ANGIOTENSIN II RECEPTOR ANTAGONISTS

This is a continuation-in-part of U.S. patent application Serial No. 844,817, filed March 2, 1992.

Technical Field
This invention relates to compounds and compositions which block angiotensin II receptors, processes for making such compounds, synthetic intermediates employed in these processes and a method of treating hypertension, edema, renal failure, benign prostatic hypertrophy, diabetic nephropathy, diabetic retinopathy, Alzheimer's disease or congestive heart failure with such compounds. The present invention also relates to compositions and a method for treating glaucoma, preventing or treating atherosclerosis, preventing or treating stroke and treatment of a variety of obesity-related disorders with such compounds. The present invention also relates to compositions and a method for treating CNS disorders.

Background of the Invention
Blood pressure is regulated by a multitude of interrelated factors involving neural, vascular and volume-related effects. The renin-angiotensin system (RAS) is one of the important blood pressure regulating systems.

The RAS functions as shown in the scheme below. Low renal perfusion pressure stimulates the juxtaglomerular cells of the kidney to
produce the proteolytic enzyme renin. This enzyme acts on a circulating protein, angiotensinogen, cleaving off a decapeptide angiotensin I. Angiotensin I is then cleaved to the octapeptide angiotensin II by angiotensin converting enzyme (ACE). Angiotensin II is the most powerful pressor substance in the RAS. Angiotensin II binds to vascular smooth muscle receptors and induces vasoconstriction, but has little or no stimulating action on the heart.

**Renin-Angiotensin System**

Human

Angiotensinogen: $\text{H}_2\text{N-Asp-Arg-Val-Tyr-Ile-His-Pro-Phe-His-Leu-Val-Ile-His-Pro-Protein}$

\[ \downarrow \text{Renin} \]

Angiotensin I: $\text{H}_2\text{N-Asp-Arg-Val-Tyr-Ile-His-Pro-Phe-His-Leu-OH}$

\[ \downarrow \text{ACE} \]

Angiotensin II: $\text{H}_2\text{N-Asp-Arg-Val-Tyr-Ile-His-Pro-Phe-OH}$

\[ \downarrow \text{Aminopeptidase} \]

Angiotensin III: $\text{H}_2\text{N-Arg-Val-Tyr-Ile-His-Pro-Phe-OH}$

\[ \downarrow \text{Angiotensinases} \]

Inactive Fragments

Inhibitors of renin (for example enalkiren) and inhibitors of ACE (for example, captopril and enalapril) have clinical efficacy in treating hypertension and congestive heart failure. ACE inhibitors, however, have reported side effects including cough and skin rash.
Peptidyl and non-peptidyl angiotensin II receptor antagonists are known. The peptidyl compound saralasin or [Sar\(^1\), Ala\(^8\)] angiotensin II has been found to be a potent antagonist of the actions of angiotensin II. Saralasin, however, has several disadvantages. Because it is a peptide, saralasin has very poor oral bioavailability. The use of saralasin, therefore, is limited to administration to hospitalized patients by continuous intravenous infusion. Saralasin is also known to cause an initial increase in blood pressure after intravenous administration due to its activity as an angiotensin receptor agonist. Therefore, non-peptidyl angiotensin II receptor antagonists are preferred.

N-protecting groups comprise carbamates, amides, N-alkyl derivatives, amino acetal derivatives, N-benzyl derivatives, imine derivatives, enamine
derivatives and N-heteroatom derivatives. Preferred N-protecting groups are formyl, acetyl, benzoyl, pivaloyl, phenylsulfonyl, benzyl, t-butyloxycarbonyl (Boc), benzylloxycarbonyl (Cbz) and the like.

