(60) Provisional application No. 60/390,459, filed on Jun. 20, 2002.

A computerized risk management method and system for facilitating analysis and quantification of risk associated with a risk subject on a proprietary basis. A proprietary risk management system combines gathered information with information received from a source such as an automated risk management clearinghouse system and maintains a database to relate risk variables and calculate a measurement of risk. The measurement, which can be a risk quotient or other rating based upon a weighted algorithm applied to the risk variables, is indicative of risk associated with the risk subject. Actions commensurate with a risk quotient can be presented to a user to facilitate management of risk associated with a particular entity or transaction or other transaction. A stored history can be created to mitigate adverse effects relating to a problematic transaction.

PROPRIETARY RISK MANAGEMENT CLEARINGHOUSE

CROSS REFERENCE TO RELATED APPLICATIONS

[0001] This application claims the benefit of the filing date of U.S. Provisional application no. 60/390,459 entitled "Proprietary Risk Management", filed Jun. 20, 2002. This application is a continuation-in-part of a prior application entitled "Risk Management Clearinghouse" filed Feb. 12, 2002 and bearing the Ser. No. 10/074,584, as well as being a continuation-in-part of a prior application entitled "Risk Management Clearinghouse" filed Oct. 30, 2001, and bearing the Ser. No. 10/021,124, which is also a continuation-in-part of a prior application entitled "Automated Global Risk Management" filed Mar. 20, 2001, and bearing the Ser. No. 09/812,627, all of which are relied upon and incorporated by reference.

BACKGROUND

[0002] This invention relates generally to a method and system for facilitating the identification, investigation, assessment and management of legal, regulatory financial and reputational risks ("Risks"). In particular, the present invention relates to a computerized system and method for banks and non-bank financial institutions to access information compiled on a worldwide basis and relate such information to a risk subject, such as a transaction at hand, wherein the information is conducive to quantifying and managing financial, legal, regulatory and reputational risk associated with the transaction.

[0003] As money-laundering and related concerns have become increasingly important public policy concerns, regulators have attempted to address these issues by imposing increasing formal and informal obligations upon financial institutions. Government regulations authorize a broad regime of record-keeping and regulatory reporting obligations on covered financial institutions as a tool for the federal government to use to fight drug trafficking, money laundering, and other crimes. The regulations may require financial institutions to file currency and monetary instrument reports and to maintain certain records for possible use in tax, criminal and regulatory proceedings. Such a body of regulation is designed chiefly to assist law enforcement authorities in detecting when criminals are using banks and other financial institutions as intermediaries for, or to hide the transfer of funds derived from, criminal activity.

[0004] Obligations include those imposed by the Department of the Treasury and federal banking regulators which adopted suspicious activity report ("SAR") regulations. These SAR regulations require that financial institutions file SARs whenever an institution detects a known or suspected violation of federal law, or a suspicious transaction related to a money laundering activity or a violation of the Bank Secrecy Act (BSA). The regulations can impose a variety of reporting obligations on financial institutions. Perhaps most broadly relevant for the present invention, they require an institution to report transactions aggregating to \$5,000 that involve potential money laundering or violations if the institution, knows, suspects, or has reason to suspect that the transaction involves funds from illegal activities, is designed to disguise such funds, has no business or legitimate purpose, or is simply not the sort of transaction in which the particular customer would normally be expected to engage, and the

institution knows of no reasonable explanation for the transaction after examining the available facts.

[0005] For example, banks must retain a copy of all SARs and all supporting documentation or equivalent business records for 5 years from the date of the filing of the SAR. Federal banking regulators are responsible for determining financial institutions' compliance with the BSA and implementing regulations.

[0006] Federal regulators have made clear that the practical effect of these requirements is that financial institutions are subject to significant obligations to "know" their customer and to engage in adequate monitoring of transactions.

[0007] Bank and non-bank financial institutions, including: investment banks; merchant banks; commercial banks; securities firms, including broker dealers securities and commodities trading firms; asset management companies, hedge funds, mutual funds, credit rating funds, securities exchanges and bourses, institutional and individual investors, law firms, accounting firms, auditing firms, any institution the business of which is engaging in financial activities as described in section 4(k) of the Bank Holding Act of 1956, and other entities subject to legal and regulatory compliance obligations with respect to money laundering, fraud, corruption, terrorism, organized crime, regulatory and suspicious activity reporting, sanctions, embargoes and other regulatory risks and associated obligations, hereinafter collectively referred to as "Financial Institutions," typically have few resources available to them to assist in the identification of present or potential risks associated with business transactions.

[0008] Risk can be multifaceted and far reaching. Generally, personnel do not have available a mechanism to provide real time assistance to assess a risk factor or otherwise qualitatively manage risk. In the event of problems, it is often difficult to quantify to regulatory bodies, shareholders, newspapers and other interested parties, the diligence exercised by the Financial Institution to properly identify and respond to risk factors. Absent a means to quantify good business practices and diligent efforts to contain risk, a Financial Institution may appear to be negligent in some respect.

[0009] Risk associated with an account involved in international transactions can be greatly increased due to the difficulty in gathering and accessing pertinent data on a basis timely to managing risk associated with the transaction. As part of due diligence associated with performing financial transactions, it may be important for a Financial Institution to "Know Their Customer" including whether a customer is contained on a list of restricted entities published by the Office of Foreign Access Control (OFAC), the Treasury Office or other government or industry organization.

[0010] What is needed is a method and system to draw upon information gathered and utilize the information to assist with risk management and due diligence related to financial transactions. A new method and system should anticipate offering guidance to personnel who interact with clients and help the personnel identify high risk situations. In addition, it should be situated to convey risk information to a compliance department and be able to demonstrate to regulators that a Financial Institution has met standards relating to risk containment.

