United States Plant Patent

Patent No.: US PP20,066 P2
Date of Patent: Jun. 9, 2009

HEUCHERA PLANT NAMED ‘RASPBERRY CHIFFON’

Latin Name: Heuchera x hybrida
Variatel Denomination: Raspberry Chiffon

Inventor: Charles Oliver, 921 Scottsdale-Dawson Rd., Scottsdale, PA (US) 15683

Notice: Subject to any disclaimer, the term of this patent is extended or adjusted under 35 U.S.C. 154(b) by 0 days.

Appl. No.: 12/154,223
Filed: May 21, 2008

ABSTRACT

A new and distinct cultivar of Heuchera plant named ‘Raspberry Chiffon’, characterized by its full, densely foliated and uniformly mounded plant habit; vigorous growth habit; ruffled purple bronze and silver-colored leaves; numerous large light pink-colored flowers arranged on erect panicles; and excellent garden performance.

Botanical designation: Heuchera x hybrida.
Cultivar denomination: ‘Raspberry Chiffon’.

BACKGROUND OF THE INVENTION

The present invention relates to a new and distinct cultivar of Heuchera, botanically known as Heuchera x hybrida and hereinafter referred to by the name ‘Raspberry Chiffon’.

The new Heuchera is a product of a planned breeding program conducted by the Inventor in Scottsdale, Pa. The objective of the breeding program is to create new vigorous Heuchera cultivars with uniform plant habit, and attractive leaf and flower coloration.

The new Heuchera originated from a cross-pollination made by the Inventor in May, 2000 in Scottsdale, Pa. of Heuchera ‘Pearl Pendants’, not patented, as the female, or seed, parent with a proprietary selection of Heuchera identified as code number H99-9B, not patented, as the male, or pollen, parent. The new Heuchera was discovered and selected by the Inventor as a single flowering plant within the progeny of the stated cross-pollination in a controlled greenhouse environment in Scottsdale, Pa. in June, 2001.

Asexual reproduction of the new Heuchera by cuttings in a controlled greenhouse environment in Scottsdale, Pa. since October, 2001, has shown that the unique features of this new Heuchera are stable and reproduced true to type in successive generations.

SUMMARY OF THE INVENTION

The new Heuchera has not been observed under all possible environmental conditions. The phenotype may vary somewhat with variations in environment and cultural practices such as temperature, daylength and light intensity without, however, any variance in genotype.

The following traits have been repeatedly observed and are determined to be the unique characteristics of ‘Raspberry Chiffon’. These characteristics in combination distinguish ‘Raspberry Chiffon’ as a new and distinct cultivar of Heuchera:

1. Full, densely foliated and uniformly mounded plant habit.
2. Vigorous growth habit.
3. Ruffled purple bronze and silver-colored leaves.
4. Numerous large light pink-colored flowers arranged on erect panicles.
5. Excellent garden performance.

Plants of the new Heuchera differ from plants of the female parent, ‘Pearl Pendants’, in the following characteristics:

1. Leaves of plants of the new Heuchera are more deeply lobed than leaves of plants of ‘Pearl Pendants’.
2. Leaves of plants of the new Heuchera are more ruffled than leaves of plants of ‘Pearl Pendants’.
3. Plants of the new Heuchera and ‘Pearl Pendants’ differ in leaf color as plants of ‘Pearl Pendants’ have bronze green-colored leaves.

Plants of the new Heuchera differ from plants of the male parent selection in the following characteristics:

1. Leaves of plants of the new Heuchera are more deeply lobed than leaves of plants of the male parent selection.
2. Leaves of plants of the new Heuchera are more ruffled than leaves of plants of the male parent selection.
3. Plants of the new Heuchera and the male parent selection differ in leaf color as plants of the male parent selection have grey green-colored leaves.

Plants of the new Heuchera can be compared to plants of the Heuchera ‘Harmonic Convergence’, disclosed in U.S. Plant Pat. No. 11,111. In side-by-side comparisons conducted in Scottsdale, Pa., plants of the new Heuchera differed from plants of ‘Harmonic Convergence’ in the following characteristics:

1. Leaves of plants of the new Heuchera were smaller, more deeply lobed and more ruffled than leaves of plants of ‘Harmonic Convergence’.
2. Plants of the new Heuchera had shorter and narrower inflorescences than plants of ‘Harmonic Convergence’.
3. Plants of the new Heuchera had larger flowers than plants of ‘Harmonic Convergence’.
BRIEF DESCRIPTION OF THE PHOTOGRAPHS

The accompanying colored photographs illustrate the overall appearance of the new *Heuchera*, showing the colors as true as it is reasonably possible to obtain in colored reproductions of this type. Colors in the photographs may differ slightly from the color values cited in the detailed botanical description which accurately describe the colors of the new *Heuchera*.

