## STADIUM CHAIR

### CROSS-REFERENCE TO RELATED APPLICATION(S)

[0001] This application is a continuation of U.S. patent application Ser. No. 11/046,366, filed on Jan. 28, 2005, which is a continuation of U.S. patent application Ser. No. 10/846,136, filed on May 14, 2004, which is a continuation of U.S. patent application Ser. No. 10/348,785, filed on Jan. 22, 2003, now U.S. Pat. No. 6,739,667, the contents of which are incorporated in their entirety by reference herein.

### FIELD OF THE INVENTION

[0002] The present invention relates to chairs. More specifically, the present invention relates to chairs and chair-backs that are attachable to or useable with stadium seating, such as bleachers.

### BACKGROUND OF THE INVENTION

[0003] Bleacher-type seating is often provided for spectator events such as sporting events, concerts, and the like. Such seating is often provided in a permanent setting, such as a stadium, a semi-permanent setting, such as retractable bleachers in a gymnasium, or on a temporary basis for specific events. Bleachers provide simple, efficient and convenient seating for a large number of spectators; however, bleachers do not necessarily provide the most comfortable seating nor do they typically identify an individual seating location.

[0004] To improve the comfort of such seating, patrons sometimes bring their own seats or cushions. While an improvement in comfort, such a solution requires the patron to remember to bring their own device, which is often an afterthought and/or a very easily overlooked consideration when attending an otherwise exciting event. In addition, having spectators hauling their own chairs or cushion into a stadium seating arrangement can be inconvenient and possibly even dangerous to other spectators. That is, walkways are narrow and space is extremely limited so carrying extra items (especially if large, bulky or cumbersome) presents a challenge.

[0005] Thus, there exists a need to balance the conveniences and mass seating offered through stadium or bleacher seating with a degree of personal comfort.

### BRIEF SUMMARY OF THE INVENTION

[0006] The present invention is a stadium chair that can be semi-permanently affixed to a bleacher. In one embodiment, the stadium chair includes a tubular or cylindrical frame having front brackets that loop over a front edge of a bleacher. The frame includes a seat portion and a back portion. A flexible member is slid over or otherwise secured to the back portion thereby providing a seatback. A cushion is placed over the seat portion of the frame and a rear portion of the cushion is secured to the frame to prevent the cushion from being easily removed.

[0007] An attachment bracket is coupleable to the back portion of the frame. The attachment bracket can be configured to be secured to the frame by frictional engagement. The attachment bracket includes one or more threaded throughbores, to which an attachment clamp can be secured

with a threaded member, such as a bolt or various other attaching mechanisms. The attachment clamp is thus used to secure the stadium chair to the bleacher.

[0008] The use of an attachment bracket in this manner provides many advantages. One such advantage is that the frame itself can remain a very simple structural member. In one embodiment, the frame is simply a bent tubular or cylindrical member. Another advantage is that with the attachment bracket secured to the seat back (i.e., somewhat further from and higher than the bleacher than the seat portion of the frame) additional leverage can be developed which makes attachment to the bleacher even more secure. Another advantage is that the attachment bracket (while allowing for more to be used) only requires a single, centrally positioned attachment clamp to be used. Thus, a single clamp can be used to secure the stadium chair to the bleacher. Alternatively, providing multiple attachment points (e.g., throughbores) allows the seat to be positioned in a desired location (e.g., over a seat designation number) despite having various obstructions located below the seat. That is, various frame or support members may preclude the use of a given attachment point. Having multiple attachment points simply allows an alternative attachment point to be utilized so that the seat can be placed wherever desired.

[0009] One context where the present invention may be used is in providing designated, comfortable seating to select patrons in a stadium seating arrangement. For example, the stadium may rent the present stadium chairs to any patron who so chooses. In such a scenario, stadium personnel would most likely secure all of the stadium chairs to the bleachers in the appropriate locations before the arrival of the patrons. This provides many advantages. For example, it can provide a source of advertising, by allowing printed matter to be prominently displayed on the stadium seats awaiting the arrival of patrons. It also allows a particular space or seating location to be physically identified and/or reserved for a particular patron.