As used herein, the term "carboxy-protecting group" refers to a carboxy group which has been esterified with one of the commonly used carboxylic acid protecting ester groups employed to block or protect the carboxylic acid functionality while the reactions involving other functional sites of the compound are carried out. Carboxy-protecting groups are disclosed in Greene, "Protective Groups in Organic Synthesis" pp. 152-186 (1981), which is incorporated herein by reference. In addition, a carboxy-protecting group can be used as a prodrug whereby the carboxy-protecting group can be readily cleaved in vivo, for example by enzymatic hydrolysis, to release the biologically active parent. T. Higuchi and V. Stella provide a thorough discussion of the prodrug concept in "Pro-drugs as Novel Delivery Systems", Vol 14 of the A.C.S. Symposium Series, American Chemical Society (1975). Such carboxy-protecting groups are well known to those skilled in the art, having been extensively used in the protection of carboxyl groups in the penicillin and cephalosporin fields, as described in U.S. Pat. No. 3,840,556 and 3,719,667, the disclosures of which are incorporated herein by reference. Examples of esters useful as prodrugs for compounds containing carboxyl groups can be found on pages 14-21 of "Bioreversible Carriers in Drug Design: Theory and Application", edited by E.B. Roche, Pergamon Press: New York (1987). Representative carboxy-protecting groups are C1 to C8 alkyl (e.g., methyl, ethyl or tertiary butyl and the like), benzyl and substituted derivatives thereof such as alkoxybenzyl or nitrobenzyl groups and the like, dialkylaminalkyl (e.g., dimethylaminomethyl and the like), alkanoyloxyalkyl groups such as pivaloyloxymethyl or propionyloxymethyl and the like, aroyloxyalkyl, such as benzoyloxyethyl and the like, alkoxy carbonylalkyl, such as methoxycarbonylmethyl, cyclohexyloxycarbonylmethyl and the like, alkoxy carbonyloxyalkyl, such as t-butyloxycarbonyloxymethyl and the like, alkoxy carbonylaminoalkyl, such as t-butyloxycarbonylaminomethyl and the like,
-20-

like, alkylaminocarbonylaminoalkyl, such as methylaminocarbonylaminoethyl and the like, alkanoylaminoalkyl, such as acetylaminomethyl and the like, heterocycliccarbonyloxalkyl, such as 4-methylpiperazinylcarbonyloxymethyl and the like, dialkylaminocarbonylfalkyl, such as dimethylaminocarbonylmethyl and the like, (5-((loweralkyl)-2-oxo-1,3-dioxolen-4-yl)alkyl, such as (5-t-butyl-2-oxo-1,3-dioxolen-4-yl)methyl and the like and (5-phenyl-2-oxo-1,3-dioxolen-4-yl)alkyl, such as (5-phenyl-2-oxo-1,3-dioxolen-4-yl)methyl and the like.

When the compounds of formula I contain one asymmetric carbon atom, they can exist as pure enantiomers or mixtures of enantiomers. When the compounds of formula I contain more than one asymmetric carbon atom, they can exist as diastereomers, mixtures of diastereomers, diastereomeric racemates or mixtures of diastereomeric racemates. The present invention includes within its scope all of the isomeric forms. The terms "R" and "S" configuration used herein are as defined by IUPAC 1974 Recommendations for Section E, Fundamental Stereochemistry, Pure Appl. Chem (1976) 45, 13-30.

In addition, in the compounds of the invention, combinations of substituents and/or variables (i.e., A, D, E, G, R₁, R₂, R₃, R₄, etc.) are permissible only if such combinations result in stable compounds.

In general, the compounds of this invention can be prepared by the processes illustrated in Schemes I through XXXII. It should be understood that substituents A, D, E, G, R₁, R₂, R₃, R₄, etc. as used herein correspond to the groups identified by formula (I). P is a protecting group. In the course of synthesis, certain groups present in the molecule, particulary carboxylic acid and tetrazole groups, are protected and deprotected as necessary. The term "protecting group" is well known in the art and refers to substituents on functional groups of compounds undergoing chemical transformation which prevent undesired reactions and degradations during a synthesis; see, for example, T.H. Greene, "Protective Groups in Organic Synthesis", John Wiley &
Suns, New York (1981) for methods of introducing and removing appropriate protecting groups. Suitable carboxy-protecting groups include t-butyl and benzyl groups. Suitable tetrazole nitrogen-protecting groups include triphenylmethyl (Tr), benzyl, t-butyl, methoxymethyl, benzyloxymethyl, p-nitrobenzyl, 1-ethoxyethyl and the like.

The compounds of formula (1) may be prepared using the reactions and techniques described in this section. The reactions are performed in a solvent appropriate to the reagents and materials employed and suitable for the transformation being effected. It is understood by those skilled in the art of organic synthesis that the functionality present on the heterocycle and other portions of the molecule must be consistent with the chemical transformation proposed. This will frequently necessitate judgment as to the order of synthetic steps, protecting groups required and deprotection conditions. Throughout the following section, not all compounds of formula (1) falling into a given class may necessarily be prepared by all methods described for that class. Substituents on the starting materials may be incompatible with some of the reaction conditions required in some of the methods described. Such restrictions to the substituents which are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternative methods described must then be used.