SUMMARY

[0011] Accordingly, the present invention provides a risk management method and system for facilitating analysis and quantification of risk associated with a financial transaction. A proprietary risk management clearinghouse (PRM) system

maintains a database that can relate risk variables including confidential and non-confidential information, such as information relating to prior transactions and accounts, world events, government advisories, and other information. The PRM system can be accessed directly or tied into front end or backend systems to automatically monitor transactions. A rating system is used to assess risk based upon criteria such as risk advisories, historical data, interpretation of world events or other variables that can affect risk.

[0012] A PRM system can generate a risk quotient or other rating based upon a weighted algorithm applied to the variables, wherein the risk quotient is indicative of risk associated with a transaction or an account. The quotient can be monitored on a periodic basis, during the course of a transaction, upon account opening or on demand. Actions commensurate with a risk quotient can be presented to a Financial Institution to help the institution properly manage risk associated with a particular entity or transaction, or other risk subject.

[0013] One or more reports can also be generated which are related to one or more risk variables searched by the PRM system **112**. In various embodiments, the reports can include informational data returned by a Risk query, any related informational artifacts, descriptions of informational artifacts, other data related to one or more risk variables or compilation or summary of data related to one or more risk variable, one or more risk quotients or other quantitative value for a Risk assessment or summaries of information resulting from any related Risk inquiry. The reports can include, for example, any one or more of: informational data, informational artifacts and descriptions of informational artifacts, one or more risk quotients.

[0014] Some implementations of the present invention provide computer implemented methods and systems for managing Risks wherein data descriptive of informational artifacts and with content related to Risks, such as, for example, at least one of: reputational risk, regulatory risk and legal risk; can be received into a computer system. Risk variables can be defined which are generally related to one or more financial transactions. Proprietary data descriptive of a particular financial transaction can also be received into the computer system and one or more risk variables identified with the received data descriptive of the financial transaction.

[0015] Informational artifacts with content related to Risk can be associated with the risk variables identified and a report can be generated for use within a predefined organization. The report can include, for example, a description of the informational artifacts associated with the risk variables identified.

[0016] In some embodiments a suggested action can be generated based upon the content of the informational artifacts. Some embodiments can also include generation of a risk quotient that is indicative of an amount of Risk.

[0017] Still other embodiments can include methods and systems for conducting a financial transaction. Details descriptive of a particular financial transaction can be transmitted to a computer system accessible via a communications network. The computer server can be operative with executable software to receive the details descriptive of the particular financial transaction and also receive data descriptive of informational artifacts with content related to Risk, such as for example, at least one of: reputational risk, regulatory risk and legal risk. One or more risk variables can be identified with the data descriptive of the particular financial transaction and at least one informational artifact can be associated with

the risk variables identified. The computer server can transmit the data descriptive of the content of the informational artifact that is associated with the risk variables to a subscriber conducting the financial transaction.

[0018] The subscriber can receive the data descriptive of the content of the informational artifact and determine a course of action related to the financial transaction based upon the received data.

[0019] In another aspect, the present invention can include a method and system for a user to interact with a network access device so as to manage risk relating to a risk subject. The user can initiate interaction with a proprietary risk management server via a communications network and input information relating to details of the risk subject, such as, for example, via a graphical user interface, and receive back a risk quotient indicative of a level of risk associated with the risk subject. A user can also receive a suggested action designed to mitigate risk associated with the risk subject. The risk quotient can be, for example a numerical value and a typical risk subject may be a particular Financial Transaction.

[0020] Various features and embodiments are further described in the following figures, drawings and claims.

DESCRIPTION OF THE DRAWINGS

[0021] FIG. 1 illustrates a block diagram that can embody this invention.

[0022] FIG. 2 illustrates a network of computer systems that can embody an automated PRM system.

[0023] FIG. 3 illustrates a flow of exemplary steps that can be executed by a PRM system.

[0024] FIG. 4 illustrates a flow of exemplary steps that can be taken by a user of the PRM system.

[0025] FIG. 5 illustrates an exemplary graphical user interface useful for gathering information according to the present invention.

[0026] FIG. 6 illustrates an exemplary graphical user interface useful for presenting reports related to proprietary risk management.

DETAILED DESCRIPTION

[0027] The present invention includes a computerized method and system for managing risk associated with Financial Transactions including those with international exposure. A computerized system gathers and stores information in a database or other data storing structure and relates the information to Risk factors pertaining to Financial Transactions. Informational Artifacts and/or data descriptive of Informational Artifacts and a source of any Information Artifact can also be stored. A Subscriber, such as a Financial Institution, can receive information from a Risk management clearinghouse and, if desired, also supply information, into a proprietary database and query the database. Queries can be automated and made a part of standard operating procedure for each transaction conducted by the Subscriber. In some embodiments, a rating system can be used by a Subscriber to assess risk based upon the information received and the Risk factors.

DEFINITIONS

[0028] Financial Institution: Financial Institution refers to any person, entity, company, corporation or statutory "person" in the business of providing Financial Transactions. As such, as used herein, a Financial Institution can collectively

and individually include: Bank and non-bank financial institutions, including: investment banks; merchant banks; commercial banks; securities firms, including broker dealers securities and commodities trading firms; asset management companies, other hedge funds, mutual funds, credit rating funds, securities exchanges and bourses, institutional and individual investors, law firms, accounting firms, auditing firms, any institution the business of which is engaging in financial activities as described in section 4(k) of the Bank Holding Act of 1956, and other entities subject to legal and regulatory compliance obligations with respect to money laundering, fraud, corruption, terrorism, organized crime, regulatory and suspicious activity reporting, sanctions, embargoes and other regulatory risks and associated obligations.

