This invention relates to new and useful improvements and structural arrangements in holders, and the principal object of the invention is to provide a device of the character herein described, such as may be conveniently and effectively employed for supporting the usual dispensing containers for waxpaper.

A further object of the invention is to provide a holder of the character described which may be conveniently attached to suitable supporting structure, such as for example, a kitchen cabinet, or the like, and from which the waxpaper may be easily and conveniently withdrawn.

Another object of the invention is to provide a holder for waxpaper dispensers which is simple in construction, which will not easily become damaged, and wherein the waxpaper dispenser may be easily replaced after the contents thereof are exhausted.

A still further object of the invention is to provide a holder for waxpaper dispensers which will be otherwise well adapted for the purpose for which it is intended.

With the above more important objects in view, and such other objects as may become apparent as this specification proceeds, the invention consists essentially of the arrangement and construction of parts as illustrated in the accompanying drawings, in which:

Figure 1 is a perspective view of the invention per se.

Figure 2 is a cross-sectional view, taken substantially in the plane of the line 2—2 in Figure 1.

Figure 3 is an end view of the invention, the same being taken in the direction of the arrow 3 in Figure 1 and illustrating a waxpaper dispenser in place therein, and

Figure 4 is a cross-sectional view, taken substantially in the plane of the line 4—4 in Figure 1 and showing a waxpaper dispenser in place in the holder.

Like characters of reference are employed to designate like parts in the specification and throughout the several views.

Referring now to the accompanying drawings in detail, the invention consists of a holder designated generally by the reference character 18, the same being intended for use in association with a dispenser or dispensing container 11 of conventional type, containing a roll of waxpaper 12.

This container is usually of cardboard construction, being provided in one side thereof with a dispensing slot 13 and with a cutting edge 14, as will be clearly understood.

The holder 18 embodies in its construction an elongated housing 15 formed from any suitable material, one end of the housing being closed as at 16, while its remaining end is open as at 17, so that the dispenser 11 may be inserted into the housing, and the housing then being closed at the open end of the latter.

One side of the housing 15 is formed with a longitudinally extending slot or opening 18, the same being open at one end thereof, namely, at the open end 17 of the housing, and matters being so arranged that when the dispenser 11 is inserted in the housing, the slot 18 and the cutting edge 14 of the dispenser will be disposed in the opening 18 of the housing, so that the dispensing of the paper 12 may be effected.

Means are provided for removably retaining the dispenser 11 in the housing 15, said means consisting of a resilient clip 19 secured to the housing 15, as at 20, the clip 19 including a flange 21 which serves to retain the dispenser 11 in its position in the housing. Needless to say, the clip 19 may be swung in the direction of the arrow 22, so as to facilitate insertion or removal of the dispenser 11.

The entire holder may be secured to suitable supporting structure, such as for example, a kitchen cabinet by means of screws (not shown) inserted in suitable apertures 23 with which the holder is equipped.

It is believed that the advantages and use of the invention will be clearly apparent from the foregoing disclosure, and accordingly, further description thereof at this point is deemed unnecessary.

While in the foregoing there has been shown and described the preferred embodiment of this invention it is to be understood that minor changes in the details of construction, combination and arrangement of parts may be resorted to without departing from the spirit and scope of the invention as claimed.

Having described the invention what is claimed as new is:

A holder for waxpaper dispensers, comprising an elongated dispenser receiving housing adapted for attachment to supporting structure and having an open end, said housing including a back wall and a front wall provided with a dispensing slot which extends longitudinally in said front wall to said open end, and a resilient clip disposed exteriorly of the housing and comprising an elongated back portion positioned against the rear surface of said back wall and having one end thereof secured to the latter, the remaining end of said back portion extending to the open end of said housing, and a forwardly extending flange provided on said remaining end of said back portion, said flange projecting over the open end of the housing to retain a dispenser therein but being movable rearwardly beyond said back wall to facilitate removal of the stated dispenser.
