25 benefits of the compounds of the formula (I) mentioned herein.

An exemplary (though not limiting) schedule for administration of a compound of formula (I) is daily administration, with preferably 1 to 3 daily dosages for a longer time, possibly until the disease is cured or, if only palliative treatment is achieved, for as long as required;

25 alternatively, treatment e.g. for 5 days, and/or administration at days 1, 4 and 9, with eventual repetition after a certain time without treatment is possible. Alternatively, treatment several times a day (e.g. 2 to 5 times) or treatment by continuous administration (e.g. infusion), e.g. at the time points indicated in the last sentence, are possible. Generally, administration is orally or parenterally, preferably orally. The test compounds are preferably
30 diluted in water or in sterile 0.9% saline.

Diseases:

On the basis of these tests and studies, a compound of formula (I) according to the invention shows therapeutic efficacy especially against disorders dependent on protein

tyrosine kinase ("protein tyrosine kinase dependent diseases") such as FGFR, VEGFR2 (KDR), PDGF-R, cKIT, LCK, cABL, RET, especially proliferative diseases mediated FGFR kinase activity. The compounds of formula (I), that inhibit the protein tyrosine kinase activities mentioned, especially tyrosine protein kinases mentioned above and below, can 5 therefore be used in the treatment of protein kinase dependent diseases. Thus, a compound of formula (I) is in particular useful in the treatment of diseases identified below.

FGFR dependent diseases include a wide variety of disorders or conditions known to the person skilled in the art.

10 A first group of FGFR dependents diseases relates to a benign or malignant proliferative disease, e. g. a cancer, e. g. tumors and/or metastasis (wherever located). In a preferred embodiment, the proliferative disease is a cancer. The proliferative diseases include, without being limited to, cancers of the bladder, cervix, or oral squamous cell carcinomas (in particular with mutated FGFR3 and/or elevated FGFR3 expression), multiple myeloma (in 15 particular with t(4,14) chromosomal translocation), breast cancers (in particular with gene amplification and /or protein overexpression of FGFR1, FGFR2 or FGFR4), endometrial cancer (in particular with FGFR2 mutations), hepatocellular cancer (in particular with elevated expression of FGFR3 or FGFR4 or FGF ligands), any cancer type with an amplification of the 11q13 amplicon, which contains the FGF3, FGF4 and FGF19 loci, for 20 example breast cancer, hepatocellular cancer, EMS myeloproliferative disorders (in particular with abnormal FGFR1 fusion proteins), lymphomas (in particular with abnormal FGFR3 fusion proteins), glioblastomas (in particular with FGFR1 abnormal expression or mutations), gastric carcinomas (in particular with FGFR2 mutations or overexpression or FGFR3 mutations), pancreatic carcinomas (in particular with abnormal FGFR1 or FGFR4 25 expression), prostate carcinomas (in particular with abnormal expression of FGFR1, FGFR4, or FGF ligands); pituitary tumors (in particular with abnormal FGFR4), any cancer that requires angiogenesis .

30 A second group of FGFR dependents diseases relates to non-cancer disorders. Such non-cancer disorders include, without being limited to, benign skin tumors (in particular with FGFR3 activating mutations), skeletal disorders (in particular resulting from mutations in FGFRs) including achondroplasia, hypochondroplasia, severe achondroplasia with developmental delay and acanthosis nigricans (SADDAN), thanatophoric dysplasia (TD), muenke coronal craniostenosis, crouzon syndrome with acanthosis nigricans, both

- 22 -

familial and sporadic forms of Pfeiffer syndrome; disorders related to alterations of phosphate homeostasis, for example autosomal dominant hypophosphatemic rickets (ADHR, in particular related to FGF23 missense mutations), x-linked hypophosphatemic rickets (XLH; an x-linked dominant disorder related to inactivating mutations in the PHEX 5 gene), tumor-induced osteomalacia (TIO, an acquired disorder of isolated phosphate), or fibrous dysplasia of the bone (FD) .

A third group of FGFR dependent diseases relates to inflammatory or autoimmune diseases. The inhibition of FGFR activity has been found to represent a means for treating 10 T cell mediated inflammatory or **autoimmune diseases**, as for example in treatment of T-cell mediated inflammatory or autoimmune diseases including but not limited to rheumatoid arthritis (RA), collagen II arthritis, multiple sclerosis (MS), systemic lupus erythematosus (SLE), psoriasis, juvenile onset diabetes, Sjogren's disease, thyroid disease, sarcoidosis, autoimmune uveitis, inflammatory bowel disease (Crohn's and ulcerative colitis), celiac 15 disease and myasthenia gravis.

A fourth group of FGFR dependent diseases relates tot the group consisting of obesity, diabetes and/or diseases related thereto. Methods of antagonizing FGFRs, especially FGFR1 or FGFR4, have also been described to be useful in the treatment of obesity, 20 diabetes and/or diseases related thereto, such as metabolic syndrome, cardiovascular diseases, hypertension, aberrant cholesterol and triglyceride levels, dermatological disorders e.g. infections, varicose veins, Acanthosis nigricans, eczema, exercise intolerance, diabetes type 2, insulin resistance, hypercholesterolemia, cholelithiasis, orthopedic injury, thromboembolic disease, coronary or vascular restriction (e.g. 25 atherosclerosis), daytime sleepiness, sleep apnoea, end stage renal disease, gallbladder disease, gout, heat disorders, impaired immune response, impaired respiratory function, infections following wounds, infertility, liver disease, lower back pain, obstetric and gynecological complications, pancreatitis, stroke, surgical complications, urinary stress incontinence and/or gastrointestinal disorders.

30 Further, enhanced (especially bronchial) expression of FGFRs, especially FGFR1, has been reported to be associated with Chronic Obstructive Pulmonary Disease (COPD).

Further, acidic Fibroblast Growth Factor (especially FGF-1) and FGFR1 have also been described to be involved in aberrant signaling in retinoblastoma, leading to proliferation upon binding of FGF-1.