[0010] While providing these and other advantages, the securement of the stadium chairs to the bleachers does place a burden on the stadium personnel (either before each event where such chairs are used or initially during a given season or time period if the chairs will be allowed to remain in place over time) especially when a large number of chairs will be attached. Thus, the attachment bracket having a single, centrally disposed clamp optimizes installation by allowing for an extremely fast yet secure attachment.

[0011] In another embodiment, a stadium seat is provided that includes a seatback and a cushion that are coupled together by one or more flexible members. This type of stadium seat is for use with a backed bleacher. The seat back includes a bracket that can be secured to the existing bleacher back. The flexible members allow the seat cushion to be placed onto the seat portion of the bleacher.

[0012] The present invention, in another embodiment, is a stadium chair having a frame with a seat portion and a back portion, the seat portion including a bracket for engaging a first portion of a bleacher, the back portion supporting a backrest. Also included is an attachment bracket coupled with the back portion of the frame and a clamp coupleable to the attachment bracket and engageable with a second portion of the bleacher for adjustably securing the stadium chair to the bleacher.

[0013] In another embodiment, the present invention is a stadium chair for use with a bleacher having an upper seating surface. That chair has a frame including a first generally U-shaped bracket for engaging a front face of a bleacher; a second generally U-shaped bracket for engaging the front face of the bleacher; a seat portion including a first support member coupled with the first generally U-shaped bracket and a second support member coupled with the second generally U-shaped bracket, wherein the seat portion is configured to engage the upper seating surface of the bleacher; a back portion having a first upright member coupled with the first support member and a second upright member coupled with the second support member; and a cross member interconnecting the first upright member and the second upright member.

[0014] The stadium chair further includes a seat cushion configured to rest on top of the seat portion; a backrest having an interior portion for receiving a portion of the first upright member, a portion of the second upright member and the cross member so that the backrest spans between the first upright member and the second upright member; and an attachment bracket coupled to the back portion of the frame and interconnecting the first upright member and the second upright member, the attachment bracket including at least one threaded throughbore. Also included is a clamp including a first section and a second section perpendicular to the first beam, wherein the clamp is coupleable to the attachment bracket via a threaded member passing through the first section and engaging the threaded throughbore.

[0015] The present invention also provides a method of attaching a stadium chair to a bleacher. The method comprises positioning a frame over an upper surface of the bleacher so that a generally U-shaped bracket of the frame engages a front portion of the bleacher; coupling a single clamp to a medially disposed throughbore on an attachment bracket attached to a back portion of the frame with a threaded member; placing a flange of the clamp below a lower surface of the bleacher; and securing the clamp to the attachment bracket by rotating the threaded member.

[0016] In another embodiment, the present invention is a stadium seat for a backed bleacher comprising a seat cushion; a back cushion coupled to the seat cushion by a flexible member; and an attachment clamp for securing the back cushion to a back of the bleacher.

[0017] While multiple embodiments are disclosed, still other embodiments of the present invention will become apparent to those skilled in the art from the following detailed description, which shows and describes illustrative embodiments of the invention. As will be realized, the invention is capable of modifications in various obvious aspects, all without departing from the spirit and scope of the present invention. Accordingly, the drawings and detailed description are to be regarded as illustrative in nature and not restrictive. The use of descriptive terms such as up, down, vertical and horizontal are for illustrative purposes only, are not meant to be limiting, and are used by way of example with respect to the illustrations presented.

#### BRIEF DESCRIPTION OF THE DRAWINGS

[0018] **FIG. 1** is an isometric view of a stadium chair attached to a bleacher in accordance with one embodiment of the present invention.

[0019] **FIG. 2** is a partially sectional view of the stadium chair of **FIG. 1**.

[0020] **FIG. 3** is an isometric view of a portion of a frame of the stadium chair of **FIG. 1** along with an attachment bracket useful in securing the stadium chair to a bleacher.

[0021] **FIG. 4** is a side, planar view illustrating a portion of the stadium chair frame and the attachment to a bleacher with an attachment clamp.

[0022] **FIG. 5** is side, planar view of an alternative attachment clamp.

