ABSTRACT

A moon roof assembly for a vehicle includes an actuator-driven panel having an open position and a closed position. A moon roof trim ring at least partially surrounds the panel. The moon roof trim ring includes a control housing for supporting a control system. A control system is located in the control housing. The control system includes a control member that is exposed through an opening in the moon roof trim ring for actuating the control member and moving the panel between the open position and the closed position.

20 Claims, 7 Drawing Sheets
ROOF ASSEMBLIES FOR VEHICLES INCLUDING MOON ROOF ASSEMBLIES

TECHNICAL FIELD

The present specification generally relates to roof systems for vehicles and, more specifically, to roof systems including moon roof assemblies.

BACKGROUND

Conventional vehicle roof systems generally include a headliner forming a ceiling of the vehicle. Headliners may include layers of materials such as a foam layer covered with a cloth material. As one example, a headliner may include an outer decorative layer to provide a pleasing visual appearance. In addition, the headliner may include a layer which is intended to absorb sound to reduce noise.

Some vehicles also include a moon roof. While some may attempt to draw a distinction between a sun roof and a moon roof, as used herein, the term "moon roof" generally refers to a panel such as glass or other material that can be opened to allow air to circulate within the vehicle through an opening in the roof. Often, such moon roofs may be motor-driven and may include controls in an overhead compartment at the front of the vehicle for use in opening and closing the moon roof. However, such controls can be difficult for back seat passengers to access. Accordingly, other moon roof assemblies are desired having increased control accessibility to passengers.

SUMMARY

In one embodiment, a moon roof assembly for a vehicle includes an actuator-driven panel having an open position and a closed position. A moon roof trim ring at least partially surrounds the panel. The moon roof trim ring includes a control housing for supporting a control system. A control system is located in the control housing. The control system includes a control member that is exposed through an opening in the moon roof trim ring for actuating the control member and moving the panel between the open position and the closed position.

In another embodiment, a vehicle includes a front moon roof assembly and a rear moon roof assembly. At least one of the front moon roof assembly and the rear moon roof assembly includes a moon roof trim ring at least partially surrounding an actuator-driven panel. The moon roof trim ring includes a control housing for supporting a control system for controlling movement of the panel between an open position and a closed position.

In another embodiment, a rear moon roof assembly for a vehicle is located above a rear seating area of the vehicle. The rear moon roof assembly includes an actuator-driven panel having an open position and a closed position. A moon roof trim ring at least partially surrounds the panel. A control system includes a manually actuable control member exposed through the moon roof trim ring for controlling movement of the panel between the open position and the closed position.

These and additional features provided by the embodiments described herein will be more fully understood in view of the following detailed description, in conjunction with the drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

The embodiments set forth in the drawings are illustrative and exemplary in nature and not intended to limit the subject matter defined by the claims. The following detailed description of the illustrative embodiments can be understood when read in conjunction with the following drawings, where like structure is indicated with like reference numerals and in which:

FIG. 1 is an exterior view of a vehicle illustrating front and rear moon roof assemblies according to one or more embodiments shown and described herein;

FIG. 2 illustrates an interior view of the roof portion of FIG. 1 according to one or more embodiments shown and described herein;

FIG. 3 illustrates an exposed, floor facing side of a moon roof trim ring according to one or more embodiments shown and described herein;

FIG. 4 illustrates a roof facing side of the moon roof trim ring of FIG. 3 according to one or more embodiments shown and described herein;

FIG. 5 illustrates a control housing of the moon roof trim ring of FIG. 4 according to one or more embodiments shown and described herein;

FIG. 6 illustrates a roof facing side of the moon roof trim ring of FIG. 4 attached to a headliner; and

FIG. 7 illustrates another view of the moon roof trim ring of FIG. 4 attached to the headliner.

