TITLE OF THE INVENTION

SUBSTITUTED PYRAZOLO-QUINAZOLINE DERIVATIVES, PROCESS FOR THEIR PREPARATION AND THEIR USE AS KINASE INHIBITORS

The present invention relates to certain substituted pyrazolo-quinazoline compounds, which modulate the activity of protein kinases. The compounds of this invention are therefore useful in treating diseases caused by dysregulated protein kinase activity.

The present invention also provides methods for preparing these compounds, pharmaceutical compositions comprising these compounds, and methods of treating diseases utilizing pharmaceutical compositions comprising these compounds.

The use of mitotic inhibitors in cancer therapy is a widely accepted clinical strategy for the treatment of a broad range of human cancers. Taxanes (Paclitaxel and Docetaxel) and Vinca Alkaloids (Vincristine and Vinblastine) work by either stabilizing or destabilizing microtubules with catastrophic consequences in cells progressing through mitosis. They are first line therapeutics for several tumour types and second line in cisplatin-refractory ovarian, breast, lung, bladder and esophagus cancers (Taxanes). However, due to the role of microtubules in processes such as cell movement, phagocytosis and axonal transport certain toxicities such as peripheral neuropathy are frequently observed with these agents. Progression through mitosis is a requirement of all proliferating cells and hence cancer therapies that have targets in mitosis are generally applicable to a wide range of tumour types. Several protein kinases play key roles in the orchestration of the cell cycle and some of them are already subject to targeted therapies in the oncology setting including Cdk-2 and Aurora-A. The fidelity of mitosis is of paramount importance and several "checkpoints" exist in normal cells to maintain chromosome integrity during the cell cycle. These checkpoints often go away during oncogenic transformation and this permits cancer cells to tolerate aneuploidy and chromosomal instability. Inhibition of mitosis in "checkpoint compromised" tumour cells should have catastrophic consequences as cancer cells try to carry forward an aberrant mitosis.

The Polo-like kinase family, comprising 4 serine / threonine kinases (Plk-1-4), are predominantly involved in the entry into, progression through and exit from mitosis. These kinases are characterized by having an n-terminal kinase domain and a unique,

Disruption of Plk-I function by various means in tumoural cells (siRNA and antisense ablation, dominant negative proteins and immunodepletion) results in an aberrant mitosis followed by mitotic catastrophe whilst causing a "checkpoint-mediated" cell cycle arrest in normal cells. Thus, pharmacological attenuation of Plk-I function may have a therapeutic benefit in the treatment of several diverse cancers.

The above process, in any one of the aforementioned variants, is an analogy process which can be carried out according to well known methods known in the art. According to step (st.1) of the process, the compound of formula (II) is reacted with the hydrazine derivative of formula (III) in the presence of acetic acid, so as a compound of formula (IV) is obtained. The reaction is preferably carried out at room temperature.

Optionally, the compound of formula (IV) wherein R2 is hydrogen, is reacted with a suitable compound of formula (V) in the presence of a base such as sodium hydride or triethylamine or cesium carbonate, in a suitable solvent, for instance dichloromethane, tetrahydrofuran, dioxane or dimethylformamide, at a temperature ranging from room temperature to 100°C, so as to obtain compound (IV) wherein R2 is as defined above but not hydrogen.

According to step (st.2) of the process, the compound of formula (IV) is reacted with dimethylformamide-di-ter t-butylacetale or dimethylformamide-diisopropylacetale, in the presence of a suitable solvent such as, for instance, dimethylformamide, so as to get the compounds of formula (VI). Preferably, the reaction is carried out at a temperature ranging from room temperature to about 80°C.

According to step (st.3a) of the process, the compound of formula (VI) is reacted with guanidine or guanidine salts as to obtain a compound of formula (VII) through pyrimidine ring formation. Compounds of formula (I) wherein R1 represents an ortho-substituted-arylamino group, can be obtained by the corresponding iodo-derivatives of formula (VIII) which, in their turn, is prepared by the corresponding compounds of formula (VII).

The preparation of the iodo-derivatives of formula (VIII) may be carried out in a suitable solvent such as tetrahydrofuran, diethyl ether or dimethoxyethane, at a temperature ranging from room temperature to about 80°C, and for a time of about 2 to about 48 hours.

The subsequent conversion of the iodo-derivative of formula (VIII) into compounds of formula (I) may be carried out in the presence of an ortho-substituted-arylamine of formula RI-H (IX) in a suitable solvent such as dimethylformamide, dimethoxyethane or acetonitrile and in the presence of catalytic amounts of palladium acetate, (2,2'-bis(diphenylphosphino)-l,l'-binaphtalene (BINAP) and a base such as potassium carbonate, potassium phosphate or cesium carbonate, at a temperature ranging from room temperature to 110°C and for a time ranging from about 2 to about 24 hours.
According to step (st.3b) of the process, the compound of formula (VI) is reacted with guanidine derivatives of formula (X) so as to obtain the corresponding compound of formula (I) through pyrimidine ring formation. Any of the above reactions are carried out according to conventional methods. As an example, the reactions with guanidine or salts thereof such as hydrochloride, carbonate or nitrate, or with the guanidine derivative of formula (X), as set forth in steps (st.3a) or (st.3b), are carried out in dimethylformamide at a temperature ranging from 80°C to refluxing temperature eventually in the presence of potassium carbonate.

According to step (st.4) of the process, the compounds of formula (VIII) may be converted into carboxylic acid derivatives of formula (XIII) or corresponding salt through basic or acidic hydrolysis conditions, widely known in the art.

Compounds of formula (XIII) may be converted into carboxamido derivatives of formula (XIV) wherein R' and R'' are as defined above. The reaction is carried out in the presence of ammonium chloride or a suitable primary or secondary amine of formula (XI), under basic conditions, preferably with N,N-diisopropyl-N-ethylamine or triethylamine, in a suitable solvent such as dichloromethane, dimethylformamide, tetrahydrofuran, or dioxane, and in the presence of a suitable condensing agent such as N,N'-dicyclohexylcarbodiimide (DCC), N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride (EDCI) or O-(benzotriazol-1-yl)-N,N,N',N'-tetramethylisouuronium tetrafluoroborate (TBTU); catalytic amounts of (benzotriazol-1-yl)tripyrrolidinophosphonium hexafluorophosphate (PyBOP) or N-hydroxybenzotriazole may be also required.

