NOVEL TRICYCLIC COMPOUNDS**CROSS REFERENCE TO RELATED APPLICATION**

5 This application claims priority to U.S. Provisional Application Serial No. 61/131,599 filed on June 10, 2008, U.S. Provisional Application Serial No. 61/131,602 filed on June 10, 2008, U.S. Provisional Application Serial No. 61/190,159 filed on August 26, 2008 and U.S. Provisional Application Serial No. 61/201,064 filed December 5, 2008, the contents of which are incorporated herein.

BACKGROUND OF THE INVENTION

10 The invention provides a novel class of compounds, pharmaceutical compositions comprising such compounds and methods of using such compounds to treat or prevent diseases or disorders associated with abnormal or deregulated kinase activity, particularly diseases or disorders that involve abnormal activation of the Jak1, Jak2, Jak3, Tyk2, KDR, Flt-3, CDK2, CDK4, TANK, Trk, FAK, Abl, Bcr-Abl, cMet, b-RAF, FGFR3, c-kit, PDGF-R, Syk, PKC
15 kinases or Aurora kinases.

The protein kinases represent a large family of proteins that play a central role in the regulation of a wide variety of cellular processes and maintenance of cellular function. A partial, non-limiting, list of these kinases include: non-receptor tyrosine kinases such as the Janus kinase family (Jak1, Jak2, Jak3 and Tyk2); the fusion kinases, such as BCR-Abl, focal adhesion kinase
20 (FAK), Fes, Lck and Syk; receptor tyrosine kinases such as platelet-derived growth factor receptor kinase (PDGF-R), the receptor kinase for stem cell factor, c-kit, the hepatocyte growth factor receptor, c-Met, and the fibroblast growth factor receptor, FGFR3; and serine/threonine kinases such as b-RAF, mitogen-activated protein kinases (e.g., MKK6) and SAPK2 β . Aberrant
25 kinase activity has been observed in many disease states including benign and malignant proliferative disorders as well as diseases resulting from inappropriate activation of the immune and nervous systems. The novel compounds of this invention inhibit the activity of one or more protein kinases and are, therefore, expected to be useful in the treatment of kinase-mediated diseases.

DETAILED DESCRIPTION OF THE INVENTION

- Protein kinases are a broad and diverse class, of over 500 enzymes, that include oncogenes, growth factors receptors, signal transduction intermediates, apoptosis related kinases
- 20 and cyclin dependent kinases. They are responsible for the transfer of a phosphate group to specific tyrosine, serine or threonine amino acid residues, and are broadly classified as tyrosine and serine/threonine kinases as a result of their substrate specificity.

- The Jak family kinases (Jak1, Jak2, Jak3 and Tyk2) are cytoplasmic tyrosine kinases that associate with membrane bound cytokine receptors. Cytokine binding to their receptor initiates
- 25 Jak kinase activation via trans and autophosphorylation processes. The activated Jak kinases phosphorylate residues on the cytokine receptors creating phosphotyrosine binding sites for SH2 domain containing proteins such as Signal Transduction Activators of Transcript (STAT) factors and other signal regulators transduction such as SOCS proteins and SHIP phosphatases. Activation of STAT factors via this process leads to their dimerization, nuclear translocation and
- 30 new mRNA transcription resulting in expression of immunocyte proliferation and survival factors as well as additional cytokines, chemokines and molecules that facilitate cellular trafficking (see *Journal of Immunology*, 2007, 178, p. 2623). Jak kinases transduce signals for many different cytokine families and hence potentially play roles in diseases with widely different pathologies including but not limited to the following examples. Both Jak1 and Jak3 control signaling of the
- 35 so-called common gamma chain cytokines (IL2, IL4, IL7, IL9, IL15 and IL21), hence simultaneous inhibition of either Jak1 or Jak3 could be predicted to impact Th1 mediated diseases such as rheumatoid arthritis via blockade of IL2, IL7 and IL15 signaling. On the other hand, IL2

signaling has recently been shown to be essential for development and homeostasis of T-regulatory cells (Malek TR *et al.*, *Immunity*, **2002**, 17(2), p.167-78). Thus, based on genetic data, blockade of IL2 signaling alone is predicted to result in autoimmunity (Yamanouchi J *et al.*, *Nat Genet.*, **2007**, 39(3), p.329-37, and Willerford DM *et al.*, *Immunity*, **1995**, 3(4), p.521-30). Th2 mediated diseases such as asthma or atopic dermatitis via IL4 and IL9 signaling blockade. Jak1 and Tyk2 mediate signaling of IL13 (see Int. Immunity, 2000, 12, p. 1499). Hence, blockade of these may also be predicted to have a therapeutic effect in asthma. These two kinases are also thought to mediate Type I interferon signaling; their blockade could therefore be predicted to reduce the severity of systemic lupus erythematosus (SLE). Tyk2 and Jak2 mediate signaling of IL12 and IL23. In fact, blockade of these cytokines using monoclonal antibodies has been effective in treating psoriasis. Therefore blockade of this pathway using inhibitors of these kinases could be predicted to be effective in psoriasis as well. In summary, this invention describes small-molecule compounds that inhibit, regulate and/or modulate Jak family kinase activity that is pivotal to several mechanisms thought critical to the progression of autoimmune diseases including, but not limited to, rheumatoid arthritis (RA), systemic lupus erythematosus (SLE), multiple sclerosis (MS), Crohn's disease, psoriasis and asthma.

Several pathologically significant cytokines signal via Jak1 alone (Guschin D, *et al.*, *EMBO J.* 1995 Apr 3;14(7):1421-9; Parganas E, *et al.*, *Cell.* 1998 May 1;93(3):385-95; Rodig S.J., *et al.*, *Cell.* 1998 May 1; 93(3):373-83). Blockade of one of these, IL6, using an IL6R neutralizing antibody, has been shown to significantly improve disease scores in human rheumatoid arthritis patients (Nishimoto N. *et al.*, *Ann Rheum Dis.*, 2007, 66(9), p.1162-7). Similarly, blockade of GCSF signaling, which is also mediated by Jak1 alone, using neutralizing monoclonal antibodies or target gene deletion protects mice from experimental arthritis (Lawlor K.E. *et al.*, *Proc Natl Acad Sci U.S.A.*, 2004, 101(31), p.11398-403). Accordingly, the identification of small-molecule compounds that inhibit, regulate and/or modulate the signal transduction of kinases, such as Jak1, is a desirable means to prevent or treat autoimmune diseases or other diseases related to aberrant Jak1 function.

Jak2 is also activated in a wide variety of human cancers such as prostate, colon, ovarian and breast cancers, melanoma, leukemia and other haematopoietic malignancies. In addition, somatic point mutation of the Jak2 gene has been identified to be highly associated with classic myeloproliferative disorders (MPD) and infrequently in other myeloid disorders. Constitutive activation of Jak2 activity is also caused by chromosomal translocation in hematopoietic malignancies. It has also been shown that inhibition of the Jak/STAT pathway, and in particular inhibition of Jak2 activity, results in anti-proliferative and pro-apoptotic effects largely due to inhibition of phosphorylation of STAT. Furthermore, pharmacological modulation or inhibition of Jak2 activity could effectively block tumor growth and induce apoptosis by reducing the STAT phosphorylation in cell culture and human tumor xenografts *in vivo*. Accordingly, the

identification of small-molecule compounds that inhibit, regulate and/or modulate the signal transduction of kinases, particularly Jak2, is desirable as a means to treat or prevent diseases and conditions associated with cancers.

Jak kinases also transmit signals regulating essential physiological processes whose inhibition could be undesirable. For example Jak2 mediates the signaling of Erythropoietin (Epo) and Granulocyte/Monocyte-Colony Stimulating Factor. Individuals with genetic, congenital or acquired defects in these signaling pathways can develop potentially life-threatening complications such as anemia and neutrophil dysfunction. Accordingly, one non-limiting aspect of this invention also relates to a method to identify compounds that may have a favorable safety profile as a result of them selectively avoiding inhibition of Jak2.

The protein kinase C family is a group of serine/threonine kinases that comprises twelve related isoenzymes. Its members are encoded by different genes and are sub-classified according to their requirements for activation. The classical enzymes (cPKC) require diacylglycerol (DAG), phosphatidylserine (PS) and calcium for activation. The novel PKC's (nPKC) require DAG and PS but are calcium independent. The atypical PKC's (aPKC) do not require calcium or DAG.

PKCtheta is a member of the nPKC sub-family (Baier, G., *et al.*, *J. Biol. Chem.*, 1993, 268, 4997). It has a restricted expression pattern, found predominantly in T cells and skeletal muscle (Mischak, H. *et al.*, *FEBS Lett.*, 1993, 326, p. 51), with some expression reported in mast cells (Liu, Y. *et al.*, *J. Leukoc. Biol.*, 2001, 69, p. 831) and endothelial cells (Mattila, P. *et al.*, *Life Sci.*, 1994, 55, p. 1253).

Upon T cell activation, a supramolecular activation complex (SMAC) forms at the site of contact between the T cell and the antigen presenting cell (APC). PKCtheta is the only PKC isoform found to localize at the SMAC (Monks, C. *et al.*, *Nature*, 1997, 385, 83), placing it in proximity with other signaling enzymes that mediate T cell activation processes.

In another study (Baier-Bitterlich, G. *et al.*, *Mol. Cell. Biol.*, 1996, 16, 842) the role of PKCtheta in the activation of AP-1, a transcription factor important in the activation of the IL-2 gene, was confirmed. In unstimulated T cells, constitutively active PKCtheta stimulated AP-1 activity while in cells with dominant negative PKCtheta, AP-1 activity was not induced upon activation by PMA.

Other studies showed that PKCtheta, via activation of I κ B kinase beta, mediates activation of NF- κ B induced by T cell receptor/CD28 co-stimulation (N. Coudronniere *et al.*, *Proc. Nat. Acad. Sci. U.S.A.*, 2000, 97, p. 3394; and Lin, X. *et al.*, *Mol. Cell. Biol.*, 2000, 20, p. 2933).

Proliferation of peripheral T cells from PKCtheta knockout mice, in response to T cell receptor (TCR)/CD28 stimulation was greatly diminished compared to T cells from wild type mice. In addition, the amount of IL-2 released from the T cells was also greatly reduced (Sun, Z.

et al., *Nature*, 2000, 404, p. 402). It has also been shown that PKC θ -deficient mice show impaired pulmonary inflammation and airway hyperresponsiveness (AHR) in a Th2-dependent murine asthma model, with no defects in viral clearance and Th1-dependent cytotoxic T cell function (Berg-Brown, N.N. *et al.*, *J. Exp. Med.*, 2004, 199, p. 743; Marsland, B.J. *et al.*, *J. Exp. Med.*, 2004, 200, p. 181). The impaired Th2 cell response results in reduced levels of IL-4 and immunoglobulin E (IgE), contributing to the AHR and inflammatory pathophysiology. Otherwise, the PKC θ knockout mice seemed normal and fertile.

Evidence also exists that PKC θ participates in the IgE receptor (Fc ϵ RI)-mediated response of mast cells (Liu, Y. *et al.*, *J. Leukoc. Biol.*, 2001, 69, p. 831). In human-cultured mast cells (HCMC), it has been demonstrated that PKC kinase activity rapidly localizes to the membrane following Fc ϵ RI cross-linking (Kimata, M. *et al.*, *Biochem. Biophys. Res. Commun.*, 1999, 257(3), p. 895). A recent study examining *in vitro* activity of bone marrow mast cells (BMMC) derived from wild-type and PKC θ -deficient mice shows that upon Fc ϵ RI cross linking, BMMCs from PKC θ -deficient mice reduced levels of IL-6, tumor necrosis factor- α (TNF α) and IL-13 in comparison with BMMCs from wild-type mice, suggesting a potential role for PKC θ in mast cell cytokine production in addition to T cell activation (Ciarletta, A.B. *et al.*, poster presentation at the 2005 American Thoracic Society International Conference).

The studies cited above and others studies confirm the critical role of PKC θ in T cells activation and in mast cell (MC) signaling. Thus an inhibitor of PKC θ would be of therapeutic benefit in treating immunological disorders and other diseases mediated by the inappropriate activation of T cells and MC signaling.

Many of the kinases, whether a receptor or non-receptor tyrosine kinase or a S/T kinase have been found to be involved in cellular signaling pathways involved in numerous pathogenic conditions, including immunomodulation, inflammation, or proliferative disorders such as cancer.

Many autoimmune diseases and disease associated with chronic inflammation, as well as acute responses, have been linked to excessive or unregulated production or activity of one or more cytokines.

The additional agent also can be an agent that imparts a beneficial attribute to the therapeutic composition e.g., an agent that affects the viscosity of the composition.

It should further be understood that the combinations which are to be included within this invention are those combinations useful for their intended purpose. The agents set forth below are illustrative for purposes and not intended to be limited. The combinations, which are part of this invention, can be the compounds of the present invention and at least one additional agent selected from the lists below. 25 In this invention, the following definitions are applicable:

A "therapeutically effective amount" is an amount of a compound of Formula (I) or a combination of two or more such compounds, which inhibits, totally or partially, the progression of the condition or alleviates, at least partially, one or more symptoms of the condition. A therapeutically effective amount can also be an amount which is prophylactically effective. The
30 amount which is therapeutically effective will depend upon the patient's size and gender, the condition to be treated, the severity of the condition and the result sought. For a given patient, a therapeutically effective amount can be determined by methods known to those of skill in the art.

"Pharmaceutically acceptable salts" refers to those salts which retain the biological effectiveness and properties of the free bases and which are obtained by reaction with inorganic
35 acids, for example, hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, and phosphoric acid or organic acids such as sulfonic acid, carboxylic acid, organic phosphoric acid, methanesulfonic acid, ethanesulfonic acid, p-toluenesulfonic acid, citric acid, fumaric acid, maleic

acid, succinic acid, benzoic acid, salicylic acid, lactic acid, tartaric acid (e.g. (+) or (-)-tartaric acid or mixtures thereof), amino acids (e.g. (+) or (-)-amino acids or mixtures thereof), and the like. These salts can be prepared by methods known to those skilled in the art.

5 Certain compounds of Formula (I) which have acidic substituents may exist as salts with pharmaceutically acceptable bases. The present invention includes such salts. Examples of such salts include sodium salts, potassium salts, lysine salts and arginine salts. These salts may be prepared by methods known to those skilled in the art.

Certain compounds of Formula (I) and their salts may exist in more than one crystal form and the present invention includes each crystal form and mixtures thereof.

10 Certain compounds of Formula (I) and their salts may also exist in the form of solvates, for example hydrates, and the present invention includes each solvate and mixtures thereof.

