A process for inhibiting dyed hair fibers from losing their color during shampooing involving contacting the dyed hair fibers with a composition containing: (a) at least one polyamine compound having at least two amino groups; (b) at least one anionic silicone; and (c) optionally, at least one surfactant, and wherein (a) is present in the composition in an amount sufficient to inhibit the dyed hair fibers from losing their color during shampooing.
PROCESS FOR INHIBITING DYED HAIR FIBERS FROM LOSING THEIR COLOR DURING SHAMPOOING

BACKGROUND OF THE INVENTION

[0001] The present invention relates to a process for inhibiting dyed hair fibers from losing their color during shampooing. The process involves contacting the hair fibers with a composition containing at least one polynamine compound having at least two amino groups and at least one anionic silicone.

[0002] There are essentially two ways in which keratin fibers may be dyed: “permanent” dyeing and “semi-permanent” dyeing.

[0003] The first, also known as oxidation dyeing, uses “oxidation” dye precursors, which are colorless or weakly colored compounds. Once mixed with oxidizing products, at the time of use, these precursors lead to colored compounds and dyes via a process of oxidative condensation. In this case, the colorations obtained are generally very colorfast and strong.

[0004] The second, also known as direct dyeing, uses direct dyes, which are nonionic or ionic dyes and colored compounds capable of producing a more or less pronounced change of the natural color of the hair, resistant to shampoo-washing several times. These dyes may or may not be used in the presence of an oxidizing agent.

[0005] In contrast with oxidation dye precursors, a direct dye is a relatively voluminous molecule that does not penetrate easily into the core of the fiber. Consequently, even though considerable progress has been made in this field, the phenomenon of bleaching of the coloration, i.e., color loss, during shampooing is still non-negligible, even if the dye(s) used is (are) chosen from cationic species. Moreover, the use of certain cationic direct dyes may be reflected by a reduction in the working qualities of the shampoo used after coloration, especially as regards the duration of the latter.

[0006] The present invention is thus directed to a process for inhibiting the phenomenon of bleaching of color from hair fibers during shampooing.

SUMMARY OF THE INVENTION

[0007] In order to achieve these and other advantages, the present invention is drawn to a process for inhibiting dyed hair fibers from losing their color during shampooing involving contacting the dyed hair fibers with a composition containing:

[0008] (a) at least one polynamine compound having at least two amino groups;

[0009] (b) at least one anionic silicone; and

[0010] (c) optionally, at least one surfactant, and

[0011] wherein (a) is present in an amount sufficient to inhibit the dyed hair fibers from losing their color during shampooing.

DETAILED DESCRIPTION

[0012] Other than in the operating examples, or where otherwise indicated, all numbers expressing quantities of ingredients and/or reaction conditions are to be understood as being modified in all instances by the term “about”.

[0013] “Amino groups” as defined herein includes primary amino groups, secondary amino groups, and tertiary amino groups, and further includes amino groups which are terminal, pendant, and intercalated in a skeleton of the at least one polynamine compound, but does not, for example, include quaternary amino groups, amido groups, imino groups, nitroso groups, or heterocyclic analogs of any of the foregoing.

[0014] “At least one” as used herein means one or more and thus includes individual components as well as mixtures/combosinations.

[0015] The at least one polynamine compound of the present invention comprises at least two amino groups, preferably at least three amino groups, more preferably at least four amino groups, more preferably at least five amino groups, more preferably at least six amino groups, more preferably at least seven amino groups, more preferably at least eight amino groups, more preferably at least nine amino groups, and more preferably at least ten amino groups.

[0016] In one embodiment of the present invention, the at least one polynamine compound may, for example, be chosen from aminated polysaccharides comprising at least two amino groups, such as, for example, hydrosolubilates (through chemical and/or enzymatic process) of aminated polysaccharides comprising greater than two amino groups. In one embodiment, the at least one polynamine compound may, for example, be chosen from polymers. Suitable polymers for use as at least one amino compound are polymers comprising at least two amino groups as defined herein.