DETAILED DESCRIPTION

Embodiments described herein generally relate to roof systems for vehicles that include one or more moon roof assemblies. The moon roof assemblies may be actuator-driven and include controls for operating the moon roof assemblies. As will be described in greater detail herein, the moon roof assemblies may include controls for operating the moon roof assemblies mounted to a moon roof trim ring for providing greater accessibility to the controls to passengers within the vehicle. Locating the controls in the trim ring may also allow passengers to easily identify the controls and recognize their use in operating the moon roof assemblies.

Referring to FIG. 1, a vehicle 10 includes a roof system 12 including a first, front moon roof assembly 14 and a second, rear moon roof assembly 16. While two moon roof assemblies 14 and 16 are depicted, there may be more or less than two moon roof assemblies. For example, there may only be one rear moon roof assembly or one front moon roof assembly. The front moon roof assembly 14 and the rear moon roof assembly 16 generally include moon roof openings 18 and 20 formed in a ceiling portion 25 of the vehicle. The moon roof openings 18 and 20 can be opened and closed by a moon roof panel 22 and 24, for example, formed of a transparent or semi-transparent material (e.g., glass, plastic, etc.) configured for viewing of the external surroundings by occupants of the vehicle. The moon roof panels 22 and 24 may slide in a longitudinal direction of the vehicle 10, for example, using an actuator such as a motor. A sunshade 26 and 28 may also be provided on the ceiling portion 25 that slides relative to the moon roof panels 22 and 24 for exposing or covering the moon roof panels 22 and 24.

Referring to FIG. 2, an interior 30 of the vehicle 10 includes the roof system 12 including the front moon roof assembly 14 and the rear moon roof assembly 16. Moon roof trim rings 32 and 34 are provided about the moon roof openings 18 and 20. The moon roof trim rings 32 and 34 may provide a smooth, molded look to the front moon roof assembly 14 and the rear moon roof assembly 16, which are more aesthetically pleasing. As can be seen by FIG. 2, controls 36 for operating the front moon roof assembly 14 may be located in an overhead compartment 38, separate from the moon roof.
Referring to FIGS. 6 and 7, the control system 58 is illustrated connected to an electrical line 80 by connector 85 (FIG. 7). The electrical line 80 may include several electrical wires, for example, for power and for connecting control functions of the control system 58 to the moon roof assembly 16 (for opening/closing/tilting the moon roof panel 34). A cable holding feature 82 may also be provided for holding and positioning the electrical line 80 at a position adjacent to the control system 58. In some embodiments, a glue or other material may be used for positioning the electrical line 80.

The moon roof trim ring 34 may be attached to a headliner 90 using any suitable method. In the illustrated embodiment, the moon roof trim ring 34 includes clip members 92 disposed about a periphery of the moon roof trim ring 34 that can be used to catch and rest onledgeportions 94 extending into an opening 96 of the headliner 90. The moon roof trim ring 34 may also include fastener regions 98 (e.g., of hook and loop-type fasteners) that are used to secure the headliner/trim ring assembly to the roof of the vehicle. As can be seen by FIG. 7, the headliner 90 includes a notch region 100 that is used to receive the control housing 56. Any other suitable method or combination of methods can be used to secure the moon roof trim ring 34 to the headliner 90, such as sonic welding, adhesives, mechanical fasteners, etc.

The moon roof assembly 16 is shown having a shape and size intended to cover a portion of the roof area of the vehicle 10, and is substantially surrounded by the moon roof trim ring 34 that can provide structural and functional support to the moon roof assembly 16, and can act as a trim piece for the overhead area of the vehicle 10. The moon roof trim ring 34 may be provided as a single piece, or as multiple pieces configured for interconnection, or as extendable/retractable (e.g. telescoping, etc.) members configured for use with roof panels of varying sizes (e.g. for multiple vehicle programs, etc.). The moon roof trim ring 34 may also be configured for retaining other overhead components, wiring and electrical components, illumination devices, head impact countermeasures (HIC) devices, etc.

