DI- AND TRIPERIDE NITRILE DERIVATIVES AS INHIBITORS OF CATHEPSIN L AND CATHEPSIN S

The present invention relates to compounds that are cysteine protease inhibitors and in particular compounds that are Cathepsin L inhibitors and or Cathepsin S inhibitors especially Cathepsin S inhibitors. The invention further relates to processes for their preparation, to intermediates useful in their preparation, to their use as therapeutic agents, to pharmaceutical compositions containing them and to a method of treating a Cathepsin L or Cathepsin S mediated disease state.

Cysteine proteases are enzymes important in normal cell physiology, but they are also associated with several disease states including inflammation, metastasis, tissue damage following myocardial infarction, bone resorption and muscle wasting in dystrophic diseases.

Cathepsins B, H, K, L, N and S are cysteinyi proteases involved in normal protein degradation and are normally located in the lysosomes of cells. However, when these enzymes are found outside the lysosomes they have been implicated as playing a causative role in a number of disease states including bone resorption disease such as osteoporosis.

The number of people living to an old age has increased dramatically in recent years. This has been marked by an increase in the number of people having osteoporosis and other diseases associated with old age. Osteoporosis is accompanied by a high incidence of bone fracture resulting in many aged patients being confined to their beds. There is therefore a great need for a pharmaceutical composition to treat or prevent this disease.

Living bone is continuously being remodelled and replenished by the process of resorption and deposition of the protein matrix and calcium minerals. These events are facilitated by the osteoclast, which has the ability to degrade and demineralise the bone, and the osteoblast which is responsible for new bone generation. In normal situations these processes are intimately linked resulting in little alteration of bone mass. However, pathological conditions exist in which there is an imbalance between their activities resulting in increased degradation and demineralisation of bone and the development of fragile and/or brittle bone structure, as seen during osteoporosis. While the exact mechanism for this resorption is not known, increased osteoclast activity, as realised by increased proteolytic activity, is a contributing factor, and selective inhibition of proteolytic action may result in the arrest or reversal of bone loss. The lysosomal cysteine proteinases, Cathepsins B, H, K, L, N
and S have been postulated as the proteinases that are responsible for osteoclast bone resorption, because of their ability to degrade insoluble type I collagens at low pH.

Cathepsins B, H, K, L, N and S have been further implicated as playing a causative role in other diseases such as rheumatoid arthritis, osteoarthritis, tumour metastasis, pneumocystis, Crithidia fusiculata, malaria, trypanosoma brucei brucei, schistosomiasis, periodontal disease, metachromatic leukodystrophy and muscular dystrophy. Cathepsins B, H, K, L, N and S, either alone or together, have also been implicated as playing a causative role in chronic obstructive pulmonary disease (COPD).

In recent years a number of synthetic inhibitors of cysteine proteases have been disclosed. US 5,055,451 discloses a series of peptidyl methyl ketones as thiol protease inhibitors; WO 95/15749 discloses peptidyl ketones with heterocyclic leaving groups as cysteine protease inhibitors; the in vivo inhibition of Cathepsin B by peptidyl (acyloxy) methyl ketones was discussed in J. Med. Chem. 1994, 37, 1833-40 and these types of compounds as inhibitors of cysteine protease inhibitors were also discussed in J. Am. Chem. Soc., 1988, 110, 4429-4431; peptidyl diazomethyl ketones as specific inactivators of thiol proteinases was discussed in J. Biol. Chem., 1981, 256, 4, 1923-8 and in Methods in Enzymology, 1981, 80, 820-5; the inhibiting activities of 1-peptidyl-2-haloacetyl hydrazines towards Cathepsin B and calpains was discussed in Eur. J. Med. Chem., 1993, 28 297-311 and peptidyl fluoromethyl ketones as inhibitors of Cathepsin B and the implication for treatment of Rheumatoid arthritis was discussed in Biochemical Pharmacology, 1992, 44, 6, 1201-7. Thus, there is a great need for a specific cysteine protease inhibitor, especially a Cathepsin L inhibitor or a Cathepsin S inhibitor.