[0029] Financial Transaction: a Financial transaction refers to any action that anticipates a transfer of money from a first set of one or more Transaction Participants to a second set of one or more Transaction Participants. Examples of Financial Transactions can include: investment and merchant banking, public and private financing, commodities and a securities trading, commercial and consumer lending, asset management, rating of corporations and securities, public and private equity investment, public and private fixed income investment, listing to companies on a securities exchange and bourse, employee screening, auditing of corporate or other entities, legal opinions relating to a corporate or other entity, or other business related transactions; a transaction involving any transfer of funds and: an insurance company, a credit card issuer, a trading exchange, a government regulator, a law enforcement agency, an investment and/or merchant bank, public and private financing, commodities and securities trading, commercial and consumer lending, asset management, a rating of corporations and securities, public and private equity investments, public and private fixed income investments, the listing of companies on securities exchanges and bourses; and employee screening.

[0030] Informational Artifact: Informational Artifact refers to a media item that contains information that can be interpreted into a humanly ascertainable form. Examples of Informational Artifacts include: a news article, a news feed portion, a video segment, a newscast, a report, an identifiable document, an agency listing, a list, a government publication, other identifiable publication, a sound byte, a sound recording, or other media item.

[0031] Proprietary Risk Management Clearinghouse (PRM): PRM refers to computerized systems and methods available to Subscribers permitted to access the computerized systems under the authorization of a parent entity. The computerized systems and methods being utilized for managing Risks and associating information and/or informational artifacts useful for quantifying Risk with a Risk subject. Generally, the functionality of a PRM is equivalent to functionality provided by an RMC system, except that data stored in the PRM and access to the PRM can be kept proprietary to the parent entity or some other designated group of users.

[0032] Risks: Risks associated with a financial transaction can include factors associated with security risk, financial risk, legal risk, regulatory risk and reputational risk. A Security Risk refers to breach of a safety measure that may result in unauthorized access to a facility; unauthorized access to data; physical harm, including threat of immediate risk of harm to a person or goods. Financial Risk refers to factors indicative of monetary costs that the Risk Bearing Institution

or a Transaction Participant may be exposed to as a result of a particular Financial Transaction. Monetary costs can be related to fines, forfeitures, costs to defend an adverse position, lost revenue, or other related potential sources of expense. Regulatory Risk refers to factors that may cause the Risk Bearing Institution or Transaction Participant to be in violation of rules put forth by a government entity or regulatory agency. Reputational risk relates to herein that a Risk Bearing Institution or Transaction Participant may suffer regarding its professional standing in an industry or the public eye. A Risk Bearing Institution and Transaction Participant can suffer from being associated with a situation that may be interpreted as contrary to an image of diligence, honesty and forthrightness.

[0033] Risks may be related to the duty to disclose material information, to report and possibly prevent: fraud, money laundering, foreign corrupt practices, bribery, embargoes and sanctions. Timely access to relevant data on which to base a regulatory or reputational Risk related action can be critical to conducting business and comply with regulatory requirements such as those set forth by the Patriot Act in the United States.

[0034] Risk Management Clearinghouse (RMC): RMC refers to computerized systems and methods for managing Risks and associating information and/or informational artifacts useful for quantifying Risk with a Risk subject, as more fully described in the related patent applications: Ser. No. 10/074,584 entitled "Risk Management Clearinghouse" filed Feb. 12, 2002, and U.S. patent application Ser. No. 10/021,124 entitled "Risk Management Clearinghouse" filed Oct. 30, 2001.

[0035] Risk Quotient: Risk Quotient refers to a quantitative value of an amount of Risk, a Risk Quotient can be based upon a weighted algorithm applied to the Risk criteria and informational artifacts.

[0036] Subscriber: Subscriber refers to any person or entity authorized to access an RMC system **106**.

[0037] Transaction Participant: Transaction Participant refers to a person who will partake in a Financial transaction.

[0038] Elements

[0039] Referring now to FIG. 1 a block diagram of one embodiment of the present invention is illustrated. A Risk Management Clearinghouse (RMC) system **106**, receives information which may be related to a Financial Transaction, or a participant to a Financial Transaction. Information is received, for example, from publicly available sources, Subscribers, investigation entities, or other sources. The information is constantly updated and can be related to a Financial Transaction or an alert list in order to facilitate compliance with regulatory requirement. Updated information is transmitted to a Proprietary Risk Management (PRM) system **112**. The PRM system **112** can be utilized to perform risk management functions for a Subscriber institution **121**.

[0040] Typically a Subscriber **121** will house a computerized PRM system **112** that receives an electronic feed from a PRM system **112**. A Subscriber **121** can include, for example: a securities broker, a retail bank, a commercial bank, investment and merchant bank, private equity firm, asset management company, a mutual fund company, a hedge fund firm, insurance company, a credit card issuer, retail or commercial financier, a securities exchange, a regulator, a money transfer agency, or other entity.

[0041] Public information can be received into the RMC system **106** or the PRM system **112** from a variety of sources,

including, for example: a list generated by the Office of Foreign Assets Control (OFAC) **101** including their sanction and embargo list, a list generated by the U.S. Commerce Department **102**, a list of international “kingpins” generated by the U.S. White House **103**, U.S. regulatory actions **104** or other information source **105** such as a foreign government, U.S. adverse business-related media reports, U.S. state regulatory enforcement actions, international regulatory enforcement actions, international adverse business-related media reports, a list of politically connected individuals and military leaders, list of U.S. and international organized crime members and affiliates or a list of recognized high risk countries. Court records or other references relating to fraud, bankruptcy, professional reprimand or a rescission of a right to practice, suspension from professional ranks, disbarment, prison records or other source of suspect behavior can also be an important source of information.

[0042] Information entered by a Subscriber into a PRM system **112** may be information gathered according to normal course of dealings with a particular entity or as a result of a concerted investigation. In addition, since the PRM system is proprietary and a Subscriber responsible for the information contained therein can control access to the information contained therein, the PRM system can include information that is public or proprietary.