[0023] **FIG. 6** is a rear, planar view of a securing strap for securing a seat cushion to the frame of the stadium chair.

[0024] **FIG. 7** is a top, planar view of the seat cushion and the securing strap of **FIG. 6**,

[0025] **FIG. 8** is a top, planar view of the seat cushion with alternative securement straps for securing the seat cushion to the frame.

[0026] **FIG. 9** is a side, planar view of a backed bleacher with a backed stadium seat attached.

[0027] **FIG. 10** is front/top planar view of the stadium seat for the backed bleacher.

[0028] **FIG. 11** is a isometric view of a portion of a back cushion of the stadium seat for the backed bleacher.

[0029] **FIG. 12** is a side, planar view of a back cushion bracket for securing the stadium seat for the backed bleacher to the back rest portion of the bleacher.

[0030] **FIG. 13** is a side, planer view illustrating a portion of the stadium chair frame and attachment to a bleacher with an attachment clamp.

#### DETAILED DESCRIPTION

[0031] **FIG. 1** is an isometric view of a stadium chair **10** attached to a bleacher **12** in accordance with one embodiment of the present invention. The bleacher **12** can take many forms. As illustrated, the bleacher **12** may be an elongated plank-like member having a planar upper seating surface **14**, a lower surface **16**, a front face **18** and rear face **20**. The bleacher **12** may be made from various materials including wood or aluminum. As illustrated in phantom, the bleacher **12** may also include a recess **22** having one or more lips **24** and one or more ribs (not shown) to provide additional structural support.

[0032] The stadium chair **10** rests on the upper seating surface **14** and is secured to both the front face **18** and rear face **20** of the bleacher. The particular configuration of the bleacher **12** may affect which particular securement members (described more fully below) should be used.

[0033] Referring to **FIGS. 1 and 2**, the stadium chair **10** includes a frame **26**. As illustrated, frame **26** is formed from a tubular or cylindrical member that is appropriately bent at predetermined angles to form the frame structure. The frame **26** could be formed from any suitable material such as metal (e.g., aluminum, steel tubing or steel rod), plastic or the like. The choice of materials will determine whether the frame **26** is formed via bending or as a pre-shaped component (e.g., molded, cast, injection molded). As illustrated, the frame **26** is a single component forming a first generally U-shaped

bracket 46 having a first face engaging member 50 and a first lower surface engaging member 54. Likewise, the frame 26 includes at an opposite end a second generally U-shaped bracket 48 having a second face engaging member 52 and a second lower surface engaging member 56.

[0034] The frame 26 includes a first horizontal member 36 and a second horizontal member 38 which rest atop the upper seating surface 14 when the stadium chair 10 is positioned as illustrated. The horizontal members 36, 38 define a seat portion 34 of the frame 26. Depending from the horizontal members 36, 38 and extending upwards (as illustrated) is a back portion 32 of the frame 26 that is defined by a first upright member 40 and a second upright member 42. The first and second upright members 40, 42 are optionally interconnected by an upright cross member 60. The upper section of back portion 32 may be angled backwards or away from bleacher 12. This provides a more comfortable seat back for patrons by preventing the upper corners from engaging the back of the patron. In addition, the angled portion aides in securing a backrest 28 to the frame 26. That is, backrest 28 is a flexible member having an interior cavity allowing the backrest 28 to be slipped over the back portion 32. The angle can increase the tension of the backrest 28, making it more secure. In addition, clips (not shown) or other attachment members can be used to temporarily or permanently secure the backrest 28 to the frame 26.

[0035] A seat cushion 30 is placed atop the seat portion 34 of frame 26. The seat cushion 30 provides a comfortable seating surface for the patron. The cushion 30 and backrest 28 can be made from any appropriate material such as vinyl, plastic, or the like. If exposed to the environment, the material chosen preferably is suitably durable and/or weather resistant. The cushion 30 and/or the backrest 28 can include a desired amount of padding or cushioning to achieve a desired size, shape and degree of comfort.

