SCHEME I

As depicted by the above Scheme I, the title compounds 5 4 may be prepared by a Pd(0) catalyzed coupling of an appropriately protected phenylsulfonamide-2-boronic acid intermediate 2 with a 4-heterocyclic aryl halide 1 in the presence of a suitable base, such as aqueous potassium carbonate, and solvent, such as a mixture of toluene and 10 ethanol.

A boronic acid intermediate 2 may be prepared from a 2-bromophenylsulfonamide 5 (preparation of which is

described in EP Publication number 0,569,193 (1993)) by lithiation with a suitable alkyl lithium (such as n-butyl lithium), subsequent treatment with a trialkylborate (e.g., triisopropyl borate) and finally adding an aqueous acid 5 such as aqueous hydrochloric acid (SCHEME II):

SCHEME II

The title compounds may also be synthesized by an alternate route shown below (SCHEME III):

15

SCHEME III

Compound 4

As depicted above, a 4'-Heterocyclic aryl halide 6 (see also compound 1) can be converted to a boronic acid intermediate 7 via the sequence shown. This compound 7, upon Pd(0) catalyzed coupling with a compound 5 can provide a biaryl analog 3, which upon deprotection can lead to the title compound 4. In certain instances, the heteroatoms J and K or L may require protection to prepare the boronic acid 7, and/or to facilitate the coupling reaction to make compound 3. (For example, when J and K or L are N, one of the groups may be protected by a suitable protecting group such as t-butoxycarbonyl, etc). Also, in certain

such as t-butoxycarbonyl, etc). Also, in certain instances, the boronic acid may be replaced with a tin species and/or the halo group may be replaced by a $-OSO_2CF_3$ moiety to perform the Pd-catalyzed coupling reaction. For 5 general strategies in biaryl synthesis, see: Bringmann et al., Angew. Chem. Inst., Ed. Engl. 29 (1990) 977 - 991.

In the above schemes, specific R^{11} - R^{14} groups are chosen to be compatible with the reaction conditions shown. Additionally, specific R^{11} - R^{14} groups may be converted 10 into alternative R^{11} - R^{14} groups, either before or after coupling of Compound 1 with Compound 2, or Compound 5 with Compound 7, using methods known in the art.

B. N-Cyclopropyl-N-[2'-(3,4-dimethyl-5-isoxazolyl)aminol-sulfonyl-4-(2-oxazolyl)[1,1'-biphenyl]-2-yl]methyl-2-methylpropanamide

Isobutyrylchloride (0.022 ml; 0.21 mmol) was added to a solution of the title compound of Step (A) (78 mg; 0.17 mmol) and triethylamine (0.060 ml; 0.42 mmol) in 1.5 ml of CH₂Cl₂ at room temperature. After 1 hour, the reaction mixture was partitioned between EtOAc (25 ml) and water (25

A 2 L three necked flask, equipped with an overhead mechanical stirrer, a 250 mL addition funnel and an argon line, was charged with 2-bromobenzenesulfonyl chloride (150 g, 587 mmol, commercially available) and anhydrous pyridine (150 mL). The resulting light yellow solution was cooled to -18°C (internal temperature) by an ice/salt bath. With stirring, a solution of 5-amino-3,4-dimethylisoxazole (69.1 g, 616 mmol, commercially available) in anhydrous pyridine (195 mL) was added dropwise through the addition funnel in 1 hour. The internal reaction temperature did not exceed -6°C during the course of the addition. After the addition, the ice/salt bath was removed and the reaction mixture was then warmed up to room temperature, stirred for 1 hour, and then stirred at 40°C for 21 hours.

The reaction mixture was cooled to room temperature and poured into a mixture of ice water (3 L) and celite (37.5 g). After stirring for 20 minutes, it was filtered and rinsed with water (250 mL x 3). Charcoal (45 g) was added to the filtrate. The mixture was stirred at room temperature for 40 minutes and was filtered through a pad of celite. The celite pad was rinsed with water (500 mL x 3). The filtrate was acidified by dropwise addition of cold HCl (6N, 750 mL) with vigorous stirring over 2 hours. Precipitation of the product occurred and the mixture was stirred for another 1 hour after the addition of HCl.

The mixture was filtered, the solid was rinsed with cold water (750 mL x 4), and suction dried for 3 days. The title compound of this Step i was obtained as a yellowish white solid (171 g) in 88% yield (HPLC area percent = 5 97.4%).

A dry 3-necked 1-liter round-bottomed flask equipped with an overhead mechanical stirrer, gas adapter, thermocouple, and septum was charged with the title compound 25 of Step ii (40.0 g; 95.4 mmol), and then thoroughly degassed and placed under an argon atmosphere. Tetrahydrofuran (THF, 185 mL) was added via syringe and the mixture was cooled to about -100°C (internal temperature). n-Butyl lithium (n-BuLi, 42.5 mL, 101 mmol, 2.38 M in hexanes) was dropwise 30 added over a period of 16 minutes, while maintaining the internal temperature between -97°C and -101°C. The pale yellow-orange solution was stirred at about -98°C to -101°C for an additional 16 minutes.