[0043] However, if desired, it can be made possible for information entered into the PRM system **112** to be shared with a RMC system **106** which contains informational data generally available to other Subscribers who may not be held by any duty of confidentiality and/or available to the public as a whole. Informational data can be shared, for example via an electronic transmission or transfer of electronic media. However, PRM system **112** data may be subject to applicable to local or national law and safeguards should be adhered in order to avoid violation of such law through data sharing practices. In the event that a Subscriber, or other interested party, discovers or suspects that a person or entity is involved in a fraudulent or otherwise illegal activity, the system can report related information to an appropriate authority.

[0044] A Financial Institution will often be closely regulated. As a result Financial Institutions are exposed to significant risks from their obligations of compliance with the law and to prevent, detect and, at times, report potential violations of laws, regulations and industry rules (“laws”). These risks include, but are not limited to, the duty to disclose material information, and to prevent and possibly report: fraud, money laundering, foreign corrupt practices, bribery, embargoes and sanctions. Through a series of structured questions and weighting of information received as answers, Financial Institutions can structure a risk exposure and receive suggested responses to a specific risk scenario.

[0045] A decision by a Financial Institution concerning whether to pursue a Financial Transaction can be dependent upon many factors. A multitude and diversity of risks related to the factors may need to be identified and evaluated. In addition, the weight and commercial implications of the factors and associated risks can be interrelated. The present invention can provide a consistent and uniform method for business, legal, compliance, credit and other personnel of Financial Institutions to identify and assess risks associated with a transaction. A PRM system **112** allows investment activity risks to be identified, correlated and quantified by a Financial Institution on a confidential basis thereby assessing legal, regulatory, financial and reputational exposure.

[0046] Types of transactions that may have risk implications can include, for example transactions relating to: an individual account, a public company domiciled in a G-7 country or Hong Kong, a public company not domiciled in a G-7 country or Hong Kong, a corporate account regulated by a G-7 agency or a corporate account regulated by a non G-7 government agency, a private company or partnership, a holding company, an intermediary managed account, such as a money manager or hedge fund, a trust or foundation, or other type of legal entity.

[0047] A Financial Institution can integrate a PRM system **112** to be part of legal and regulatory oversight for various due diligence and “know your customer” obligations imposed by regulatory authorities. The PRM system **112** can facilitate detection and reporting of potential violations of law as well as address the “suitability” of a Financial Transaction and/or the assessment of sophistication of a customer. Similarly, the PRM system **112** can support a Financial Institution’s effort to meet requirements regarding the maintenance of accurate books and records relating to their Financial Transactions and affirmative duty to disclose material issues affecting an investor’s decisions.

[0048] In some embodiments, a RMC system **106** provides informational data, informational artifacts, and descriptions of informational artifacts generally related to Risks, as updated input into an in-house risk management database that is part of the PRM system **112**. The PRM system **112** can allow a Financial Institution, or other Subscriber, to screen one or more Risk Variables, such as for example: a name of any or all current and/or prospective account holder and/or wire transfer receipt/payment party against the data stored in the PRM System **112** on a very low cost and timely basis.

[0049] A log or other stored history can be created by the PRM system **112**, such that utilization of the system can mitigate adverse effects relating to a problematic account. Mitigation can be accomplished by demonstrating to regulatory bodies, shareholders, news media and other interested parties that corporate governance is being addressed through tangible risk management processes.

[0050] Information relating to financial, legal, regulatory and/or reputational risk is received as data into a computer system contained in the PRM system **112** from a source, such as, for example, a RMC system **106**, or other source. Informational data received can be related by keyword, fuzzy logic, artificial intelligence programs, full text, numerical value, financial value, coded entry or other well known or proprietary forms of data manipulation. In one embodiment, a periodic update can be transmitted from the RMC system **106** to the PRM system **112**, such as an hourly or daily update. In another embodiment, communication between the RMC system **106** and the PRM system **112** can be consistently maintained, thereby allowing constant real-time interaction between the RMC system **106** and the PRM system **112**. Real time interaction can enable a Subscriber **121** to access the most recent data available from the RMC system **106**. Use of a PRM system **112** can allow the Subscriber **121** to maintain complete privacy regarding data in the PRM system **112**, and also maintain complete privacy as to what queries are run against the databases contained in the PRM system **112**.

[0051] A PRM system **112** can also execute programmable software which will weight risk related informational data in order to calculate a risk quotient or similar score or rating. The risk quotient can include, for example, a scaled numeric or alpha-numeric value.

[0052] If a transaction reaches or exceeds a risk quotient threshold, the PRM system **112**, or Subscriber **121** can respond with a responsive action **114**. A responsive action **114** can include, for example, generating an alert, blocking acceptance of a transaction, creating a report, notifying a compliance department, notifying an authority, or other appropriate response. In addition, the PRM system **112** can create a structured history relating to a transaction that can demonstrate due diligence and proper corporate governance. Reporting can be generated from the structured history. A benefit of the PRM system **112** reporting and quantified risk due diligence **109** lies in the ability to keep all such reporting confidential if desired.

[0053] In the case of an automated transaction, such as, for example, execution of an online transaction, a direct feed of information can be implemented from a front end system involved in the transaction to the PRM system **112** or via questions that are presented to a transaction initiator by a programmable robot via a GUI. Questions can relate to a particular type of account, a particular type of client, types of investment, or other criteria. Other prompts or questions can aid a Financial Institution ascertain the identity of an account holder and an account's beneficial owner. If there is information indicating that a proposed transaction is related to an account that is beneficially owned by a high risk entity, the Financial Institution may not wish to perform the transaction if it is unable to determine the identity of the high risk entity and his or her relationship to the account holder.

[0054] The PRM system **112** can also receive open queries, such as, for example, from Subscriber personnel not necessarily associated with a particular transaction. An open query may, for example, search for information relating to an individual or circumstance not associated with a Financial Transaction and/or provide questions, historical data, world event information and other targeted information to facilitate a determination of risk associated with a risk subject, such as a query regarding an at risk entity's source of wealth or of particular funds involved with an account or transaction in consideration.