The subsequent conversion of the compound of formula (XIV) to the compound of formula (I) may be carried out in a suitable solvent such as dimethylformamide, dimethoxycarbene or acetonitrile and in the presence of an ortho-substituted-arylamine of formula R1-H (IX), catalytic amounts of palladium acetate, (2,2'-bis(diphenylphosphino)-1,1'-binaphtalene (BINAP) and a base such as potassium carbonate, potassium phosphate or cesium carbonate, at a temperature ranging from room temperature to 110°C and for a time ranging from about 2 to about 24 hours.

As formerly indicated, the compounds of formula (I) previously prepared may be easily converted into several other compounds of formula (I) of the invention.

As an example, compounds of formula (I) bearing R3 as an ethoxycarbonyl group, or even as an alkoxy carbonyl group, can be converted into a variety of derivatives according to methods well-known in the art to convert carboxyester groups (-COOR).
into carboxamides (-CONH₂), N-substituted carboxamides (-CONHR'), N,N-
disubstituted carboxamides (-CONR'R'”), and carboxylic acids (-COOH), for instance
as defined in conversion (a), (b) and (e).

The operative conditions are those widely known in the art and may comprise, for
instance, the conversion of a carboxyester group into a carboxamide group, the
reaction with ammonia or ammonium hydroxide in the presence of a suitable solvent
such as a lower alcohol, dimethylformamide or mixtures thereof; preferably the
reaction is carried out with ammonium hydroxide in a methanol/dimethylformamide
mixture, at a temperature ranging from about 50⁰C to about 100⁰C.

Analogous operative conditions apply in the preparation of N-substituted
carboxamides or N,N,N-disubstituted carboxamides wherein a suitable primary or
secondary amine is used in place of ammonia or ammonium hydroxide.

Alternatively, carboxyester groups may be converted into carboxamide or N-
substituted carboxamides or N,N,N-disubstituted carboxamides under basic conditions
such as lithium bis-trimethylsilylamide 1 N in THF, using ammonium chloride or a
suitable primary or secondary amine; preferably the reaction is carried out in
tetrahydrofuran at a temperature ranging from 20⁰C to reflux.

Likewise, carboxyester groups may be converted into carboxylic acid derivatives
through basic or acidic hydrolysis conditions, widely known in the art.

According to conversion (d) of the process, compounds of formula (I) wherein R3 is
carboxylic acid (-COOH) may be converted into carboxamido derivatives (-
CONR'R'”) wherein R' and R” are as formerly indicated.

The reaction is carried out in the presence of ammonium chloride or a suitable
primary or secondary amine of formula (XI), under basic conditions, preferably with
N,N-diisopropyl-N-ethylamine or triethylamine, in a suitable solvent such as
dichloromethane, dimethylformamide, tetrahydrofuran, or dioxane, and in the
presence of a suitable condensing agent such as N,N'-dicyclohexylcarbodiimide
(DCC), N-(3-dimethylaminopropyl)-N'-ethylcarbodiimide hydrochloride (EDCI) or
O-(benzotriazol-1-yl)-N,N,N',N'-tetramethylisourea onium tetrafluoroborate (TBTU);
catalytic amounts of (benzotriazol-1-yl)trispyrrolidinophosphonium
hexafluorophosphate (PyBOP) or N-hydroxybenzotriazole may also be required.

According to conversion(e), the trityl group of the compounds of formula (I) is
removed under acidic conditions, for instance with trifluoroacetic acid and in the
presence of a suitable solvent such as dichloromethane, so as to give rise to the corresponding compound of formula (I) wherein R2 is hydrogen.

According to conversion (f) of the process, the compounds of formula (I) wherein R2 is hydrogen are reacted with an alcohol of formula R2-0H (XII) wherein R2 is as defined above but not hydrogen, in the presence of di-t-butylazadicarboxylate and triphenylphosphine or triphenylphosphine supported on resin, in a suitable solvent such as, for instance, tetrahydrofurane, so as to obtain the corresponding compounds of formula (I).

According to conversion (g) of the process, the compounds of formula (I) wherein R2 is hydrogen are reacted with a compound of formula R2-X (XV) wherein R2 is as defined above but not hydrogen and X is halogen preferably chlorine, bromine or iodine, in the presence of a base like cesium carbonate in a suitable solvent such, as for instance, dimethylformamide, so as to obtain the corresponding compounds of formula (I).

According to conversion (h) of the process, the compounds of formula (I) wherein R2 is an haloethyl, preferably chloroethyl, are treated with a base, preferably DBU, at a temperature ranging from 20°C to 80°C, so as to obtain the corresponding compounds of formula (I) wherein R2 is vinyl.

According to conversion (i) of the process, the conversion of a compound of formula (I) wherein R1 is an ortho-substituted-arylamino bearing in any position a bromine, into a compound of formula (I) wherein R1 is an ortho-substituted-arylamino bearing in any position a group \(-\text{NRR}\)\(^{\prime}\), can be accomplished in a variety of ways according to conventional methods. Preferably it is carried in a suitable solvent such as tetrahydrofurane or dioxane by treatment with an amine of formula RR\(^{\prime}\)-\(\text{NH}\) (XI), and in the presence of catalytic amounts of tris(dibenzilideneacetone)dipalladium, 2-dicyclocethylphosphino-2'-(N,N-dimethylamino)-biphenyl and a base such as LiN(TMS)\(_2\) at a temperature ranging from room temperature to reflux and for a time ranging from 1 to about 24 hours.