Trimethylborate (16.0 mL, 140.9 mmol) in THF (24 mL) was 35 dropwise added over 14.5 minutes, while maintaining the internal temperature between -96°C and -99°C. The mixture

was stirred for about 44 minutes at about -93°C to -101°C, and an additional 39 minutes at about -93°C to -72°C. HCl (3.0 N, 120 mL, 360 mmol) was added to the reaction (the solution exothermed to about -7°C) and was stirred for 20 minutes (-7°C to +6°C). The two layers were separated in a separatory funnel, and the aqueous phase was washed with toluene (3 x 120 mL) and t-butyl methyl ether (MTBE, 3 x 100 mL). The combined organic layer was washed with brine (4 x 100 mL), dried over Na₂SO₄, and concentrated on a rotary evaporator to a volume of about 100 mL containing the title compound of this Step iii (HPLC area percent = 97.7%).

Alternative preparation of the title compound of this Step iii:

15 A 500 mL 3-neck flask equipped with a stir bar was charged with the title compound of Step ii (20.0 g, 47.7 mmol) and purged with argon for 0.5 hr. Anhydrous THF (200 mL) was added via syringe and the flask was cooled to -78°C in an acetone/dry ice bath. Phenyl lithium (PhLi, 37.1 mL, 48.2 mmol, 1.3 M in cyclohexane-ether, titrated according to *J. Organomet. Chem.*, 186, 155 (1980), and determined to be 1.3 M) was added via an addition funnel over the course of 25 minutes. The rate of addition of PhLi was such that the internal temperature of the reaction mixture was maintained below -75°C. The resulting solution was stirred at -78°C for 15 minutes following which a solution of trimethylborate (10.8 mL, 95.4 mmol) in THF (5 mL) was cannulated dropwise into the reaction mixture over 15 minutes. The trimethylborate/THF solution was cooled in an ice-water bath prior to addition. The rate of addition was maintained such that the internal temperature of the reaction mixture did not go above -73°C. The reaction mixture was stirred at -78°C for 0.5 hr, and then quenched by the dropwise addition of a solution of acetic acid (15 mL) in THF (10 mL). The 30 acidified solution was stirred at -78°C for 10 minutes following which the solution was warmed to 0°C. To this was 35

added dropwise, 1N HCl (25 mL). (1N HCl was prepared by diluting 42 mL of 12N HCl into 500 mL of water. The excess acid was added in order to ensure complete quenching. The HCl solution was pre-cooled in an ice/water bath prior to 5 addition.) The reaction mixture was then allowed to warm to room temperature and extracted with t-butyl methyl ether (TBME, 4 X 250 mL). The organic layers were combined and extracted with 0.5N aqueous NaOH (4 X 25 mL). The aqueous layers were combined and back extracted with TBME (1 X 100 10 mL). The aqueous extract was cooled to 0°C and the pH adjusted to 2.0 (pH meter) by the dropwise addition of 6N HCl with rapid stirring. The acidified solution was extracted with TBME (4 X 250 mL), the organic layers pooled and dried over anhydrous MgSO₄. The suspension was filtered and the 15 solution concentrated to give the boronic acid title compound of this Step iii as a pale brown oil (17.1 g, 93%, HPLC area percent = 88%).

The residue was purified by reverse phase preparative HPLC on a 30x500 mm ODS S10 column using 62% solvent B (90% MeOH , 10% H_2O , 0.1% TFA) and 38% solvent A (10% MeOH , 90% H_2O , 0.1% TFA). The appropriate fractions were collected and 25 neutralized with aqueous sodium bicarbonate to pH 7 and concentrated to 5 mL. The solution was then acidified to pH 2 using aqueous sodium bisulfate and the white solid was filtered and dried to provide 0.039 g (17%) of the title

compound of this Example as a white solid. m.p. 105-115°C (amorphous).

To ethyl 4-amino-3,3-dimethyl butyrate (159 mg, 1.0 mmol) and the title compound of step E of Example 21 (256 mg, 0.5 mmol) and 3Å molecular sieves in 5 mL CH₂Cl₂, acetic acid (60 mg, 1.0 mmol) was added followed by sodium triacetoxyborohydride (318 mg, 1.5 mmol). The reaction mixture was stirred at room temperature overnight and filtered. The filtrate was washed with H₂O and brine, dried and concentrated. The residue was chromatographed on silica gel using 1:2.5 hexane/EtOAc to give the title compound of this step (220 mg, 72%) as a gum.