[0017] In one embodiment of the present invention, the at least one polynamine compound is chosen from polyanamines. As used herein, “polyanamines” comprise at least two repeating units, wherein each unit comprises at least one amino group as defined herein. In one embodiment, polyanamines are chosen from polyethylenimines. Polyethylenimines suitable for use in the compositions of the present invention may optionally be substituted. Non-limiting examples of polyethylenimines which may be used in the composition according to the present invention are the Lupasol™ products commercially available from BASF. Suitable examples of Lupasol™ polyethylenimines include Lupasol™ PS, Lupasol™ PL, Lupasol™ PRB, Lupasol™ MR35, Lupasol™ G35 as well as Lupasol™ SC Polyethylenimine Reaction Products (such as Lupasol™ SC-61B®, Lupasol™ SC-62B®, and Lupasol™ SC-86X®). Other non-limiting
examples of polyethyleneimines which may be used in the composition according to the present invention are the Epomin™ products commercially available from Aetco. Suitable examples of Epomin™ polyethyleneimines include Epomin™ SP-006, Epomin™ SP-012, Epomin™ SP-018, and Epomin™ P-1000.

Polyamines suitable for use in the present invention may also be chosen from polyvinylamines. Examples thereof include Lupamines® 9095, 9030, 9010, 5095, and 1595 from BASF.

The polyamine compounds can also be substituted. An example of such a compound is PEG-15 Cocopolyamine from Cognis.

In another embodiment, the at least one polyamine compound comprising at least two amino groups is chosen from proteins and protein derivatives. Non-limiting examples of suitable proteins and protein derivatives for use in the present invention include those listed at pages 1701 to 1703 of the C.I.T.A. International Cosmetic Ingredient Dictionary and Handbook, 8th edition, vol. 2, (2000). In one embodiment, the at least one polyamine compound comprising at least two amino groups is chosen from wheat protein, soy protein, oat protein, collagen, and keratin protein.

In one embodiment, the at least one polyamine compound comprising at least two amino groups is not chosen from proteins and protein derivatives. In one embodiment, the at least one polyamine compound comprising at least two amino groups is not chosen from compounds comprising lysine, compounds comprising arginine, and compounds comprising histidine. In one embodiment, the at least one polyamine compound comprising at least two amino groups is chosen from compounds comprising lysine, compounds comprising arginine, and compounds comprising histidine.

In the present invention, the at least one polyamine compound is employed in an amount sufficient to inhibit dyed hair fibers from losing their color during shampooing and/or inhibit hair fibers, in general, from appearing frizzy, especially when exposed to high humidity. Typically, it will be present in an amount of from greater than 0% to 30% by weight, preferably from 5% to 20% by weight, and more preferably from 5% to 10% by weight, based on the weight of the composition as a whole.

In general, non-limiting examples of anionic silicones which may be used in the process of the present invention include silicone carboxylates, silicone phosphates, silicone sulfates, silicone sulfosuccinates, and silicone sulfonates.

Suitable silicone carboxylates may be chosen from water soluble silicone compounds comprising at least one carboxylic acid group, oil soluble silicone compounds comprising at least one carboxylic acid group, water-dispersible silicone compounds comprising at least one carboxylic acid group, and silicone compounds comprising at least one carboxylic acid group which are soluble in organic solvents. In one embodiment, the at least one silicone compound comprising at least one carboxylic acid group further comprises at least one alkoxylated chain, wherein the at least one alkoxylated chain may be chosen from terminal alkoxyl groups, pendant alkoxyl groups, and alkoxyl groups which are intercalated in the skeleton of the at least one silicone compound.

Non-limiting examples of at least one alkoxy group include ethylene oxide groups and propylene oxide groups.

The at least one carboxylic acid group may be chosen from terminal carboxylic acid groups and pendant carboxylic acid groups. Further, the at least one carboxylic acid may be chosen from carboxylic acid groups in free acid form, i.e., —COOH, and carboxylic acid groups in salt form, i.e., —COOM, wherein M may be chosen from inorganic cations, such as, for example, potassium cations and sodium cations, and organic cations.