From all of the above it is clear to the skilled person that any compound of formula (I) bearing a functional group which can be further derivatized to another functional group, by working according to methods well known in the art thus leading to other compounds of formula (I), is intended to be comprised within the scope of the present invention.
According to any variant of the process for preparing the compounds of formula (I),
the starting materials and any other reactants are known or easily prepared according
5 to known methods. As an example, whilst the starting material of the compounds of
formula (II) is commercially available, the compounds of formula (II) can be prepared
as described in the aforementioned WO 04/104007. Compounds of formula (III), (V),
(XII) and (XV) are commercially available. Some compounds of formula (IX), (X)
and (XI) are commercially available, others were prepared, see following examples 28
to 35 and 43 to 44.

From all of the above, it is clear to the skilled person that when preparing the
10 compounds of formula (I) according to any one of the aforementioned process
variants, optional functional groups within the starting materials or the intermediates
thereof that could give rise to unwanted side reactions, need to be properly protected
according to conventional techniques. Likewise, the conversion of these latter into the
free deprotected compounds may be carried out according to known procedures.

As it will be readily appreciated, if the compounds of formula (I) prepared according
to the process described above are obtained as mixture of isomers, their separation
using conventional techniques into the single isomers of formula (I), is within the
scope of the present invention.

Conventional techniques for racemate resolution include, for instance, partitioned
20 crystallization of diastereoisomeric salt derivatives or preparative chiral HPLC.

In addition, the compounds of formula (I) of the invention may be also prepared
according to combinatorial chemistry techniques widely known in the art, for instance
by accomplishing the aforementioned reactions between the several intermediates in a
parallel and/or serial manner and by working under solid-phase-synthesis (SPS)
25 conditions.

For a general reference to the preparation of the compounds of formula (I) of the
invention according to combinatorial chemistry techniques, see the experimental
section.

See the experimental section for any specific example concerning the preparation of
30 the compounds of formula (I) of the invention and their conversion into other
compounds of formula (I).

Cloning, expression and purification of recombinant PLKI kinase domain.

PLKI kinase domain (corresponding to residues 2-345 of the full length sequence, see Swiss-Prot accession number P53350) was PCR amplified from the full-length human PLKI gene purchased from imaGenes as clone IRATp970A078D. Amplification was performed using the forward oligonucleotide: 5’GGGGACAAGTTTGTACAAAAAAGCAGGCTTATTCGAAAACCTGTATTTTCAGGGCCCTAGTGCTGCAGTGACTGCAAGAGS’ [SEQ ID NO: 1]
and the reverse oligonucleotide:

5' GGGACCACCTTGTAACAAGAAAGCTGGGTTTCACTATTTATTGAGGACT
GTGAGGGGCTT -3'  [SEQ ID NO: 2].

For cloning purposes, the oligonucleotides included attB sites in order to obtain an ωDI?-flanked PCR product suitable for cloning using the Gateway® technology (Invitrogen). Furthermore, for purification purposes, forward primer included a TEV® cleavage site (Amersham Biosciences). The resulting PCR product was cloned in the pDONR221 plasmid and then transferred in the baculovirus expression vector pVL1393 (Invitrogen) Gateway®-modified. For expression and purification purposes, a His tag was added N-terminal to the PLK kinase domain. Cloning was performed according to the protocols described in the Gateway® manual.

Baculoviruses were generated by cotransfecting Sf9 insect cells with the expression vector and the viral DNA using the BaculoGold® transfection kit (Pharmingen). Viral supernatant was recovered after 5 days and subjected to 3 rounds of amplification to increase viral titer. Recombinant protein was produced by infecting High5 insect cells. After 48 hours of infection, cells were recovered, pelleted and freezeed at -80°C. For purification of recombinant protein, pellet was thawed, resuspended in lysis buffer (PBS, NaCl 150 mM, CHAPS 0.1%, DTT 20 mM, glycerol 10%, protease inhibitors) and lysed by sonication. Lysate was cleared by centrifugation and loaded on a Nichel affinity column. After extensive wash, recombinant protein was cleaved and eluted by incubation with TEV® protease.

**Biochemical assay for inhibitors of PLK-I kinase activity**

The inhibitory activity of putative kinase inhibitors and the potency of selected compounds were determined using a trans-phosphorylation assay.

Specific peptide or protein substrates are trans-phosphorylated by their specific serine-threonine or tyrosine kinase, in the presence of ATP traced with 33P-γ-ATP, and in the presence of their own optimal buffer and cofactors. At the end of the phosphorylation reaction, more than 98% cold ATP and radioactive ATP is captured by an excess of the ion exchange dowex resin; the resin then settles down to the bottom of the reaction plate by gravity.

Supernatant, containing the phosphorylated substrate, is subsequently withdrawn and transferred into a counting plate, then evaluated by β-counting.

**Reagents/assay conditions**

i. Dowex resin preparation
500 g of wet resin (SIGMA, custom prepared resin DOWEX 1x8 200-400 mesh, 2.5 Kg) are weighed out and diluted to 2 L in 150 mM sodium formate, pH 3.00. The resin is allowed to settle down (some hours) and then the supernatant is discarded.

After three washes as above over a couple of days, the resin is allowed to settle, the supernatant is discarded and two volumes of 150 mM sodium formate buffer are added per volume of pellet. The pH is then measured and should be around 3.00. The washed resin is stable for more than one week; the stock resin is kept at 4° C before use.

ii. Kinase Buffer (KB)
Kinase buffer was composed of 50 mM HEPES pH 7.9 containing 10 mM MgCl₂, 1 mM DTT, 3 microM NaVO₃, and 0.2 mg/mL BSA, 10 mM β-glycerophosphate.

iii Assay conditions
The kinase assay was run with a final enzyme concentration PLK-I of 3 nM, in presence of 40 microM ATP, 3 nM ³²P-γ-ATP and 85 microM substrate alpha-casein, SIGMA, # C-3240.