Certain compounds of Formula (I) may contain one or more chiral centers, and exist in different optically active forms. When compounds of Formula (I) contain one chiral center, the compounds exist in two enantiomeric forms and the present invention includes both enantiomers and mixtures of enantiomers, such as racemic mixtures. The enantiomers may be resolved by methods known to those skilled in the art, for example by formation of diastereoisomeric salts which may be separated, for example, by crystallization; formation of diastereoisomeric derivatives or complexes which may be separated, for example, by crystallization, gas-liquid or liquid chromatography; selective reaction of one enantiomer with an enantiomer-specific reagent, for example enzymatic esterification; or gas-liquid or liquid chromatography in a chiral environment, for example on a chiral support for example silica with a bound chiral ligand or in the presence of a chiral solvent. It will be appreciated that where the desired enantiomer is converted into another chemical entity by one of the separation procedures described above, a further step is required to liberate the desired enantiomeric form. Alternatively, specific enantiomers may be synthesized by asymmetric synthesis using optically active reagents, substrates, catalysts or solvents, or by converting one enantiomer into the other by asymmetric transformation.

20 When a compound of Formula (I) contains more than one chiral center, it may exist in diastereoisomeric forms. The diastereoisomeric compounds may be separated by methods known to those skilled in the art, for example chromatography or crystallization and the individual enantiomers may be separated as described above. The present invention includes each diastereoisomer of compounds of Formula (I), and mixtures thereof.

30 Certain compounds of Formula (I) may exist in different tautomeric forms or as different geometric isomers, and the present invention includes each tautomer and/or geometric isomer of compounds of Formula (I) and mixtures thereof.

Certain compounds of Formula (I) may exist in different stable conformational forms which may be separable. Torsional asymmetry due to restricted rotation about an asymmetric

single bond, for example because of steric hindrance or ring strain, may permit separation of different conformers. The present invention includes each conformational isomer of compounds of Formula (I) and mixtures thereof.

5 Certain compounds of Formula (I) may exist in zwitterionic form and the present invention includes each zwitterionic form of compounds of Formula (I) and mixtures thereof.

As used herein the term "pro-drug" refers to an agent which is converted into the parent drug *in vivo* by some physiological chemical process (e.g., a prodrug on being brought to the physiological pH is converted to the desired drug form). Pro-drugs are often useful because, in some situations, they may be easier to administer than the parent drug. They may, for instance, be
10 bioavailable by oral administration whereas the parent drug is not. The pro-drug may also have improved solubility in pharmacological compositions over the parent drug. An example, without limitation, of a pro-drug would be a compound of the present invention wherein it is administered as an ester (the "pro-drug") to facilitate transmittal across a cell membrane where water solubility is not beneficial, but then it is metabolically hydrolyzed to the carboxylic acid once inside the cell
15 where water solubility is beneficial.

Pro-drugs have many useful properties. For example, a pro-drug may be more water soluble than the ultimate drug, thereby facilitating intravenous administration of the drug. A pro-drug may also have a higher level of oral bioavailability than the ultimate drug. After administration, the prodrug is enzymatically or chemically cleaved to deliver the ultimate drug in
20 the blood or tissue.

Exemplary pro-drugs upon cleavage release the corresponding free acid, and such hydrolyzable ester-forming residues of the compounds of this invention include but are not limited to carboxylic acid substituents wherein the free hydrogen is replaced by (C₁-C₄)alkyl, (C₁-C₁₂)alkanoyloxymethyl, (C₄-C₉)1-(alkanoyloxy)ethyl, 1-methyl-1-(alkanoyloxy)-ethyl having
25 from 5 to 10 carbon atoms, alkoxycarbonyloxymethyl having from 3 to 6 carbon atoms, 1-(alkoxycarbonyloxy)ethyl having from 4 to 7 carbon atoms, 1-methyl-1-(alkoxycarbonyloxy)ethyl having from 5 to 8 carbon atoms, N-(alkoxycarbonyl)aminomethyl having from 3 to 9 carbon atoms, 1-(N-(alkoxycarbonyl)amino)ethyl having from 4 to 10 carbon atoms, 3-phthalidyl, 4-crotonolactonyl, gamma-butyrolacton-4-yl, di-N,N-(C₁-C₂)alkylamino(C₂-C₃)alkyl (such as β-dimethylaminoethyl), carbamoyl-(C₁-C₂)alkyl, N,N-di(C₁-C₂)-alkylcarbamoyl-(C₁-C₂)alkyl and
30 piperidino-, pyrrolidino- or morpholino(C₂-C₃)alkyl.

Other exemplary pro-drugs release an alcohol of Formula (I) wherein the free hydrogen of the hydroxyl substituent (e.g., R¹ contains hydroxyl) is replaced by (C₁-C₆)alkanoyloxymethyl, 1-((C₁-C₆)alkanoyloxy)ethyl, 1-methyl-1-((C₁-C₆)alkanoyloxy)ethyl, (C₁-C₁₂)alkoxycarbonyloxymethyl, N-(C₁-C₆)alkoxycarbonylamino-methyl, succinoyl, (C₁-C₆)alkanoyl, α-amino(C₁-C₄)alkanoyl, arylactyl and α-aminoacyl, or α-aminoacyl-α-aminoacyl

wherein said α -aminoacyl moieties are independently any of the naturally occurring L-amino acids found in proteins, $P(O)(OH)_2$, $-P(O)(O(C_1-C_6)alkyl)_2$ or glycosyl (the radical resulting from detachment of the hydroxyl of the hemiacetal of a carbohydrate).

“” in Formula (I) represents an aromatic ring.

One or more compounds of this invention can be administered to a human patient by themselves or in pharmaceutical compositions where they are mixed with biologically suitable carriers or excipient(s) at doses to treat or ameliorate a disease or condition as described herein. Mixtures of these compounds can also be administered to the patient as a simple mixture or in suitable formulated pharmaceutical compositions. A therapeutically effective dose refers to that amount of the compound or compounds sufficient to result in the prevention or attenuation of a disease or condition as described herein. Techniques for formulation and administration of the compounds of the instant application may be found in references well known to one of ordinary skill in the art, such as "Remington's Pharmaceutical Sciences," Mack Publishing Co., Easton, PA, latest edition.

Suitable routes of administration may, for example, include oral, eyedrop, rectal, transmucosal, topical, or intestinal administration; parenteral delivery, including intramuscular, subcutaneous, intramedullary injections, as well as intrathecal, direct intraventricular, intravenous, intraperitoneal, intranasal, or intraocular injections.

Alternatively, one may administer the compound in a local rather than a systemic manner, for example, via injection of the compound directly into an edematous site, often in a depot or sustained release formulation.

Furthermore, one may administer the drug in a targeted drug delivery system, for example, in a liposome coated with endothelial cell-specific antibody.

The pharmaceutical compositions of the present invention may be manufactured in a manner that is itself known, e.g., by means of conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping or lyophilizing processes.

Pharmaceutical compositions for use in accordance with the present invention thus may be formulated in a conventional manner using one or more physiologically acceptable carriers comprising excipients and auxiliaries which facilitate processing of the active compounds into preparations which can be used pharmaceutically. Proper formulation is dependent upon the route of administration chosen.

For injection, the agents of the invention may be formulated in aqueous solutions, preferably in physiologically compatible buffers such as Hanks' solution, Ringer's solution, or physiological saline buffer. For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art.

For oral administration, the compounds can be formulated readily by combining the active compounds with pharmaceutically acceptable carriers well known in the art. Such carriers

enable the compounds of the invention to be formulated as tablets, pills, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient to be treated. Pharmaceutical preparations for oral use can be obtained by combining the active compound with a solid excipient, optionally grinding a resulting mixture, and processing the mixture of granules, after adding suitable auxiliaries, if desired, to obtain tablets or dragee cores. Suitable excipients are, in particular, fillers such as sugars, including lactose, sucrose, mannitol, or sorbitol; cellulose preparations such as, for example, maize starch, wheat starch, rice starch, potato starch, gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethylcellulose, and/or polyvinylpyrrolidone (PVP). If desired, disintegrating agents may be added, such as the cross-linked polyvinyl pyrrolidone, agar, or alginic acid or a salt thereof such as sodium alginate.

Dragee cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used, which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents or solvent mixtures. Dyestuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

Pharmaceutical preparations that can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active ingredients in admixture with filler such as lactose, binders such as starches, and/or lubricants such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. In addition, stabilizers may be added. All formulations for oral administration should be in dosages suitable for such administration.

For buccal administration, the compositions may take the form of tablets or lozenges formulated in conventional manner.

For administration by inhalation, the compounds for use according to the present invention are conveniently delivered in the form of an aerosol spray presentation from pressurized packs or a nebuliser, with the use of a suitable propellant, e.g., dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of pressurized aerosol the dosage unit may be determined by providing a valve to deliver a metered amount. Capsules and cartridges of e.g. gelatin for use in an inhaler or insufflator may be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

The compounds can be formulated for parenteral administration by injection, e.g. bolus injection or continuous infusion. Formulations for injection may be presented in unit dosage form, e.g. in ampoules or in multi-dose containers, with an added preservative. The compositions

may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulatory agents such as suspending, stabilizing and/or dispersing agents.

Pharmaceutical formulations for parenteral administration include aqueous solutions of the active compounds in water-soluble form. Additionally, suspensions of the active compounds
5 may be prepared as appropriate oily injection suspensions. Suitable lipophilic solvents or vehicles include fatty oils such as sesame oil, or synthetic fatty acid esters, such as ethyl oleate or triglycerides, or liposomes. Aqueous injection suspensions may contain substances which increase the viscosity of the suspension, such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension may also contain suitable stabilizers or agents which increase
10 the solubility of the compounds to allow for the preparation of highly concentrated solutions.

Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, e.g., sterile pyrogen-free water, before use.

The compounds may also be formulated in rectal compositions such as suppositories or retention enemas, e.g., containing conventional suppository bases such as cocoa butter or other
15 glycerides.

In addition to the formulations described previously, the compounds may also be formulated as a depot preparation. Such long acting formulations may be administered by implantation (for example subcutaneously or intramuscularly or by intramuscular injection). Thus, for example, the compounds may be formulated with suitable polymeric or hydrophobic
20 materials (for example as an emulsion in an acceptable oil) or ion exchange resins, or as sparingly soluble derivatives, for example, as a sparingly soluble salt.

An example of a pharmaceutical carrier for the hydrophobic compounds of the invention is a cosolvent system comprising benzyl alcohol, a nonpolar surfactant, a water-miscible organic polymer, and an aqueous phase. The cosolvent system may be the VPD co-solvent system. VPD
25 is a solution of 3% w/v benzyl alcohol, 8% w/v of the nonpolar surfactant polysorbate 80, and 65% w/v polyethylene glycol 300, made up to volume in absolute ethanol. The VPD co-solvent system (VPD:5W) consists of VPD diluted 1:1 with a 5% dextrose in water solution. This co-solvent system dissolves hydrophobic compounds well, and itself produces low toxicity upon systemic administration. Naturally, the proportions of a co-solvent system may be varied
30 considerably without destroying its solubility and toxicity characteristics. Furthermore, the identity of the co-solvent components may be varied: for example, other low-toxicity nonpolar surfactants may be used instead of polysorbate 80; the fraction size of polyethylene glycol may be varied; other biocompatible polymers may replace polyethylene glycol, e.g. polyvinyl pyrrolidone; and other sugars or polysaccharides may substitute for dextrose.

35 Alternatively, other delivery systems for hydrophobic pharmaceutical compounds may be employed. Liposomes and emulsions are well known examples of delivery vehicles or carriers for hydrophobic drugs. Certain organic solvents such as dimethylsulfoxide also may be employed,

although usually at the cost of greater toxicity. Additionally, the compounds may be delivered using a sustained-release system, such as semipermeable matrices of solid hydrophobic polymers containing the therapeutic agent. Various sustained-release materials have been established and are well known by those skilled in the art. Sustained-release capsules may, depending on their
5 chemical nature, release the compounds for a few weeks up to over 100 days. Depending on the chemical nature and the biological stability of the therapeutic reagent, additional strategies for protein stabilization may be employed.

The pharmaceutical compositions also may comprise suitable solid or gel phase carriers or excipients. Examples of such carriers or excipients include but are not limited to calcium
10 carbonate, calcium phosphate, various sugars, starches, cellulose derivatives, gelatin, and polymers such as polyethylene glycols.

Many of the compounds of the invention may be provided as salts with pharmaceutically compatible counterions. Pharmaceutically compatible salts may be formed with many acids, including but not limited to hydrochloric, sulfuric, acetic, lactic, tartaric, malic, succinic, etc.
15 Salts tend to be more soluble in aqueous or other protonic solvents than are the corresponding free base forms.

Pharmaceutical compositions suitable for use in the present invention include compositions wherein the active ingredients are contained in an effective amount to achieve its intended purpose. More specifically, a therapeutically effective amount means an amount
20 effective to prevent development of or to alleviate the existing symptoms of the subject being treated. Determination of the effective amounts is well within the capability of those skilled in the art.

For any compound used in a method of the present invention, the therapeutically effective dose can be estimated initially from cellular assays. For example, a dose can be formulated in
25 cellular and animal models to achieve a circulating concentration range that includes the IC_{50} as determined in cellular assays (i.e., the concentration of the test compound which achieves a half-maximal inhibition of a given protein kinase activity). In some cases it is appropriate to determine the IC_{50} in the presence of 3 to 5% serum albumin since such a determination approximates the binding effects of plasma protein on the compound. Such information can be
30 used to more accurately determine useful doses in humans. Further, the most preferred compounds for systemic administration effectively inhibit protein kinase signaling in intact cells at levels that are safely achievable in plasma.

A therapeutically effective dose refers to that amount of the compound that results in amelioration of symptoms in a patient. Toxicity and therapeutic efficacy of such compounds can
35 be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., for determining the maximum tolerated dose (MTD) and the ED_{50} (effective dose for 50% maximal response). The dose ratio between toxic and therapeutic effects is the therapeutic index

and it can be expressed as the ratio between MTD and ED₅₀. Compounds which exhibit high therapeutic indices are preferred. The data obtained from these cell culture assays and animal studies can be used in formulating a range of dosage for use in humans. The dosage of such compounds lies preferably within a range of circulating concentrations that include the ED₅₀ with
5 little or no toxicity. The dosage may vary within this range depending upon the dosage form employed and the route of administration utilized. The exact formulation, route of administration and dosage can be chosen by the individual physician in view of the patient's condition (see e.g. Fingl *et al.*, 1975, in "The Pharmacological Basis of Therapeutics", Ch. 1 p. 1). In the treatment of crises, the administration of an acute bolus or an infusion approaching the MTD may be
10 required to obtain a rapid response.

Dosage amount and interval may be adjusted individually to provide plasma levels of the active moiety which are sufficient to maintain the kinase modulating effects, or minimal effective concentration (MEC). The MEC will vary for each compound but can be estimated from *in vitro* data; e.g. the concentration necessary to achieve 50-90% inhibition of protein kinase using the
15 assays described herein. Dosages necessary to achieve the MEC will depend on individual characteristics and route of administration. However, HPLC assays or bioassays can be used to determine plasma concentrations.

Dosage intervals can also be determined using the MEC value. Compounds should be administered using a regimen which maintains plasma levels above the MEC for 10-90% of the
20 time, preferably between 30-90% and most preferably between 50-90% until the desired amelioration of symptoms is achieved. In cases of local administration or selective uptake, the effective local concentration of the drug may not be related to plasma concentration.