In one embodiment, the at least one silicone compound comprising at least one carboxylic acid group is chosen from silicone compounds of formula (I) and salts thereof:

\[
\begin{align*}
\text{R}_a \ & \text{Si} \left( \text{O} \text{Si} \right)_b \text{O} \text{Si} \left( \text{O} \text{Si} \right)_c \text{O} \text{Si} \left( \text{O} \text{Si} \right)_d \text{O} \text{Si} \left( \text{O} \text{Si} \right)_e \text{R} \\
\end{align*}
\]

wherein: \( a \) is an integer ranging from 1 to 100; \( b \) is an integer ranging from 0 to 500; \( R \), which may be identical or different, are each chosen from optionally substituted hydrocarbon groups comprising from 1 to 9 carbon atoms, optionally substituted phenyl groups, and groups of formula (II):

\[
\begin{align*}
\text{R}_a \ & \text{Si} \left( \text{O} \text{Si} \right)_b \text{O} \text{Si} \left( \text{O} \text{Si} \right)_c \text{O} \text{Si} \left( \text{O} \text{Si} \right)_d \text{O} \text{Si} \left( \text{O} \text{Si} \right)_e \text{R} \\
\end{align*}
\]

wherein: \( R \), which may be identical or different, are each chosen from optionally substituted hydrocarbon groups, such as alkyl, cycloalkyl, aryl, and substituted aryl groups, comprising from 2 to 22 carbon atoms, and optionally substituted divalent aromatic groups, such as groups of formula (III):

\[
\begin{align*}
\text{CH}_2 \ & \text{R} \ & \text{R} \ & \text{R} \ & \text{R} \ & \text{R} \\
\end{align*}
\]

and groups of formula (IV):

\[
\begin{align*}
\text{Cl} \ & \text{Cl} \ & \text{Cl} \ & \text{Cl} \\
\end{align*}
\]
with the proviso that at least one of the R groups is chosen from groups of formula (II) and with the further proviso that when only one of the R groups is chosen from groups of formula (II), the other R groups are not all methyl groups.

Non-limiting examples of the at least one silicone compound include those commercially available from Noveon under the name Ultrasil® CA-1 Silicone and Ultrasil® CA-2 Silicone, both of which correspond to formula (V) below. This silicone carboxylate is sold in the free acid form as an emulsifier and dispersing aid for complexing fatty cationic amines and quaternary amines. Thus, in one embodiment, the at least one silicone compound is chosen from silicone compounds of formula (V) and salts thereof:

![Silicone Carboxylate Structure](image)

wherein: a is an integer ranging from 1 to 100; b is an integer ranging from 0 to 500; AO is chosen from groups of formula (VI):

![Silicone Phosphate Structure](image)

wherein: c, d, and e, which may be identical or different, are each integers ranging from 0 to 20; E0 is an ethylene oxide group; and PO is a propylene oxide group; x is an integer ranging from 0 to 60; R" is chosen from optionally substituted divalent hydrocarbons, such as alkylene groups and alkenylene groups comprising from 2 to 22 carbon atoms, and optionally substituted divalent aromatic groups, such as groups of formula (III):
wherein: a is an integer ranging from 0 to 200; b is an integer ranging from 0 to 200; R', which may be identical or different, are each chosen from optionally substituted hydrocarbons, such as alkyl groups and alkyl groups comprising from 1 to 22 carbon atoms, optionally substituted aromatic groups, groups of formula (III) as defined above and salts thereof; and R, which may be identical or different, are each chosen from optionally substituted hydrocarbons, such as alkyl groups and alkyl groups comprising from 1 to 22 carbon atoms, optionally substituted aromatic groups, optionally substituted divalent hydrocarbons, such as alkylene groups and alkenoxy groups comprising from 1 to 22 carbon atoms, optionally substituted divalent aromatic groups, groups of formula (VII) as defined above and salts thereof, and groups of formula (XI):

\[ (EO)_a-(PO)_b-(EO)_c-(CH_2)_y \]  

wherein:

the (CH₂)ₙ end is bonded to the silicon of the compound of formula (X) and the (EO) or (PO) end, if present, is bonded to the oxygen of the compound of formula (I); c, d, and e, which may be identical or different, are each integers ranging from 0 to 20; EO is an ethylene oxide group; and PO is a propylene oxide group; and with the proviso that at least one R is chosen from groups of formula (XI) and salts thereof; and with the further proviso that at least one R is chosen from groups of formula (X) and salts thereof and at least one other R is chosen from H, organic cations, and inorganic cations.

[0033] Non-limiting examples of the inorganic cations include alkali metals, such as potassium, lithium, and sodium. Non-limiting examples of the at least one silicone compound include those commercially available from Phoenix Chemical, Inc. of New Jersey under the name of Pecosil®, such as Pecosil® PS-100, Pecosil® PS-112, Pecosil® PS-150, Pecosil® PS-200, Pecosil® WDS-100, Pecosil® WDS-200, Pecosil® PS-100 B, and Pecosil® PS-100 K and those commercially available from Siltech under the name Silphos A-100 and Silphos A-150. Other non-limiting examples of the at least one silicone compound include those described in U.S. Pat. Nos. 5,070,171, 5,093,452, and 5,149,765 the disclosures of which are incorporated herein by reference.