B. N-(3,4-dimethyl-5-isoxazolyl)-2'-(4,4-dimethyl-2-oxo-1-pyrrolidinyl)methyl-N-[(2-oxazolyl)[1,1'-biphenyl]-2-sulfonamide

To a solution of the title compound of step A (218 mg, 0.36 mmol) in 7 mL of CH₃CN, trimethylsilyl chloride (315 mg, 2.9 mmol) was added followed by NaI (435 mg, 2.9 mmol). The mixture was stirred at room temperature for 1 hr. Additional trimethylsilyl chloride (158 mg, 1.5 mmol) and

NaI (218 mg, 1.5 mmol) were added and the reaction was stirred for an additional 1 hr and 15 min. The reaction mixture was then added to H₂O and EtOAc. The organic layer was separated and washed with saturated aqueous Na₂S₂O₃, 5 brine, dried and concentrated. The residue was purified by preparative HPLC on an ODS S10 column using 35% solvent A (10% MeOH, 90% H₂O, 0.1% TFA) and 65% solvent B (90% MeOH, 10% H₂O, 0.1% TFA) to provide the title compound of this Example (80 mg, 43% for two steps) as a white solid, m.p. 10 118-125°C.

Examples 202 to 270

The compounds of Examples 202 to 270 have the 15 structure below where, for each compound, R* is the moiety shown in Table II following.

20 These compounds were prepared robotically as follows. To a vial containing an acid R*-COOH (0.075 mmol), a solution of 2'-(methylamino)methyl-N-(3,4-dimethyl-5-isoxazolyl)-4'-(2-oxazolyl)[1,1'-biphenyl]-2-sulfonamide, prepared as described in step A of Example 28 25 (32.9 mg, 0.075 mmol) in 0.34 ml CH₂Cl₂ and 0.09 ml DMF was added followed by a solution of 1,3-diisopropylcarbodiimide in CH₂Cl₂ (0.28 N, 0.320 ml, 0.09 mmol). The reaction mixture was vortexed for 3 minutes and let stand at room temperature for 24 hr. The mixture was then loaded onto 30 1.5 g of a Strong Anion Exchange ("SAX", Quaternary Amine)

resin and eluted with 20 ml CH_2Cl_2 and then 10 ml 3% TFA in CH_2Cl_2 to give the desired compound.

Lett.*, 37, 3339-3342 (1996)) in a flask, 100 ml 4N HCl in dioxane was added. The mixture was stirred at room temperature for 5 hrs and concentrated to give the title compound of this step as a solid which was used in the next step without further 30 purification.

B. 2-Bromo-N-(4,5-dimethyl-3-isoxazolyl)benzenesulfonamide

To the entirety of the solid obtained in step A and 5 4-dimethylaminopyridine (1.44 g, 11.78 mmol) in 79 ml pyridine at 0°C, 2-bromobenzenesulfonyl chloride (28.59 g, 111.90 mmol) was added in portions over 10 minutes. The mixture was stirred at 40°C for 6.5 hrs and concentrated. The residue was dissolved in 300 ml MeOH, 1000 ml 3% 10 aqueous NaHCO₃ solution was added, and the mixture was concentrated *in vacuo* to remove most of the MeOH. The solid was filtered off and the aqueous filtrate was acidified to pH 1 with 6N HCl at 0°C, and extracted with EtOAc (2x400 ml). The extracts were washed with 100 ml 1N 15 HCl, 100 ml H₂O and 100 ml brine, dried and concentrated to give the title compound of this step (34.32 g, ~95% pure, yield 84% for two steps). R_f=0.57, silica gel, 1:1 hexane/EtOAc.

After stirring at room temperature for 30 minutes, the mixture was cooled with an ice-salt bath (-15°C) and 2-methoxyethoxymethyl chloride (16.00 g, 128.48 mmol) was added dropwise over 20 minutes. The reaction was stirred with an ice-salt bath 30 for 20 minutes and then at room temperature for 1.5 hrs. 1400 ml 1:1 hexane/EtOAc was added to the reaction mixture. The organic layer was separated and washed with 2x800 ml water, 400 ml brine and dried and concentrated. The residue was chromatographed on silica gel using 2.5:1

The 10 mixture was stirred at -95°C for 10 minutes and trimethylborate (6.59 g, 63.42 mmol) was added and stirred at -78°C for 15 minutes. The cold bath was removed and the mixture was warmed to room temperature slowly and stirred at room temperature for 0.5 hr. The mixture was then 15 cooled to 0°C and 100 ml 3N HCl was added dropwise. After stirring for 30 minutes, the mixture was extracted with CH₂Cl₂ (300 ml, 100 ml). The combined organic extracts were washed with 30 ml brine, dried and concentrated to give 2-borono-N-(4,5-dimethyl-3-isoxazolyl)-N-[(2-methoxyethoxy)methyl]benzene-sulfonamide as a gum.