5 Non-FGFR protein kinase dependent diseases include VEGFR2 (KDR), PDGF, cKIT, LCK, cABL and RET dependent diseases and are especially proliferative diseases, preferably benign or especially malignant tumours (for example carcinoma of the kidneys, liver, adrenal glands, bladder, breast, stomach, ovaries, colon, rectum, prostate, pancreas, lungs, vagina or thyroid, sarcoma, glioblastomas and numerous tumours of the neck and head, as
10 well as leukemias). They are able to bring about the regression of tumours and to prevent the formation of tumour metastases and the growth of (also micro)-metastases. In addition they can be used in epidermal hyperproliferation (e.g. psoriasis), in prostate hyperplasia, and in the treatment of neoplasias, especially of epithelial character, for example mammary carcinoma. It is also possible to use the compounds of formula (I) in the treatment of
15 diseases of the immune system insofar as several or, especially, individual tyrosine protein kinases are involved; furthermore, the compounds of formula (I) can be used also in the treatment of diseases of the central or peripheral nervous system where signal transmission by at least one tyrosine protein kinase, especially selected from those mentioned specifically, is involved.

VEGFR2 (KDR) dependent diseases include a wide variety of disorders or conditions known to the person skilled in the art. Vascular endothelial growth factor receptor-2 (VEGFR2; KDR) is expressed on the primary vascular endothelium and is essential for normal vascular development. Angiogenesis, or the sprouting of new blood vessels, is also
25 a central process in the growth of solid tumors. For many cancers, the extent of vascularization of a tumor is a negative prognostic indicator signifying aggressive disease and increased potential for metastasis. Recent efforts to understand the molecular basis of tumor-associated angiogenesis have identified several potential therapeutic targets, including the receptor tyrosine kinases for the angiogenic factor vascular endothelial growth
30 factor (VEGF). The compounds of formula (I) as inhibitors of VEGF-receptor tyrosine kinase activity, may primarily inhibit the growth of blood vessels and are thus, for example, effective against a number of diseases associated with deregulated angiogenesis, especially diseases caused by ocular neovascularisation, especially retinopathies, such as diabetic retinopathy or age-related macula degeneration, psoriasis, haemangioblastoma,

such as haemangioma, mesangial cell proliferative disorders, such as chronic or acute renal diseases, e.g. diabetic nephropathy, malignant nephrosclerosis, thrombotic microangiopathy syndromes or transplant rejection, or especially inflammatory renal disease, such as glomerulonephritis, especially mesangiproliferative glomerulonephritis,

5 haemolytic-uraemic syndrome, diabetic nephropathy, hypertensive nephrosclerosis, atheroma, arterial restenosis, autoimmune diseases, diabetes, endometriosis, chronic asthma, and especially neoplastic diseases, for example so-called solid tumors (especially cancers of the gastrointestinal tract, the pancreas, breast, stomach, cervix, bladder, kidney, prostate, ovaries, endometrium, lung, brain, melanoma, Kaposi's sarcoma, squamous cell 10 carcinoma of head and neck, malignant pleural mesothelioma, lymphoma or multiple myeloma) and liquid tumors (e.g. leukemias), especially those expressing KDR, are especially important. A compound of formula (I) inhibits the growth of tumors and is especially suited to preventing the metastatic spread of tumors and the growth of micrometastases. These diseases are thus also Protein kinase dependent diseases.

15

PDGF dependent diseases include a wide variety of disorders or conditions known to the person skilled in the art. Compounds of the formula (I), in view of their activity as PDGF receptor inhibitors, are also especially appropriate in the treatment of proliferate diseases, especially glioblastoma, small lung cancer, atherosclerosis, thrombosis, psoriasis, 20 scleroderma or fibrosis.

cKIT dependent diseases include a wide variety of disorders or conditions known to the person skilled in the art. It is known that such kinases are frequently aberrantly expressed in common human cancers such as breast cancer, head and neck cancers, gastrointestinal 25 cancer such as colon, rectal or stomach cancer, leukemia, and ovarian, bronchial, lung or pancreatic cancer. KIT kinase expression has been documented in a wide variety of human malignancies such as mastocytosis/ mast cell leukemia, gastrointestinal stromal tumors (GIST), small cell lung carcinoma (SCLC), sinonasal natural killer/T-cell lymphoma, testicular cancer (seminoma), thyroid carcinoma, malignant melanoma, ovarian carcinoma, 30 adenoid cystic carcinoma, acute myelogenous leukemia (AML), breast carcinoma, pediatric T-cell acute lymphoblastic leukemia, angiosarcoma, anaplastic large cell lymphoma, endometrial carcinoma, and prostate carcinoma. The kinase activity of KIT has been implicated in the pathophysiology of several of these - and additional tumors - including breast carcinoma, SCLC, GIST, germ cell tumors, mast cell leukemia, neuroblastoma, AML,

melanoma and ovarian carcinoma. Further, C-kit is a receptor tyrosine kinase expressed on the surface of mast cells, to which stem cell factor (SCF) is a ligand. Aberrant c-kit signaling is a mediator of certain autoimmune diseases. Binding of SCF to the c-kit receptor mediates various functions of the mast cell. As an important mediator of mast cell function, c-kit plays 5 a role in pathologies associated with mast cells (MC). C-kit functions through mast cell generation, which plays an important role in triggering autoimmune diseases.

LCK dependent diseases include a wide variety of disorders or conditions known to the person skilled in the art. LCK is a cytoplasmic tyrosine kinase of the Src family expressed in 10 T cells and natural killer cells. It is generally accepted that Lck activity is important for signaling mediated by the T cell receptor and leads to normal T cell development and activation. Thus, compounds of formula (I) are a useful immunosuppressive for the treatment of autoimmune and inflammatory disorders and / or organ transplant rejection (in particular T cell mediated).

15 **cABL dependent diseases** include a wide variety of disorders or conditions known to the person skilled in the art. In CML, a reciprocally balanced chromosomal translocation in hematopoietic stem cells (HSCs) produces the BCR-ABL hybrid gene. The latter encodes the oncogenic Bcr-Abl fusion protein. Whereas ABL encodes a tightly regulated protein 20 tyrosine kinase, which plays a fundamental role in regulating cell proliferation, adherence and apoptosis, the BCR-ABL fusion gene encodes as constitutively activated kinase, which transforms HSCs to produce a phenotype exhibiting deregulated clonal proliferation, reduced capacity to adhere to the bone marrow stroma and a reduces apoptotic response to mutagenic stimuli, which enable it to accumulate progressively more malignant 25 transformations. Compounds of the formula (I), in view of their activity as Abl protein tyrosine kinase inhibitors, are also especially appropriate in the treatment of leukemias, e.g. CML or acute lymphoblastic leukemia (ALL).