The photograph on the first sheet comprises a side perspective view of a typical plant of ‘Raspberry Chiffon’.

The photograph on the second sheet is a close-up view of typical flowers of ‘Raspberry Chiffon’.

DETAILED BOTANICAL DESCRIPTION

The aforementioned photographs and following observations, measurements and values describe plants grown in Scottsdale, Pa. in one-gallon containers in a glass-covered greenhouse and under conditions which closely approximate commercial *Heuchera* production. During the production of the plants, day temperatures ranged from 15° C. to 26° C. and night temperatures ranged from 5° C. to 18° C. Plants were one year old when the photographs and the description were taken. In the description, color references are made to The Royal Horticultural Society Colour Chart, 1995 Edition, except where general terms of ordinary dictionary significance are used.

Botanical classification: *Heuchera x hybrid* ‘Raspberry Chiffon’.

Parentage:

Female, or seed, parent.—*Heuchera x hybrid* ‘Pearl Pendants’, not patented.

Male, or pollen, parent.—Proprietary selection of *Heuchera x hybrid* identified as code number 199-9B, not patented.

Propagation:

Type.—By cuttings.

Time to initiate roots, summer.—About 15 days at 23° C.

Time to initiate roots, winter.—About 21 days at 17° C.

Time to produce a rooted young plant, summer.—About 45 days at 23° C.

Time to produce a rooted young plant, winter.—About 60 days at 17° C.

Root description.—Fine, fibrous; white in color.

Rooting habit.—Freely branching; moderately dense.

Plant description:

Appearance.—Herbaceous perennial; basal rosette plant habit with leaves developing from the base; densely foliated; full, mounded and uniform plant habit with upright panicles with white-colored flowers. Vigorous growth habit.

Plant size.—Height, soil level to top of foliar plane: About 10 cm. Height, soil level to top of panicles: About 60 cm. Diameter or spread: About 30 cm.

Foliage description:

Arrangement.—Basal rosette, simple.

Length.—About 9 cm.

Width.—About 9.5 cm.

Shape.—Rounded cordate; seven-lobed.

Apex.—Broadly obtuse, lobed.

Base.—Auriculate.

Margin.—Crenate with ciliation; ruffled.

Texture, upper and lower surfaces.—Slightly pubescent; slightly rough.

Venation pattern.—Palmate; reticulate.

Color.—Developing and fully expanded leaves, upper surface: Close to 198A; venation, close to 131A underrain with close to 200A. Developing and fully expanded leaves, lower surface: Close to 187A; venation, 187A.

Petiole.—Length: About 12 cm. Diameter: About 1.8 mm. Texture, upper and lower surfaces: Smooth. Color, upper and lower surfaces: Close to 187B.

Flower description:

Appearance/arrangement.—Single campanulate flowers arranged on loose, narrow and mostly erect panicles; about ten to 15 panicles develop during the flowering season, each panicle with about 150 to 250 flowers and flower buds. Flowers face mostly outward to slightly downward. Flowers not fragrant.

Time of flowering.—Plants flower from May through August in Scottsdale, Pa.; flowering continuous during this period.

Inflorescence longevity.—Individual inflorescences last about one week on the plant. Flowers persistent.

Inflorescence size.—Length: About 40 to 60 cm. Diameter: About 7 cm.

Flower size.—Diameter: About 5 mm. Depth (height): About 9 mm.

Flower buds.—Height: About 4 mm. Diameter: About 2.5 mm. Shape: Bulbous. Color: Close to 59C.

Sepals.—Quantity/arrangement: Five sepals; radially symmetrical and fused at base. Calyx length: About 7 mm. Calyx diameter: About 5 mm. Shape: Elongate. Apex: Obtuse. Margin: Entire. Texture, upper and lower surfaces: Pubescent. Color, upper surface: Close to 62D; towards the apex, shaded with close to 150D. Color, lower surface: Close to 155D; shaded with close to 59D; glandular hairs, close to 59B; towards the apex, shaded with close to 150D.

Reproductive organs.—Androecium: Stamen number: Five per flower. Anther shape: Oval. Anther size: About 1 mm by 0.6 mm. Anther color: Close to 25B.

Seed.—Size: About 0.6 mm by 0.3 mm. Color: Close to 202A.
Disease/pest resistance: Resistance to pathogens and pests common to *Heuchera* has not been observed on plants grown under commercial conditions.

Garden performance: Plants of the new *Heuchera* have been observed to have excellent garden performance. Plants of the new *Heuchera* have demonstrated good tolerance to rain, wind, night temperatures as low as ~30°C and day temperatures as high as 45°C.

It is claimed:

1. A new and distinct *Heuchera* plant named ‘Raspberry Chiffon’ as illustrated and described.