The amount of composition administered will, of course, be dependent on the subject being treated, on the subject's weight, the severity of the affliction, the manner of administration
25 and the judgment of the prescribing physician.

The compositions may, if desired, be presented in a pack or dispenser device which may contain one or more unit dosage forms containing the active ingredient. The pack may for example comprise metal or plastic foil, such as a blister pack. The pack or dispenser device may be accompanied by instructions for administration. Compositions comprising a compound of the
30 invention formulated in a compatible pharmaceutical carrier may also be prepared, placed in an appropriate container, and labelled for treatment of an indicated condition.

In some formulations it may be beneficial to use the compounds of the present invention in the form of particles of very small size, for example as obtained by fluid energy milling.

The use of compounds of the present invention in the manufacture of pharmaceutical
35 compositions is illustrated by the following description. In this description the term "active compound" denotes any compound of the invention but particularly any compound which is the final product of one of the following Examples.

a) Capsules

In the preparation of capsules, 10 parts by weight of active compound and 240 parts by weight of lactose can be de-aggregated and blended. The mixture can be filled into hard gelatin capsules, each capsule containing a unit dose or part of a unit dose of active compound.

5 b) Tablets

Tablets can be prepared, for example, from the following ingredients.

Parts by weight

	Active compound	10
	Lactose	190
10	Maize starch	22
	Polyvinylpyrrolidone	10
	Magnesium stearate	3

The active compound, the lactose and some of the starch can be de-aggregated, blended and the resulting mixture can be granulated with a solution of the polyvinylpyrrolidone in ethanol.

15 The dry granulate can be blended with the magnesium stearate and the rest of the starch. The mixture is then compressed in a tableting machine to give tablets each containing a unit dose or a part of a unit dose of active compound.

c) Enteric coated tablets

20 Tablets can be prepared by the method described in (b) above. The tablets can be enteric coated in a conventional manner using a solution of 20% cellulose acetate phthalate and 3% diethyl phthalate in ethanol:dichloromethane (1:1).

d) Suppositories

25 In the preparation of suppositories, for example, 100 parts by weight of active compound can be incorporated in 1300 parts by weight of triglyceride suppository base and the mixture formed into suppositories each containing a therapeutically effective amount of active ingredient.

In the compositions of the present invention the active compound may, if desired, be associated with other compatible pharmacologically active ingredients. For example, the compounds of this invention can be administered in combination with another therapeutic agent that is known to treat a disease or condition described herein. For example, with one or more additional pharmaceutical agents that inhibit or prevent the production of VEGF or angiopoietins, attenuate intracellular responses to VEGF or angiopoietins, block intracellular signal transduction, inhibit vascular hyperpermeability, reduce inflammation, or inhibit or prevent the formation of edema or neovascularization. The compounds of the invention can be administered prior to, subsequent to or simultaneously with the additional pharmaceutical agent, whichever course of administration is appropriate. The additional pharmaceutical agents include, but are not limited to, anti-edemic steroids, NSAIDS, ras inhibitors, anti-TNF agents, anti-IL1 agents, antihistamines, PAF-antagonists, COX-1 inhibitors, COX-2 inhibitors, NO synthase inhibitors, Akt/PTB

inhibitors, IGF-1R inhibitors, PKC inhibitors, PI3 kinase inhibitors, calcineurin inhibitors and immunosuppressants. The compounds of the invention and the additional pharmaceutical agents act either additively or synergistically. Thus, the administration of such a combination of substances that inhibit angiogenesis, vascular hyperpermeability and/or inhibit the formation of edema can provide greater relief from the deleterious effects of a hyperproliferative disorder, angiogenesis, vascular hyperpermeability or edema than the administration of either substance alone. In the treatment of malignant disorders combinations with antiproliferative or cytotoxic chemotherapies or radiation are included in the scope of the present invention.

The present invention also comprises the use of a compound of Formula (I) as a medicament.

A further aspect of the present invention provides the use of a compound of Formula (I) or a salt thereof in the manufacture of a medicament for treating vascular hyperpermeability, angiogenesis-dependent disorders, proliferative diseases and/or disorders of the immune system in mammals, particularly human beings.

The present invention also provides a method of treating vascular hyperpermeability, inappropriate neovascularization, proliferative diseases and/or disorders of the immune system which comprises the administration of a therapeutically effective amount of a compound of Formula (I) to a mammal, particularly a human being, in need thereof.

ASSAYS***In vitro* Jak1 kinase activity measured by homogenous time-resolved fluorescence (HTRF)**

Purified Jak1 enzyme (aa 845-1142; expressed in SF9 cells as a GST fusion and purified by glutathione affinity chromatography) was mixed with 2 μ M peptide substrate (biotin-TYR2, Sequence: Biotin-(Ahx)-AEEEYFFLFA-amide) at varying concentrations of inhibitor in reaction buffer: 50 mM MOPSO pH 6.5, 10 mM MgCl₂, 2 mM MnCl₂, 2.5 mM DTT, 0.01% BSA, 0.1 mM Na₃VO₄ and 0.001 mM ATP. After about 60 min incubation at room temperature, the reaction was quenched by addition of EDTA (final concentration: 100 mM) and developed by addition of revelation reagents (final approximate concentrations: 30 mM HEPES pH 7.0, 0.06% BSA, 0.006% Tween-20, 0.24 M KF, 80 ng/mL PT66K (europium labeled anti-phosphotyrosine antibody cat #61T66KLB Cisbio, Bedford, MA) and 3.12 μ g/mL SAXL (Phycolink streptavidin-allophycocyanin acceptor, cat #PJ52S, Prozyme, San Leandro, CA). The developed reaction was incubated in the dark either at about 4 °C for about 14 h or for about 60 min at room temperature, then read via a time-resolved fluorescence detector (Rbystar, BMG) using a 337 nm laser for excitation and emission wavelengths of 620 nm and 665 nm. Within the linear range of the assay, the ratio of observed signal at 620 nm and 665 nm is directly related to phosphorylated product and used to calculate the IC₅₀ values.

Other kinase assays were performed using a similar protocol. Additional purified enzymes Tyk2 (aa 880-1185 with an N-terminal histidine-tag and C-terminal FLAG tag; purified in-house by immobilized metal ion affinity chromatography), RET (aa 711-1072 with an N-terminal histidine-tag; purified by immobilized metal ion affinity chromatography) and KDR (aa 792-1354 with an N-terminal histidine-tag; purified in-house by immobilized metal ion affinity and ion-exchange chromatography) were expressed in SF9 cells and Aurora 1/B (aa1-344 with a N-terminal histidine-tag and purified by immobilized metal ion affinity chromatography) was expressed in *E. coli*. Other enzymes used are available from commercial sources. Enzymes were mixed with biotinylated substrates at varying concentrations of inhibitor in different reaction

5 buffers (see **Table 1**). After about 60 min incubation at room temperature, the reaction was quenched by addition of EDTA and developed by addition of revelation reagents (final approximate concentrations: 30 mM HEPES pH 7.0, 0.06% BSA, 0.006% Tween-20, 0.24 M KF, varying amounts of donor europium labeled antibodies and acceptor streptavidin labeled allophycocyanin (SAXL)). The developed reactions were incubated in the dark at about 4 °C for about 14 h or for about 60 min at room temperature, then read in a time-resolved fluorescence detector (Rubystar, BMG Labtech) as described above.

***In vitro* Syk kinase activity measured by homogenous time-resolved fluorescence (HTRF)**

1 nM purified full-length Syk enzyme (purchased from Millipore, Billerica, MA, Cat # 14-314) was mixed with 0.1 μM peptide substrate (biotin-TYR1, Sequence: Biotin-(Ahx)-GAEEEIYAAFFA-COOH) at varying concentrations of inhibitor in reaction buffer: 50 mM MOPS pH 6.5, 10 mM MgCl₂, 2 mM MnCl₂, 2.5 mM DTT, 0.01% BSA, 0.1 mM Na₃VO₄ and 0.01 mM ATP. After about 60 min incubation at room temperature, the reaction was quenched by addition of EDTA (final concentration: 100 mM) and developed by addition of revelation reagents (final approximate concentrations: 30 mM HEPES pH 7.0, 0.06% BSA, 0.006% Tween-20, 0.24 M KF, 90 ng/mL PT66K (europium labeled anti-phosphotyrosine antibody cat #61T66KLB Cisbio, Bedford, MA) and 0.6 μg/mL SAXL (Phycolink streptavidin-allophycocyanin acceptor, cat #PJ52S, Prozyme, San Leandro, CA). The developed reaction was incubated in the dark either at about 4 °C for about 14h or for about 60 min at room temperature, then read via a time-resolved fluorescence detector (Rbystar, BMG) using a 337 nm laser for excitation and emission wavelengths of 620 nm and 665 nm. Within the linear range of the assay, the ratio of observed signal at 620 nm and 665 nm is directly related to phosphorylated product and used to calculate the IC₅₀ values.

Human T-Blasts IL-2 pSTAT5 Cellular Assay

Materials:

35 Phytohemagglutinin T-blasts were prepared from Leukopacks purchased from Biological Specialty Corporation, Colmar, PA 18915, and cryopreserved in 5% DMSO/media prior to assay.

For this assay the cells were thawed in assay medium with the following composition: RPMI 1640 medium (Gibco 11875093) with 2 mM L-glutamine (Gibco 25030-081), 10 mM HEPES (Gibco 15630-080), 100 µg/mL Pen/Strep (Gibco 15140-122), and 10% heat inactivated FBS (Gibco 10438026). Other materials used in the assay: DMSO (Sigma D2650), 96-well dilution plates (polypropylene) (Corning 3365), 96-well assay plates (white, ½ area, 96 well) (Corning 3642), D-PBS (Gibco 14040133), IL-2 (R&D 202-IL-10 (10µg)), Alphascreen pSTAT5 kit (Perkin Elmer TGRS5S10K) and Alphascreen protein A kit (Perkin Elmer 6760617M)

Methods:

T-Blasts were thawed and cultured for about 24 h without IL-2 prior to assay. Test compounds or controls are dissolved and serially diluted in 100% DMSO. DMSO stocks are subsequently diluted 1:50 in cell culture media to create the 4x compound stocks (containing 2% DMSO). Using a Corning white 96 well, ½ area plate, cells are plated at $2 \times 10^5/10$ µl/well in 10 µL media followed by addition of 5 µL of 4x test compound in duplicate. Cells are incubated with compound for about 0.5 h at about 37 °C. Next, 5 µL of IL-2 stock is added at 20 ng/mL final concentration. IL-2 is stored as a 4 µg/mL stock solution, as specified by the manufacturer, at about -20 °C in aliquots and diluted 1:50 with assay media (to 80 ng/mL) just prior to use. The contents of the wells are mixed by carefully tapping sides of plate(s) several times followed by incubation at about 37 °C for about 15 min. The assay is terminated by adding 5 µL of 5x AlphaScreen lysis buffer and shaking on an orbital shaker for about 10 min at room temperature. Alphascreen acceptor bead mix is reconstituted following Perkin Elmer's protocol. 30 µL/well of reconstituted Alphascreen acceptor bead mix was added, covered with foil then shaken on orbital shaker for about 2 min on high then about 2 h on low. Donor bead mix is reconstituted following Perkin Elmer's AlphaScreen protocol; 12 µL/well are added, covered with foil then shaken for about 2 min on high, and about 2 h on low. Plates are read on an EnVision reader following Perkin Elmer's AlphaScreen protocol instructions.

Other materials used in this assay: DMSO (Sigma D2650), 96-well dilution plates (polypropylene) (Corning 3365), 96-well assay plates (white, ½ area, 96 well) (Corning 3642), D-PBS (Gibco 14040133), IL-6 (R&D 206-IL/CF-050 (50 µg)), Alphascreen pSTAT3 kit (Perkin Elmer TGRS3S10K) and Alphascreen protein A kit (Perkin Elmer 6760617M).

Methods:

Prior to the assay, cells are cultured for about 18 h in the culture medium without GM-CSF. Test compounds or controls are dissolved and serially diluted in 100% DMSO. DMSO stocks are subsequently diluted 1:50 in cell culture media to create the 4x compound stocks (containing 2% DMSO). Using a Corning white 96 well, ½ area plate, cells are plated at $2 \times 10^7/10 \mu\text{L}/\text{well}$ in 10 μL media followed by addition of 5 μL of the 4x test compound stock in duplicate. Cells are incubated with compound for about 0.5 h at about 37 °C followed by addition of 5 μL of 400 ng/mL IL-6. IL-6 is stored in 10 $\mu\text{g}/\text{mL}$ aliquots using endotoxin free D-PBS (0.1% BSA) at about -20 °C. Prior to assay IL-6 is diluted to 400 ng/mL in culture media and applied (5 $\mu\text{L}/\text{well}$) to all wells, except to negative control wells where 5 $\mu\text{L}/\text{well}$ of media is added. The contents of the wells are mixed carefully by tapping the side of the plate several times. Plates are incubated at about 37 °C for about 30 min. Cells are lysed by adding 5 μL of 5X AlphaScreen cell lysis buffer to all wells, shaken for about 10 min at room temperature then assayed. Alternatively, assay plates may be frozen at about -80 °C and thawed later at room temperature. Using the pSTAT3 SureFire Assay kit (Perkin Elmer #TGRS3S10K) acceptor bead mix is reconstituted following Perkin Elmer's AlphaScreen protocol instructions. 30 μL are added per well then the plate is covered with foil and shaken on an orbital shaker for about 2 min on high, then about 2 h on low at room temperature. Donor bead mix is reconstituted following Perkin Elmer's AlphaScreen protocol instructions. 12 μL are added per well, then covered with foil and shaken on orbital shaker for about 2 min on high, then about 2 h on low at about 37 °C. Plates are read on an EnVision reader following Perkin Elmer's AlphaScreen protocol instructions at room temperature.

Methods:

Culture cells for about 16 h without EPO prior to running assay. Test compounds or controls are dissolved and serially diluted in 100% DMSO. DMSO stocks are subsequently diluted 1:50 in cell culture media to create the 4x compound stocks (containing 2% DMSO). Using a Corning white 5 96 well, $\frac{1}{2}$ area plate, cells are plated at $2 \times 10^5/10$ $\mu\text{L}/\text{well}$ in 10 μL media followed by addition of 5 μL of 4x test compound stock in duplicate. Donor beads are reconstituted following Perkin Elmer's AlphaScreen protocol instructions followed by addition of 12 $\mu\text{L}/\text{well}$, covered with foil and shaken on an orbital shaker for about 2 15 min on high, about 2 h on low. Plates are read on an EnVision reader following Perkin Elmer's AlphaScreen protocol instructions.