[0055] A query can also be automatically generated from monitoring transactions being conducted by a Subscriber **121**. For example, an information system can electronically scan transaction data for key words, entity names, geographic locales, or other pertinent data. Programmable software can be utilized to formulate a query according to suspect names or other pertinent data and run the query against a database maintained by the PRM system **112**. Other methods can include voice queries via a telephone or other voice line, such as voice over internet, fax, electronic messaging, or other means of communication. A query can also include direct input into a PRM system **112**, such as through a graphical user interface (GUI) with input areas or prompts.

[0056] Prompts or other questions proffered by the PRM system **112** can also depend from previous information received. Information generally received, or received in response to the questions, can be input into the PRM system **112** from which it can be utilized for real time risk assessment and generation of a risk quotient **108**.

[0057] An alert list containing names and/or terms of interest to a Subscriber can be supplied to the PRM system **112** by a Subscriber **121** or other source. Embodiments can include each list being customized and specific to a Subscriber. The PRM system **112** can continually monitor data in its database via an alert query with key word, fuzzy logic or other search

algorithms and transmit related informational data to the interested party. In this manner, ongoing diligence can be conducted. In the event that new information is uncovered by the alert query, the Subscriber can be immediately notified, or notified according to a predetermined schedule. Appropriate action can be taken according to the information uncovered.

[0058] A risk assessment or risk quotient **108** can be made available to the Subscriber **121** or personnel interested in the transaction **107**. In one embodiment, the risk quotient **108** can be assessed in real time. A real time assessment can allow a Subscriber **121** or other interested party to provide a responsive action **114** and/or execute an action to address a particular risk quotient timely to the circumstances resulting in the risk quotient score **108**. A responsive action **114** may include; for example, limiting the scope of a transaction entered into, discontinuing a transaction associated with high risk participants, notifying authorities, or other appropriate actions.

[0059] The PRM system **112** can quantify risk due diligence **109** by capturing and storing a record of information received and actions taken relating to a RMC transaction. Once quantified, the due diligence data can be utilized for presentation, as appropriate, to regulatory bodies, shareholders, news media and/or other interested parties, such presentation may be useful to mitigate adverse effects relating to a problematic transaction. The data can demonstrate that corporate governance is being addressed through tangible risk management processes.

[0060] In some embodiments, the PRM system **112** can generate a quantitative value indicative of an amount of Risk that is associated with a RMC inquiry such as an inquiry related to a particular transaction or a query related to a particular account holder or account beneficiary. The risk quotient can be based upon a weighted algorithm applied to the risk factors. The risk quotient can be made available on a periodic basis, on demand in real time, in response to an event such as a transaction, or according to some other request. Actions commensurate with a risk level can be presented to assist with proper risk management.

[0061] In some embodiments, the PRM system **112** can also calculate or otherwise generate an aggregated risk quotient score **110**. An aggregated Risk Quotient score can include a sum of all outstanding Risk associated with a Financial Institution or subset of the Financial Institution, such as a particular department or branch, with a certain type of account or investment vehicle, or with a particular account holder or group of account holders. The risk quotient aggregation **110** can be useful in assessing various levels of risk being tolerated by a Financial Institution. Other calculations, such as, for example, the sum, mean, average, or other calculation can be made to further analyze risk at a Financial Institution. If desired, a rating can be applied to an institution according to the amount of risk tolerated by the institution, such as, for example, the average risk tolerated for a transaction.

Systems

[0062] Referring now to FIG. 2, a network diagram illustrating one embodiment of the present invention is shown **200**. An automated PRM system **112** can include a computerized RMC server **210** accessible via a distributed network **201** such as the Internet, or a private network. A Subscriber **220-222**, regulatory entity **226**, remote user **227**, or other party interested in risk management, can use a computerized system or network access device **204-207** to receive, input,

transmit or view information processed in the RMC server 210. A protocol, such as the transmission control protocol internet protocol (TCP/IP) can be utilized to provide consistency and reliability.

[0063] In addition, a PRM server 211 can access the RMC server 210 via the network 201 or via a direct link 209, such as a T1 line or other high speed pipe. The PRM server 211 can in turn be accessed by an in-house user 222-224 via a system access device 212-214 and a distributed network 201, such as a local area network, or other private network, or even the Internet, if desired. An in-house user 224 can also be situated to access the PRM server 211 via a direct linkage, or any other system architecture conducive to a particular need or situation. In one embodiment, a remote user can access the PRM server 211 via a system access device 204-207 also used to access other services, such as an RMC server 210.

[0064] A computerized system or system access device 204-207 212-214 used to access the PRM system 211 can include a processor, memory and a user input device, such as a keyboard and/or mouse, and a user output device, such as a display screen and/or printer. The system access devices 212-214 can communicate with the PRM server 112 to access data and programs stored at the PRM server 211. The system access device 212-214 may interact with the PRM system 211 as if the PRM system 211 was a single entity in the network 200. However, the PRM system 211 may include multiple processing and database sub-systems, such as cooperative or redundant processing and/or database servers, that can be geographically dispersed throughout the network 200.

[0065] The PRM server 211 includes one or more databases 225 storing data relating to proprietary risk management. The PRM server 211 may interact with and/or gather data from an operator of a system access device 220-224 226 227 or other source, such as from the RMC server 210. Data received may be structured according to risk criteria and utilized to calculate a risk quotient 108.

[0066] Typically an in-house user 222-224 or other user will access the PRM server 211 using client software executed at a system access device 212-214. The client software may include a generic hypertext markup language (HTML) browser, such as Netscape Navigator or Microsoft Internet Explorer, (a "WEB browser"). The client software may also be a proprietary browser, and/or other host access software. In some cases, an executable program, such as a Java™ program, may be downloaded from the PRM server 211 to the client computer and executed at the system access device or computer as part of the PRM software. Other implementations include proprietary software installed from a computer readable medium, such as a CD ROM. The invention may therefore be implemented in digital electronic circuitry, computer hardware, firmware, software, or in combinations of the above. Apparatus of the invention may be implemented in a computer program product tangibly embodied in a machine-readable storage device for execution by a programmable processor; and method steps of the invention may be performed by a programmable processor executing a program of instructions to perform functions of the invention by operating on input data and generating output.