30 **RET dependent diseases** include a wide variety of disorders or conditions known to the person skilled in the art. In humans, activating RET mutations are found in the inherited cancer syndrome multiple endocrine neoplasia 2 and in sporadic medullary and papillary thyroid carcinomas. The specific type and location of RET mutations are strongly correlated with the disease phenotype and also have diagnostic and prognostic value. Further, RET –

associated thyroid tumors encompass malignancies of the parafollicular C.cells and of follicular epithelial cells, of which the most common are papillary thyroid carcinomas. In addition, RET mutations cause the early onset cancer syndrome multiple endocrine neoloasia type 2 associated with several endocrine tumors including MTX, PC and 5 parathyroid hyperplasia.

The invention also provides, **in a third aspect**, a combination of a compound of formula (I) and one or more further therapeutic agents. A compound of formula (I) can be administered alone or in combination with one or more other therapeutic agents, possible combination 10 therapy taking the form of fixed combinations or the administration of a compound of the invention and one or more other therapeutic agents being staggered or given independently of one another, or the combined administration of fixed combinations and one or more other therapeutic agents. A compound of formula (I) can besides or in addition be administered especially for tumor therapy in combination with chemotherapy, radiotherapy, 15 immunotherapy, surgical intervention, or a combination of these. Long-term therapy is equally possible as is adjuvant therapy in the context of other treatment strategies, as described above. Other possible treatments are therapy to maintain the patient's status after tumor regression, or even chemopreventive therapy, for example in patients at risk.

zolomide (TEMODAL®); kinesin spindle protein inhibitors, such as SB715992 or SB743921 from GlaxoSmithKline, or pentamidine/chlorpromazine from CombinatoRx; MEK inhibitors such as ARRY142886 from Array BioPharma, AZD6244 from AstraZeneca, PD181461 from Pfizer, leucovorin, EDG binders, antileukemia compounds, ribonucleotide reductase inhibi-

5 tors, S-adenosylmethionine decarboxylase inhibitors, antiproliferative antibodies or other chemotherapeutic compounds. Also, in anti-inflammatory and/or antiproliferative treatment, combination
10 with anti-inflammatory drugs is included. Combination is also possible with antihistamine drug substances, bronchodilatory drugs, NSAID or antagonists of chemokine receptors.

The compounds of the invention may be administered by any conventional route, in particular parenterally, for example in the form of injectable solutions or suspensions, enterally, e.g. orally, for example in the form of tablets or capsules, topically, e.g. in the form of

15 lotions, gels, ointments or creams, or in a nasal or a suppository form. Topical administration is e.g. to the skin. A further form of topical administration is to the eye. 25 enteral, for example oral or rectal, or parenteral administration and that may be inorganic or organic, solid or liquid. The present pharmaceutical compositions, which may, if 5 desired, comprise other pharmacologically active substances are prepared in a manner known per se, for example by means of conventional mixing, granulating, confectionning, dissolving or lyophilising processes, and comprise approximately from 1% to 99%, especially from approx. 1% to approx. 20%, active ingredient(s).

10 The dosage of the active ingredient to be applied to a warm-blooded animal depends upon a variety of factors including type, species, age, weight, sex and medical condition of the patient; the severity of the condition to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound employed. A physician, clinician or veterinarian of ordinary skill can readily determine and prescribe the effective 15 amount of the drug required to prevent, counter or arrest the progress of the condition. Optimal precision in achieving concentration of drug within the range that yields efficacy without toxicity requires a regimen based on the kinetics of the drug's availability to target sites. This involves a consideration of the distribution, equilibrium, and elimination of a drug. The dose of a compound of the formula (I) or a pharmaceutically acceptable salt thereof to 20 be administered to warm-blooded animals, for example humans of approximately 70 kg body weight, is preferably from approximately 3 mg to approximately 5 g, more preferably from approximately 10 mg to approximately 1.5 g per person per day, divided preferably into 1 to 3 single doses which may, for example, be of the same size. Usually, children receive half of the adult dose.

The invention also provides, in a **further aspect**, methods of manufacturing a compound of formula (I) and intermediates and their methods of manufacturing; such intermediates are useful for the manufacturing of a compound of formula (I). A compound of the **formula (I)** may be prepared by processes that, though not applied hitherto for the new compounds of the present invention where they thus form new processes, are known *per se*, the following scheme illustrates methods for such preparation.

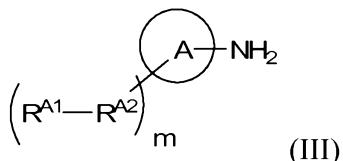

10

Preferably, a process for the manufacture of a compound of the formula (I) comprises either

Method A) reacting a carboxylic acid of the formula (II),

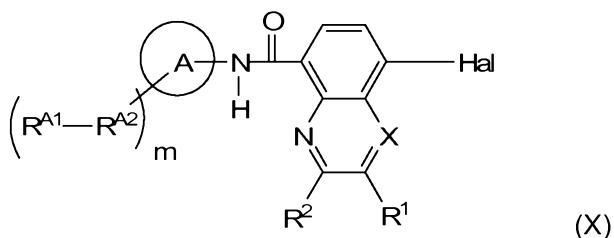

15 wherein the substituents are as defined for a compound of the formula (I) with an amine of the formula (III)

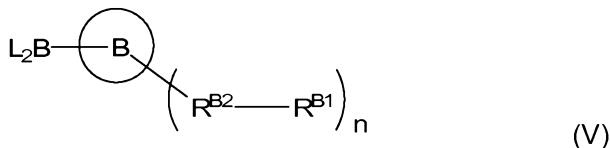

20 optionally in the presence of a diluent (such as a polar organic solvent), optionally in the presence of a reaction aid (such as DMAP or TBTU), optionally in the presence of a base (such as an amine) to obtain a compound of formula I; or

Method B) reacting a compound of formula (X)

wherein the substituents are as defined for a compound of the formula (I) and Hal represents halo (in particular bromo) with a boron compound of the formula (V)

wherein the substituents are as defined for a compound of the formula (I) and L_2B represents a boronic acid residue or an ester thereof (such as $(\text{HO})_2\text{B}-$) or 4,4,5,5-tetramethyl-[1,3,2]dioxaborolan-2-yl-, optionally in the presence of a diluent (such as an apolar organic solvent), optionally in the presence of a catalyst (such as a homogeneous Pd-catalyst), optionally in the presence of a reaction aid (such as an inorganic base) to obtain a compound of formula I;

10

and, if desired, converting a compound of the formula (I) obtained according to method A) or method B) into a different compound of the formula (I), and/or converting an obtainable salt of a compound of the formula (I) into a different salt thereof, and/or converting an obtainable free compound of the formula (I) into a salt thereof, and/or separating an obtainable isomer of a compound of the formula (I) from one or more different obtainable isomers of the formula I.