Antigen-Induced Degranulation of RBL-2H3 Cells:

RBL-2H3 cells are maintained in T75 flasks at about 37 °C and 5% CO_2 , and passaged every 3-4 20 days. To harvest cells, 20 mL of PBS is used to rinse the flask once, and then 3 mL of Trypsin-EDTA is added and incubated at about 37 °C for about 2 min. Cells are transferred to a tube with 20 mL medium, spun down at 1000 RPM at room temperature for about 5 min and resuspended at 1×10^6 cells/mL. Cells are sensitized by adding DNP-specific mouse IgE to a final concentration of 0.1 $\mu\text{g}/\text{mL}$. 50 μL of cells are added to each well of a 96 well flat bottom plate (50×10^3 25 cells/well) and incubated overnight at about 37 °C in 5% CO_2 . The next day, compounds are prepared in 100% DMSO at 10 mM. Each compound is then serially diluted 1:4 six times in 100% DMSO. Each compound dilution is then diluted 1:20 and then 1:25, both dilutions in Tyrode's buffer. Media is aspirated from the cell plates and the cells are rinsed twice with 100 μL of Tyrode's buffer (prewarmed to about 37 °C). 50 μL of compounds diluted in Tyrode's buffer 30 are added to each well and the plates are incubated for about 15 min at about 37 °C in 5% CO_2 . 50 μL of 0.2 $\mu\text{g}/\text{mL}$ DNP-HSA in Tyrode's buffer is then added to each well and the plates are incubated for about 30 min at about 37 °C in 5% CO_2 . The final concentration of the various components in the incubation mix are 0.002 – 10 μM compounds, 0.1% DMSO, and 0.1 $\mu\text{g}/\text{mL}$ DNP-HSA. As one control, 0.2% DMSO (no compound) in Tyrode's buffer is added to a set of 35 wells to determine maximum stimulated release. As a second control, Tyrode's buffer without DNP-HSA is added to a set of wells with containing 0.2% DMSO without compounds to

- determine unstimulated release. Each condition (compounds and controls) is set up in triplicate wells. At the end of the 30 min incubation, 50 μ L of supernate is transferred to a new 96 well plate. The remaining supernate in the cell plates is aspirated and replaced with 50 μ L of 0.1% Triton X-100 in Tyrode's buffer to lyse the cells. 50 μ L of freshly prepared 1.8 mM 4-Nitrophenyl N-acetyl- β -D-glucosaminide (pNAG) is then added to each well of supernate and cell lysate and the plates are incubated for about 60 min at about 37 °C in 5% CO₂. 100 μ L of 7.5 mg/mL sodium bicarbonate is added to each well to stop the reaction. The plates are then read at 405 nm on a Molecular Devices SpectraMax 250 plate reader.
- 10 Calculation of results
- 1) The plate background OD₄₀₅ obtained from wells containing Tyrode's buffer and pNAG (no supernate or lysate) is subtracted from the OD₄₀₅ reading for each well containing supernate or lysate.
 - 2) The release for each well is expressed as the percentage of the total release for that well, where
15 the total release is twice the release in the supernate plus the release in the cell lysate. This calculation corrects for variable cell number in each well.
 - 3) The maximum response is the mean response of wells containing DNP-HSA but no compound.
 - 4) The minimum response is the mean response of wells containing no DNP-HSA and no compound.
 - 20 5) The response in each compound well is calculated as a percentage of the maximum response (expressed as % control) where the maximum response is 100% and the minimum response is 0%.
 - 6) A dose response curve is generated for each compound and the IC₅₀ of the curve is calculated using Prism GraphPad software and nonlinear least squares regression analysis.

- Concanavalin A (Con A)-induced cytokine production in Lewis Rats**
- The test compound is formulated in an inert vehicle (for example but not limited to 0.5% hydroxypropylmethyl cellulose (Sigma, cat # H3785)/0.02% Tween 80 (Sigma, cat # 4780) in water) at the desired concentration to achieve doses in the range of 0.01- 100 mg/kg. Six-week-
30 old male Lewis rats (125g-150g) (Charles River Laboratories) are dosed with the compound orally, at time zero (0 min). After about 30 min the rats are injected intravenously (i.v.) with 10 mg/kg Concanavalin A (Con A, AmershamBioscience, cat #17-0450-01) dissolved in PBS (Invitrogen, cat # 14190). About 4 h later, the rats are cardiac bled and their plasma is analyzed for levels of IL-2 (ELISA kit: R&D Systems cat #R2000) and IFN- γ (ELISA kit: R&D Systems

Reverse Passive Arthus Model

On day 0 OVA was made up at a concentration of 17.5mg/mL, in PBS by rocking gently until a solution was formed. 2% Evans Blue solution (Sigma Aldrich, cat# E2129) was then added to double the volume for a final concentration of 8.75 mg/mL of OVA and 1% Evans Blue dye. Anti-OVA antibody (Abazyme), stock concentration 10 mg/mL, was thawed and a 400 μ g/100 μ L solution was made with PBS. Compounds were made up by adding the vehicle, 0.5% HPMC with 0.02% Tween80, and vortexing for about 15 seconds followed by homogenizing for a minimum of about 2 min at 28,000 rpm until there was a fine particulate suspension with no clumps of compound. Rats were weighed and dosed with compound at a pre-determined t-max based on pharmacokinetic studies. Animals were then placed under general anesthesia with a 5% isoflurane and oxygen mixture and shaved. Using a 1/2 mL insulin syringe two sites were injected i.d., 1 site with 100 μ L of 400 μ g/100 μ L of anti-OVA antibody, and 1 site with 100 μ L of sterile PBS. Each site was then circled with permanent marker for explant later. Right after i.d. injections animals were injected with 200 μ L of the OVA (10mg/kg)/ Evans Blue mixture i.v., using a 1/2 mL insulin syringe. About four hours post injection animals were euthanized, bled via cardiac puncture and blood was collected using a plasma separating tube. Blood samples were stored on ice until centrifugation (within about 2 h of collection). Each injection site was removed with a disposable biopsy punch (Acuderm Acu-Punch Disposable 12mm), cut into four pieces and placed in a pre-labeled 2 mL eppendorf tube. One mL of DMF was added to each biopsy tube and placed in a heat block for about 24 h at about 50 °C. About 24 h after incubation 100 μ L of each sample was added to a 96 well flat bottom plate. The samples were read at 620 nm on a plate reader using the Softmax software. Background was removed by subtracting the OD from the PBS injected site from the OD of the anti-OVA injected site for each individual animal.

Plasma samples were spun down in a microcentrifuge for about 5 min at 16.1 rcf. 200 μ L of plasma was placed in a 1.7 mL eppendorf tube for drug level measurement and tubes were stored at -80 °C until evaluation.

Chronic *in vivo* effects of the compounds on an arthritis disease model is measured using the:

Adjuvant Induced Arthritis (AIA) in a Lewis Rat

Female Lewis rats, (6 weeks of age, 125g-150g in weight from Charles River Laboratories) are immunized intradermally (i.d.) in the right hind-footpad with 100 μ L of a suspension of mineral oil (Sigma, cat # M5905) and containing 200 μ g *M. tuberculosis*, H37RA (Difco, cat # 231141). The inflammation appears in the contra-lateral (left) hind paw seven days after the initial

immunization. Seven days post immunization, the compound is formulated in an inert vehicle (for example but not limited to 0.5% hydroxypropylmethyl cellulose (Sigma, cat # H3785)/0.02% Tween 80 (Sigma, cat # 4780) in water) and dosed orally once or twice a day for at least 10 days. Baseline paw volume is taken on day 0 using a water displacement plethysmograph (Vgo Basile North America Inc. PA 19473, Model # 7140). Rats are lightly anesthetized with an inhalant anesthetic (isoflurane) and the contra-lateral (left) hind paw is dipped into the plethysmograph and the paw volume is recorded. The rats are scored every other day up to day 17 after immunization. On day 17 after immunization, all rats are exsanguinated by cardiac puncture under isoflurane anesthesia, and the left hind paw is collected to assess the impact on bone erosion using micro-CT scans (SCANCO Medical, Southeastern, PA, Model # μ CT 40) at a voxel size of 18 μ m, a threshold of 400, sigma-gauss 0.8, support-gauss 1.0. Bone volume and density is determined for a 360 μ m (200 slice) vertical section encompassing the tarsal section of the paw. The 360 μ m section is analyzed from the base of the metatarsals to the top of the tibia, with the lower reference point fixed at the tibiotalar junction. Drug exposure is determined in the plasma using LC/MS.

Collagen Induced Arthritis (CIA) in a Lewis Rat

On day -1 Collagen Type II (CII), soluble from bovine nasal septum (Elastin Products, cat# CN276) was weighed out for a dose of 600 μ g/rat, 0.01M acetic acid (150 μ L HOAc USP grade, J.T.Baker, order# 9522-03, and 250 mL Milli Q Water) was added for a concentration of 4 mg/mL. The vial was covered with aluminum foil and placed on a rocker at about 4 °C overnight. On day 0 collagen stock solution was diluted 1:1 with Incomplete Freund's adjuvant (IFA) (Difco labs, cat#263910) using a glass Hamilton luer lock syringe (SGE Syringe Perfection VWR cat# 007230), final concentration 2 mg/mL. Female Lewis rats (Charles River Laboratories) acclimated for 7 days at the time of immunization weighing approximately 150 g were anesthetized in an anesthesia chamber using isoflurane (5%) and oxygen. Once the rats were completely anesthetized, they were transferred to a nose cone to maintain anesthesia during the injections. Rats were shaved at the base of the tail, 300 μ L of collagen was injected i.d. on the rump of the rat, n=9 per group. 100 μ L at three sites with a 500 μ L luer lock syringe and a 27 g needle. IFA control rats are injected in the same manner (n=6). The IFA is a 1:1 emulsion with the 0.01M acetic acid. Boost was done on day 6 of the study. Shaving was not done on this day and injections were done in the same manner as the immunization. The inflammation appears in both hind paws 10 days after the initial immunization. 10 days post immunization, the compound was formulated in an inert vehicle (for example but not limited to 0.5% hydroxypropylmethyl cellulose (Sigma, cat # H3785)/0.02% Tween 80 (Sigma, cat # 4780) in water) and dosed orally once or twice a day for at least 9 days. Baseline paw volume was taken on day 7 using a water displacement plethysmograph (Vgo Basile North America Inc. PA 19473, Model # 7140). Rats were lightly anesthetized with an inhalant anesthetic (isoflurane) and both hind paws were dipped

into the plethysmograph and the paw volume was recorded. The rats were scored 2 to 3 times a week up to day 18 after immunization. On day 18 after immunization, all rats were exsanguinated by cardiac puncture under isoflurane anesthesia, and the hind paws were collected to assess the impact on bone erosion using micro-CT scans (SCANCO Medical, Southeastern, PA, Model # μ CT 40) at a voxel size of 18 μ m, a threshold of 400, sigma-gauss 0.8, support-gauss 1.0. Bone volume and density was determined for a 360 μ m (200 slice) vertical section encompassing the tarsal section of the paw. The 360 μ m section was analyzed from the base of the metatarsals to the top of the tibia, with the lower reference point fixed at the tibiotalar junction. Drug exposure was determined from plasma using LC/MS.

GENERAL SYNTHETIC SCHEMES

Compounds of the invention may be prepared using the synthetic transformations illustrated in Schemes I-XII. Starting materials are commercially available, may be prepared by the procedures described herein, by literature procedures, or by procedures that would be well known to one skilled in the art of organic chemistry. Methods for preparing pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazine compounds of the invention are illustrated in Scheme I. In Scheme 1, step a, commercially available 2-bromo-5*H*-pyrrolo[2,3-*b*]pyrazine (also called 5-bromo-4,7-diazaindole from Ark Pharm, Inc) is protected as a sulfonamide using conditions such as those described in Preparation #1 or by methods known to one skilled in the art (for example, Larock, R.C. "Comprehensive Organic Transformations: A Guide to Functional Group Preparations, 2nd edition", 1999, Wiley-VCH or Greene, T.W. and Wuts, P.G.M. "Protective Groups in Organic Synthesis, 3rd Edition", 1999, Wiley-Interscience). Alternatively, protected pyrrolo[2,3-*b*]pyrazine **2** can be prepared from commercially available 3,5-dibromopyrazin-2-amine via a Sonogashira cross coupling (Scheme 1, step g) to give alkyne **9** which can be cyclized (Scheme 1, step h) to provide pyrrolopyrazines **2** using methods known to one skilled in the art (for example Preparation #7, Method B). In Scheme I, step b, a substituted hydrazine is introduced by reaction with pyrrolopyrazines **2** under Buchwald-Hartwig amination conditions (for example, Preparation # 2 or *Advanced Synthesis & Catalysis* **2004**, 346, 1599-1626) to give pyrrolopyrazines **3**. If R" is such that pyrrolopyrazines **3** contain a hydrazide (R"= -C(O)R''') or hydrazone, the material may be directly cyclized to pyrrolotriazolopyrazines **6** using conditions such as those described in General Procedure C, the initial step of Example #1, General Procedure G or by methods known to one skilled in the art (for example, *Bioorganic & Medicinal Chemistry Letters* **2007**, 17(12), 3373-3377 or *Journal of Medicinal Chemistry* **1990**, 33(9), 2326-34). In some cases, pyrrolotriazolopyrazines **6** may be reacted *in situ* to give pyrrolotriazolopyrazines **7**

(for example, Example #1 or General Procedures **B** and **E**). Additional reactions may also occur without isolation of initial pyrrolotriazolopyrazines **6** or **7** as seen in General Procedures **D** and **F**. If R" is a protecting group, deprotection of compounds **3** to yield hydrazinylpyrrolopyrazines **4** can be performed using conditions such as those described in General Procedure **I**, General Procedure **J**, or Greene, T.W. and Wuts, P.G.M. "Protective Groups in Organic Synthesis, 3rd Edition", 1999, Wiley-Interscience. For example, a protecting group such as a *t*-butoxycarbonyl group can be removed with acid using conditions such as those described in Preparation #3, General Procedure **I** or by methods known to one skilled in the art (for example, the books from Larock, R.C. or Greene, T.W. and Wuts, P.G.M. referenced above). Alternatively, reaction of pyrrolopyrazines **2** with hydrazine under Buchwald-Hartwig amination conditions as described above may give hydrazinylpyrrolopyrazines **4** directly. The formation of hydrazides **5** from hydrazinylpyrrolopyrazines **4** (Scheme I, step d) may be accomplished by a variety of methods known to one skilled in the art including *in situ* conditions such as those described in Example #1, General Procedure **A**, or standard peptide coupling methods such as those found in Larock, R.C. referenced above. The hydrazides **5** may be cyclized to pyrrolotriazolopyrazines **6** using conditions such as those described in Example #1, General Procedure **C**, or by methods known to one skilled in the art (for example, *Bioorganic & Medicinal Chemistry Letters* **2007**, 17(12), 3373-3377 or *Journal of Medicinal Chemistry* **1990**, 33(9), 2326-34). Further functionalization of pyrrolotriazolopyrazines **6** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, ureas, sulfonamides, aryl amines, or heteroaryl amines can be prepared from pyrrolotriazolopyrazines **6** containing a primary or secondary amine (for example, Examples #3 and #4 or General Procedures **L**, **M**, **N** or **O**). Also, deprotection of pyrrolotriazolopyrazines **6** can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. referenced above or in General Procedures **I** or **J**. For example, a protecting group such as a benzyloxycarbonyl group can be removed from a protected amine to yield the unprotected amine (for example, Example #2) and the deprotected compounds **6** may then be reacted further as described above. Removal of the sulfonamide protecting group of pyrrolotriazolopyrazines **6** may be accomplished using conditions such as those described in Example #1, General Procedure **H**, or by methods known to one skilled in the art (for example, the books from Larock, R.C. or Greene, T.W. and Wuts, P.G.M. referenced above) to give pyrrolotriazolopyrazines **7** (Scheme I, step f). Further functionalization of the R''' group in pyrrolotriazolopyrazines **7** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, ureas, sulfonamides, aryl amines, or heteroaryl amines can be prepared from pyrrolotriazolopyrazines **7** with an R''' containing a primary or secondary amine (for example, Examples #3 and #4 or General Procedures **L**, **M**, **N** or **O**). Also, deprotection of the R''' group in pyrrolotriazolopyrazines **7** to yield an unprotected compound can be performed

using conditions such as those described in Greene, T.W. and Wuts, P.G.M. referenced above or in General Procedures **I** or **J**. For example, a protecting group such as a benzyloxycarbonyl group can be removed from a protected amine to yield the unprotected amine (for example, Example #2 or General Procedure **J**) and the deprotected compounds **7** may then be reacted further as described above.