Methods

[0067] Referring now to FIG. 3, steps are illustrated which may be taken to implement various embodiments of the present invention and manage risk associated with a Financial Transaction. At 310, the steps can include gathering informa-

tion relating to risk entities and other risk variables and receiving the gathered information into a PRM server 211. Informational data can be gathered from a user such as a Financial Institution employee, from a source of electronic data such as an external database, messaging system, news feed, government agency, from any other automated data provider, from a party to a transaction, or other source. Typically, the PRM server 211 will receive data relating to a transactor, beneficiary or other associated party. The informational data can also include data descriptive of informational artifacts with content related to one or more types of Risk, such as for example: Reputational Risk, Regulatory Risk and Legal Risk. In some embodiments, the informational data can be received on an ongoing basis such that if new events occur in the world that affect the exposure of a transactor, the calculated risk can be adjusted accordingly.

[0068] At 311, informational data can also be received from a RMC system 106 or other provider of risk management related data. In some embodiments, information received from a RMC system 106 can be structured according to risk variables and readily imported into a risk management database included as part of a PRM system 112. Data received from a RMC system 106 can include a periodic data dump, such as a download of any data fields that are new or modified since a previous data download. A data download can be executed, for example, on an hourly, daily, or monthly basis or other periodic schedule.

[0069] In addition to the types and sources of information listed previously that can provide indications of high risk, the Financial Institution or compliance entity can receive information that relates to requests to involve a Financial Institution that is not accustomed to foreign account activity; requests for secrecy or exceptions to Bank Secrecy Act requirements, routing through a secrecy jurisdiction, or missing wire transfer information; unusual and unexplained fund or transaction activity, such as fund flow through several jurisdictions or Financial Institutions, use of a government-owned bank, excessive funds or wire transfers, rapid increase or decrease of funds or asset value not attributable to the market value of investments, high value deposits or withdrawals, wires of the same amount of funds into and out of the account, and frequent zeroing of account balance; and large currency or bearer transactions, or structuring of transactions below reporting thresholds. Other information can include activities a person or entity is involved in, associates of a transactor, governmental changes, attempting to open more than one account in the same time proximity, or other related events.

[0070] Sources of information that supply informational data to a PRM server 211 or to a RMC server 210 can include, for example, publications issued by Treasury's Financial Crimes Enforcement Network ("FinCEN"), the State Department, the CIA, the General Accounting Office, Congress, the Financial Action Task Force ("FATF"), various international Financial Institutions (such as the World Bank and the International Monetary Fund), the United Nations, other government and non-government organizations, internet websites, news feeds, commercial databases, or other information sources.

[0071] A RMC server 210 can also be accessed in real time, or on a transaction by transaction basis. In the real time embodiment, any changes to data in the RMC may be automatically forwarded to an in-house PRM system 112. On a

transaction by transaction basis, the RMC server **210** can be queried for specific data that relates to variables associated with a particular transaction.

[0072] At **312**, all data received can be combined in the PRM server **112** to create an aggregate source of data which can be accessed to perform risk management activities. The step of combining data can be useful for aggregating public information received from a RMC system **106** type information provider with proprietary information contained in the PRM system **112**. Combining data can be accomplished by any known data manipulation method. For example, the data can be maintained in separate tables and linked with relational linkages, or the data can be gathered into on comprehensive table or other data structure.

[0073] At **313**, the information received as data can be structured according to defined risk variables. Risk variables are used to calculate an indicator of risk, such as a risk quotient score **108**. For example, information received can be associated with one or more variables including a position held by the account holder or other transactor, the country in which the position is held, how long the position has been held, the strength of the position, the veracity of previous dealings with persons from that country, the propensity of people in similar positions to execute unlawful or unethical transactions, the type of transaction or other criteria.

[0074] At **314**, a risk quotient score **108** can be calculated as a result of the analysis of the variables. For example, one method for calculating risk quotient **108** can include generating a numerical value or other scaled weighting that is resultant to particular information being associated with a variable. The scaled weighting is representative of a degree of risk experienced as a result of that particular information being associated with that variable. In addition the scaled weighting can be adjusted higher or lower, or otherwise re-weighted, depending upon information received that relates to another risk variable if the risk variables can have an affect upon each other. In this manner complex associations and can be developed between variables, and algorithms can be developed that reflect those associations.

[0075] For example, in one embodiment, a Risk quotient **108** can be calculated by weighting information received according to its importance in determining high Risk activities, such as the likelihood of illegal or unethical dealings. Calculating a risk quotient **108** can be accomplished by assigning a numerical value to each field of information, wherein the numerical value is representative of the Risk associated with that particular piece of information. Therefore, it may be determined in one case that a government official from a G-7 country trading equities in a public company from a G-7 country poses minimal Risk. This information from the first case is assigned a low numerical value, or even a negative numerical value. In a second case, an individual who appears on a list generated by the FATF and is attempting to transact in a corporate holding company may be viewed as a high risk. In another case, information conveying this high risk may be assigned a high numerical value. In addition, a weight can be assigned to a variable to which the information is assigned. Therefore a designated country may receive a higher weight than the position held, or vice versa. A Risk Quotient **108** can be calculated by multiplying a weighted numerical value of the specific information times the category weighting.

[0076] Similarly, information received may indicate that a transactor is a high ranking finance official from a G7 country.