Method A) is particularly useful for manufacturing of compounds wherein X represents N (such as formula (I-A), (I-B), (I-C); while method B) is particular useful for manufacturing of compounds wherein X represents CH (such as formula (I-D)).

Reaction conditions

Where temperatures are given hereinbefore or hereinafter, "about" has to be added, as minor deviations from the numeric values given, e.g. variations of $\pm 10\%$, are tolerable. All

25

reactions may take place in the presence of one or more diluents and/or solvents.

Protective gases, such as argon, may be used. The starting materials may be used in equimolar amounts; alternatively, a compound may be used in excess, e.g. to function as a solvent or to shift equilibrium or to generally accelerate reaction rates. Reaction aids, such as acids, bases or catalysts may be added in suitable amounts, as known in the field, required by a reaction and in line with generally known procedures.

30

- 45 -

Intermediates and final products can be worked up and/or purified according to standard methods, e.g. using chromatographic methods, distribution methods, (re-) crystallization, and the like. Intermediates may be directly used in the further reaction step or may be subject to one or more work up and/or purification steps. Additionally, intermediates may be
5 subject to further derivatization / functionalization, as the case may be. For example, substitution of an aryl/heteroaryl ring may take place to introduce additional substituents (such as chloro, fluoro).

Starting materials may be used as commercially available, and/or subject to one or more
10 work up and/or purification steps and/or produced in situ.

Amide forming reaction

Such reactions are generally known in the field. The reaction typically takes place in the presence of an activating agent (such as TBTU or others) which may be added in a slight
15 excess and in the presence of a tert. amine and in the presence of one or more diluents (such as polar aprotic diluents). Typically, the reaction takes place at r.t., reaction times may vary, good conversion rates are typically obtained after 18 hours. Further details may be found in the examples.

20 Suzuki-coupling

This reaction is, inter alia, useful for manufacturing of compounds of formula (I) according to method B) as described above. Reaction conditions, starting materials and catalysts for a Suzuki(-Miyaura) reaction are generally known in the field. This reaction typically takes place by palladium-catalyzed crosscoupling of organoboranes (e.g. of formula (V) or a
25 reactive derivative thereof, with a halogen derivative (e.g. of the formula (IV) or (X)). The reaction may be typically performed in analogy to the procedure described by K. Jones, M. Keenan, and F. Hibbert [Synlett, 1996, (6), 509-510].

Protecting groups

Protected derivatives of the compounds of the invention can be made by means known to those of ordinary skill in the art. Protecting groups are such groups that are typically no longer present in the final compounds once they are removed, while groups that remain as

5 substituents are not protecting groups in the sense used here which are groups that are added at a starting material or intermediate stage and removed to obtain a final compound. Also in the case of conversions of a compound of the formula (I) into a different compound of the formula (I), protecting groups may be introduced and removed, if useful or required.

10 The protecting groups may already be present in precursors and should protect the functional groups concerned against unwanted secondary reactions, such as acylations, etherifications, esterifications, oxidations, solvolysis, and similar reactions. It is a characteristic of protecting groups that they lend themselves readily, i.e. without undesired secondary reactions, to removal, typically by acetolysis, protonolysis, solvolysis, reduction, photolysis or
15 also by enzyme activity, for example under conditions analogous to physiological conditions, and that they are not present in the end-products. The specialist knows, or can easily establish, which protecting groups are suitable with the reactions mentioned above and below.

20 The protection of such functional groups by such protecting groups, the protecting groups themselves, and their removal reactions are described for example in standard reference works, such as J. F. W. McOmie, "Protective Groups in Organic Chemistry", Plenum Press, London and New York 1973, in T. W. Greene, "Protective Groups in Organic Synthesis", Third edition, Wiley, New York 1999, in "The Peptides"; Volume 3 (editors: E. Gross and J.
25 Meienhofer), Academic Press, London and New York 1981, in "Methoden der organischen Chemie" (*Methods of organic chemistry*), Houben Weyl, 4th edition, Volume 15/I, Georg Thieme Verlag, Stuttgart 1974, in H.-D. Jakubke and H. Jeschkeit, "Aminosäuren, Peptide, Proteine" (*Amino acids, peptides, proteins*), Verlag Chemie, Weinheim, Deerfield Beach, and Basel 1982, and in Jochen Lehmann, "Chemie der Kohlenhydrate: Monosaccharide
30 und Derivate" (*Chemistry of carbohydrates: monosaccharides and derivatives*), Georg Thieme Verlag, Stuttgart 1974.

Optional Reactions and Conversions

A compound of the formula (I) may be converted into a different compound of the formula (I). The following description provides a non-limiting overview of particular relevant optional reactions and conversions:

5 **Benzyl groups:** For example, in a compound of the formula (I) having a benzyl which is optionally substituted (e.g. methoxybenzyl), said benzyl moiety may be removed by hydrogenation, e.g. in the presence of a noble metal catalyst, such as palladium on coal, in an appropriate solvent, such as an alcohol, e.g. methanol, at appropriate temperatures, e.g. from 0 to 50 °C, in the case of removal from the piperazine nitrogen in the additional presence of an 10 acid, e.g. HCl, to yield the corresponding compound wherein instead of the benzyl moiety a hydrogen is present.