The hydrazones **10** may be cyclized to pyrrolotriazolopyrazines **6** using conditions such as those described in General Procedure **G** or by methods known to one skilled in the art. Further functionalization of pyrrolotriazolopyrazines **6** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). Further functionalization of pyrrolotriazolopyrazines **6** including sulfonamide hydrolysis to give pyrrolotriazolopyrazines **7** (Scheme I, step f) are described above.

Methods for preparing imidazo[1,2-*a*]pyrrolo[2,3-*e*]pyrazines compounds of the invention are illustrated in Scheme III. In step a, a carbamate is introduced by reacting pyrrolopyrazines **2** with *tert*-butyl carbamate under Buchwald-Hartwig amination conditions (for example, Example #8, Step A; Preparation #2, or *Advanced Synthesis & Catalysis* **2004**, 346, 1599-1626) to give pyrrolopyrazin-2-ylcarbamates **11**. Deprotection of compounds **11** to yield 2-aminopyrrolopyrazine sulfonamides **12** can be performed using conditions such as those described in Example #8, Step B; General Procedure **I**, or Greene, T.W. and Wuts, P.G.M. "Protective Groups in Organic Synthesis, 3rd Edition", 1999, Wiley-Interscience. The formation of imidazopyrrolopyrazines **13** substituted in the 7-position can be achieved by reacting 2-aminopyrrolopyrazine sulfonamides **12** with appropriately substituted 2-halomethyl ketones by methods known to one skilled in the art (for example, *Journal of Medicinal Chemistry*, **1987**, 30(11), 2031-2046 or Example #8, Step C). Further functionalization of imidazopyrrolopyrazines **13** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, urcas, sulfonamides, aryl amines or heteroaryl amines can be prepared from imidazopyrrolopyrazines **13** containing a primary or secondary amine (for example, Examples #3 and #4 or General Procedures **L**, **M**, **N** or **O**). Also, deprotection of imidazopyrrolopyrazines **13** can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. referenced above or in General Procedures **I** or **J** and the deprotected compounds **13** may then be reacted further as described above. Removal of the sulfonamide protecting group of imidazopyrrolopyrazines **13** may be accomplished using conditions such as those described in Example #8, Step D; General Procedure **H**, or by methods known to one skilled in the art (for example, the books from Larock, R.C. or Greene, T.W. and Wuts, P.G.M. referenced above) to give imidazopyrrolopyrazines **14**. Alternatively, alkylation of pyrrolopyrazin-2-ylcarbamates **11** with appropriately substituted 2-halomethyl ketones by methods known to one skilled in the art (for example, Example #9, Step A; *Tetrahedron Letters*, **2006**, 47(34), 6113-6115; or *Journal of Medicinal Chemistry*, **2005**, 48(14), 4535-4546) yields pyrrolopyrazines **15**. Cyclization of pyrrolopyrazines **15** into imidazopyrrolopyrazines **16** can be accomplished by methods known to one skilled in the art (for example, Example #9, Step B;

European Journal of Medicinal Chemistry, **2001**, 36(3), 255-264; or *Bioorganic and Medicinal Chemistry Letters*, **2007**, 17(5), 1233-1237). Further functionalization of the R^{'''} group in imidazopyrrolopyrazines **16** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, ureas, sulfonamides, aryl amines, or heteroaryl amines can be prepared from imidazopyrrolopyrazines **16** with an R^{'''} group containing a primary or secondary amine (for example, Examples #3 and #4 or General Procedures **L**, **M**, **N** or **O**). Also, deprotection of the R^{'''} group in imidazopyrrolopyrazines **16** to yield an unprotected compound **17** can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. referenced above or in General Procedures **I** or **J** and the deprotected compounds **17** may then be reacted further as described above. Removal of the sulfonamide protecting group of imidazopyrrolopyrazines **16** may be accomplished using conditions such as those described in Example #9, Step C; General Procedure **H**, or by methods known to one skilled in the art (for example, the books from Larock, R.C. or Greene, T.W. and Wuts, P.G.M. referenced above) to give imidazopyrrolopyrazines **17**.

Scheme III

Methods for preparing imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazines compounds of the invention are illustrated in Scheme IV. In step a, a vinyl group is introduced by reacting pyrrolopyrazines **2** with a boronic acid under Suzuki cross coupling conditions (for example, Example #10, Step A). Oxidative cleavage of the alkenes, **18**, provides aldehydes **19** (for example, Example #10, Step B). Conversion to the corresponding primary amines can be accomplished by first condensation with hydroxyl amine followed by reduction with zinc, providing amines **21** (for example, Example #10, Step C). Alternatively amines **21** can be prepared by reduction of aldehydes **19** to the corresponding alcohols (for example, Example #13, Step D), conversion of the alcohol to the chloride and displacement with azide to provide the azides **20** (for example, Example #13, Step

- E). Reduction of the azides provide amines **21** (for example, Example #13, Step F). Alternatively amines **21** can be prepared by conversion of bromides **2** to the corresponding nitriles **25** (for example, Preparation #28), followed by reduction to amines **21** (for example, Preparation #28). Coupling of amines **21** with acids provides amides **22** (for example, Example #10, Step C).
- 5 Cyclization of amides **22** can be accomplished by conversion to the thioamide followed by treatment with an activating agent (such as a mercury salt, a silver salt or a copper salt) providing the imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazines **23** (for example, Example #10, Step D). Deprotection of compounds **23** to yield imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazines **24** can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. "Protective Groups in
- 10 Organic Synthesis, 3rd Edition", 1999, Wiley-Interscience, General Procedure H, or Example #10, Step E. Further functionalization of the R''' group in imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazines **23** or imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazines **24** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, ureas, sulfonamides, aryl amines, or heteroaryl amines can be prepared from compounds
- 15 **23** or **24** with an R''' group containing a primary or secondary amine (for example, General Procedures L, M, N or O). Also, deprotection of the R''' group in compounds **23** or **24** to yield an unprotected compound can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. referenced above or in General Procedures I or J and the deprotected compounds may then be reacted further as described above.

provide α,β -unsaturated ketones **26** (for example, Example #11, Step A). Reduction of the double bond provides the saturated ketones **27** (for example, Example #11, Step B). Cyclization to the tricycles **28** can be accomplished by treatment of **27** with an activating agent by methods known to one skilled in the art (for example, Example #11, Step C). Deprotection of compounds **28** to yield 3*H*-dipyrrolo[1,2-*a*:2',3'-*e*]pyrazines **29** can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. "Protective Groups in Organic Synthesis, 3rd Edition", 1999, Wiley-Interscience; General Procedure **H**, or Example #11, Step D. Further functionalization of the R''' group in 3*H*-dipyrrolo[1,2-*a*:2',3'-*e*]pyrazines **28** or **29** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, ureas, sulfonamides, aryl amines, or heteroaryl amines can be prepared from compounds **28** or **29** with an R''' group containing a primary or secondary amine (for example, General Procedures **L**, **M**, **N** or **O**). Also, deprotection of the R''' group in compounds **28** or **29** to yield an unprotected compound can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. referenced above or in General Procedures **I** or **J** and the deprotected compounds may then be reacted further as described above.

In step a, β -ketoesters **31** may be condensed with methyl 4-chloroacetoacetate **30** to give cyclic β -ketoester enolate salts **32** (for example, General Procedure **BB**). Decarboxylation of compounds **32** to give α,β -unsaturated ketones **33** is accomplished by standard methods known to one skilled in the art (for example, General Procedure **CC**). As shown in step c, hydrogenation of α,β -unsaturated ketones **33**

25

provides the saturated ketones **34** (for example, General Procedure **DD**). Reductive amination of ketones **34** with dibenzylamine yields compounds **35** using conditions such as those described in General Procedure **EE**. The debenzylation of compounds **35** may be accomplished via hydrogenation as described in General Procedure **FF** to give amines **36**. Alternate conditions may be used to access amines **36** from ketones **34**, for example, as described in Larock, R.C. "Comprehensive Organic Transformations: A Guide to Functional Group Preparations, 2nd edition", 1999, Wiley-VCH. Amines **36** may undergo further functionalization using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, ureas, sulfonamides, aryl amines, or heteroaryl amines can be prepared from amines **36** (for example, General Procedures **L**, **M**, **N** or **O**) to give compounds **37**. The ester of compounds **37** may be hydrolyzed under aqueous base or acid conditions to give the desired carboxylic acids **38** (for example, General Procedure **GG** or Larock, R.C. referenced above). If desired, chiral separation of compounds **33**, **34**, **35**, **36**, **37**, or **38** may be done using methods known to one skilled in the art such as chiral preparative HPLC (for example, General Procedure **II**).

In step a, reaction of aldehyde **42** with a Grignard reagent provides alcohols **43** using methods known to one skilled in the art (for example, Example # 23, Step A). Preparation of ketones **44** (step b) can be accomplished by treatment of alcohols **43** with an oxidizing agent by methods known to one skilled in the art (for example, Example #23, Step B). Alternatively, ketones **44** can be prepared by reaction of heteroaryl iodide **45** with an aldehyde (step c) to provide alcohols **43** (for example, Example #24, Step A) followed by oxidation as described previously. Preparation of ketones **44** can be accomplished directly by reaction of heteroaryl iodide **45** with an appropriately substituted acid chloride by methods known to one skilled in the art (such as *Heterocycles*, **2003**, 59(1), 369-385). Ketones **44** can then be converted to hydrazones **46** through reaction with hydrazine using conditions such as those described in Example #24, Step C. Cyclization of hydrazones **46** to provide dihydropyrazolo[4,3-*d*]pyrrolo[2,3-*b*]pyridines **47** can be accomplished via an intramolecular Buchwald-Hartwig cyclization (for example, Example #24, Step B, or *Organic Letters*, **2008**, 10(18), 4109-4112). Further functionalization of the R''' group in dihydropyrazolo[4,3-*d*]pyrrolo[2,3-*b*]pyridines **47** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, ureas, sulfonamides, aryl amines, or heteroaryl amines can be prepared from compounds **47** with an R''' group containing a primary or secondary amine (for example, General Procedures L, M, N or O). Also, deprotection of the R''' group in compounds **47** to yield an unprotected compound can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. referenced above or in General Procedures I or J and the deprotected compounds may then be reacted further as described above.

Further functionalization of the R''' group in isoxazolo[4,5-*d*]pyrrolo[2,3-*b*]pyridines **49** can be performed, if desired, using reactions known to one skilled in the art (for example, Larock, R.C. referenced above). For example, formation of amides, ureas, sulfonamides, aryl amines, or heteroaryl amines can be prepared from compounds **49** with an R''' group containing a primary or secondary amine (for example, General Procedures **L**, **M**, **N** or **O**). Also, deprotection of the R''' group in compounds **49** to yield an unprotected compound can be performed using conditions such as those described in Greene, T.W. and Wuts, P.G.M. referenced above or in General Procedures **I** or **J** and the deprotected compounds may then be reacted further as described above.

Preparation #1: 2-Bromo-5-(4-*tert*-butylphenylsulfonyl)-5H-pyrrolo[2,3-*b*]pyrazine

A solution of 2-bromo-5H-pyrrolo[2,3-*b*]pyrazine (5.00 g, 25.2 mmol, Ark Pharm) in DMF (150 mL) was cooled in an ice bath to about 0 °C and then NaH (60% dispersion in mineral oil, 1.21 g, 30.3 mmol) was added. After about 15 min, 4-*tert*-butylbenzene-1-sulfonyl chloride (6.46 g, 27.8 mmol) was added. The reaction was maintained between about 0-10 °C for about 2 h. Then, the reaction was diluted with water (200 mL) to give a yellow suspension. The solid was collected by vacuum filtration, while washing with additional water (100 mL), and dried in a vacuum oven at about 70 °C to give 2-bromo-5-(4-*tert*-butylphenylsulfonyl)-5H-pyrrolo[2,3-*b*]pyrazine (9.05 g, 91%); LC/MS (Table 2, Method a) R_t = 3.05 min; MS m/z : 394/396 (M+H)⁺.

The solvent was removed and the crude solid was triturated with MeOH/DCM (4:1, 10 volumes of solvent per gram of crude solid) at ambient temperature for about 5 h. The solid was filtered and washed with MeOH (300 mL). The product was dried in a vacuum oven to provide *5-tosyl-5H-pyrrolo[2,3-b]pyrazine-2-carbonitrile* (58.8 g, 70%) as a colorless solid: ¹H NMR (400 MHz, CDCl₃) δ 8.67 (s, 1H), 8.21 (d, J=4.2 Hz, 1H), 8.07 (d, J=8.4 Hz, 2H), 7.34 (d, J=8.1 Hz, 2H), 6.89 (d, J=4.2 Hz, 1H), 2.42 (s, 3H). A 2-L 316-stainless steel pressure reactor was charged with 5% Pd/C (15.4 g of 63.6 wt% water wet material, 5.6 g dry basis, Johnson Matthey A503032-5), *5-tosyl-5H-pyrrolo[2,3-b]pyrazine-2-carbonitrile* (55 g, 184 mmol), THF (1.1 L), deionized water (165 mL), aqueous HCl, (37 wt%, 30 mL, 369 mmol) and quinoline (1.1 mL, 9.0 mmol). The vessel was purged, pressurized, and maintained at 40 psi with hydrogen supplied from a high pressure reservoir. The mixture was vigorously agitated at about 25 °C. After about 5 h the reactor was vented and purged with nitrogen to remove most of the dissolved hydrogen, and the reaction mixture was filtered to remove the catalyst. The reactor and catalyst cake were rinsed with THF:H₂O (1:1, 2 × 40 mL). The combined filtrate and rinses were concentrated and EtOH (500 mL) was added. After two additional solvent switches with EtOH (2 x 500 mL), the crude residue was concentrated to give a residue (76 g) that was suspended in EtOH (550 mL) and stirred at ambient temperature for about 4 h. The solid was collected by filtration and washed with cold EtOH (50 mL). The wet cake was dried in a vacuum oven to provide (*5-tosyl-5H-pyrrolo[2,3-b]pyrazin-2-yl*)methanamine hydrochloride (51.2 g, 82%) as a colorless solid: LC/MS (Table 2, Method a) R_t = 1.44 min; MS m/z: 303 (M+H)⁺.