[0034] Suitable silicone sulfates for use in the present invention include those represented by formula XII:

\[ CH_3-Si-O-Si(CH_3)_{a'}(CH_2)_{b'}(CH_3)_y \]  

wherein a' and b' range from 0 to 30; x and y are such that the molecular weight ranges from 700 to 1600, and M is an alkali metal such as sodium or potassium, or an ammonium group.

[0036] A particularly preferred anionic silicone is Dime thicone PEG-8 phosphate, commercially available from Noveon under the tradename Ultrasil PE-100.

[0037] The anionic silicone may be employed in an amount ranging from greater than 0 to 50% by weight, preferably from 5 to 30% by weight, and more preferably from 5 to 15% by weight, based on the weight of the composition as a whole. It may also be desirable to employ various auxiliary ingredients, depending on the type of hair care composition being formulated, i.e., shampoo, conditioner, leave-on/deep treatment, and the like.

[0038] For example, when formulating a shampoo, a deteregent surfactant will typically be employed in order to impart cleaning capabilities to the compositions. Examples of suitable detergents surfactants include nonionic surfactants, anionic surfactants, amphoteric/zwiterionic surfactants.
Suitable nonionic surfactants are any suitable nonionic surfactants that have an HLB of from about 3 to about 14. The abbreviation “HLB” stands for hydrophilic lipophilic balance. Examples of suitable nonionic surfactants include, but are not limited to, fatty acid esters and alkoxylated, particularly ethoxylated, fatty acid esters of polyhydric alcohols such as glycerols and sorbitol, for example, polyoxyethylene monolaurate, polyoxyethylene monooleate, polyoxyethylene monostearate, sorbitan mono- 
larate, sorbitan trioleate, generally with a degree of 
ethoxilation of from about 20 to about 85; mono- and di-alkanolamines, such as the N-acyl derivatives of mono- and di-ethanol amines, and polyethoxylated monoalkanolamines; amine oxides, such as cocamidopropyl dimethylamine oxides, coco bis-2-hydroxyethyl amine oxides and lauryl dimethylamine oxide; ethoxylated alkanolamines; ethoxylated oils and fats such as ethoxylated lanolins; and ethoxylated alklyphenols, such as Nonoxynol. Suitable anionic surfactants include, for example, the following: the alkali metal, ammonium, or amine salts of alkyl sulfates, alkyl ether sulfates, linear alpha-olefin sulfonates, dialkyl sulfo succinates, alkylamidomaleic acid esters, and alkyl 
ates each having from about C10 to C18 alkyl or alkyl 
group. Particularly preferred are the salts of lauryl sulfates and lauryl ether sulfates the latter having an average level of 
ethoxilation of 1-3.

Amphoteric/zwitterionic surfactants belong to the 
category of surface active chemicals that possess a positive and a negative charge in the same molecule and behave as a cation or an anion depending on the pH of the medium. In 
general, the positive charge is located on a nitrogen atom while the negative charge is carried by a carboxylic or 
ulfonate group.

There are a large number of amphoteric surfactants 
that are suitable for use in this invention. They include, for 
example, lauryl betaine, lauroampholyglycinat, lauroam-
popropylsulfonate, lauroamphopropionate, lauropho-
carboboxylate, lauryl sulfate, myristamidopropyl 
betaine, myrist betaine, myristampholyglycinat, myristyl 
propionate, stearamipholyglycinat, stearamphopropionate, 
stearamphopropylsulfonate, stearyl betaine, cocamidoethyl 
betaine, cocamidopropyl betaine, cocamidopropyl hydroxy-
sulfate, cocamidopropyl dimethylamine propionate, coco-
pholyglycinat, cocamphoaoxypropionate, cocamo-
phoarylxyglycinat, coco-betaine, cocamphoaoxypropionate, 
cocamphoaoxypropylsulfonate.

The amphoteric surfactants presently preferred for 
use in this invention are: cocamidopropyl betaine, coco-
betaine, stearyl betaine, cocamphoaoxypropylglycinat, coco-
amphodipropionate, and stearampholyglycinat.