N-oxides: A compound of formula (I) can be converted to a corresponding **N-oxide**. The reaction is typically carried out with a suitable oxidizing agent, preferably a peroxide, for 15 example m-chloroperbenzoic acid, in a suitable solvent, e.g. halogenated hydrocarbon, typically chloroform or dichloromethane, or in a lower alkanecarboxylic acid, typically acetic acid, preferably at a temperature between 0°C and the boiling temperature of the reaction mixture, especially at about room temperature. Compounds of formula (I) in unoxidized form can typically be prepared from N-oxides of compounds of formula (I) by treating with a 20 reducing agent (e.g., sulfur, sulfur dioxide, triphenyl phosphine, lithium borohydride, sodium borohydride, phosphorus trichloride, tribromide, or the like) in a suitable inert organic solvent (e.g. acetonitrile, ethanol, aqueous dioxane, or the like) at 0 to 80°C.

Salts of compounds of formula (I) having at least one salt-forming group may be prepared 25 in a manner known *per se*. For example, an acid addition salt of compounds of formula (I) with basic groups (e.g. basic nitrogen) can be typically obtained in customary manner, e.g. by treating a compound of the formula (I) with an acid or a suitable anion exchange reagent. A salt of a compound of formula (I) having acid groups may be typically formed by treating the compound with a metal compound, such as an alkali metal salt of a suitable organic 30 carboxylic acid, e.g. the sodium salt of 2-ethylhexanoic acid, with an organic alkali metal or alkaline earth metal compound, such as the corresponding hydroxide, carbonate or hydrogen carbonate, such as sodium or potassium hydroxide, carbonate or hydrogen carbonate, with a corresponding calcium compound or with ammonia or a suitable organic amine, stoichiometric amounts or only a small excess of the salt-forming agent preferably

being used. Internal salts of compounds of formula (I) containing acid and basic salt-forming groups, e.g. a free carboxy group and a free amino group, may be formed, e.g. by the neutralization of salts, such as acid addition salts, to the isoelectric point, e.g. with weak bases, or by treatment with ion exchangers. A salt of a compound of the formula (I) can be typically 5 converted in customary manner into the free compound; a metal or ammonium salt can be converted, for example, by treatment with a suitable acid, and an acid addition salt, for example, by treatment with a suitable basic agent into a different salt. In both cases, suitable ion exchangers may be used.

10 **Prodrug derivatives** of the compounds of the invention can be prepared by methods known to those of ordinary skill in the art (e.g., for further details see Saulnier et al., (1994), Bioorganic and Medicinal Chemistry Letters, Vol. 4, p. 1985). For example, appropriate prodrugs can be typically prepared by reacting a non-derivatized compound of the invention with a suitable carbamylating agent (e.g., 1,1-acycloxyalkylcarbanochloride, para- 15 nitrophenyl carbonate, or the like).

Solvates: Compounds of the present invention can be conveniently prepared, or formed during the process of the invention, as solvates (e.g., hydrates). Hydrates of compounds of the present invention can be conveniently prepared by recrystallization from an 20 aqueous/organic solvent mixture, using organic solvents such as dioxin, tetrahydrofuran or methanol.

For example, in a compound of the formula (I) wherein a substituent carries an amino or amino-C₁-C₇-alkyl substituent, the amino can be converted into acylamino, e.g. C₁-C₇- 25 alkanoylamino or C₁-C₇-alkanesulfonylamino, typically by reaction with a corresponding C₁-C₇-alkanoylhalogenide or C₁-C₇-alkanesulfonylhalogenide, e.g. a corresponding chloride, in the presence of a tertiary nitrogen base, such as triethylamine or pyridine, in the absence or presence of an appropriate solvent, such as a methylene chloride, for example at temperatures in the range from -20 to 50 °C, e.g. at about room 30 temperature.

In a compound of the formula (I) wherein a substituent carries a cyano substituent, the cyano may be converted to an aminomethyl group, e.g. by hydrogenation in the presence of an appropriate metal catalyst, such as Raney Nickel or Raney Cobalt, in an

appropriate solvent, e.g. a lower alkanol, such as methanol and/or ethanol, for example at temperatures in the range from -20 to 50 °C, e.g. at about room temperature.

In a compound of the formula (I) wherein a substituent carries a carboxyl group (-

5 COOH), the latter can be converted into an amide group, e.g. an N-C₁-C₇-alkyl-carbamoyl group, typically by reaction with the corresponding amine, e.g. in the presence of a coupling agent, that forms a preferred reactive derivative of the carboxyl group *in situ*, for example dicyclohexylcarbodiimide/1-hydroxybenzotriazole (DCC/ HOBT); bis(2-oxo-3-oxazolidinyl)phosphinic chloride (BOPCl); O-(1,2-dihydro-2-oxo-1-pyridyl)-N,N,N',N'-tetramethyl-10 uronium tetrafluoroborate (TPTU); O-benzotriazol-1-yl)-N,N,N',N'-tetramethyluronium tetrafluoroborate (TBTU); (benzotriazol-1-yloxy)-tritylpyrrolidinophosphonium-hexafluorophosphate (PyBOP), O-(1H-6-chlorobenzotriazole-1-yl)-1,1,3,3-tetramethyluronium hexafluorophosphate, 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride/hydroxybenzotriazole or/1-hydroxy-7-azabenzotriazole (EDC/HOBt or EDC/HOAt) or HOAt 15 alone, or with (1-chloro-2-methyl-propenyl)-dimethylamine. For review of some other possible coupling agents, see e.g. Klauser; Bodansky, *Synthesis* (1972), 453-463. The reaction mixture is preferably stirred at a temperature of between approximately -20 and 50 °C, especially between 0 °C and 30 °C, e.g. at room temperature.

20 **Salts** of a compound of formula (I) with a salt-forming group may be prepared in a manner known *per se*. Acid addition salts of compounds of formula (I) may thus be obtained by treatment with an acid or with a suitable anion exchange reagent. A salt with two acid molecules (for example a dihalogenide of a compound of formula I) may also be converted into a salt with one acid molecule per compound (for example a monohalogenide); this may be 25 typically done by heating to a melt, or for example by heating as a solid under a high vacuum at elevated temperature, for example from 130 to 170°C, one molecule of the acid being expelled per molecule of a compound of formula I. Salts can usually be converted to free compounds, e.g. by treating with suitable basic compounds, for example with alkali metal carbonates, alkali metal hydrogencarbonates, or alkali metal hydroxides, typically 30 K₂CO₃ or sodium NaOH.

Stereoisomeric mixtures, e.g. mixtures of diastereomers, can be separated into their corresponding isomers in a manner known *per se* by means of suitable separation methods.