Robotized Dowex assay
1) 3x Enzyme mix (done in Kinase Buffer 3X), 5 microL/well
2) 3x substrate and ATP mix (done in ddH₂O), together with ³²P-γ-ATP, 5 microL/well
3) 3x test compounds (diluted into ddH₂O - 3% DMSO) - 5 microL/well

Compound dilution and assay scheme is defined below.

i. Dilution of compounds
10 mM stock solutions of test compounds in 100% DMSO were distributed into 96 well 12x8 format microtiter plates.

For % inhibition studies, individual dilution plates at 1 mM, 100 microM and 10 microM are prepared in 100% DMSO, then diluted at a 3X concentration (30, 3 and 0.3 microM) in ddH₂O, 3% DMSO. A Multimek 96 (Beckman) is used for dilutions and compound pipetting into the test plates.

For IC50 determination, compounds are received as 1 mM, 100% DMSO solutions, plated into the first column of a microtiter plate (A1 to Gl), 100 microL.
A Biomek 2000 (Beckman) is used for serial 1:3 dilutions in water, 3% DMSO, from column A1 to A10 and for all the seven compounds in the plate. In a standard
experiment, the highest concentration of all compounds is 30 microM, then diluted in the final test mixture down to 10 microM.

**ii. Assay scheme**

384-well plates, V bottom (test plates) are prepared with 5 microL of the compound dilution (3X) and then placed onto a PlateTrak 12 robotized station (Perkin Elmer; the robot has one 384-tips pipetting head for starting the assay plus one 96-tips head for dispensing the resin) together with one reservoir for the Enzyme mix (3X) and one for the ATP mix (3X). At the start of the run, the robot aspirates 5 microL of ATP mix, makes an air gap inside the tips (3 microL) and aspirates 5 microL of PLK1 mix. The following dispensation into the plates allows the kinase reaction to start upon 3 cycles of mixing, done by the robot itself. At this point, the correct concentration is restored for all reagents. The robot incubates the plates for 60 minutes at room temperature, and then stops the reaction by pipetting 70 microL of dowex resin suspension into the reaction mix. Three cycles of mixing are done immediately after the addition of the resin. Another mixing cycle is performed after all the plates are stopped, this time using normal tips: the plates are then allowed to rest for about one hour in order to maximize ATP capture. At this point, 20 microL of the supernatant are transferred into 384-Optiplates (Perkin-Elmer), with 70 microL of Microscint 40 (Perkin-Elmer); after 5 min of orbital shaking the plates are read on a Perkin-Elmer Top Count radioactivity counter.

**iii. Data analysis**

Data are analysed by an internally customized version of the SW package "Assay Explorer" that provides either % inhibition for primary assays or sigmoidal fittings of the ten-dilutions curves for IC50 determination, for the secondary assays/hit confirmation routines.

**Biochemical assay for inhibitors of Aurora-2 kinase activity**

The in vitro kinase inhibition assay was conducted in the same way as described for PLK-I enzyme.

**i. Kinase Buffer (KB) for Aurora-2**

The kinase buffer was composed of 50 mM HEPES, pH 7.0, 10 mM MgCl$_2$, 1 mM DTT, 3 microM NaVO$_3$, and 0.2 mg/mL BSA.

**ii. Assay conditions for Aurora-2 (final concentrations)**
The kinase assay was run with an enzyme concentration of 2.5 nM, 10 microM ATP, 1 nM \(^{33}\text{P-}\gamma\text{-ATP}\), and 8 microM substrate, composed of 4 LRRWSLG repeats.

**Inhibition** assay of Cdk2/Cyclin A activity

Kinase reaction: 1.5 microM histone H1 substrate, 25 microM ATP (0.2 microCi P33\(\gamma\)-ATP), 30 ng of baculo virus co-expressed Cdk2/Cyclin A, 10 microM inhibitor in a final volume of 100 microL buffer (TRIS HCl 10 mM pH 7.5, MgCl\(_2\) 10 mM, 7.5 mM DTT) were added to each well of a 96 U bottom well plate. After 10 min at 37°C incubation, reaction was stopped by 20 microL EDTA 120 mM.

Capture: 100 microL were transferred from each well to MultiScreen plate, to allow substrate binding to phosphocellulose filter. Plates were then washed 3 times with 150 microL/well PBS Ca\(^{++}\)/Mg\(^{++}\) free and filtered by MultiScreen filtration system.

**In vitro cell proliferation** assay

A2780 human ovarian and MCF7 human breast cancer cells (1250 cells/well) were seeded in white 384 well-plates in complete medium (RPMI 1640 or EMEM plus 10% Fetal bovine serum) and treated with compounds dissolved in 0.1% DMSO, 24h after seeding. The cells were incubated at 37°C and 5 % CO\(_2\) and after 72 hours the plates were processed using CellTiter-Glo assay (Promega) following the manufacturer’s instruction.

CellTiter-Glo is a homogenous method based on the quantification of the ATP present, an indicator of metabolitically active cells. ATP is quantified using a system based on luciferase and D-luciferin resulting into light generation. The luminescent signal is proportional to the number of cells present in culture.

Briefly 25 microL/well reagent solution are added to each wells and after 5 minutes shacking microplates are red by a luminometer. The luminescent signal is proportional to the number of cells present in culture.

The present invention also includes pharmaceutical compositions comprising a compound of formula (I) or a pharmaceutically acceptable salt thereof in association with a pharmaceutically acceptable excipient, which may be a carrier or a diluent. The pharmaceutical compositions containing the compounds of the invention are usually prepared following conventional methods and are administered in a suitable pharmaceutical form. For example, the solid oral forms may contain, together with the active compound, diluents, e.g., lactose, dextrose saccharose, sucrose, cellulose, corn starch or potato starch; lubricants, e.g., silica, talc, stearic acid, magnesium or calcium stearate, and/or polyethylene glycols; binding agents, e.g., starches, arabic gum, gelatine methylcellulose, carboxymethylcellulose or polyvinyl pyrrolidone; disintegrating agents, e.g., starch, alginic acid, alginates or sodium starch glycolate; effervescent mixtures; dyestuffs; sweeteners; wetting agents such as lecithin, polysorbates, lauryle sulphates; and, in general, non-toxic and pharmacologically inactive substances used in pharmaceutical formulations. These pharmaceutical
preparations may be manufactured in known manner, for example, by means of mixing, granulating, tabletting, sugar-coating, or film-coating processes. The liquid dispersions for oral administration may be, e.g., syrups, emulsions and suspensions. As an example, the syrups may contain, as carrier, saccharose or saccharose with glycerine and/or mannitol and sorbitol.