Intermediates useful for the preparation of the novel compounds of this invention include a compound of the formula (II):

wherein A, L, L', M, M' and R5 are defined as above; P1 is hydrogen or an N-protecting group; and R1* is R1 as defined above, -NO2, -CN, a tetrazolyl group or an N-protected tetrazolyl group wherein the tetrazole is N-protected with a trityl group, a t-butyl group, a benzyl group, a benzyloxymethyl group or a methoxymethyl group.

Preferred intermediates of formula II are those wherein A is a bond; L, L', M and M' are hydrogen; and R1* is a tetrazolyl group or an N-protected tetrazolyl group.

Other intermediates useful for the preparation of the novel compounds of this invention include a compound of the formula (III):
wherein A, L, L', M and M' are defined as above; and
R_1'' is R_1 as defined above, -NO_2, -CN, a tetrazolyl group or an N-protected
tetrazolyl group wherein the tetrazole is N-protected with a trityl group, a
‘-butyl group, a benzyl group, a benzyloxymethyl group or a methoxymethyl group.

Preferred intermediates of formula III are those wherein A is a bond; L,
L', M and M' are hydrogen; and R_1'' is a tetrazolyl group or an N-protected
tetrazolyl group.

Intermediates of the formula II wherein A is a covalent bond, L, L', M and
M' are hydrogen and R_1'' is a trazolyl group (i.e., compound 366) can be
prepared as illustrated in Scheme XXXIII. Aldehyde 360 (X'' is halogen) can
be reductively aminated to provide amine 361a. Protection of the amino group
(for example, P_1 = trityl), followed by Grignard formation, provides compound
362. Reaction of 362 with oxazoline 363 provides biphenyl 364. Reaction of
biphenyl 364 with POCl_3 provides nitrile 365. Nitrile 365 can then be
elaborated to tetrazole 366 (for example, by reaction with sodium azide).

4-[(N-tert-Butyloxycarbonyl-N-propylamino)methyl]phenyl boronic acid

To the compound resulting from Example 26B in methylene chloride at 0 °C was added triethylamine (2 equivalents) and di-tert-butyl-dicarbonate (1.05 equivalents). The cooling bath was removed and the mixture allowed to warm to ambient temperature. The solution was diluted with a suitable solvent (ether or hexane), washed with 2 N hydrochloric acid, dried over sodium sulfate and concentrated in vacuo. The Boc-protected compound was obtained as a colorless oil in quantitative yield and was used without further purification.

Grignard formation was effected by treatment of magnesium (1.2 equivalents) in tetrahydrofuran with dibromoethane (0.05 equivalents) followed by heating to reflux and then adding a solution of the protected compound from above in tetrahydrofuran. The reaction mixture turned brown and after 4 hours, most of the metal had been consumed. The Grignard reagent was cooled in a dry ice/acetone bath and then transferred via cannula into a -70 °C solution of trimethyl borate (2.5 equivalents) (~2 M in tetrahydrofuran). Upon completion of the addition, the cooling bath was removed and the mixture allowed to warm to ambient temperature. The solution was diluted with ether (4 volumes), washed
with 3 N hydrochloric acid, ensuring that the aqueous layer was pH 2 or lower. The pH was then adjusted to 10 by the addition of 1 N sodium hydroxide and the ether layer was discarded. The aqueous solution was cooled to 0 °C, carefully acidified to pH 2 with 3 N hydrochloric acid and extracted with ether. The combined organic extracts were dried over sodium sulfate and concentrated in vacuo to about 20% of volume, whereupon the boronic acid crystallizes in 36% yield.

After 10 minutes, a 2 M aqueous solution of sodium carbonate was added followed by the compound resulting from Example 26C dissolved in the minimum amount of ethanol. The two-phase mixture was rapidly stirred under reflux for 2.5 hours and then cooled to ambient temperature. The solution was diluted with ether and the organic phase was dried over sodium sulfate and concentrated in vacuo to afford a brown oil. Filtration through silica gel eluting with 35% ether in hexanes afforded the title compound as a colorless oil (87%).

After 3 hours, the solvent was removed in vacuo and the residue
triturated with 8 mL of ethyl acetate. The white solid was then dried in vacuo at 60 °C to afford the title compound (553 mg, 86%).