25 General Procedure A: Formation of a hydrazide from a carboxylic acid

To mixture of a 2-hydrazinylpyrrolo[2,3-b]pyrazine (preferably 1 equiv) and a carboxylic acid (1-2 equiv, preferably 1.1-1.3 equiv) in a solvent such as DCM or THF, preferably DCM, is added a coupling agent such as EDC•HCl or HATU (1.0-2.0 equiv, preferably 1.2-1.6 equiv) with or without an organic base such as TEA or DIEA (2-5 equiv, preferably 3-4 equiv). After about 1-72 h (preferably 2-6 h) at about 20-60 °C (preferably about room temperature), the reaction is worked up using one of the following methods. Method 1: Water is added and the layers are separated. Optionally, the mixture may be filtered through Celite® prior to the separation of the layers. The aqueous layer is then extracted with an organic solvent such as EtOAc or DCM. The combined organic layers are optionally washed with brine, dried over anhydrous Na₂SO₄ or MgSO₄, filtered or decanted, and concentrated under reduced pressure. Method 2: The reaction is diluted with an organic solvent such as EtOAc or DCM and is washed with either water or brine or both. The aqueous layer is optionally further extracted with an organic solvent such as EtOAc

or DCM. Then the organic layer or combined organic layers are optionally washed with brine, dried over anhydrous Na₂SO₄ or MgSO₄, filtered or decanted, and concentrated under reduced pressure. Method 3: The reaction is diluted with an organic solvent such as EtOAc or DCM and water is added. The layers are separated and the organic layer is directly purified by chromatography. In all cases, the crude material is optionally purified by precipitation, crystallization, and/or trituration from an appropriate solvent or solvents and/or by chromatography to give the target compound.

The organic solution was decanted away from the resulting precipitate to afford ((1*R*,3*R*)-3-(6*H*-pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazin-1-yl)cyclopentyl)methanamine hydrochloride as a yellow solid (0.11 g, 33 %): LC/MS (Table 2, Method **a**) *R*_t = 1.01 min; MS *m/z*: 257 (M+H)⁺.

General Procedure G: Formation of a hydrazone followed by cyclization and sulfonamide hydrolysis

To a solution of a 2-hydrazinyl-5-sulfonyl-5*H*-pyrrolo[2,3-*b*]pyrazine (preferably 1 equiv) in an organic solvent or solvents such as MeOH or MeOH/DCM (preferably MeOH) is added a solution of an aldehyde (1.0-1.3 equiv, preferably 1.0 equiv) in an organic solvent such as DCM. The reaction mixture is stirred at about 15-30 °C (preferably ambient temperature) for about 1-8 h (preferably about 2 h) before iodobenzene diacetate (1-3 equiv, preferably 1 equiv) is added. The reaction is stirred at about 15-30 °C (preferably ambient temperature) for about 15-60 min (preferably about 30 min) before it is concentrated to constant weight. To the residue is added an organic solvent such as 1,4-dioxane, THF, MeOH or EtOH (preferably 1,4-dioxane) followed by aqueous base such as aqueous Na₂CO₃ or NaOH (2-50 equiv), preferably NaOH (2 equiv). The reaction was heated at about 40-80 °C (preferably about 60 °C) for about 1- 24 h (preferably about 2 h). The crude product is optionally purified by precipitation, crystallization, and/or trituration from an appropriate solvent or solvents and/or by chromatography to give the target compound.

Example #G.1.1: 1-(Tetrahydro-2*H*-pyran-4-yl)-6*H*-pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazine

To a solution of 2-hydrazinyl-5-tosyl-5*H*-pyrrolo[2,3-*b*]pyrazine (0.100 g, 0.330 mmol, Preparation #9) in MeOH (2 mL) was added tetrahydro-2*H*-pyran-4-carbaldehyde (0.038 g, 0.330 mmol, J&W PharmLab) in DCM (1 mL). The reaction mixture was stirred at ambient temperature for about 2 h before iodobenzene diacetate (0.106 g, 0.330 mmol) was added. The reaction mixture was stirred at ambient temperature for about 15 min before it was concentrated to constant weight. To the residue was added MeOH (2 mL) followed by aqueous NaOH (2 N, 0.330 mL, 0.659 mmol). The reaction mixture was heated at about 60 °C for about 1 h. The crude reaction mixture was purified by RP-HPLC (Table 2, Method f). The combined product-containing fractions were concentrated under reduced pressure to remove MeCN and then lyophilized to afford 1-(tetrahydro-2*H*-pyran-4-yl)-6*H*-pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazine as a white solid (0.028 g, 35%); LC/MS (Table 2, Method a) *R*_t = 1.25 min; MS *m/z*: 244 (M+H)⁺.

General Procedure H: Hydrolysis of a sulfonamide

To a flask containing a sulfonamide, for example, a sulfonyl-protected pyrrole, (preferably 1 equiv) in an organic solvent (such as 1,4-dioxane, MeOH, or THF/MeOH, preferably 1,4-dioxane) is added an aqueous base (such as aqueous Na₂CO₃ or aqueous NaOH, 1-30 equiv, preferably 1-2 equiv for aqueous NaOH, preferably 15-20 equiv for aqueous Na₂CO₃). The mixture is stirred at about 25-100 °C (preferably about 60 °C) for about 1-72 h (preferably about 1-16 h). In cases where the reaction does not proceed to completion as monitored by TLC, LC/MS, or HPLC, additional aqueous base (such as aqueous Na₂CO₃, 10-20 equiv, preferably 10 equiv or aqueous NaOH, 1-5 equiv, preferably 1-2 equiv) is added and the reaction is continued at about 25-100 °C (preferably about 60 °C) for about 0.25-3 h (preferably about 1-2 h). The reaction is worked up using one of the following methods. Method 1. The organic solvent is optionally removed under reduced pressure and the aqueous solution is neutralized with the addition of a suitable aqueous acid (such as aqueous HCl). A suitable organic solvent (such as EtOAc or DCM) and water are added, the layers are separated, and the organic solution is dried over anhydrous Na₂SO₄ or MgSO₄, filtered, and concentrated to dryness under reduced pressure to give the target compound. Method 2. The organic solvent is optionally removed under reduced pressure a suitable organic solvent (such as EtOAc or DCM) and water are added, the layers are separated, and the organic solution is dried over anhydrous Na₂SO₄ or MgSO₄, filtered, and concentrated to dryness under reduced pressure to give the target compound. Method 3. The reaction mixture is concentrated and directly purified by one of the subsequent methods. The crude material obtained from any of the preceding methods is optionally purified by precipitation, crystallization, and/or trituration from an appropriate solvent or solvents and/or by chromatography to give the target compound.

General Procedure I: Acidic cleavage of a Boc-protected amine

To a solution of a Boc-protected amine (preferably 1 equiv) in an organic solvent (such as DCM, 1,4-dioxane, or MeOH) is added TFA or HCl (preferably 4 N HCl in 1,4-dioxane solution, 2-35 equiv, preferably 2-15 equiv). The reaction is stirred at about 20-100 °C (preferably ambient temperature to about 60 °C) for about 1-24 h (preferably about 1-6 h). Optionally additional TFA or HCl (preferably 4 N HCl in 1,4-dioxane solution, 2-35 equiv, preferably 2-15 equiv) may be added to the reaction mixture in cases where the reaction does not proceed to completion as monitored by TLC, LC/MS, or HPLC. The reaction is then continued at ambient temperature or optionally heated up to about 100 °C (preferably heated at about 60 °C) for about 1-24 h (preferably about 1-6 h). If a solid is present in the reaction mixture, the reaction mixture may be filtered and the solid washed with an organic solvent such as 1,4-dioxane or Et₂O. The resulting solid is then optionally dried under reduced pressure. Alternatively, the filtered material may be partitioned between an organic solvent (such as EtOAc, DCM or 1,4-dioxane) and an aqueous base (such as as saturated aqueous NaHCO₃ or saturated aqueous Na₂CO₃, preferably saturated aqueous NaHCO₃). The mixture is stirred for about 1-5 h (preferably about 1 h). Any insoluble material is collected by filtration and may be washed with a suitable solvent (such as cold water and/or Et₂O) then may be optionally dried under reduced pressure. The organic layer may optionally be washed with brine, dried over anhydrous Na₂SO₄ or MgSO₄, then decanted or filtered, prior to concentrating under reduced pressure to give the target compound. Alternatively, the reaction is partitioned between a basic aqueous solution (such as Na₂CO₃, NaHCO₃ or NaOH, preferably NaOH) and an organic solvent (such as EtOAc or DCM). The aqueous layer is then optionally extracted with additional organic solvent such as EtOAc or DCM. The combined organic layers may optionally be washed with brine, dried over anhydrous Na₂SO₄ or MgSO₄, then decanted or filtered, prior to concentrating under reduced pressure to give the target compound. Optionally, the crude material is purified by chromatography, trituration with an appropriate solvent, or crystallization from one or more solvents to give the target compound.

Example #I.1.1 (R)-1-(Piperidin-3-yl)-6H-pyrrolo[2,3-e][1,2,4]triazolo[4,3-a]pyrazine hydrochloride

A round bottom flask was charged with (R)-tert-butyl 3-(6H-pyrrolo[2,3-e][1,2,4]triazolo[4,3-a]pyrazin-1-yl)piperidine-1-carboxylate (0.92 g, 2.68 mmol; prepared using **A** from Preparation #9, (R)-1-(tert-butoxycarbonyl)piperidine-3-carboxylic acid [CNH Technologies], EDC and TEA, and **E** using SOCl₂, TEA, and saturated aqueous Na₂CO₃), HCl (4 N in 1,4-dioxane, 2.9 mL, 11.5 mmol), and 1,4-dioxane (20 mL). The reaction mixture was heated at about 60 °C for about 3 h. The reaction mixture was cooled to ambient temperature then filtered under vacuum and washed with Et₂O (35 mL). The solid was then dried for about 16 h in a heated vacuum oven (at about 70 °C) to give (R)-1-(piperidin-3-yl)-6H-pyrrolo[2,3-e][1,2,4]triazolo[4,3-a]pyrazine hydrochloride as a brown solid (0.69 g, 82%): LC/MS (Table 2, Method **a**) R_t = 0.45 min; MS m/z 243 (M+H)⁺.

General Procedure K: Formation of an amide from an activated acid and an amine

To a round-bottomed flask containing an amine or an amine salt (preferably 1 equiv) in an organic solvent (such as DCM, DMF, or 1,4-dioxane, preferably DCM or DMF) is added an organic base such as DIEA or TEA (0-5 equiv, preferably 3 equiv). Alternatively, the solvent is concentrated under reduced pressure or a suitable organic solvent (such as EtOAc or DCM) is added and the solution is washed with water or brine. The layers are separated and the organic solution is optionally dried over anhydrous Na₂SO₄ or MgSO₄, filtered or decanted, and concentrated to dryness under reduced pressure. The crude material is optionally purified by precipitation, crystallization, and/or trituration from an appropriate solvent or solvents and/or by chromatography to give the target compound.

General Procedure L: Formation of an amide from a carboxylic acid and an amine

- 5 To a solution or suspension of a carboxylic acid (1-5 equiv, preferably 1.5 equiv) and an amine (1-5 equiv, preferably 1 equiv) in an organic solvent (such as DCM, DCE, THF, or 1,4-dioxane, preferably DCM) is added a peptide coupling reagent (such as BOP-Cl, IBCF, HATU, or EDC•HCl, preferably EDC•HCl, 1-10 equiv, preferably 1-10 equiv), a base (such as TEA, DIEA, or pyridine, preferably TEA, 0-20 equiv, preferably 2 equiv) and HOBt (0-5 equiv, preferably 0-1
- 10 equiv when EDC•HCl is used). The reaction mixture is then stirred at ambient temperature for about 15 min to 24 h (preferably about 16 h). The reaction mixture is then worked up using one of the following methods. Method 1: The reaction mixture is diluted with water or saturated aqueous NaHCO₃. The layers are separated. The aqueous layer is optionally extracted with

additional organic solvent such as EtOAc or DCM. The organic layer is (or combined layers are) optionally washed with water, saturated aqueous NaHCO₃ and/or brine, dried over anhydrous MgSO₄ or Na₂SO₄, filtered or decanted, and concentrated under reduced pressure. Method 2: The crude reaction mixture is filtered through a pad of silica gel, washing with a suitable solvent (such as EtOAc, MeOH, or DCM, preferably MeOH), and concentrated under reduced pressure. Method 3: The crude reaction mixture is directly purified by chromatography without a work up. In all cases, the crude material is optionally further purified by precipitation, crystallization, and/or trituration from an appropriate solvent or solvents and/or by chromatography to give the target compound.

General Procedure M: Formation of a urea from an amine and a carbamoyl chloride

To a flask containing an amine or an amine salt (1 equiv) in an organic solvent (such as THF, or 1,4-dioxane, preferably THF) is added a base (such as DIEA or TEA, preferably TEA (3-5 equiv, preferably 3 equiv) and stirred at ambient temperature for about 0-30 min (preferably about 5 min) then added a carbamoyl chloride (0.5-2 equiv, preferably 0.75 equiv). The mixture is stirred at about 0-90 °C (preferably about 60-65 °C) for about 2-24 h (preferably about 16 h). The reaction mixture is allowed to reach ambient temperature. The organic solvent is optionally removed under reduced pressure. The crude material can be partitioned between an organic solvent (such as EtOAc or DCM) and water, an aqueous base (such as saturated aqueous NaHCO₃) or brine. The layers are separated and the organic layer is optionally washed with water, an aqueous base (such as saturated aqueous NaHCO₃) and/or brine, dried over anhydrous Na₂SO₄ or MgSO₄, filtered, and concentrated under reduced pressure to give the target compound. The crude material is optionally purified by precipitation crystallization or trituration from an appropriate solvent or solvents or by chromatography to give the target compound.

A round bottom flask was charged with (1*R*,3*R*)-3-(6*H*-pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazin-1-yl)cyclopentanamine hydrochloride (0.150 g, 0.62 mmol, Example #D.1.4) and TEA (0.26 mL, 1.9 mmol) in THF (5.7 mL). The reaction mixture was stirred for about 5 min at ambient temperature before pyrrolidine-1-carbonyl chloride (0.052 mL, 0.46 mmol) was added.

The reaction was heated at about 60 °C for about 16 h, cooled to ambient temperature, and concentrated under reduced pressure. The crude product was dissolved in DCM (40 mL) and washed with saturated aqueous NaHCO₃ (20 mL), brine (20 mL), dried over anhydrous MgSO₄, filtered and concentrated under reduced pressure. The material was purified by RP-HPLC (Table 2, Method i). The appropriate fractions were combined, the solvent was mostly removed under reduced pressure, and the solid was filtered and dried under lyophilization to give *N*-((1*R*,3*R*)-3-(6*H*-pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazin-1-yl)cyclopentyl)pyrrolidine-1-carboxamide (0.018 g, 8%): LC/MS (Table 2, Method a) *R*_t = 1.40 min; MS *m/z* 340 (M+H)⁺.