[0036] In use, the frame 26 is positioned so that the first and second generally U-shaped brackets 46, 48 loop over the front face 18 of the bleacher 12. The shape of the generally U-shaped brackets 46, 48 and the overall rigidity of the frame 26 thus prevent the stadium chair 10 from tipping either forwards or backwards. An attachment bracket 44 is positioned on the back portion 32 of the frame 26, between the first and second uprights 40, 42. The attachment bracket 44 provides additional strength and rigidity to the overall frame assembly. An L-shaped attachment clamp 62 is releasably secured to the attachment bracket 44 and is positioned so that a portion thereof is below the bleacher 12, in contact with lower surface 16, as shown in FIG. 2. Thus, as attachment clamp 62 is tightened against attachment bracket 44, attachment clamp 62 frictionally engages bleacher 12, effectively clamping stadium chair 10 to the bleacher 12. In this manner, stadium chair 10 is prevented from being tilted forwards or backwards; sliding forwards or backwards (e.g., off the bleacher 12), lifted vertically; and if sufficient tension is applied, from sliding horizontally along upper surface 14. Thus, a defined location on the bleacher 12 is presented that provides a comfortable, backed seating position to a patron.

[0037] FIG. 3 is an isometric view of one embodiment of the attachment bracket 44. The attachment bracket 44 is preferably a rigid member made of suitably strong material such as metal. For example, attachment bracket 44 could be

stamped, cast, bent or otherwise fabricated from steel, aluminum or the like. Attachment bracket 44 is a channeled member having some degree of depth or thickness. At opposing ends, a first tab 70 and a second tab 72 are provided. The tabs 70, 72 may be bent around upright member 40, 42 respectively to secure the attachment bracket 44 to the frame 26. Other methods of attachment such as bolting, crimping, clamping, welding, or the like may also be used to secure the attachment bracket 44 to the upright members 40, 42 of the frame 26. As the tabs 70, 72 are bent around upright members 40, 42, they form channels 74, 76 that ultimately receive and frictionally engage the upright members 40, 42. Thus, the attachment bracket is securely attached to a given position on the back portion 32 of the frame 26.

[0038] The attachment bracket 44 is provided with one or more threaded throughbores 78, 80, 82. If multiple clamps 62 are to be attached they may be balanced by utilizing left and right threaded throughbores 80, 82. If only one clamp 62 is to be used, it may normally be secured to central threaded throughbore 78 or alternatively to any throughbore that is unobstructed. That is, the seat 10 may be positioned as desired and the multiple throughbores 78, 80, 82 provide for multiple attachment points. Thus, if one or more attachment points is obscured or occluded by an obstruction (e.g., a frame member of the bleacher 12), it is a simple matter to utilize one of the other unobstructed attachment points. Fewer threaded throughbores may be provided, more may be provided, and different configurations could also be utilized as desired.

[0039] By utilizing an attachment bracket 44, frame 26 can be made as a relatively simple and straightforward component. That is, the frame 26 can be easily and readily produced as can the attachment bracket 44. These two components can be quickly and easily joined to produce a complete frame assembly.

[0040] FIG. 4 illustrates how attachment clamp 62 is secured to attachment bracket 44 and how clamp 62 engages bleacher 12. A threaded member such as bolt 84 is passed through an upper portion of clamp 62 so as to engage one of the threaded throughbores 78, 80, 82 illustrated in FIG. 3. Rotating the bolt 84 causes the clamp 62 to abut and engage the attachment bracket 44, in the known way. Thus, by tightening the bolt 84, the clamp 62 is secured; this in turn effectively secures the chair 10 to the bleacher 12. As shown, the clamp 62 is spaced from the rear face 20; however, these two portions could be in contact. Likewise, as illustrated, clamp 62 contacts the lower surface 16; however, a small gap could also be present.

[0041] In a particularly efficient arrangement, one of the clamps 62 could be loosely attached to each of the chairs 10 prior to installation on the bleachers. Thus, the installer could position the chair 10, pivot the clamp into place, tighten the bolt 84 with a wrench or the like and the chair 10 is installed. When installing hundreds or even thousands of chairs at one time, this efficiency is well placed. Alternatively, various other known attachment mechanisms could be used to secure the clamp 62 to the attachment bracket 44. For example, as shown in FIG. 13, the throughbore 78, 80, 82 need not be threaded. Rather, a threaded member 84 (e.g., a bolt) could be passed therethrough and secured with a fastener 87, such as a nut, wing nut, cotter pin, or the like.