The detersive surfactant may be employed in an 
amount of from greater than 0 to 80% by weight, preferably 
from 5 to 50% by weight, and more preferably from 15 to 
30% by weight, based on the weight of the composition as 
a whole.

Conditioning agents may also be employed in 
order to impart added conditioning benefits to the composi-
tion. The conditioning agents useful in the present inven-
tion are those which are dispersible in water and typically 
may be chosen from cationic surfactants, silicone com-
ounds, polyalkylene glycols and mixtures thereof, prefer-
ably mono long-chain ammonium compounds, hydrophi-

cally substituted cationic surfactants, hydrophilically 
substituted silicone compounds, polyalkylene glycols, and 
mixtures thereof.

The type of conditioning agent selected depends on 
the desired characteristics of the product. Highly water 
soluble conditioning agents are typically used. A combina-
tion of conditioning agents is preferably used to provide 
benefits provided by the different conditioning agents. 
Conditioning agents which are less water soluble can be used in 
combination with highly water soluble conditioning agents.

Cationic surfactants may be used as conditioning 
agents herein. Suitable cationic surfactants useful herein 
include, but are not limited to, those generally described as 
mono long-chain ammonium compounds. Nonlimiting 
examples of such cationic surfactants include: cetly trim-
ethyl ammonium chloride, for example, with tradename 
CA-2350 from Nikko Chemicals and CTAC 30K available 
from KCI, stearyl trimethyl ammonium chloride with tradename Arquad 18/50 available from Akzo Nobel, 
hydrogenated tallow alky trimethyl ammonium chloride, 
stearyl dimethyl benzyl ammonium chloride, stearyl prop-
ylglycol phosphate dimethyl ammonium chloride, 
stearyl amidopropyl dimethyl benzyl ammonium chloride, 
stearyl amidopropyl dimethyl (myristylacetate) ammonium 
chloride, and N-(stearyl colamino formyl methy) pyri-
dinium chloride.

Also preferred are hydrophilically substituted cat-
ionic surfactants in which at least one of the substituents 
contain one or more aromatic, ether, ester, amido, or amino 
moieties present as substituents or as linkages in the radical 
chain. Nonlimiting examples of hydrophilically substituted cationic surfactants useful in the present invention include 
the materials having the following CTFA designations: 
quaternium-16, quaternium-26, quaternium-27, quaternium-
38, quaternium-33, quaternium-43, quaternium-52, quater-
nium-53, quaternium-56, quaternium-60, quaternium-61, 
quaternium-62, quaternium-70, quaternium-71, quaternium-
72, quaternium-75, quaternium-76 hydrolyzed collagen, 
quaternium-77, quaternium-78, quaternium-79 hydrolyzed 
collagen, quaternium-79 hydrolyzed keratin, quaternium-79 
hydrolyzed milk protein, quaternium-79 hydrolyzed silk, 
quaternium-79 hydrolyzed soy protein, and quaternium-79 
hydrolyzed wheat protein, quaternium-80, quaternium-81, 
quaternium-82, quaternium-83, quaternium-84, and mix-
tures thereof.

Highly preferred hydrophilically substituted cat-
ionic surfactants include dialkylamido ethyl hydroxyethyl-
monium salt, dialkyamidoethyl dimonium salt, dialkylo-
yl ethyl hydroxyethylmonium salt, dialkyloyl ethylidimoniun 
salt, alkyl amidopropyl trimonium salt, polyoxyethylene 
alkyl ammonium salt, and mixtures thereof; for example, 
commercially available under the following tradenames; 
VARISOFT 110, VARISOFT PATC, VARISOFT K212B 
and 638 from Witco Chemical, ETHOQUAD O/12PG, 
ETHOQUAD C/25, and ETHOQUAD S/25 from Akzo, 
DEHYQUART SP from Cognis, and MONQUAT I 95S, 
and MONQUAT SL-5 available from Uniqema.

The polyalkylene glycols useful herein as condition-
ing agents include those which are soluble or dispersible 
in water. Polyethylene glycols are preferred.