General Procedure N: Formation of a sulfonamide from an amine

To a mixture or a solution (preferably a solution) of an amine or an amine salt (preferably 1 equiv) in a solvent such as THF, DCM or DMF (preferably DMF) is added an organic base such as TEA or DIEA (1-10 equiv, preferably 2-4 equiv) or an aqueous base such as saturated aqueous NaHCO₃ (5-20 equiv, preferably 5-10 equiv) (preferably an organic base) and a sulfonyl chloride (0.85-3 equiv, preferably 1-1.5 equiv). The reaction is stirred at -10 – 80 °C (preferably at ambient temperature) for about 0.5-72 h (preferably about 1-2 h). Optionally, additional base (1-10 equiv) and/or sulfonyl chloride (0.4-2 equiv) may be added at any point during the reaction time. The reaction is worked up using one of the following methods. Method 1: The reaction is diluted with water and extracted with an organic solvent such as DCM or EtOAc. The combined organic layers are optionally washed with brine, dried over anhydrous Na₂SO₄ or MgSO₄, filtered or decanted, and concentrated under reduced pressure. Method 2: The crude reaction mixture is purified by preparative HPLC directly or after the addition of organic solvent such as MeOH or DMF or an aqueous buffer such as 50 mM NH₄OAc with or without concentrating the mixture

under reduced pressure first. Method 3: The reaction is diluted with an organic solvent such as DCM or EtOAc and washed with water and/or brine. The organic layer is optionally dried over anhydrous Na₂SO₄ or MgSO₄, filtered or decanted, and concentrated under reduced pressure. Method 4: The reaction is diluted with water and the resulting solid is collected by vacuum filtration. In all cases, the crude material is optionally purified by precipitation, crystallization, and/or trituration from an appropriate solvent or solvents and/or by chromatography to give the target compound.

Silica gel (2 g) was added to the filtrate and the mixture was concentrated under reduced pressure. The mixture was purified by silica gel chromatography eluting with a step-wise gradient of DCM/MeOH/NH₄OH 990:9:1 to 980:18:2 to give an off-white solid that was dried in a vacuum oven at about 70 °C. The solid was dissolved in hot MeOH, filtered while hot to remove particulates and then the filtrate was sonicated while cooling to provide a fine suspension which was concentrated under reduced pressure and dried in a vacuum oven at about 100 °C to give *N*-((1*S*,3*R*)-3-(6*H*-pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazin-1-yl)cyclopentyl)cyclopropanesulfonamide (0.21 g, 64%); LC/MS (Table 2, Method a) *R*_t = 1.51 min; MS *m/z*: 347 (M+H)⁺.

5 General Procedure O: Displacement of an aryl or heteroaryl halide with an amine

To a microwave vessel is added an amine or an amine salt (preferably 1 equiv), an aryl or heteroaryl halide (1-10 equiv, preferably 1.5 equiv), a solvent such as MeCN, *n*-PrOH, *n*-BuOH, toluene, DMSO, or EtOH (preferably EtOH), and a base such as K₂CO₃, Na₂CO₃, TEA or DIEA, preferably TEA or DIEA (1-5 equiv, preferably 2-4 equiv). The reaction mixture is subjected to microwave heating at about 100-200 °C (preferably about 130-150 °C) for about 0.5-8 h (preferably about 1-2 h). In cases where the reaction did not proceed to completion as monitored by TLC, LC/MS, or HPLC, the reaction may be resubjected to a microwave at about 120-200 °C (preferably about 130-150 °C) for an additional about 1-8 h (preferably about 1-2 h) with the optional addition of more aryl or heteroaryl halide (1-10 equiv, preferably 1.5 equiv) and/or base such as K₂CO₃, Na₂CO₃, TEA or DIEA, preferably TEA or DIEA (1-5 equiv, preferably 2-4 equiv). This process is repeated until the reaction proceeds no further. After cooling to ambient

temperature, the reaction is worked up using one of the following methods. Method 1: The reaction is concentrated under reduced pressure. Method 2: A reaction mixture containing a precipitate may be filtered to collect the target compound, while optionally washing with organic solvent or solvents such as Et₂O, DCM and/or petroleum ether. Method 3: The reaction mixture is diluted with an organic solvent such as MeOH, silica gel is added, and the mixture is concentrated under reduced pressure to prepare for separation by chromatography. Method 4: The reaction mixture is concentrated under reduced pressure prior to the addition of an organic solvent such as EtOAc or DCM and is then optionally washed with water and/or brine, dried over anhydrous Na₂SO₄ or MgSO₄, filtered or decanted, and concentrated under reduced pressure. Method 5: An organic solvent such as EtOAc or DCM is added with the optional addition of water or brine and the layers are separated. The aqueous layer is then optionally extracted with additional organic solvent such as EtOAc or DCM. The combined organic layers are optionally washed with brine or water, dried over anhydrous MgSO₄ or Na₂SO₄, filtered or decanted, and concentrated under reduced pressure. In all cases, the crude material is optionally purified by precipitation, crystallization, and/or trituration from an appropriate solvent or solvents and/or by chromatography to give the target compound.

Example #O.1.1: 6-((1*S*,3*R*)-3-(6*H*-Pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazin-1-yl)cyclopentylamino)nicotinonitrile

To a microwave vessel was added (1*S*,3*R*)-3-(6*H*-pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazin-1-yl)cyclopentanamine hydrochloride (0.0979 g, 0.311 mmol, Example #6, Step C), EtOH (2 mL), 6-chloronicotinonitrile (0.057 g, 0.41 mmol), and TEA (0.130 mL, 0.932 mmol). The reaction mixture was heated in a CEMTM microwave at about 130 °C for about 1 h (250 psi maximum pressure, 5 min maximum ramp, 300 maximum watts). After cooling to ambient temperature, the reaction was concentrated under reduced pressure and purified by silica gel chromatography eluting with DCM/MeOH/Et₂NH (970:27:3) to give 6-((1*S*,3*R*)-3-(6*H*-pyrrolo[2,3-*e*][1,2,4]triazolo[4,3-*a*]pyrazin-1-yl)cyclopentylamino)nicotinonitrile (0.027 g, 25%); LC/MS (Table 2, Method a) R_t = 1.24 min; MS *m/z*: 345(M+H)⁺.

General Procedure O.1: Displacement of an aryl or heteroaryl halide with an amine (under thermal conditions)

A round bottom flask is charged with a mixture of an amine or an amine salt (preferably 1 equiv), an aryl or heteroaryl halide (1-10 equiv, preferably 1.5 equiv), a solvent such as MeCN, toluene, DMSO, EtOH, or DMF (preferably DMF), and a base such as K₂CO₃, Na₂CO₃, TEA or DIEA, preferably TEA or K₂CO₃ (1-5 equiv, preferably 2-4 equiv). The reaction mixture is heated at about 40-220 °C (preferably about 65 °C) for about 0.5-16 h (preferably about 8.5 h). In cases where the reaction did not proceed to completion as monitored by TLC, LC/MS, or HPLC, the reaction may be resubjected heating at about 40-220 °C (preferably about 65 °C) for an additional about 1-12 h (preferably about 1-2 h) with the optional addition of more aryl or heteroaryl halide (1-10 equiv, preferably 1.5 equiv) and/or base such as K₂CO₃, Na₂CO₃, TEA or DIEA, preferably TEA or K₂CO₃ (1-5 equiv, preferably 2-4 equiv). This process is repeated until the reaction proceeds no further. After cooling to ambient temperature, the reaction mixture is subjected to one of the following methods. Method 1: The reaction is concentrated to dryness under reduced pressure. Method 2: A reaction mixture containing a precipitate may be filtered to collect the target compound, while optionally washing with organic solvent or solvents such as Et₂O, DCM and/or petroleum ether. Method 3: The reaction mixture is diluted with an organic solvent (such as MeOH) silica gel is added, and the mixture is concentrated under reduced pressure to prepare for separation by chromatography. Method 4: The reaction mixture is concentrated under reduced pressure prior to the addition of an organic solvent such as EtOAc or DCM and is then optionally washed with water and/or brine, dried over anhydrous Na₂SO₄ or MgSO₄, filtered or decanted, and concentrated under reduced pressure. Method 5: An organic solvent such as EtOAc or DCM is added with the optional addition of water or brine and the layers are separated. The aqueous layer is then optionally extracted with additional organic solvent such as EtOAc or DCM. The combined organic layers are optionally washed with brine or water, dried over anhydrous MgSO₄ or Na₂SO₄, filtered or decanted, and concentrated under reduced pressure. In all cases, the crude material is optionally purified by precipitation, crystallization, and/or trituration from an appropriate solvent or solvents and/or by chromatography to give the target compound.

General Procedure JJ: Acidic hydrolysis of an acetyl protected amine

To a solution of an *N*-acetamide (preferably 1 equiv) in an organic solvent (such as 1,4-dioxane) is added an acid, such as 6 N aqueous HCl (3-100 equiv, preferably 40 equiv). The reaction mixture is heated at about 60-100 °C (preferably about 100 °C) for about 1- 24 h (preferably about 16 h). The resulting mixture was heated to about 50 °C for about 19 h to give a yellow-orange suspension. The reaction mixture was then concentrated under reduced pressure and the resulting solid was transferred to a beaker and diluted with water (350 mL). The solid was collected by vacuum filtration and the filter cake was rinsed with water (150 mL) and dried under vacuum for about 1 h. The product containing fractions were combined and concentrated to give a pale yellow solid. The solid was dissolved in a 1:1 mixture of DCM:MeOH (about 100 mL), 10 g of silica gel was added, and the mixture was concentrated. The resulting mixture was purified by silica gel chromatography using a gradient of 0-100% DCM/MeOH/Et₂NH (990:9:1) to DCM/MeOH/Et₂NH (970:27:3). The product-containing fractions were combined and concentrated to give a white solid. The solid was dissolved in boiling EtOH (150 mL) and sonicated for about 1 h. The resulting mixture was heated to about 50 °C for about 19 h to give a reddish orange suspension. The reaction mixture was then concentrated under reduced pressure and the resulting liquid was transferred to a beaker and diluted with water (350 mL). The mixture was stirred and placed in an ice bath for about 2 h. The solid was collected by vacuum filtration and the filter cake was rinsed with water (150 mL) and dried under vacuum. To the solid was added EtOAc (30 mL) to give a suspension which was heated briefly with a heat gun and then sonicated for about 15 min. After sitting at ambient temperature for about 15 min, the resulting white solid was collected by vacuum filtration, washing with additional EtOAc (15 mL), and dried in a vacuum oven at about 50 °C. The solid was dissolved in hot EtOH (~200 mL), filtered to remove minor insolubles (<10 mg), sonicated for about 10 min, while cooling, to give a white suspension, which was concentrated under reduced pressure. containing fractions was further purified by silica gel chromatography eluting with EtOAc to give 7-(5-methoxy-1-methyl-1*H*-indol-3-yl)-6-((2-(trimethylsilyl)ethoxy)methyl)-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine (0.048 g, 49%); LC/MS (Table 2, Method **a**) R_t = 3.16 min; MS m/z : 448 (M+H)⁺.

Step C: 7-(5-Methoxy-1-methyl-1*H*-indol-3-yl)-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine

7-(5-Methoxy-1-methyl-1*H*-indol-3-yl)-6-((2-(trimethylsilyl)ethoxy)methyl)-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine (0.048 g, 0.11 mmol) in DMF (4 mL) was treated with ethylenediamine (0.22 mL, 3.3 mmol) and heated to about 85 °C for about 5 min. The solution was cooled and TBAF (1 M in THF, 0.11 mL, 0.11 mmol) was added. The solution was re-heated to about 85 °C for about 30 min. The mixture was cooled to ambient temperature and another portion of the TBAF (1 M in THF, 0.054 mL, 0.054 mmol) was added and heating was continued for about 1.5 h. The product-containing fractions were concentrated to remove MeCN then basified with saturated aqueous NaHCO₃ and extracted with EtOAc (2 x 10 mL). The combined organic solutions were dried over anhydrous MgSO₄, filtered, and concentrated. Trituration of the solid with heptane (5 mL) then collection by filtration gave 7-(5-methoxy-1-methyl-1*H*-indol-3-yl)-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine (0.028 g, 8 %); LC/MS (Table 2, Method **a**) R_t = 1.91 min; MS m/z : 318.1 (M+H)⁺. ¹H NMR (400 MHz, DMSO-*d*₆) δ 12.18 (s, 1H), 8.77 (s, 1H), 8.59 (s, 1H), 7.83 (s, 1H), 7.79 (s, 1H), 7.48 (d, *J*=2.3 Hz, 1H), 7.43 (d, *J*=8.9 Hz, 1H), 7.20 (d, *J*= 2.3 Hz, 1H), 6.92 (dd, *J*=8.90, 2.36 Hz, 1H), 3.88 (s, 3H), 3.82 (s, 3H).

The mixture was stirred for about 20 min at about 60 °C and cooled to ambient temperature, diluted with aqueous Na₂CO₃ (15 mL), and extracted with EtOAc (20 mL). The organic solution was dried over anhydrous MgSO₄, filtered, and concentrated to give *N*-((6-(5-methoxy-1-methyl-1*H*-indol-3-yl)-5-((2-(trimethylsilyl)ethoxy)methyl)-5*H*-pyrrolo[2,3-*b*]pyrazin-2-yl)methyl)benzamide (0.118 g, 100 %): LC/MS (Table 2, Method d) *R*_t = 1.64 min; MS *m/z*: 542 (M+H)⁺.

Step B: 7-(5-Methoxy-1-methyl-1*H*-indol-3-yl)-6-((2-(trimethylsilyl)ethoxy)methyl)-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine

N-((6-(5-Methoxy-1-methyl-1*H*-indol-3-yl)-5-((2-(trimethylsilyl)ethoxy)methyl)-5*H*-pyrrolo[2,3-*b*]pyrazin-2-yl)methyl)benzamide (0.118 g, 0.218 mmol) in 1,4-dioxane (3 mL) was treated with Lawesson's Reagent (0.070 g, 0.17 mmol) and was heated to about 80 °C in an oil bath for about 20 min. The mixture was cooled to ambient temperature and then mercuric acetate (0.073 g, 0.23 mmol) was added. The mixture was stirred for about 60 min at ambient temperature then another portion of mercuric acetate (0.069 g, 0.22 mmol) was added and stirring was continued for about 20 min at ambient temperature. The mixture was diluted with EtOAc (20 mL) and then filtered. The filtrate was concentrated under reduced pressure and the material was purified by silica gel chromatography eluting with EtOAc to give 7-(5-methoxy-1-methyl-1*H*-indol-3-yl)-6-((2-(trimethylsilyl)ethoxy)methyl)-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine (0.055 g, 48%): LC/MS (Table 2, Method d) *R*_t = 1.91 min; MS *m/z*: 524 (M+H)⁺.