This may, in some cases, allow installation and removal without requiring a separate tool. For example, a wing nut could be manually tightened or loosened by hand. In such and example, the bolt head may be positioned underneath the seat cushion 30 so that the wing nut would be exposed from behind the chair 10. Additionally, the clamp 62 could be secured to attachment bracket 44 via any other attachment clamps, levers, connectors or brackets that would allow the clamp 62 to be appropriately tensioned against the attachment bracket 44 with a desired degree of manipulation.

[0042] As mentioned above, some bleachers 14 may have lips 24 and recesses 22 (FIG. 1). In such a case, a J-clamp 86, as illustrated in FIG. 5, can be utilized. That is, the J-clamp 86 is secured to the attachment bracket 44 instead of the L-shaped attachment clamp 62. The J-clamp 86 includes a lip 88 that is received within recess 22 and may abut lip 24. The J-clamp provides additional security when attaching the seats 10.

[0043] With the use of either type of clamp 62, 86 the attachment of the stadium chair 10 to the bleacher 12 is a relatively quick and easy process that results in semi-permanent attachment. That is, the seat cannot be readily removed by a patron (without the aid of a tool such as a wrench). This serves to protect the chairs 10, reduce vandalism, reduce accidental damage, and prevent theft. Also, the chairs (if left over time) need only be positioned once.

[0044] In furtherance of many of these same goals, it may be desirable to secure the seat cushion 30 to the frame 26. FIGS. 6-7 illustrate having a single securement strap 90 connected to opposite rear corners of the seat cushion 30 that can be looped around the upright members 40, 42. This serves to hold the cushion 30 in the position illustrated and prevent it from being tipped forward. To attach, the cushion 30 is lowered into place while the strap 90 is simply slipped over the upright member 40, 42. Alternatively, the strap 90 could be openable or removable (e.g., hook and loop type fasteners). FIG. 8 illustrates an embodiment where two securing loops 92, 94 are provided. Each loop 92, 94 is placed around one upright member 40, 42 respectively. Again, the individual loops 92, 94 could be slid around the U-brackets 46, 48 of the frame 26, or they could be openable (e.g., buttons, hook and loop type fasteners, etc.). With solid loops 92, 94 it would be difficult and perhaps impossible for the seat cushion 30 to be removed while the frame 26 is secured to the bleacher, depending of course on how tightly the frame 26 engages the bleacher 12. In those cases where the cushion 30 could be removed or when using strap 90, the relevant straps could be further secured to the frame 26 and/or attachment bracket 44 with locking members (e.g., zip ties), if desired.

[0045] FIG. 9 is a side, planar view of a backed bleacher 105 with a backed stadium seat 110 attached. A backed bleacher 105 is any stadium bleacher or bench type seat provided with a structure to support or abut a patron's back. The example illustrated includes a support member 102 and a bleacher seat 100. A bleacher back 104 is coupled to the bleacher seat by a back support column 106. Any number of arrangements are possible for backed bleacher seats and the back and seat portion may be integral, connected or completely separate.

[0046] The backed bleacher stadium seat 110 includes a seat cushion 112 which rests on the bleacher seat 100 to

provide cushioned comfort to the patron. A back cushion 114 is connected to the seat cushion 112 by one or more flexible members. As illustrated, a first connecting strap 116 and a second connecting strap 118 act as the flexible member in this embodiment.

[0047] The back cushion 114 includes a front surface 120 and an opposing rear surface 122 that is proximal to the bleacher back 104. A back cushion bracket 124 securely couples the back cushion 114 to the bleacher back support 106. One such bracket 124 is illustrated and is sufficient for attachment; however, more than one bracket 124 (e.g., spacing two such brackets on opposite ends) may also be utilized to attach the back cushion 114. As the seat cushion 112 is coupled to the back cushion 114, the seat cushion is likewise retained proximate to the bleacher 105, though having some degree of permissible movement. FIG. 10 illustrates the interconnection between the back cushion 114 and the seat cushion 112, which are freely movable with respect to one another to the extent that the flexible connecting straps 116, 118 permit such a range of movement.