The organics were combined, washed once with 100 mL of 20% aqueous HCl and 2 times with 100 mL saturated brine and dried over magnesium sulfate. Concentration in vacuo gave 11.1 g (97% yield) of a brown oil which required no purification.

After the addition of 75 mL of toluene, the filtered solution was evaporated to dryness under reduced pressure to give 4.5 g of crude silylated pyrimidine. To this crude material was slowly added 15 mL of thionyl chloride under nitrogen and the mixture was refluxed for 20 minutes. After removal of the excess thionyl chloride under reduced pressure, 100 mL of methanol was added, and the mixture was refluxed for 2 hours. The solvents were removed under reduced pressure and the solid obtained was recrystallized from methanol to afford 2.19 g (78%) of the title compound. m.p. 142-143 °C.

Example 38B

Methyl 3-bromo-1,2,5-thiadiazole-4-carboxylate

To a solution of 1.07 g (4.8 mmol) of copper(II)bromide and 618 mg (6 mmol) of tert-butyl nitrite in acetonitrile (20 mL) at 60 °C was added portionwise the compound resulting from Example 38A (636 mg, 4 mmol). After the addition, the solution was heated at 65 °C for 30 additional minutes. The reaction mixture was cooled and poured into 75 mL of cold aqueous 20% hydrobromic acid. The aqueous solution was extracted with 400 mL of ethyl acetate. The organic layer was washed with water and brine, dried and concentrated under reduced pressure. The residue obtained was purified by column chromatography on silica gel eluting with 10% ethyl acetate in hexane to give 520 mg (59%) of the title compound. m.p. 57-58 °C.
Example 38C

Methyl 4-\{N-propyl-N-\{(2'-\{N-triphenylmethyl-1H-tetrazol-5-yl\}biphenyl-4-y\}methyl\}amino\}-1,2,5-thiadiazole-4-carboxylate

N-Triphenylmethyl-5-[2-(4'-propylaminomethyl-biphenyl)]tetrazole (107 mg, 0.2 mmol), the compound resulting from Example 21A, and 133 mg (3 equivalents) of the compound resulting from Example 38B were dissolved in 5 ML of anhydrous acetonitrile and 0.5 mL of diisopropylethylamine. The reaction tube was sealed and the mixture was stirred in an oil bath at 100-110 °C for 1.5 hours. The solvents were removed under reduced pressure and the residue obtained was purified by column chromatography on silica gel eluting with 10-15% ethyl acetate in hexane to afford the title compound (95 mg, 70%).

Example 38D

**ANGIOTENSIN II FUNCTIONAL ASSAY: Antagonism of Contraction of Rabbit Aorta**

The protocol reported by A.T Chiu and P.Timmermans (P.C. Wong, *et al.* *Hypertension*, 13, 489-497 (1989)) was followed with a few modifications. Female New Zealand White rabbits weighing 2-5 kg were sedated with carbon dioxide and then sacrificed. Main abdominal aortas were removed and placed in Krebs-Henseleit buffer at room temperature.

The buffer contained no cocaine, propanol or steroid.
The pH of the buffer was 7.40 at 37°C when saturated with 5% carbon dioxide/95% oxygen.

The tissues were cleaned of extraneous connective tissue, cut into 3 mm rings, and suspended within a 10 mL tissue bath. All dilutions of peptide preparations were made with 0.3% aqueous BSA. The tissues were primed with 55 mM potassium chloride. Tissues were pre-loaded with 1 g of tension.
Tension was recorded on a model 7 Grass polygraph using FT03 transducers. At the end of the equilibrium period, a control cumulative concentration-contractile response curve for angiotensin II (A II: $1 \times 10^{-10} - 10^{-8}$ M) was obtained. The tissue was washed several times until the baseline was reached. Forty five minutes later, test compound (antagonist) was added and the tissue was incubated for 30 minutes. The concentration-response curve for A II was then repeated in the presence of the test compound. One dose of antagonist was tested per tissue only. For single dose shift experiments a dose of 1 mM of test compound was used, for a full pA2 experiment multiple doses were used depending upon the potency of the antagonist.

All responses to the control agonist were calculated as a percentage of the maximum response. These points in duplicate were plotted and analyzed according to standard Schild analysis (H.O. Schild, British J Pharmacology and Chemotherapy, 2, 189-206 (1947). The pA2 values calculated for the compounds of the invention are shown in Table 6. The pA2 value is the negative logarithm of the [A]2 value. [A]2 is the concentration of antagonist which necessitates doubling the agonist concentration in order to achieve the agonist effect which was measured in the absence of antagonist.