Diastereomeric mixtures for example may be separated into their individual diastereomers by means of fractionated crystallization, chromatography, solvent distribution, and similar procedures. This separation may take place either at the level of a starting compound or in a compound of formula (I) itself. Enantiomers may be separated through the formation of 5 diastereomeric salts, for example by salt formation with an enantiomer-pure chiral acid, or by means of chromatography, for example by HPLC, using chromatographic substrates with chiral ligands. A more detailed description of the techniques applicable to the resolution of stereoisomers of compounds from their racemic mixture can be found in J. Jacques, A. Collet, S. H. Wilen, "Enantiomers, Racemates and Resolutions", Wiley, 1981.

10

It should be emphasized that reactions analogous to the conversions mentioned in this chapter may also take place at the level of appropriate intermediates (and are thus useful in the preparation of corresponding starting materials).

15 Insofar as the production of the starting materials is not particularly described, the compounds are known or can be prepared analogously to methods known in the art or as disclosed in the Examples hereinafter.

20 One of skill in the art will appreciate that the above transformations are only representative of methods for preparation of the compounds of the present invention, and that other well known methods can similarly be used.

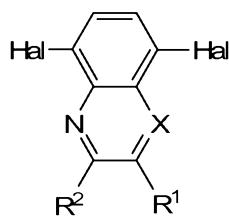

Starting materials:

25 The starting materials of the formulae II, III, IV and V, as well as other starting materials mentioned herein, e.g. below, can be prepared according to or in analogy to methods that are known in the art, are known in the art and/or are commercially available. Novel starting materials, as well as processes for the preparation thereof, are likewise an embodiment of the present invention. In the preferred embodiments, such starting materials are used and the reaction chosen are selected so as to enable the preferred compounds to be obtained.

30 Wherein the starting materials and intermediates R^1 , R^2 , R^{A1} , R^{A2} , R^{B1} , R^{B2} , X, ring A, ring B, m and n are used ("the substituents of formula (I)"), these symbols preferably have the meanings given for a compound of the formula (I), if not indicated otherwise.

In the starting materials (including intermediates), which may also be used and/or obtained as salts where appropriate and expedient, the substituents are preferably as defined for a compound of the formula I.

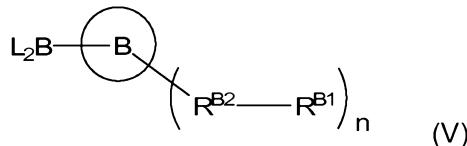

5 Compounds of the **formula (II)** are known or may be prepared by processes that, though not applied hitherto for the compounds of the formula (II) where they thus form new processes, are known *per se*, the following scheme illustrates methods for such preparation. A process for the manufacture of a compound of the formula (II) comprises method A), step 1: reacting first a compound of formula (IV)

(IV)

10

wherein the substituents are as defined for a compound of the formula (I) and Hal represents halo (in particular bromo) with a boron compound of the formula (V)

(V)

wherein the substituents are as defined for a compound of the formula (I) and L₂B

15

represents a boronic acid residue or an ester thereof (such as (HO)₂B⁻) or 4,4,5,5-tetramethyl-[1,3,2]dioxaborolan-2-yl-, optionally in the presence of a diluent (such as an apolar organic solvent), optionally in the presence of a catalyst (such as a homogeneous Pd-catalyst), optionally in the presence of a reaction aid (such as an inorganic base);

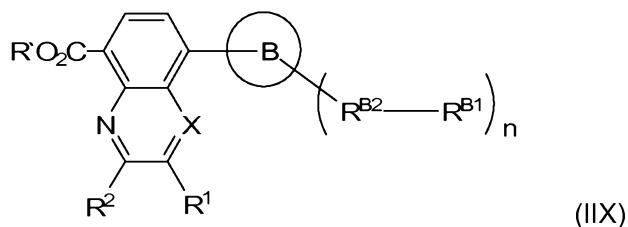

20

step 2: converting the thus obtained compound, optionally after purification or isolation, with CuCN, optionally in the presence of a polar organic solvent (such as NMP) into the corresponding cyano derivative ;

step 3: hydrolysing the thus obtained compound, optionally after purification or isolation, optionally in the presence of a polar organic solvent, to obtain a compound of formula (II);

25

or, method B), hydrolyzing an ester of formula (II)