Polyalkylene glycols having a molecular weight of 
more than about 100 are useful herein. Ethylene oxide 
polymermers are preferred in view of their generally good water 
solubility, dispersibility, and transparency. Polyethylene-
polypropylene glycols and polyoxyethylene-polypropy-
gen copolymer polymers having good dispersibility and 
transparency may also be useful.
The composition of the present invention may also comprise additives, for instance those chosen from the non-exhaustive list such as reducing agents, antioxidants, sequestering agents, softeners, anti-foams, moisturizers, emollients, basifying agents, plasticizers, sunscreens, direct dyes or oxidation dyes, pigments, mineral fillers, clays, colloidal minerals, nacre, nacreous agents, fragrances, pectizers, preserving agents, fixing or non-fixing polymers, proteins, vitamins, antidandruff agents, aliphatic or aromatic alcohols, and more particularly ethanol, benzyl alcohol, modified or unmodified polylols, such as glycerol, glycol, propylene glycol, dipropylene glycol, butylene glycol or butyl diglycol, volatile silicones, mineral, organic or plant oils, oxyethyleneated or non-oxyethyleneated waxes, paraffins, fatty acids, associative or non-associative thickening polymers, fatty amides, fatty esters, fatty alcohols, and the like.

The present invention will be better understood from the examples which follow, all of which are intended for illustrative purposes only and are not meant to unduly limit the scope of the invention in any way.

**EXAMPLES**

**General Procedure:**

Bleached hair swatches were dyed with commercially available colors. Following the coloring process, the initial L*a*b* values of the swatches were obtained. The colored swatches were swirled in a beaker containing 50 g of a polyamine: silicone phosphate solution and blown dry. Swatches were shampooed three consecutive times with a 10% SLES-2 solution (pH 6.07). Specifically, 0.4 g of SLES-2 solution per 1 g of hair was applied, massaged into the swatch for 15 seconds, and rinsed with warm water for 10 seconds. Following the third shampoo, swatches were blown dry. Swatches were retreated and shampooed in the same manner, for a total of 2 treatments and 6 shampoos. Final calorimetric data were obtained and the ΔE* value, representing the total color change was calculated using the following formula:

\[ \Delta E^* = \sqrt{(\Delta L^*)^2 + (\Delta a^*)^2 + (\Delta b^*)^2} \]

In all polyamine-anionic silicone solutions, the reported concentration is percent active.

**Example 1**

Effectiveness of Polyamines/Silicone Phosphate Solutions as Leave on Treatments

Following the General Procedure, hair swatches were dyed with Redken Color Fusion Hi-Fusion R containing chromatic dyes. The chromatic coloration was mixed in a 1:1 ratio with Redken Pro-oxide 20 Volume Cream Developer and remained on the hair for 30 minutes.

Swatches were treated in triplicate with one of the following polyamine: anionic silicone solutions:

- **A:** 1.0% polyethyleneimine (PEI) and 1.7% dimethicone PEG-8 phosphate, pH 5
- **B:** 2.0% PEI and 1.7% dimethicone PEG-8 phosphate, pH 5
- **C:** 2.0% PEI and 1.7% dimethicone PEG-8 phosphate, pH 7
- **D:** 1.0% PEI and 3.4% dimethicone PEG-8 phosphate, pH 5
- **E:** 0.5% Chitosan and 1.5% dimethicone PEG-8 phosphate, pH 5
- **F:** 1.0% Chitosan and 3% dimethicone PEG-8 phosphate, pH 5
- **G:** 2.0% polyvinylamine (Lupamin 9095) and 2.75% dimethicone PEG-8 phosphate, pH 5
- **H:** 2.0% polyvinylamine (Lupamin 9030) and 2.75% dimethicone PEG-8 phosphate, pH 5
- **I:** 2.0% polyvinylamine (Lupamin 9010) and 2.75% dimethicone PEG-8 phosphate, pH 5

Water, instead of the polyamine: anionic silicone solution was used as the control.

**Example 2**

Effectiveness of Polyamines/Silicone Phosphate/Nonionic Surfactant Solution as a Leave On Treatment

Following the General Procedure, hair swatches were dyed with Paul Michell Inkworks, Matrix Prism Light Auburn, Redken Color Fusion Hi-Fusion R, Redken Color Fusion 5Vr containing acid dyes, basic/Arianor dyes, chromatic dyes, oxidative dyes, respectively. The chromatic and oxidative colorations were mixed in a 1:1 ratio with Redken Pro-oxide 20 Volume Cream Developer and remained on the hair for 30 minutes, while the acid and basic colorations were applied to the hair as is and remained on the hair at least 15 minutes.