The pA2 value, therefore, is a measure of the effectiveness of the compound as an antagonist. The data in Table 5 show that the compounds of the invention are potent antagonists at the angiotensin II receptor.

Sar,-1, Thr-8 All (SARILE) 9.02

The ability of the compounds of the invention to lower blood pressure in vivo in renal artery ligated rats can be demonstrated according to the method disclosed by Cangiano, et al., J. Pharmacol. Exp. Ther. 208 310 (1979)).

The total daily dose of the compounds of this invention administered to a human or other mammal in single or in divided doses can be in amounts, for example, from 0.01 to 25 mg/kg body weight or more usually from 0.1 to 15 mg/kg body weight. Single dose compositions can contain such amounts or submultiples thereof to make up the daily dose. In general, treatment regimens according to the present invention comprise administration to a patient in need of such treatment from about 10 mg to about 1000 mg of the compound(s) of this invention per day in multiple doses or in a single dose of from 10 mg to 1000 mg.

It will be understood, however, that the total daily usage of the compounds and compositions of the present invention will be decided by the
attending physician within the scope of sound medical judgement. The specific therapeutically effective dose level for any particular patient will depend upon a variety of factors including the disorder being treated and the severity of the disorder; activity of the specific compound employed; the specific composition employed; the age, body weight, general health, sex and diet of the patient; the time of administration, route of administration, and rate of excretion of the specific compound employed; the duration of the treatment; drugs used in combination or coincidental with the specific compound employed; and like factors well known in the medical arts.

The compounds of the present invention can be administered orally, parenterally, by inhalation spray, rectally, or topically in dosage unit formulations containing conventional nontoxic pharmaceutically acceptable carriers, adjuvants, and vehicles as desired. Topical administration can also involve the use of transdermal administration such as transdermal patches. The term parenteral as used herein includes subcutaneous injections, intravenous, intramuscular, intrasternal injection, or infusion techniques.

Liquid dosage forms for oral administration can include pharmaceutically acceptable emulsions, microemulsions, solutions, suspensions, syrups and elixirs containing inert diluents commonly used in the art such as water. Such compositions can also comprise adjuvants, such as wetting agents; emulsifying and suspending agents; sweetening, flavoring and perfuming agents.

Injectable preparations, for example, sterile injectable aqueous or oleaginous suspensions can be formulated according to the known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation can also be a sterile injectable solution, suspension or emulsion in a nontoxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3-butandiol. Among the acceptable vehicles and solvents that can be employed are water, Ringer's solution, U.S.P. and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this
purpose any bland fixed oil can be employed including synthetic mono- or diglycerides. In addition, fatty acids such as oleic acid are used in the preparation of injectables.

The injectable formulation can be sterilized, for example, by filtration through a bacteria-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior to use.

In order to prolong the effect of a drug, it is often desirable to slow the absorption of a drug from subcutaneous or intramuscular injection. The most common way to accomplish this is to inject a suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug becomes dependent on the rate of dissolution of the drug which is, in turn, dependent on the physical state of the drug, for example, the crystal size and the crystalline form. Another approach to delaying absorption of a drug is to administer the drug as a solution or suspension in oil. Injectable depot forms can also be made by forming microcapsule matrices of drugs and biodegradable polymers such as polylactide-polyglycolide. Depending on the ratio of drug to polymer and the composition of the polymer, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly-orthoesters and polyanhydrides. The depot injectables can also be made by entrapping the drug in liposomes or microemulsions which are compatible with body tissues.

Suppositories for rectal administration of the drug can be prepared by mixing the drug with a suitable nonirritating excipient such as cocoa butter and polyethylene glycol which are solid at ordinary temperature but liquid at the rectal temperature and will therefore melt in the rectum and release the drug.

Solid dosage forms for oral administration can include capsules, tablets, pills, powders, prills and granules. In such solid dosage forms the active compound can be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms can also comprise, as is
normal practice, additional substances other than inert diluents, e.g., tableting
lubricants and other tableting aids such as magnesium stearate and
microcrystalline cellulose. In the case of capsules, tablets and pills, the
dosage forms can also comprise buffering agents. Tablets and pills can
additionally be prepared with enteric coatings and other release-controlling
c coatings.