Step C: 7-(5-Methoxy-1-methyl-1*H*-indol-3-yl)-1-phenyl-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine

- 7-(5-Methoxy-1-methyl-1*H*-indol-3-yl)-1-phenyl-6-((2-(trimethylsilyl)ethoxy)methyl)-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine (0.054 g, 0.103 mmol) in DMF (3 mL) was treated with ethylenediamine (0.207 mL, 3.09 mmol) and TBAF (1 M in THF, 0.412 mL, 0.412 mmol). The solution was heated to about 90°C for about 70 min. The mixture was cooled to ambient temperature and the mixture was diluted with EtOAc (10 mL), washed with water (6 mL), dried over anhydrous MgSO₄, filtered, and concentrated to give a yellow residue. The residue was purified by silica gel chromatography eluting with 1-6% MeOH/DCM to provide a yellow solid. The solid was triturated with heptane (2 mL) to provide 7-(5-methoxy-1-methyl-1*H*-indol-3-yl)-1-phenyl-6*H*-imidazo[1,5-*a*]pyrrolo[2,3-*e*]pyrazine (0.004 g, 10 %): LC/MS (Table 2, Method a) R_t = 2.26 min; MS *m/z*: 394 (M+H)⁺.

5 **Preparation #29: (3R)-(3,6-Dihydropyrazolo[4,3-d]pyrrolo[2,3-b]pyridin-1-yl)cyclopentanamine**

Step A: (3R)-3-(Dibenzylamino)-N-methoxy-N-methylcyclopentanecarboxamide

Hydrogen chloride gas was bubbled through a solution of (1S,3R)-3-aminocyclopentanecarboxylic acid (4.22 g, 32.7 mmol, Peptech) in MeOH (15 mL) for about 5 min. The resulting mixture was stirred at about 50 °C for about 6 h and then at room temperature for about 16 h. The solvent was removed under reduced pressure and the residue was suspended in MeCN (30 mL). The precipitate was collected by filtration and dried *in vacuo* to yield (3R)-methyl 3-aminocyclopentanecarboxylate hydrochloride (3.1 g, 53%) as a white solid. Et₂O (120 mL) was added to the filtrate and the precipitate was collected by vacuum filtration to give additional (3R)-methyl 3-aminocyclopentanecarboxylate hydrochloride (1.1 g, 19%) which was combined with the product above to give (3R)-methyl 3-aminocyclopentanecarboxylate hydrochloride (4.2 g, 72% total) that was used without further purification. A portion of this ester (3.05 g, 17.0 mmol) was dissolved in DMF (15 mL), followed by the additional of benzyl bromide (5.80 g, 34.0 mmol) and K₂CO₃ (7.27 g, 52.6 mmol). The mixture was stirred at room

temperature about 16 h, filtered, and the filtrate was concentrated under reduced pressure. The crude product was purified by silica gel chromatography eluting with a gradient of 5-35% EtOAc in heptane to give (3*R*)-methyl 3-(dibenzylamino)cyclopentanecarboxylate (3.52 g, 64%) as a colorless oil that was used directly. A portion of this material (1.18 g, 3.65 mmol) was combined with *O,N*-dimethylhydroxylamine hydrochloride (1.07 g, 10.9 mmol) in THF (40 mL) at about -25 °C, followed by the drop-wise addition of LHMDs (1 M in THF, 14.6 mL, 14.6 mmol). The mixture was stirred at about 0 °C for about 1 h. The mixture was re-cooled to about -25 °C and *O,N*-dimethylhydroxylamine hydrochloride (0.50 g, 5.1 mmol) was added, followed by the drop-wise addition of additional LHMDs (1 M in THF, 14.6 mL, 14.6 mmol). The reaction mixture was stirred at about 0 °C for about 1 h and was quenched by the drop-wise addition of water (10 mL). The organic solvent was removed under reduced pressure. DCM (60 mL) was added and the layers were separated. The organic phase was washed with brine, concentrated under reduced pressure, and purified by silica gel chromatography eluting with a gradient of 5-35% EtOAc in heptane to yield (3*R*)-3-(dibenzylamino)-*N*-methoxy-*N*-methylcyclopentanecarboxamide (1.01 g, 79%) as a colorless oil: LC/MS (Table 2, Method a) R_t = 2.08 min; MS m/z : 353 (M+H)⁺.

Step B: (3*R*)-3-(Dibenzylamino)cyclopentanecarbaldehyde

A solution of (3*R*)-3-(dibenzylamino)-*N*-methoxy-*N*-methylcyclopentanecarboxamide (3.34 g, 9.48 mmol) in THF (70 mL) was cooled to about -78 °C, followed by the drop-wise addition of DIBAL-H (1.0 M in hexanes, 9.48 mL, 9.48 mmol). The reaction mixture was stirred at about -78 °C for about 1 h, and was quenched by drop-wise addition of saturated aqueous sodium potassium tartrate. The resulting mixture was stirred at room temperature for about 1 h. The solvent was removed under reduced pressure and the aqueous layer was extracted with EtOAc (100 mL). The organic layer was washed with brine, dried over anhydrous MgSO₄, and concentrated *in vacuo*. The residue was purified by chromatography on neutral alumina eluting with a gradient of 0-20% EtOAc in heptane to yield (3*R*)-3-(dibenzylamino)cyclopentanecarbaldehyde (1.63 g, 75%) as a colorless oil: LC/MS (Table 2, Method a) R_t = 2.03 min; MS m/z : 294 (M+H)⁺.

Step C: (5-Chloro-1-(triisopropylsilyl)-1*H*-pyrrolo[2,3-*b*]pyridin-4-yl)((3*R*)-3-(dibenzylamino)cyclopentyl)methanol

A solution of 5-chloro-4-iodo-1-(triisopropylsilyl)-1*H*-pyrrolo[2,3-*b*]pyridine (1.23 g, 2.83 mmol, Adesis) in THF (10 mL) was cooled to about -78°C and *n*-BuLi (1.6 M in hexanes, 2.3 mL, 3.7 mmol) was added drop-wise while keeping the temperature below about -70°C . The mixture was stirred for about 40 min, and a solution of (3*R*)-3-(dibenzylamino)cyclopentanecarbaldehyde (0.83 g, 2.8 mmol, Step B) in THF (3 mL) was added drop-wise, and the resulting mixture was stirred at about -75°C for about 2 h. The reaction mixture was quenched by a drop-wise addition of saturated aqueous NH_4Cl (20 mL), and the organic solvent was removed under reduced pressure. The aqueous mixture was extracted with EtOAc (25 mL) and the organic layer was washed with brine (20 mL) and concentrated under reduced pressure. The residue was purified by silica gel chromatography eluting with a gradient of 0-20% EtOAc in heptane to yield (5-chloro-1-(triisopropylsilyl)-1*H*-pyrrolo[2,3-*b*]pyridin-4-yl)((3*R*)-3-(dibenzylamino) cyclopentyl)methanol (1.14 g, 67%); LC/MS (Table 2, Method **a**) $R_t = 3.31$ min; MS m/z : 602 ($\text{M}+\text{H}$) $^{+}$..

Step D: (5-Chloro-1-(triisopropylsilyl)-1*H*-pyrrolo[2,3-*b*]pyridin-4-yl)((3*R*)-3-(dibenzylamino)cyclopentyl)methanone

A solution of (5-chloro-1-(triisopropylsilyl)-1*H*-pyrrolo[2,3-*b*]pyridin-4-yl)((3*R*)-3-(dibenzylamino) cyclopentyl)methanol (1.14 g, 1.89 mmol) in DCM (50 mL) was cooled to about 0°C . Dess-Martin periodinane (2.41 g, 5.68 mmol) was added and the reaction mixture was stirred at about $0-10^{\circ}\text{C}$ for about 3 h. The mixture was quenched by a drop-wise addition of aqueous sodium sulfite (1 M, 20 mL), and the organic solvent was removed under reduced pressure. The aqueous layer was extracted with EtOAc (2 x 25 mL), and the combined organic extracts were washed with aqueous NaOH (1 N, 3 x 20 mL), brine, dried over anhydrous MgSO_4 , filtered, and concentrated. The residue was purified by silica gel chromatography eluting with a gradient of 0-20% EtOAc in heptane to yield (5-chloro-1-(triisopropylsilyl)-1*H*-pyrrolo[2,3-

b]pyridin-4-yl)((3*R*)-3-(dibenzylamino)cyclopentyl)methanone (0.68 g, 60%) as a yellow amorphous solid: LC/MS (Table 2, Method **a**) R_t = 1.65 min; MS m/z : 442 (M+H)⁺.

Step E: (3*R*)-(3,6-Dihydropyrazolo[4,3-*d*]pyrrolo[2,3-*b*]pyridin-1-yl)cyclopentanamine

5

A mixture of (5-chloro-1-(triisopropylsilyl)-1*H*-pyrrolo[2,3-*b*]pyridin-4-yl)((3*R*)-3-(dibenzylamino)cyclopentyl)methanone (1.5 g, 2.5 mmol), hydrazine (0.24 mL, 7.5 mmol), and AcOH (0.14 mL, 2.5 mmol) in EtOH (40 mL) was heated to reflux for about 8 h and at about 90 °C for about 16 h. The solvent was removed *in vacuo* and the residue was partitioned between saturated aqueous NaHCO₃ (50 mL) and EtOAc (50 mL). The organic phase was separated and washed with brine (40 mL), dried over anhydrous MgSO₄, filtered, and concentrated to yield crude (3*R*)-(3,6-dihydropyrazolo[4,3-*d*]pyrrolo[2,3-*b*]pyridin-1-yl)cyclopentanamine (1.14 g, 100%) as a yellow amorphous solid that was used without purification. Preparation #30: (1*S*)-3-(3,6-Dihydropyrazolo[4,3-*d*]pyrrolo[2,3-*b*]pyridin-1-yl)cyclopentanamine

Step A: (3*S*)-Methyl 3-(dibenzylamino)cyclopentanecarboxylate

5 Hydrogen chloride gas was bubbled through a solution of (1*R*,3*S*)-3-aminocyclopentanecarboxylic acid (5.00 g, 38.7 mmol, Peptech) in MeOH (100 mL) for about 15 min to give a tan solution, and the reaction mixture was stirred at ambient temperature for about 24 h. The solvent was removed under reduced pressure to give (3*S*)-methyl 3-aminocyclopentanecarboxylate (5.5 g, 25.5 mmol, 66%) which was dissolved in DMF (100 mL) and then K₂CO₃ (17.6 g, 127 mmol) and (bromomethyl)benzene (6.05 mL, 50.9 mmol) were added. The reaction mixture was stirred overnight at ambient temperature. The solid was collected by filtration and washed with DMF (100 mL). The filtrate was concentrated under high vacuum and the crude material was purified by silica gel chromatography eluting with 10% EtOAc in heptane to give (3*S*)-methyl 3-(dibenzylamino)cyclopentanecarboxylate (7.3 g, 89%) as a yellow oil: LC/MS (Table 2, Method **a**) *R*_t = 2.97 min; MS *m/z*: 324 (M+H)⁺.

Step B: (3*S*)-3-(Dibenzylamino)cyclopentanecarbaldehyde

20 A round bottom flask was charged with (3*S*)-methyl 3-(dibenzylamino)cyclopentanecarboxylate (7.3 g, 23 mmol) in THF (154 mL) to give a colorless solution. The solution was cooled to about -25 °C followed by the addition of *N,O*-dimethylhydroxylamine hydrochloride (5.95 g, 61.0 mmol). A solution of LHMDS (1 M in THF, 84 mL, 84 mmol) was added drop-wise and the reaction was stirred for about 1 h at about 0 °C. The reaction mixture was re-cooled to about -25 °C and additional *N,O*-dimethylhydroxylamine hydrochloride (0.5 g, 5 mmol) and 10 mL of

LHMDS (1 M in THF, 10 mL, 10 mmol) were added. The reaction mixture was stirred at about 0 °C for about 1 h. Analysis of the reaction mixture by LC/MS indicated that starting material still remained, and the mixture was re-cooled to about -25 °C and *N,O*-dimethylhydroxylamine hydrochloride (2.0 g, 20 mmol) and LHMDS (1 M in THF, 20 mL, 20 mmol) were added. The reaction mixture was stirred at about 0 °C for about 1 h. This re-cooling and addition sequence was repeated once more with the addition of *N,O*-dimethylhydroxylamine hydrochloride (1.5 g, 15 mmol) and LHMDS (1 M in THF, 40 mL, 40 mmol). After stirring at about 0 °C for about 1 h, water (50 mL) was added drop-wise. The organic solvent was removed under reduced pressure, and EtOAc (200 mL) was added. The layers were partitioned and the organic layer was washed with water (250 mL) and brine (125 mL), dried over anhydrous MgSO₄, filtered, and the solvent was removed under reduced pressure to give a brown oil. The crude product was purified by silica gel chromatography (120 g column) eluting with 20% EtOAc in heptane to give (3*S*)-3-(dibenzylamino)-*N*-methoxy-*N*-methylcyclopentanecarboxamide (6.86 g, 19 mmol, 86%) which was dissolved in THF (100 mL) and cooled to about -78 °C. DIBAL-H (1.0 M in hexanes, 21.2 mL, 21.2 mmol) was added drop-wise to the solution over about 15 min. The reaction solution was stirred at about -78 °C for about 1 h. Saturated aqueous potassium sodium tartrate (25 mL) was added drop-wise at about -78 °C and the reaction mixture was stirred at ambient temperature for about 1 h. The organic solvent was removed under reduced pressure, EtOAc (100 mL) was added, and the layers were separated. The aqueous layer was extracted with EtOAc (2 x 25 mL). The combined organic layers were washed with brine (3 x 50 mL), dried over anhydrous MgSO₄, filtered, and the solvent was removed under reduced pressure to give a yellow oil. The crude material was purified by silica gel chromatography eluting with 10% EtOAc in heptane to give (3*S*)-3-(dibenzylamino)cyclopentanecarbaldehyde (5.6 g, 100%); LC/MS (Table 2, Method a) *R*_t = 2.26 min; MS *m/z*: 294 (M+H)⁺.

was cooled to about -78 °C and *n*-BuLi (1.6 M in hexanes, 6.54 mL, 10.46 mmol) was added drop-wise over about 15 min. After addition of the *n*-BuLi solution was complete, (3*S*)-3-(dibenzylamino)cyclopentanecarbaldehyde (2.48 g, 8.45 mmol) in THF (10 mL) was added drop-wise over about 5 min. The reaction mixture was stirred for about 4 h at about -78 °C. Saturated aqueous NH₄Cl (40 mL) was added slowly and the mixture was stirred for about 5 min. The organic solvent was removed under reduced pressure and EtOAc (100 mL) was added. The layers were separated and the organic layer was washed with brine (3 x 50 mL), dried over MgSO₄, filtered, and the solvent was removed under reduced pressure to give a yellow oil that was purified by silica gel chromatography eluting with a gradient of 5-10% EtOAc in heptane.