Other information may relate to an ownership variable which indicates that the ownership structure of a company the transactor wishes to transact is a public entity. A public entity may receive a numerical value of -5 because it is a relatively low risk ownership structure. In addition, this information may be included in a Company Profile variable, wherein the Company Profile is assigned a variable weighting of 3 , in this case, a variable weighting cannot be a negative value. Therefore, the net score for this ownership structure can be calculated to be -5 times 3 or -15 . Similarly the transactor or associated account holder being a high ranking official from a G-7 country may also receive a low number such as 1 . The risk quotient for the transactor would be 1 times 3 , or 3 . All scores within the Company Profile can be summed to calculate a RMC risk quotient. In this case the RMC risk quotient is $-15+3$ which equals -12 , indicating a low risk. Weighted risk scores from all associated categories can be summed to calculate a total Risk Quotient Score **108**.

[0077] At **315**, a request for clearing risk can be received by the PRM system **112** as part of a normal course of business, such as before consummating a Financial Transaction, or upon request. Risk clearing that is part of a normal course of business, may simply look for a risk quotient **108** or other risk rating to be below a threshold. Depending upon a level of risk calculated as well as the reasons for the risk calculation, at **316**, a responsive action **114** can be generated that is commensurate with the level of risk and the underlying reasons.

[0078] As an example, in response to a high risk score, a responsive action **114** may recommend that a Financial Institution not proceed with a transaction, or that an appropriate authority be notified. In response to a low risk score, the Financial Institution may respond by completing a transaction as usual. Intermediate scores may respond by suggesting that additional information be gathered, that transactions for this account be monitored or other interim measures.

[0079] Once generated, risk management tools, such as the risk quotient **108**, responsive action **114**, and transaction related information, can be transmitted to an appropriate user. Typically, the risk management tools will be transmitted from the PRM server **211** to a PRM system access device **213-214**, however, a Subscriber **220-221**, or other user **226-227** that is remote to the PRM server may also submit risk management requests and receive risk management tools via a distributed network **201** or via voice, facsimile or other communication.

[0080] At **318**, the PRM server **211** can also store in memory, or otherwise archive, Risk management related data and proceedings. For example, the PRM server **211** can store information received, a risk quotient generated **108**, and/or any responsive action **114** taken. Archived management related data and proceedings can be useful to quantify corporate governance and diligent efforts to address high risk situations. Accordingly, at **319**, reports quantifying PRM risk management procedures, executed due diligence, corporate governance, as well as informational data and informational artifacts considered, or other matters can be generated.

[0081] Referring now to FIG. 4, a flow chart illustrates additional steps that can be implemented to manage risk associated with a transaction. At **410**, a Subscriber can receive information relating to one or more risk variables such as, for example, an Transaction Participant associated with a Financial Transaction. This information may be received during the normal course of business, such as when a Transaction Participants are ascertained. At **411**, the Subscriber can access a PRM server **211** and identify to the PRM server **211** one or

more entities, jurisdictions, or other Risk Variables involved in the transaction. Access can be accomplished by opening a dialogue with a PRM system 211 with a network access device, 204-207, 212-214. Typically, the dialogue would be opened by presenting a GUI to a network access device accessible by a person or an electronic feed that will enter information relating to the transactor. The GUI will be capable of accepting data input via a network access device. An example of a GUI would include a series of questions relating to a transaction. Alternatively, information can be received directly into fields of a database, such as from a commercial data source. Questions can be fielded during a transaction, or at any other opportunity to gather information.

[0082] In one embodiment, automated monitoring software can run in the background of a normal transaction program and screen data traversing an application. The screened data can be processed to determine key words wherein the key words can in turn be presented to the PRM server 211 as risk variables. The PRM server 211 will process the key words to identify entities or other risk variables. Monitoring software can also be installed to screen data traversing a network or communications link.

[0083] At 412, the Subscriber can receive back information relating to one or more Risks associated with conducting a transaction involving the submitted Risk Variables. In one embodiment, a Subscriber can receive ongoing monitoring of key words, identified entities, a geographic location, or other subject, or list of subjects. Any updated information or change of status detected via an ongoing monitoring can result in an alarm or other alert being sent to one or more appropriate users.

[0084] At 413, the user can also receive a risk quotient. As addressed more completely above, the risk quotient is typically a scaled numerical score based upon values for weighted criteria. It will represent a magnitude of risk associated with a particular transaction and can be based upon the participants involved in a transaction, the type of transaction, the state sovereignties involved, an amount of money involved in the transaction, or other risk variables.

[0085] At 414, in addition to receiving a risk quotient, a user can also receive one or more responsive actions from a PRM server 211. A suggested action based upon informational data and informational artifacts can include steps that can be taken by the Financial Institution or other user to address a risk that is associated with the transaction. At 415, if appropriate, a user can request identification of a source of informational data or an informational artifact and at 416, receive identification of a source of informational data or informational artifact. The source of the may be useful to pursue more details relating to the informational data and/or informational artifact, or may just be utilized to help determine the credibility of the information received.

[0086] At 417, a user can also cause an archive to be created relating to Risk management. An archive may include, for example, information received relating to Risk associated with a Financial Transaction, as well as steps taken to address the Risk, and a Risk Quotient. In addition, at 418, the user can cause a PRM server 211 to generate reports that can include, for example, a description of related informational data and informational artifacts and otherwise document actions taken to address due diligence relating to Risk management.

[0087] Referring now to FIG. 5, an exemplary GUI for displaying information related to PRM is illustrated 500. The GUI can include areas prompting for information, such as in

the form of a key word or a question 501. Areas can also be included for an appropriate response 506. The area for an appropriate response 506 can, for example, receive text, allow a selection from choices proffered, or otherwise receive data into the PRM server 211. A programmable user interactive device, such as a checkbox, X field, yes/no field or other device 503-505 can also be utilized to indicate an answer, or otherwise input information. Other programmable devices, such as programmable icons, hyperlinks, push buttons or other devices 502 can be utilized to execute a particular function. A category weighting area 507 can also be included on the GUI 500. Typically the weighting will be predetermined. However, if desired the weighting can be modified by a user such that a weighting value, such as a numerical value, will be utilized to calculate a risk quotient. The PRM GUI 500 can also include an area for displaying a quotient score relating to the transaction 508.