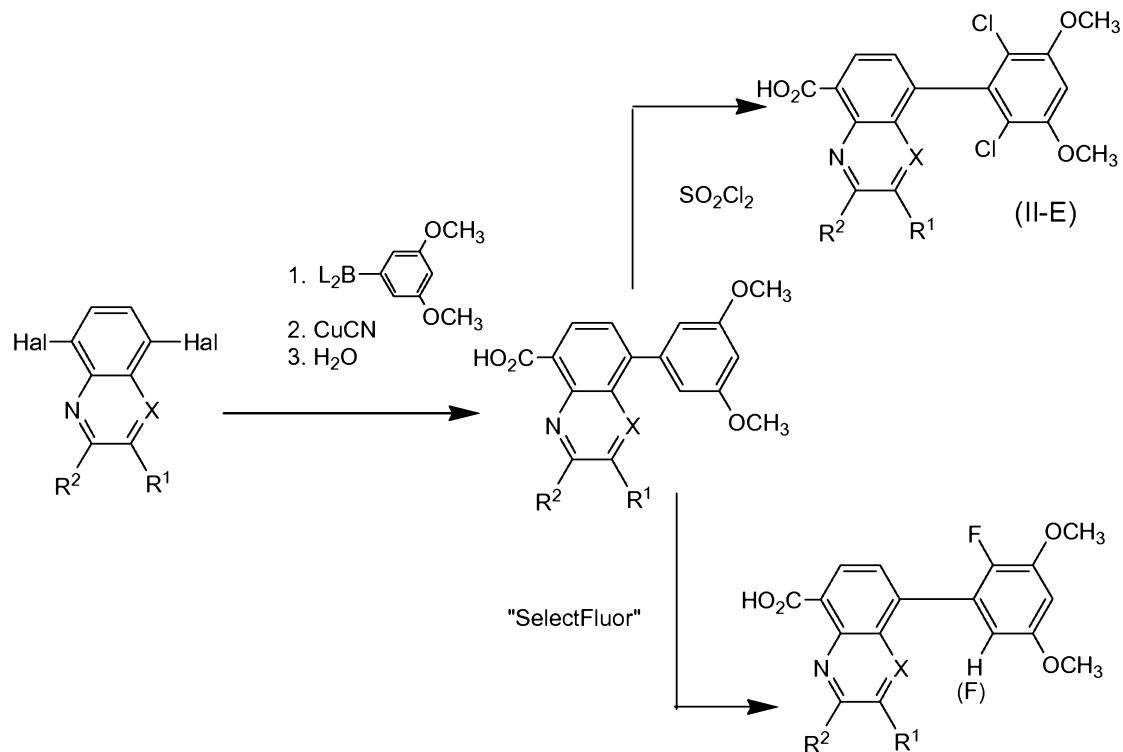

wherein the substituents are as defined for a compound of the formula (I) and R' represents lower alkyl (in particular ethyl) under basic conditions, optionally in the presence of a diluent, to obtain a compound of formula (II);

5

and, if desired, converting a compound of the formula (II) obtained into a different compound of the formula (II), and/or converting an obtainable salt of a compound of the formula (II) into a different salt thereof, and/or converting an obtainable free compound of the formula (II) into a salt thereof, and/or separating an obtainable isomer of a compound of 10 the formula (II) from one or more different obtainable isomers of the formula (II).

The subsequent conversion of a compound of formula (II) into another compound of formula (II) is further illustrated by the following scheme.

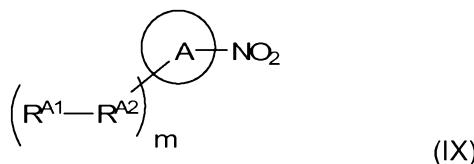

In this scheme, the substituents have the meaning as defined herein. Thus, compounds of formula (II), in particular wherein ring B represents phenyl, a halogenation step may take place once a compound of formula (II) is formed. Such subsequent reaction step (halogenation step) is particular suitable if a substituent $-R^{B2}-R^{B1}$ (such as fluoro or chloro)

5 is to be introduced in one or both of the ortho-position(s) of ring B. Thus, the invention relates also to a process of manufacturing a compound of formula (II) wherein a Suzuki-coupling reation as described above is followed by a substitution reaction, in particular a halogenation reaction of ring B.

the formula (V) into a salt thereof, and/or separating an obtainable isomer of a compound of the formula (V) from one or more different obtainable isomers of the formula (V).

Example 1: 8-(2,6-Dichloro-3,5-dimethoxy-phenyl)-quinoxaline-5-carboxylic acid [4-(4-ethyl-piperazin-1-yl)-phenyl]-amide

A mixture of propylphosphonic anhydride (50% in DMF, 0.31 mL, 0.53 mmol, 2 equiv), 8-

5 (2,6-dichloro-3,5-dimethoxy-phenyl)-quinoxaline-5-carboxylic acid (100 mg, 0.26 mmol) (Step 1.1), 4-(4-ethylpiperazin-1-yl)-aniline (Step 1.9) (65 mg, 0.32 mmol, 1.2 equiv), DMAP (2 mg), and Et₃N (0.37 mL, 2.65 mmol, 10 equiv) in DMF (2.0 mL), was stirred for 18 h at rt, under an argon atmosphere. The reaction mixture was diluted with EtOAc and H₂O. The aqueous layer was separated and extracted with EtOAc. The combined organic phase was 10 washed with brine, dried (Na₂SO₄), filtered and concentrated. The residue was purified by trituration in Et₂O to afford the title compound as a yellow solid: ES-MS: 565.9 [M+H]⁺; t_R = 4.26 min (System 1).

Step 1.1: 8-(2,6-Dichloro-3,5-dimethoxy-phenyl)-quinoxaline-5-carboxylic acid

15 Sulfuryl chloride (1.7 mL, 21.3 mmol, 2 equiv) was added dropwise to a cold (5°C) suspension of 8-(3,5-dimethoxy-phenyl)-quinoxaline-5-carboxylic acid (Step 1.2) (3.3 g, 10.6 mmol) in CH₃CN (30 mL). The reaction mixture was stirred at 5°C for 2 h, quenched by addition of H₂O, and concentrated. Trituration of the residue in H₂O provided 4.0 g of the title compound as a white solid: ESI-MS: 378.9 [M+H]⁺; t_R = 4.54 min (System 1).

20 Step 1.2: 8-(3,5-Dimethoxy-phenyl)-quinoxaline-5-carboxylic acid

The reaction mixture was stirred at 150°C for 3 h (a solution was obtained), allowed to cool to rt, diluted with Et₂O/ H₂O, and extracted with Et₂O. The aqueous phase was acidified to pH 5 by addition of HCl. Vacuum filtration of the resulting suspension afforded 3.3 g of the title compound as a yellow solid: ESI-MS: 311.0 [M+H]⁺; t_R = 4.34 min (System 1).

Step 1.3: 8-(3,5-Dimethoxy-phenyl)-quinoxaline-5-carbonitrile

30 A mixture of 5-bromo-8-(3,5-dimethoxy-phenyl)-quinoxaline (Step 1.4) (4.54 g, 13.2 mmol) and CuCN (1.54 g, 17.1 mmol, 1.3 equiv) in NMP (50 mL) was stirred for 2 h at 180°C,

under an argon atmosphere. The reaction mixture was allowed to cool to rt, diluted with EtOAc (10% aqueous solution of ethylenediamine) (150 mL), and filtered to afford 1.19 g (batch 1) of the title compound as a yellow solid. The filtrate was extracted with DCM. The organic phase was washed with H₂O and brine, dried (Na₂SO₄), filtered and concentrated.

5 The residue was triturated in EtOAc to provide 2.31 g (batch 2) of the title compound: ESI-MS: 292.1 [M+H]⁺; t_R = 4.53 min (System 1).