The suspensions and the emulsions may contain, as examples of carriers, natural gum, agar, sodium alginate, pectin, methylcellulose, carboxymethylcellulose, or polyvinyl alcohol. The suspension or solutions for intramuscular injections may contain, together with the active compound, a pharmaceutically acceptable carrier, e.g., sterile water, olive oil, ethyl oleate, glycols, e.g., propylene glycol and, if desired, a suitable amount of lidocaine hydrochloride.

The solutions for intravenous injections or infusions may contain, as a carrier, sterile water or preferably they may be in the form of sterile, aqueous, isotonic, saline solutions or they may contain propylene glycol as a carrier.

The suppositories may contain, together with the active compound, a pharmaceutically acceptable carrier, e.g., cocoa butter, polyethylene glycol, a polyoxyethylene sorbitan fatty acid ester surfactant or lecithin.

With the aim of better illustrating the present invention, without posing any limitation to it, the following examples are now given.

EXAMPLES

The synthetic preparation of some compounds of formula (I) of the invention is described in the following examples. All the compounds were conveniently and unambiguously identified through a coding system (see following table IV), some of them were herewith listed and indicated also according to their chemical name whilst others were conveniently and unambiguously identified through a coding system, together with their \(^1\)H-NMR data or HPLC/Mass data (see following tables V to XX).

Each code, which unambiguously identifies a single specific compound of formula (I), consists of four units A-B-C-Z.

Code A represents any R1 substituent, as per formula (I), being attached to the rest of the molecule to the position 8; each A group is represented through the proper chemical formula in the following table I, also indicating its point of attachment to the rest of the molecule.

Code B represents the R2 group being attached to the rest of the molecule through the pyrazole nitrogen atom, as per formula (I). Each B group is represented through the
proper chemical formula in the following table II, also indicating its point of attachment to the rest of the molecule.

Code C represents the R3 group being attached to the rest of the molecule to the position 3, as per formula (I). Each C group is represented through the proper chemical formula in the following table III, also indicating its point of attachment to the rest of the molecule.

Each specific A B and C group is represented and consecutively numbered in the following table I, II and III respectively.

Finally, code Z refers to the central core of the molecule (I). From all of the above it is clear to the skilled person that Z is substituted by R1 (code A), R2 (code B), and R3 (code C), as defined in formula (I), also indicating the positions of the other substituents.

Therefore, the coding system presently used for some compounds of formula (I) can be shortly summarised as follows:

Just as an example, which is not intended to limit the scope of the present invention, the compound A45B8C2Z (see example) represents the pyrazolo-quinazoline derivative of formula (I) wherein the central core is represented by the moiety Z, R1 is the group of formula A45 of table I, R2 is the group of formula B8 of table II, R3 is the group of formula C2 of table III, having formula

Mobile phase A was formic acid 0.1% pH=3.3 buffer with acetonitrile (98:2), and mobile phase B was H\(_2\)O/acetonitrile (5:95); the gradient was from 5 to 95% B in 2 minutes then hold 95% B 0.1 minutes. The injection volume was 2 microL. The mass spectrometer was operated in positive and in negative ion mode, the capillary voltage was set up at 3.5 KV (ES\(^{+}\)) and 28 V (ES\(^{-}\)); the source temperature was 120°C; cone was 14 V (ES\(^{+}\)) and 2.8 KV (ES\(^{-}\)); full scan, mass range from 100 to 800 amu was set up.

**HPLC/MS Analytic Method 2**

Mobile phase A was ammonium acetate 5mM pH=5.2 buffer with acetonitrile (95:5), and mobile phase B was H\(_2\)O/acetonitrile (5:95); the gradient was from 10 to 90% B in 8 minutes then ramp to 100% B in 1.0 minutes. The injection volume was 10 microL. The mass spectrometer was operated in positive and in negative ion mode, the capillary voltage was set up at 3.5 KV (ES\(^{+}\))
and 28 V (ES'); the source temperature was 120°C; cone was 14 V (ES+) and 2.8 KV (ES'); full scan, mass range from 100 to 800 amu was set up.

**HPLC/MS Analytical Method 3**

The HPLC equipment consisted of a Waters Acquity™ UPLC system equipped with a 2996 Waters PDA detector and Micromass mod. ZQ single quadrupole mass spectrometer, equipped with an electrospray (ESI) ion source. Instrument control, data acquisition and data processing were provided by Empower and MassLynx 4.0 software.

Mobile phase A was ammonium hydroxide 0.05% pH=10 buffer with acetonitrile (95:5), and mobile phase B was H20/acetonitrile (5:95); the gradient was from 5 to 95% B in 2 minutes then hold 95% B 0.1 minutes. The injection volume was 2 microL. The mass spectrometer was operated in positive and in negative ion mode, the capillary voltage was set up at 3.5 KV (ES+) and 28 V (ES'); the source temperature was 120°C; cone was 14 V (ES+) and 2.8 KV (ES'); full scan, mass range from 100 to 800 amu was set up.

**HPLC/MS Analytical Method 4**

The HPLC equipment consisted of a Waters 2790 HPLC system equipped with a 996 Waters PDA detector and Micromass mod. ZQ single quadrupole mass spectrometer, equipped with an electrospray (ESI) ion source. Instrument control, data acquisition and data processing were provided by Empower and MassLynx 4.0 software.