Solid compositions of a similar type can also be employed as fillers in
soft and hard-filled gelatin capsules using such excipients as lactose or milk
sugar as well as high molecular weight polyethylene glycols and the like.

The active compounds can also be in micro-encapsulated form with one
or more excipients as noted above. The solid dosage forms of tablets,
dragees, capsules, pills, and granules can be prepared with coatings and
shells such as enteric coatings and other coatings well known in the
pharmaceutical formulating art. They can optionally contain opacifying agents
and can also be of a composition that they release the active ingredient(s)
only, or preferably, in a certain part of the intestinal tract, optionally in a
delayed manner. Examples of embedding compositions which can be used
include polymeric substances and waxes.

Dosage forms for topical or transdermal administration of a compound
of this invention include ointments, pastes, creams, lotions, gels, powders,
solutions, sprays, inhalants or patches. The active component is admixed
under sterile conditions with a pharmaceutically acceptable carrier and any
needed preservatives or buffers as can be required. Ophthalmic formulations,
ear drops, eye ointments, powders and solutions are also contemplated as
being within the scope of this invention.

The ointments, pastes, creams and gels can contain, in addition to an
active compound of this invention, excipients such as animal and vegetable
fats, oils, waxes, paraffins, starch, tragacanth, cellulose derivatives,
polyethylene glycols, silicones, bentonites, silicic acid, talc and zinc oxide, or
mixtures thereof.
Powders and sprays can contain, in addition to the compounds of this invention, excipients such as lactose, talc, silicic acid, aluminum hydroxide, calcium silicates and polyamide powder, or mixtures of these substances. Sprays can additionally contain customary propellants such as chlorofluorohydrocarbons.

Transdermal patches have the added advantage of providing controlled delivery of a compound to the body. Such dosage forms can be made by dissolving or dispersing the compound in the proper medium. Absorption enhancers can also be used to increase the flux of the compound across the skin. The rate can be controlled by either providing a rate controlling membrane or by dispersing the compound in a polymer matrix or gel.

Some examples of the materials that can serve as pharmaceutically acceptable carriers are sugars, such as lactose, glucose and sucrose; starches such as corn starch and potato starch; cellulose and its derivatives such as sodium carboxymethyl cellulose, ethyl cellulose and cellulose acetate; powdered tragacanth; malt; gelatin; talc; excipients such as cocoa butter and suppository waxes; oils such as peanut oil, cottonseed oil, safflower oil, sesame oil, olive oil, corn oil and soybean oil; glycols, such as propylene glycol; polyols such as glycerin, sorbitol, mannitol and polyethylene glycol; esters such as ethyl oleate and ethyl laurate; agar; buffering agents such as magnesium hydroxide and aluminum hydroxide; alginic acid; pyrogen-free water; isotonic saline; Ringer's solution; ethyl alcohol and phosphate buffer solutions, as well as other non-toxic compatible substances used in pharmaceutical formulations. Wetting agents, emulsifiers and lubricants such as sodium lauryl sulfate and magnesium stearate, as well as coloring agents, releasing agents, coating agents, sweetening, flavoring and perfuming agents, preservatives and antioxidants can also be present in the composition, according to the judgement of the formulator.
The compounds of the present invention can be administered alone or in combination or in concurrent therapy with other cardiovascular agents independently selected from diuretics, adrenergic blocking agents, vasodilators, calcium channel blockers, angiotensin converting enzyme (ACE) inhibitors, potassium channel activators, antiserotonergic agents, thromboxane synthetase inhibitors, renin inhibitors and other agents useful for treating (in a human or other mammal) hypertension, edema or congestive heart failure.

Other representative cardiovascular agents include sympatholytic agents such as methyldopa, clonidine, guanabenz, reserpine and the like or a pharmaceutically acceptable salt thereof.

The compound of formula I and the other cardiovascular agent can be administered at the recommended maximum clinical dosage or at lower doses. Dosage levels of the active compounds in the compositions of the invention can be varied so as to obtain a desired therapeutic response depending on the route of administration, severity of the disease and the response of the patient. The combination can be administered as separate compositions or as a single dosage form containing both agents.

The foregoing is merely illustrative of the invention and is not intended to limit the invention to the disclosed compounds. Variations and changes which are obvious to one skilled in the art are intended to be within the scope and nature of the invention which are defined in the appended claims.