Swatches were treated in triplicate with one of the following polyamine: anionic silicone solutions:

- **J:** 10% Polysorbate 80 (control)
- **K:** 10% Polysorbate 80 with 2.0% PEI and 1.7% Dimethicone PEG-8 phosphate

After at least 2 treatments and 6 shampoos with the 10% Polysorbate 80 solution containing PEI and Dimethicone PEG-8 phosphate on various dye types, there was a
statistically significant improvement in color retention compared with those swatches treated with 10% Polysorbate 80 (control). Table II displays the resulting ΔE* values.

Example 3

Effectiveness of Polyamines/Silicone Phosphate in Anionic Shampoo

[0060] Following the General Procedure, hair swatches were dyed with Redken Color Fusion Hi-Fusion R and Redken Shades EQ Rocketfire containing chromatic dyes and direct dyes/oxidative dyes, respectively. The chromatic coloration was mixed in a 1:1 ratio with Redken Pro-oxide 20 Volume Cream Developer and remained on the hair for 30 minutes. The direct and oxidative coloration was mixed with Redken Shades EQ Processing Solution in a 1:1 ratio and remained on the hair 20 minutes.

[0061] Swatches were treated in triplicate with one of the following anionic shampoos 6 times:

I: Shampoo control containing 4.2% SLES-2 and 9.8% Laureth-5 Carboxylic Acid

M: Shampoo containing 4.2% SLES-2 and 9.8% Laureth-5 Carboxylic Acid with 2.0% PEI and 1.7% Dimethicone PEG-8 phosphate

[0062] After 6 shampoos with the anionic shampoo containing PEI and Dimethicone PEG-8 phosphate on hair swatches colored with various dye types, there was a statistically significant improvement in color retention compared with those swatches treated with the Shampoo control. Table III displays the resulting ΔE* values.

Example 4

Effectiveness of Polyamines/Silicone Phosphate in Anionic/Amphoteric Shampoo

[0063] Following the General Procedure, hair swatches were dyed with Paul Mitchell Inkworks, Matrix Prizms Light Auburn, Redken Color Fusion Hi-Fusion R, Redken Color Fusion 5VR as described above.

[0064] Swatches were treated in triplicate with one of the following anionic shampoos for at least 7 times:

N: Shampoo control containing 5% Ammonium Laureth Sulfate and 10% Cocamidopropyl Hydroxysultaine

O: Shampoo containing 5% Ammonium Laureth Sulfate and 10% Cocamidopropyl Hydroxysultaine with 1.25% PEI and 0.5% Dimethicone PEG-8 phosphate

[0065] After at least 7 shampoos with the Anionic/Amphoteric Shampoo containing PEI and Dimethicone PEG-8 phosphate on hair swatches colored with various dye types, there was a statistically significant improvement in color retention compared with those swatches treated with the Shampoo control. Table IV displays the resulting ΔE* values.

What is claimed is:

1. A process for inhibiting dyed hair fibers from losing their color during shampooing comprising contacting the dyed hair fibers with a composition containing:
   (a) at least one polyamine compound having at least two amino groups;
   (b) at least one anionic silicone; and
   (c) optionally, at least one surfactant, and

wherein (a) is present in the composition in an amount sufficient to inhibit the dyed hair fibers from losing their color during shampooing.

2. The process of claim 1 wherein (a) is a polyethyleneimine.

3. The process of claim 1 wherein (a) is a polyvinylamine.

4. The process of claim 1 wherein (a) is a chitosan.

5. The process of claim 1 wherein (a) is present in an amount of from greater than 0 to about 30% by weight, based on the weight of the composition.

6. The process of claim 1 wherein (a) is present in an amount of from about 5% to about 10% by weight, based on the weight of the composition.

7. The process of claim 1 wherein (b) is a silicone phosphate.

8. The process of claim 1 wherein (b) is present in an amount of from greater than 0 to about 50% by weight, based on the weight of the composition.

9. The process of claim 1 wherein (b) is present in an amount of from greater than 0% to about 15% by weight, based on the weight of the composition.
10. The process of claim 1 wherein (c) is an anionic surfactant.

11. The process of claim 1 wherein (c) is present in an amount of from greater than 0% to about 80% by weight, based on the weight of the composition.

12. The process of claim 1 wherein the composition is a shampoo.

13. The process of claim 1 wherein the composition is a hair conditioning product.