HPLC was carried out at 25°C at a flow rate of 1 mL/min using a RP18 Waters X Terra (3.0 x 20 mm) column. Mobile phase A was ammonium hydroxide 0.05% pH=10 buffer with acetonitrile (95:5), and Mobile phase B was H20/acetonitrile (5:95); the gradient was from 10 to 90% B in 4 minutes then hold 90% B 1 minutes. The injection volume was 10 microL. The mass spectrometer was operated in positive and in negative ion mode, the capillary voltage was set up at 2.5 KV; the source temperature was 120°C; cone was 10 V; full scan, mass range from 100 to 800 amu was set up.

Several compounds of the invention of formula (I), as prepared according to the following examples, were purified by preparative HPLC.

The operative conditions are defined below:

The mixture was maintained at 65°C under stirring for 12 h in a closed bottle. The solvent was then evaporated to dryness, the residue redissolved with dichloromethane and washed with water. The organic layer was dried over Na₂SO₄ and evaporated. The crude product was purified by flash chromatography on silica gel (eluants: dichloromethane/methanol 94/6) to afford 60 mg (47% yield) of the title compound.

Example 13

8-Iodo-1-methyl-4,5-dihydro-1H-pyrazolo[4,3-h]quinazoline-3-carboxamide

A suspension of potassium 8-iodo-1-methyl-4,5-dihydro-1H-pyrazolo[4,3-h]quinazoline-3-carboxylate (394 mg, 1.0 mmol) in anhydrous dimethylformamide (10 mL) was treated with N-ethyl-N',N'-diisopropyl carbodiimide hydrochloride (EDCI) (287 mg, 1.5 mmol) and with ammonium 1H-1,2,3-benzotriazol-1-ate (304 mg, 2 mmol). The reaction was stirred at room temperature overnight. The reaction was diluted with water and the resulting precipitate was collected by filtration to afford the title compound (320 mg, 90 % yield).

\(^1\)H NMR (400 MHz, DMSO-\(d_6\)) \(\delta\) ppm 2.99 (m, 4 H) 4.25 (s, 3 H) 6.50 (bs, 2 H) 7.31 (s, 1 H) 7.51 (s, 1 H) 8.47 (s, 1 H).

By working according to the above method and using the suitable amine the following compounds were prepared:

8-Amino-1-methyl-1H-pyrazolo[4,3-h]quinazoline-3-carboxamide

\(^1\)H NMR (400 MHz, DMSO-\(d_6\)) \(\delta\) ppm 2.68 and 2.90 (2 m, 4 H) 4.28 (s, 3 H) 6.50 (bs, 2 H) 7.32 (bs, 2 H) 8.15 (s, 1 H).
8-iodo-l-trityl-4,5-dihydro-lH-pyrazolo[4,3-h]quinazoline-3-carboxamide

$^1$H NMR (400 MHz, DMSO-$d_6$) $\delta$ ppm: 2.76 (m, 2 H) 3.08 (m, 2 H) 6.63 (s, 1 H)
7.08-7.30 (m, 15 H) 7.43 (s, 1 H) 8.21 (s, 1 H).

8-iodo-l-methyl-4,5-dihydro-lH-pyrazolo[4,3-h]quinazoline-3-carboxylic acid methylamide

$^1$H NMR (400 MHz, DMSO-$d_6$) $\delta$ ppm 2.75 (d, $J = 4.63$ Hz, 3 H) 2.90 (m, 2H) 3.03 (m, 2 H) 4.24 (s, 3 H) 6.14 (q, $J = 4.63$ Hz, 1 H) 8.47 (s, 1 H).

8-Iodo-4,5-dihydro-lH-pyrazolo[4,3-h]quinazoline-3-carboxamide
8-Iodo-1-trityl-4,5-dihydro-lH-pyrazolo[4,3-h]quinazoline-3-carboxamide (291 mg, 0.5 mmol) in DCM (10 mL) was treated with trifluoroacetic acid (0.5 mL). The resulting mixture was stirred at room temperature for 1 hour. DCM (40 mL) was added and the organic phase was washed with saturated solution of sodium hydrogen carbonate, then with brine, dried over sodium sulfate and concentrated. The crude solid was purified by flash chromatography on silica gel (eluant: DCM/EtOH 90/10) to afford 143 mg of the title compound (84% yield).

8-Iodo-1-(2-fluoroethyl)-4,5-dihydro-lH-pyrazolo[4,3-h]quinazoline-3-carboxamide

A mixture of 8-iodo-4,5-dihydro-lH-pyrazolo[4,3-h]quinazoline-3-carboxamide (104 mg, 0.3 mmol) in THF (3 mL) was treated with triphenylphosphine supported on resin (0.4 g, 3 mmol/g, 1.2 mmol), di-tert-butylazadicarboxylate (276 mg, 1.2 mmol), 2-

8-[(2-acetylphenyl)amino]-1-methyl-4,5-dihydro-1H-pyrazolo[4,3-h]quinazoline-3-carboxamide (A2B1C1Z)

Palladium acetate Pd(OAc)$_2$ (20 mg, 0.09 mmol), (HK)-BINAP (55 mg, 0.09 mmol) and dimethylformamide (5 mL) were charged in a round-bottom flask flushed with argon. The flask was evacuated and backfilled with argon. The mixture was stirred under argon for 30 minutes and added to a mixture of 2-acetylaniline (0.162 ml, 1.35 mmol), 8-iodo-1-methyl-4,5-dihydro-1H-pyrazolo[4,3-h]quinazoline-3-carboxamide (319 mg, 0.9 mmol), potassium carbonate (1.24 g, 9 mmol) in dimethylformamide (10 mL). The resulting mixture was stirred at 80°C for 4 hours under argon. After cooling to room temperature, the reaction mixture was filtered on a pad of celite. The solvent was concentrated, the crude solid was purified by flash chromatography on silica gel (eluant: DCM/EtOH 90/10) to afford 153 mg (47% yield) of the title compound.