Step 1.4: 5-Bromo-8-(3,5-dimethoxy-phenyl)-quinoxaline

A mixture of 3,5-dimethoxyphenylboronic acid (Step 1.8) (3.38 g, 18.6 mmol) in EtOH (15 mL) was added dropwise to a mixture of 5,8-dibromo-quinoxaline (Step 1.5) (10.7 g, 37.1 mmol, 2 equiv), PdCl₂(dppf) (530 mg, 0.7 mmol, 0.03 equiv), Na₂CO₃ (2 M solution in H₂O, 37 mL, 74.3 mmol, 4 equiv) in toluene (100 mL) at 105°C, under an argon atmosphere. The reaction mixture was stirred at 105 °C for 2 h, allowed to cool to rt, diluted with EtOAc and H₂O, filtered through a pad of celite and extracted with EtOAc. The organic phase was washed with H₂O and brine, dried (Na₂SO₄), filtered and concentrated *in vacuo*. The crude product was purified by trituration in DCM, followed by silica gel column chromatography (Hex/EtOAc, 4:1) to afford 4.54 g of the title compound as a yellow solid: ES-MS: 345.0 [M+H]⁺; t_R = 5.13 min (System 1); R_f = 0.17 (Hex/EtOAc, 4:1).

20 Step 1.5: 5,8-Dibromo-quinoxaline

The reaction mixture was heated to reflux for 3 h and allowed to cool to rt overnight. Vacuum filtration of the reaction mixture afforded 9.7 g of the title compound as a yellow solid: APCI-MS: 286.2 / 288.1 / 290.1 [M-1]⁻; t_R = 4.40 min (System 1).

Step 1.6: 3,6-Dibromo-benzene-1,2-diamine

NaBH₄ (26 g, 680 mmol, 10 equiv) was added portionwise (2h) to a vigorously stirred suspension of 4,7-dibromo-benzo[1,2,5]thiadiazole (Step 1.7) (20 g, 68.0 mmol) in EtOH (400 mL), under a nitrogen atmosphere and keeping the internal temperature below 15°C. The reaction mixture was allowed to warm to 30°C, stirred for 1 h, cooled to 5°C, quenched by addition of H₂O (50 mL), and concentrated. The residue was diluted with Et₂O/H₂O. The resulting suspension was filtered and the filtrate extracted with Et₂O. The organic phase was washed with H₂O and brine, dried (Na₂SO₄), filtered and concentrated. The residue was

triturated in hexane to provide 12 g of the title compound as a white solid: ESI-MS: 262.9 / 264.9 / 266.9 [M+H]⁺; t_R = 4.20 min (System 1).

Step 1.7: 4,7-Dibromo-benzo[1,2,5]thiadiazole

The reaction mixture was stirred for 4 h at reflux and allowed to cool to rt. The resulting solid was collected by vacuum filtration, washed with H₂O, dried under vacuum, and triturated in MeOH to afford 63 g of the title compound as an off-white solid: ¹H NMR (400 MHz, DMSO-*d*6) δ (ppm): 8.00 (s, 2H);
10 t_R = 5.05 min (System 1).

The yellow mixture was stirred for 45 min at -78°C. Trimethyl borate (20 mL, 179 mmol, 3.5 equiv) was then added. The colorless reaction mixture was allowed to warm to 0°C, quenched by addition of a saturated solution of NH₄Cl (5 mL), and concentrated. The residue was diluted with EtOAc/NH₄Cl (saturated aqueous solution), and extracted with EtOAc. The organic phase was dried (Na₂SO₄), filtered and concentrated.
20 The residue was triturated in Et₂O to provide 6.8 g of the title compound as a white solid: ESI-MS: 183.1 [M+H]⁺; t_R = 2.70 min (System 1).

Step 1.9: 4-(4-Ethylpiperazin-1-yl)-aniline

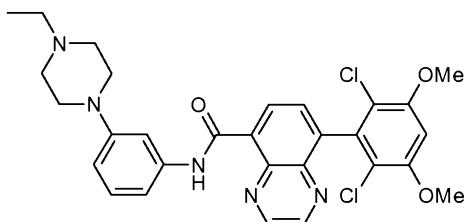

A suspension of 1-ethyl-4-(4-nitro-phenyl)-piperazine (Step 1.10) (6.2 g, 26.35 mmol) and 25 Raney nickel (2 g) in MeOH (120 mL) was stirred for 7 h at rt, under a hydrogen atmosphere. The reaction mixture was filtered through a pad of celite and concentrated to afford 5.3 g of the title compound as a violet solid: ESI-MS: 206.1 [M+H]⁺; TLC: R_f = 0.15 (DCM/MeOH + 1 % NH₃^{aq}, 9:1).

30 Step 1.10: 1-Ethyl-4-(4-nitro-phenyl)-piperazine

A mixture of 1-bromo-4-nitrobenzene (6 g, 29.7 mmol) and 1-ethylpiperazine (7.6 mL, 59.4 mmol, 2 equiv) was heated to 80°C for 15 h. After cooling to rt, the reaction mixture was diluted with H₂O and DCM/MeOH (9:1, v/v). The aqueous layer was separated and extracted with DCM/MeOH, 9:1. The organic phase was washed with brine, dried (sodium sulfate), filtered and concentrated. Purification of the residue by silica gel column

generic assay set-up: Enzyme activities were measured by mixing 10 µL of a 3-fold concentrated compound solution or control with 10 µL of the corresponding substrate mixture (peptidic substrate, ATP and [γ ³²P]ATP). The reactions were initiated by addition of 10 µL of a 3-fold concentrated solution of the respective enzyme in assay buffer. The final concentrations of the assay components were as following: (**FGFR-3-K650E**) 10 ng of GST-

10 Filter binding (FB) method: FB assays were carried out in 96-well plates at room temperature for 10 min in a final volume of 30 µL including the components as indicated in section above. The enzymatic reactions were stopped by the addition of 20 µL of 125 mM EDTA and the incorporation of ³³P into the poly-peptidic substrates were quantified as following: 30 µL of the stopped reaction mixture were transferred onto Immobilon-PVDF membranes previously soaked for 5 min with methanol, rinsed with water, soaked for 5 min with 0.5% H₃PO₄ and mounted on vacuum manifold with disconnected vacuum source. After spotting, vacuum was connected and each well rinsed with 200 µL 0.5% H₃PO₄. Free membranes were removed and washed 4 times on a shaker with 1% H₃PO₄ and once with ethanol. Membranes were dried and overlaid with addition of 10 µL/well of a scintillation fluid. The plates were eventually sealed and counted in a microplate scintillation counter. IC₅₀ values were calculated by linear regression analysis of the percentage inhibition of the compound.