While particular embodiments have been illustrated and described herein, it should be understood that various other changes and modifications may be made without departing from the spirit and scope of the claimed subject matter. Moreover, although various aspects of the claimed subject matter have been described herein, such aspects need not be utilized in combination. It is therefore intended that the appended claims cover all such changes and modifications that are within the scope of the claimed subject matter.

What is claimed is:

1. A moon roof assembly for a vehicle, comprising:
a moon roof trim ring at least partially surrounding the panel, the moon roof trim ring including a control housing for supporting a control system; and
a control system located in the control housing, the control system including a control member that is exposed through an opening in the moon roof trim ring for actuating the control member and moving the panel between the open position and the closed position.

2. The moon roof assembly of claim 1 wherein the moon roof trim ring forms a continuous, closed ring having a front portion, a rear portion and side portions extending from the front portion to the rear portion, the control housing located at a roof-facing side of the front portion.

3. The moon roof assembly of claim 2 wherein the control housing is integrally molded with the front portion of the moon roof trim ring.
4. The moon roof assembly of claim 1, wherein the control housing includes a front wall, a rear wall and side walls extending between the front wall and the rear wall thereby defining a volume for receiving the control system.

5. The moon roof assembly of claim 1 further comprising a cable support feature for securing an electrical cable adjacent the control system.

6. The moon roof assembly of claim 1 further comprising a moveable sunshade having a closed position covering the panel and an open position exposing the panel.

7. A vehicle comprising:
   a front moon roof assembly; and
   a rear moon roof assembly;
   wherein at least one of the front moon roof assembly and the rear moon roof assembly includes a moon roof trim ring at least partially surrounding an actuator-driven panel, the moon roof trim ring including a control housing for supporting a control system for controlling movement of the panel between an open position and a closed position.

8. The vehicle of claim 7, wherein the rear moon roof assembly includes the moon roof trim ring at least partially surrounding the panel, the moon roof trim ring including the control housing for supporting the control system for controlling movement of the panel between the open position and the closed position.

9. The vehicle of claim 8 further comprising a control system located in the control housing, the control system including a control member that is exposed through an opening in the moon roof trim ring for actuating the control member and moving the panel of the rear moon roof assembly between the open position and the closed position.

10. The vehicle of claim 9 further comprising an overhead compartment that houses a front control system configured for controlling the front moon roof assembly.

11. The vehicle of claim 10, wherein the overhead compartment is located above a front seating area of the vehicle and the control housing of the moon roof trim ring is located above a rear seating area of the vehicle.

12. The vehicle of claim 8, wherein the moon roof trim ring forms a continuous, closed ring having a front portion, a rear portion and side portions extending from the front portion to the rear portion, the control housing located at a roof-facing side of the front portion.

13. The vehicle of claim 12, wherein the control housing is integrally molded with the front portion of the moon roof trim ring.

14. The vehicle of claim 13, wherein the control housing includes a front wall, a rear wall and side walls extending between the front wall and the rear wall thereby defining a volume for receiving the control system.

15. The vehicle of claim 14 further comprising a cable support feature for securing an electrical cable adjacent the control system.

16. The vehicle of claim 8 further comprising a moveable sunshade having a closed position covering the panel and an open position exposing the panel.

17. A rear moon roof assembly for a vehicle located above a rear seating area of the vehicle, the rear moon roof assembly comprising:
   an actuator-driven panel having an open position and a closed position;
   a moon roof trim ring at least partially surrounding the panel; and
   a control system including a manually actutable control member exposed through the moon roof trim ring for controlling movement of the panel between the open position and the closed position.

18. The rear moon roof assembly of claim 17, wherein the moon roof trim ring includes a control housing for supporting the control system.

19. The rear moon roof assembly of claim 18, wherein the moon roof trim ring forms a continuous, closed ring having a front portion, a rear portion and side portions extending from the front portion to the rear portion, the control housing located at a roof-facing side of the front portion.

20. The rear moon roof assembly of claim 19, wherein the control housing includes a front wall, a rear wall and side walls extending between the front wall and the rear wall thereby defining a volume for receiving the control system.