Example 17

8-(2-Trifluoromethoxy-phenylamino)-l-(2-hydroxyethyl)-4,5-dihydro-lH-pyrazolo [4,3-h]quinazoline-3-carboxamide (A45B5C1Z)

0.085 g (0.15 mmol) of 8-(2-trifluoromethoxy-phenylamino)-l-[2-(tetrahydro-pyran-2-yloxy)-ethyl]-4,5-dihydro-lH-pyrazolo[4,3-h]quinazoline-3-carboxamide were dissolved in 10 mL of ethanol and 28 mg of p-toluensulfonic acid (0.15 mmol) were added. The solution was stirred at room temperature overnight and the solvent removed in vacuo. The residue was purified by flash chromatography on silica gel (eluant: ethyl acetate/hexane 80/20) to afford 59 mg (90% yield) of the title compound.
1H NMR (400 MHz, DMSO-\(\delta\))  \(\delta\) ppm 2.80 (m, 2 H) 2.98 (m, 2 H) 3.67 (m, 2 H) 4.66 (m, 2 H) 7.22 (m, 1 H) 7.24 (bs, 1 H) 7.39 (m, 2 H) 7.43 (bs, 1 H) 7.87 (m, 1 H) 8.36 (s, 1 H) 9.0 (s, 1 H).

By working according to the above method the following compound was prepared:

1-(2-hydroxy-ethyl)-8-[5-(4-methyl-piperazin-1-yl)-2-trifluoromethoxy-phenylamino]-4,5-dihydro-1H-pyrazolo[4,3-h]quinazoline-3-carboxamide (A51B5C1Z)

1H NMR (400 MHz, DMSO-\(\delta\))  \(\delta\) ppm 2.24 (s, 3 H) 2.46 (br. s., 4 H) 2.80 (t, \(J=7.62\) Hz, 2 H) 2.98 (t, \(J=7.62\) Hz, 2 H) 3.15 (br. s., 4 H) 3.64 (q, \(J=5.49\) Hz, 2 H) 4.59 (t, \(J=5.79\) Hz, 1 H) 4.63 (t, \(J=5.37\) Hz, 2 H) 6.79 (dd, \(J=8.96, 2.99\) Hz, 1 H) 7.19 - 7.24 (m, 1 H) 7.24 (br. s., 1 H) 7.25 (d, \(J=2.93\) Hz, 1 H) 7.43 (s, 1 H) 8.34 (s, 1 H) 8.85 (s, 1 H).

8-[5-(4-Ethyl-piperazin-1-yl)-2-trifluoromethoxy-phenylamino]-l-methyl-4,5-dihydro- 1H-pyrazolo [4,3-h]quinazoline-3-carboxamide (A94B1C1Z)

Tris(dibenzylideneacetone)dipalladium, \(\text{Pd}(_2\text{dba})_3\), (9.1 mg, 0.01 mmol), 2-dicyclohexylphosphino-2’-(N,N-dimethy lamino)-biphenyl (7.8 mg, 0.02 mmol), 8-[2-trifluoromethoxy-5'-bromo-phenylamino]-1-methyl-4,5-dihydro-1H-pyrazolo \(\kappa\) [4,3-h]quinazoline-3-carboxamide (200 mg, 0.41 mmol) in THF (4.5 mL) were charged in a round-bottom flask flushed with argon. The flask was evacuated and backfilled with argon. LiN(TMS)\(_2\) solution (1M in THF, 2.7 mL) and N-ethylpiperazine (0.125 mL, 0.98 mmol) were added and the reaction mixture refluxed for 3 h. The reaction mixture was then allowed to cool to room temperature and concentrated. The crude solid was purified by flash chromatography on silica gel (elu ant: DCM/EtOH 90/10) to afford 46 mg (52 % yield) of the title compound.

1H NMR (400 MHz, DMSO-\(\delta\))  \(\delta\) ppm 1.02 - 1.07 (m, 3 H) 2.32 - 2.64 (m, 6 H) 2.77 - 2.83 (m, 2 H) 2.97 (t, \(J=7.80\) Hz, 2 H) 3.14 (bs, 4 H) 4.16 (s, 3 H) 6.76 (dd, \(J=9.08, 2.99\) Hz, 1 H) 7.17 - 7.22 (m, 1 H) 7.24 (bs, 1 H) 7.31 (d, \(J=2.93\) Hz, 1 H) 7.43 (br.s, 1 H) 8.35 (s, 1 H) 8.88 (s, 1 H).

**Example 24**

**Step 1. Acylation of the solid supported amine with 8-iodo-l-methyl-4,5-dihydro-lH-pyrazolo [4,3-h]quinazoline-3-carbonyl fluoride**

In this case, the "resin" is Rink amide, 4-(2',4'-dimethoxyphenyl-fmoc-aminomethyl)phenoxy (copolystyrene-1% DVB):
8.8 g (4.8 mmol) of the aforementioned resin were charged into a 100 mL Argonaut Quest 205 reaction tube. Removal of the Fmoc protecting group was accomplished by treating the resin with 60 mL of 20% piperidine in DMF for 5 minutes and followed by a second treatment for 30 minutes at room temperature. The resin was washed with DMF (3 x 50 mL, 5 min.), methanol (3 x 50 mL, 5 min.) and finally with dichloromethane (3 x 50 mL, 5 min).

To the 8.8 g (4.8 mmol) of previously deprotected resin, the following pre-activated carboxylic acid fluoride reagent was added. In 50 mL of 1,4-dioxane, 2.78 g (7.81 mmol, 1.6 equivalents) of 8-iodo-l-methyl-4,5-dihydro-lH-pyrazolo[4,3-h]quinazoline-3-carboxylate, 2.41 g (9.12 mmol, 1.9 equivalents) of tetramethylfluoroformamidinium hexafluorophosphate and 1.59 mL (9.12 mmol, 1.9 equivalents) of N,N-diisopropylethylamine were dissolved. N,N-dimethylacetamide was added dropwise to the solution until all reagents were in solution with sonication. The reaction system was stirred at room temperature for 30 minutes. An additional 1.59 mL (9.12 mmol, 1.9 equivalents) of N,N-diisopropylethylamine were added to the solution and the entire contents was charged to the resin on the Quest 210 synthesizer. The resin was mixed for 6 hours at 60°C followed by an additional 12 hours at room temperature. The resin was drained of the acylation cocktail and washed with 1,4-dioxane (3 x 50 mL, 5 min.) whereby the acylation procedure was repeated a second time using the previously described protocol. Upon completion of the second acylation cycle, the resin was again drained of the acylation cocktail and washed with 1,4-dioxane (3 x 50 mL, 5 min.), DMF (3 x 50 mL, 5 min.), and finally with DCM (3 x 50 mL, 5 min.). The resin was dried from DCM under vacuum. The resin was qualitatively tested for the acylation reaction completion using the ninhydrin test method.