[0048] The backed bleacher stadium seat 110 can be attached to most any backed bleacher 105 to provide cushioned comfort for seating and for back support. As disclosed above, the stadium seat 110 could also be semi-permanently attached to the bleacher seat 105 by virtue of the bracket 124.

[0049] FIGS. 11 and 12 illustrate one embodiment of the stadium seat 110 allowing for semi-permanent attachment. The rear surface 122 of the back cushion is provided with an attachment strap 130 that spans across at least a portion of the rear surface. As illustrated, strap 130 is provided from one vertical (as illustrated) edge to the opposite edge. This allows maximum adjustability.

[0050] A back cushion bracket 124 includes substantially C-shaped bracket having a strap loop 132 at one end and a threaded throughbore 135 at the other end for receiving a locking bolt 134. The bracket 124 is placed over the top portion of the bleacher back 104 (FIG. 9) and the locking bolt is advanced so as to exert pressure against the bleacher back 104 and hold the bracket 124 in place relative to the bleacher back 104. The attachment strap 130 of the cushion 114 is received by the strap loop 132, thus securing the back cushion 114. Depending upon the tension exerted, the back cushion may be horizontally slidable relative to the bleacher back 104; the amount of such movement being determined by the length and flexibility of the attachment strap 30.

[0051] In addition to using the stadium seat 110 on a backed bleacher, the seat 110 may also be used on a club seat. Club seats are often provided in stadiums and have a seat portion and a back portion forming a chair. The seat portion often folds upwards towards the back portion to allow more space in an aisle. The use of the stadium seat 110 on a club seat is substantially similar to the use described above. In addition, the seat cushion 112 may be provided with a strap (not separately shown) that is substantially similar to the attachment strap 130 provided on the back cushion 114 (FIG. 11). Such a strap could then be slid under the seat portion of the club seat, serving to retain the seat cushion 112 in place. This is particularly useful on those club seats that fold upwards, as the seat cushion 112 need not be repositioned or reattached each time the patron rises and the club seat folds.

[0052] Although the present invention has been described with reference to preferred embodiments, persons skilled in the art will recognize that changes may be made in form and detail without departing from the spirit and scope of the invention.

1. A stadium chair for use with a bleacher comprising:

(a) a frame comprising:

(1) a seat portion comprising:

- (i) a first support member configured to be positionable on a top portion of the bleacher;
- (ii) a first generally U-shaped bracket coupled to the first support member, the first generally U-shaped bracket configured to engage a front portion of the bleacher;
- (iii) a second support member configured to be positionable on the top portion of the bleacher, the second support member disposed parallel to the first support member; and
- (iv) a second generally U-shaped bracket coupled to the second support member, the second generally U-shaped bracket configured to engage the front portion of the bleacher;

(2) a back portion integrally connected to the seat portion comprising:

- (i) a first upright member coupled with the first support member; and
- (ii) a second upright member coupled with the second support member; and
- (iii) a cross member interconnecting the first upright member and the second upright member;

(b) a seat cushion configured to rest on top of the support members of the seat portion; and

(c) a backrest coupled to the back portion,

whereby the chair is secured to the bleacher at least in part by the first and second generally U-shaped brackets.

2. The stadium chair of claim 1, wherein the backrest defines an interior portion for receiving a portion of the back portion.

3. The stadium chair of claim 1, wherein the seat cushion comprises a strap spanning across at least a portion of a back surface of the seat cushion the strap being configured such that the back portion can be disposed between the seat cushion and the strap, whereby the seat cushion is coupled to the back portion.