[0088] Referring now to FIG. 6, an exemplary GUI for presenting reports or suggested actions related to PRM is illustrated 600. The GUI for presenting reports 600 can include geographic areas of a user interface containing risk management procedures 601, including those procedures specifically followed in relation to a particular PRM query or other suggested actions. Additional areas can include a list of electronic or hardcopy reports available concerning risk management efforts undertaken 602. Another area can include a list of risk quotients and/or calculations concerning a risk quotient, such as the average risk quotient for the financial institution, or the mean risk quotient 603. Still another area can contain information descriptive of a particular transactor or other PRM risk subject 604.

[0089] A number of embodiments of the present invention have been described. Nevertheless, it will be understood that various modifications may be made without departing from the spirit and scope of the invention. For example, network access devices 204-208 can comprise a personal computer executing an operating system such as Microsoft Windows™, Unix™, or Apple Mac OS™, as well as software applications, such as a JAVA program or a web browser, network access devices 204-208 can also be a terminal device, a palm-type computer, mobile WEB access device, a TV WEB browser or other device that can adhere to a point-to-point or network communication protocol such as the Internet protocol. Computers and network access devices can include a processor, RAM and/or ROM memory, a display capability, an input device and hard disk or other relatively permanent storage. Accordingly, other embodiments are within the scope of the following claims.

1-21. (canceled)

22. A computer system implemented method for managing risk, the method comprising:

receiving into the computer system data descriptive of informational artifacts having content related to at least one of: reputational risk, regulatory risk, and legal risk; defining, within the computer system, risk variables based on the data descriptive of the informational artifacts, wherein the risk variables are generally related to one or more financial transactions;

receiving, into the computer system, proprietary data relating to a particular financial transaction;

identifying, by the computer system, at least two of the risk variables associated with the particular financial transaction;

generating, by the computer system, a numerically weighted value for each of the at least two risk variables, wherein each numerically weighted value indicates a degree of risk associated with the respective risk variable;

adjusting, by the computer system, the numerically weighted values based on one or more relationships between the at least two risk variables;

calculating, by the computer system, a risk quotient based on the adjusted numerically weighted values; and

generating a report comprising the risk quotient and a description of the informational artifacts associated with the at least two risk variables.

23. The method of claim **22** wherein the risk quotient comprises a quantitative indication of at least one of: reputational risk, regulatory risk, and legal risk, associated with the particular financial transaction.

24. The method of claim **22**, wherein the data descriptive of the informational artifacts is received from a risk management clearinghouse data provider.

25. The method of claim **22** further comprising generating a suggested action based on the informational artifacts associated with the at least two risk variables.

26. The method of claim **25** wherein the suggested action is directed toward reducing risk.

27. The method of claim **25** further comprising recalculating the risk quotient based upon implementation of the suggested action.

28. The method of claim **25** wherein the suggested action comprises refusing to perform a transaction.

29. The method of claim **25** wherein the suggested action comprises blocking opening of an account.

30. The method of claim **25** wherein the suggested action comprises notifying a law enforcement authority.

31. The method of claim **22** wherein the data descriptive of a particular financial transaction comprises an identity of a secrecy jurisdiction.

32. The method of claim **22** wherein receiving the proprietary data relating to a particular financial transaction comprises screening data traversing a network or communications link.

33. A system for managing regulatory and reputational risk, the system comprising:

a memory storing computer executable instructions; and
a computer processor configured to execute the instructions to:

receive data descriptive of informational artifacts having content related to at least one of: reputational risk, regulatory risk, and legal risk;

define risk variables based on the data descriptive of the informational artifacts, wherein the risk variables are generally related to one or more financial transactions;

receive proprietary data relating to a particular financial transaction;

identify at least two of the risk variables associated with the particular financial transaction;

generate a numerically weighted value for each of the at least two risk variables, wherein each numerically

weighted value indicates a degree of risk associated with the respective risk variable;

adjust the numerically weighted values based on one or more effects the at least two risk variables can have upon each other;

calculate a risk quotient based on the adjusted numerically weighted values; and

generate a report comprising the risk quotient and a description of the informational artifacts associated with the at least two risk variables.

34. The system of claim **33**, wherein the data descriptive of the informational artifacts is received from a risk management clearinghouse data provider.

35. The system of claim **33** wherein the computer processor further executes the instructions to generate a suggested action based on the informational artifacts associated with the at least two risk variables.

36. The system of claim **35** wherein the suggested action is directed toward reducing risk.

37. The system of claim **35** wherein the suggested action comprises refusing to perform a transaction.

38. The system of claim **35** wherein the suggested action comprises blocking opening of an account.

39. The system of claim **33** wherein the data descriptive of a particular financial transaction comprises an identity of a secrecy jurisdiction.

40. The system of claim **33** further comprising calculating an average risk quotient for multiple financial transactions associated with a financial institution.

41. A non-transitory computer-readable medium comprising computer readable instructions that, when executed by one or more computer processors, direct the one or more computer processors to:

receive data descriptive of informational artifacts having content related to at least one of: reputational risk, regulatory risk, and legal risk;

define risk variables based on the data descriptive of the informational artifacts, wherein the risk variables are generally related to one or more financial transactions;

receive proprietary data relating to a particular financial transaction;

identify at least two of the risk variables associated with the particular financial transaction;

generate a numerically weighted value for each of the at least two risk variables, wherein each numerically weighted value indicates a degree of risk associated with the respective risk variable;

adjust the numerically weighted values based on one or more relationships between the at least two risk variables;

calculate a risk quotient based on the adjusted numerically weighted values; and

generate a report comprising the risk quotient and a description of the informational artifacts associated with the at least two risk variables.

42. The computer-readable medium of claim **41** wherein the instructions further direct the one or more computer processors to generate a suggested action based on the informational artifacts associated with the at least two risk variables.