**Step 2.** Catalytic amination of the solid supported 8-iodo-l-methyl-4,5-dihydro-lH-pyrazolo [4,3-h]quinazoline-3-carboxamide
Using a 4 ml Argonaut Trident synthesizer cassette, 200 mg (0.11 mmol) of the resin from step 1 above, were charged into separate vials. To each of the reactor vials flushed with argon, finely divided potassium carbonate (0.15 g, 1.1 mmol), palladium acetate \([\text{Pd(OAc)}_2]\) (2.5 mg, 0.011 mmol, 10%), \((\text{HK})\text{-BINAP}\) (6.8 mg, 0.011 mmol, 10%) and the corresponding amine (0.22 mmol, 2 equivalents) in degassed (argon) dimethylacetamide (2 mL) were added. The resulting mixture was agitated at 60°C for 10 hours on the Argonaut Trident Automated Library Synthesizer (ALS) station. The Trident ALS station was programmed to continuously mechanically agitate the resin at 60°C while a nitrogen gas "sparge" was incorporated to re-suspend the scarcely soluble potassium carbonate. Nitrogen gas sparging was incorporated once per hour, for a 30 second duration, throughout the 16-hour heating cycle.

The resin was drained from the synthesis cocktail and washed using the Argonaut Trident External Agitation Thermal Unit (EATU) synthesis station with DMA (3 x 2 mL, 5 min.). The above catalytic amination cycle was repeated a second time using the previously described procedure.

Upon completion of the second amination cycle, the resin was drained from the synthesis cocktail and washed using the Argonaut Trident EATU synthesis station with DMF (1 x 2 mL, 5 min.), with water (1 x 2 mL, 5 min.), with DMF/water (1:1) (3 x 2 mL, 5 min.), with DMF (3 x 2 mL, 5 min.), with methanol (3 x 2 mL, 5 min.) and with DCM (3 x 2 mL, 5 min.).

**Step 3. Cleavage of the differentially substituted 8-amino-1-methyl-4,5-dihydro-1H-pyrazolo[4,3-h]quinazoline-3-carboxamide from the solid support**

To each Argonaut Trident reactor vial, 2 mL of the following resin cleavage cocktail were added: dichloromethane (100 mL), trifluoroacetic acid (98 mL) and water (2 mL). The resin, suspended in the cleavage cocktail, was shaken for 2 hours at room temperature on the Argonaut Trident EATU synthesis station. The solution containing the crude products was captured into separate vials. The resin was treated to a second cycle of the aforementioned cleavage cocktail and three additional resin washes with dichloromethane (2 mL each) were also captured to the same corresponding vials.
By working analogously, the following compounds were prepared:

Step 1. Direct acylation of the solid supported methyl esters of methyl 4-[[3-carbamoyl-1-methyl-4,5-dihydro-1H-pyrazolo[4,3-h]quinazoline-8-yl]amino]-3-methylbenzoate

A modified protocol of Weinreb amide acylation chemistry (Tetrahedron Lett. 1977, 48, 4171) was applied in the generation of the desired carboxamides directly from methyl ester compounds tethered to a solid support. To a Biotage/Personal Chemistry, Smith Creator 0.5-2 mL microwave reactor vial was charged 200 mg (1.1 mmol) of dry resin prepared in step 2 (catalytic amination) above. The vial was purged with argon gas and placed aside. To an argon gas purged, 1-dram vial containing 2 mL of dry DCM was charged 0.045 g (0.44 mmol, 4 equivalents) of the appropriate amine followed by 225 microL of a trimethylaluminum solution (2M in toluene). The vial was agitated on a vortex mixer for 30 seconds and allowed to stand at room temperature for 15 minutes, after which time the entire contents was charged to the microwave reactor vial containing the dry resin. The microwave vial was placed in the Smith Creator microwave system that was programmed to irradiate the vial for 10 minutes at H O C with simultaneous cooling. Upon completion of the heating and cool down cycle, the reaction was quenched with methanol/water (1:1) and washed with DMF (3 x 2 mL, 5 min.), with methanol (3 x 2 mL, 5 min.) and with DCM (3 x 2 mL, 5 min.).

Step 2. Cleavage of the differentially substituted 8-[[5-carbamoyl-2-methylphenyl]amino]-1-methyl-4,5-dihydro-1 H-pyrazolo[4,3-f]quinazoline-3-carboxamide compounds from the solid support

To each reactor vials, 2 mL of the following resin cleavage cocktail were added: dichloromethane (100 mL), trifluoroacetic acid (98 mL) and water (2 mL). The resin suspended in the cleavage cocktail was shaken for 2 hours at room. The solution containing the crude products was captured into separate vials. The resin was treated
to a second cycle of the aforementioned cleavage cocktail and three additional resin washes with dichloromethane (2 mL each) were also captured to the same corresponding vials.

**Box No. II** Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. JjH Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:

   Although claims 11-21 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

2. [ ] Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. [ ] Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box No. III** Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. [ ] As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. [ ] As all searchable claims could be searched without effort justifying an additional fees, this Authority did not invite payment of additional fees.

3. [ ] As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. [ ] No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

**Remark on Protest**

- [ ] The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- [ ] The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- [ ] No protest accompanied the payment of additional search fees.