4. A stadium chair for use with a bleacher comprising:

(a) a frame comprising:

(1) a seat portion comprising:

- (i) a first support member configured to be positionable on a top portion of the bleacher;
- (ii) a first generally U-shaped bracket coupled to the first support member, the first generally U-shaped bracket configured to engage a front portion of the bleacher;
- (iii) a second support member configured to be positionable on the top portion of the bleacher, the

second support member disposed parallel to the first support member; and

(iv) a second generally U-shaped bracket coupled to the second support member, the second generally U-shaped bracket configured to engage the front portion of the bleacher;

(2) a back portion integrally connected to the seat portion comprising:

- (i) a first upright member coupled with the first support member;
- (ii) a second upright member coupled with the second support member; and
- (iii) a cross member interconnecting the first upright member and the second upright member;

(b) a seat cushion configured to rest on top of the support members of the seat portion;

(c) a backrest coupled to the back portion; and

(d) a bracket coupled to the frame, the bracket defining at least one throughbore,

whereby the chair is secured to the bleacher at least in part by use of the bracket and the first and second generally U-shaped brackets.

5. The stadium chair of claim 4, wherein the backrest defines an interior portion for receiving a portion of the back portion.

6. The stadium chair of claim 4, wherein the seat cushion comprises a strap spanning across at least a portion of a back surface of the seat cushion, the strap being configured such that the back portion can be disposed between the seat cushion and the strap, whereby the seat cushion is coupled to the back portion.

7. A stadium chair for use with a bleacher comprising:

a frame comprising:

a seat portion comprising:

a first support member configured to be positionable on a top portion of a bleacher;

a first generally U-shaped bracket coupled to the first support member, the first generally U-shaped bracket configured to engage a front portion of the bleacher;

a second support member configured to be positionable on the top portion of the bleacher; and

a second generally U-shaped bracket coupled to the second support member, the second generally U-shaped bracket configured to engage the front portion of the bleacher;

a back portion comprising:

a first upright member coupled with the first support member;

a second upright member coupled with the second support member; and

a cross member interconnecting the first upright member and the second upright member;

- a seat cushion configured to rest on top of the seat portion and comprising a member for coupling the seat cushion to the frame;
- a backrest having an interior portion for receiving a portion of the frame so that the backrest spans between the first upright member and the second upright member and is at least partially supported by the cross member; and
- a horizontally configured structure for attachment of the stadium chair to the bleacher.
- 8. A stadium chair for use with a bleacher comprising:
  - a frame comprising:
    - a seat portion comprising:
      - a first support member configured to be positionable on a top portion of a bleacher;
      - a first generally U-shaped bracket coupled to the first support member, the first generally U-shaped bracket configured to engage a front portion of the bleacher;
      - a second support member configured to be positionable on the top portion of the bleacher; and
      - a second generally U-shaped bracket coupled to the second support member, the second generally U-shaped bracket configured to engage the front portion of the bleacher;
  - a back portion comprising:
    - a first upright member coupled with the first support member;
    - a second upright member coupled with the second support member; and
    - a cross member interconnecting the first upright member and the second upright member;
- a seat cushion configured to rest on top of the seat portion and comprising a member for coupling the seat cushion to the frame;
- a backrest having an interior portion for receiving a portion of the frame so that the backrest spans between the first upright member and the second upright member and is at least partially supported by the cross member; and

- a horizontally positioned member on the stadium chair for use in attachment of the stadium chair to the bleacher.
- 9. A stadium chair for use with a bleacher comprising:
  - a frame comprising:
    - a seat portion comprising:
      - a first support member configured to be positionable on a top portion of a bleacher;
      - a first generally U-shaped bracket coupled to the first support member, the first generally U-shaped bracket configured to engage a front portion of the bleacher;
      - a second support member configured to be positionable on the top portion of the bleacher; and
      - a second generally U-shaped bracket coupled to the second support member, the second generally U-shaped bracket configured to engage the front portion of the bleacher;
    - a back portion comprising:
      - a first upright member coupled with the first support member;
      - a second upright member coupled with the second support member; and
      - a cross member interconnecting the first upright member and the second upright member;
  - a seat cushion configured to rest on top of the seat portion and comprising a member for coupling the seat cushion to the frame;
  - a backrest having an interior portion for receiving a portion of the frame so that the backrest spans between the first upright member and the second upright member and is at least partially supported by the cross member; and
  - a member having a horizontal axis for attachment of the stadium chair to the bleacher.