The present invention discloses compounds with inhibitory activity of cysteine proteases and in particular of Cathepsin L and or Cathepsin S. The compounds of the invention are also useful in the treatment of chronic obstructive pulmonary disease (COPD).

or a pharmaceutically acceptable salt thereof.

In this specification the term ‘alkyl’ includes straight chained and branched structures and ring systems. For example, C_{1.6}alkyl includes propyl, isopropyl, t-butyl, cyclopropyl and cyclohexyl. However, references to individual alkyl groups such as ‘propyl’ are specific for the straight chained version only, references to individual branched chain alkyl groups such as ‘isopropyl’ are specific for the branched chain version only and references to individual cycloalkyl groups such as cyclohexyl are specific to the cyclic groups only.

A similar convention applies to other radicals, for example “hydroxyC_{1.6}alkyl” includes 1-hydroxyethyl and 2-hydroxyethyl.

The term “halo” refers to fluoro, chloro, bromo and iodo.

“Het” means, unless otherwise further specified, a fully saturated monocyclic 5 - 8 membered heterocyclic ring, with up to 4 ring heteroatoms. Preferably these ring heteroatoms
are selected from nitrogen, oxygen and sulphur. Examples of “Het” include pyrrolidinyl, imidazolidinyl, pyrazolidinyl, piperidyl, piperazinyl and morpholinyl.

Unless otherwise defined standard amino acid abbreviations are used. For example “Ala” refers to alanine and “Gly” refers to glycine.

“5- or 6-membered heteroaryl ring” means, unless otherwise further specified, a 5- or 6-membered ring that contains some degree of unsaturation, with up to four ring heteroatoms selected from nitrogen, oxygen and sulphur. Examples of “5- or 6-membered heteroaryl ring” include thieryl, furyl, imidazolyl, thiazolyl, pyrimidinyl, pyridinyl, pyrrolyl and pyrazolyl.

Examples of “6-membered heteroaryl ring” include pyrimidinyl, pyridinyl, pyrazinyl and pyridazinyl. Examples of “5-membered heteroaryl ring” include thieryl, furyl, imidazolyl, thiazolyl, pyrrolyl and oxadiazolyl.

Examples of “C_{1-6}alkanoyloxy” are acetoxy and propionyloxy. Examples of “C_{1-6}alkoxyxycarbonyl” include methoxycarbonyl, ethoxycarbonyl, n- and t-butoxycarbonyl. Examples of “C_{1-6}alkoxy” include methoxy, ethoxy and propoxy. Examples of “C_{1-6}alkanoylamino” include formamido, acetamido and propionylamino. Examples of “C_{1-6}alkylsulphanyl” include methylthio and ethylthio. Examples of “C_{1-6}alkylsulphphonyl” include methylsulphinyl and ethylsulphinyl. Examples of “C_{1-6}alkylsulphonyl” include mesyl and ethylsulphonyl. Examples of “C_{1-6}alkanoyl” include acetyl and propionyl. Examples of “C_{1-6}alkylamino” include methylamino and ethylamino. Examples of “N,N-{C_{1-6}alkyl}amino” include N,N-dimethylamino, N,N-diethylamino and N-ethyl-N-methylamino. Examples of “N-{C_{1-6}alkyl}carbamoylC_{1-6}alkyl” are 2-(methylamino)carbonylthethyl and 3-(ethylamino)carbonylpropyl. Examples of “N,N-{C_{1-6}alkyl}carbamoylC_{1-6}alkyl” are 2-(dimethylamino)carbonylthethyl and 3-(N-methyl-N-ethylamino)carbonylpropyl. Examples of “C_{2-6}alkenylen” are vinyl, allyl and 1-propenyl. If not commercially available, the necessary starting materials for the procedures described above may be made by procedures which are selected from standard organic chemical techniques, techniques which are analogous to the synthesis of known, structurally similar compounds, by techniques which are analogous to the above described procedures or by techniques which are analogous to the procedures described in the examples.
For example, it will be appreciated that certain of the optional substituents on a phenyl or naphthyl or a heteroaryl ring in the compounds of the present invention may be introduced by standard aromatic substitution reactions or generated by conventional functional group modifications either prior to or immediately following the processes mentioned above, and as such are included in the process aspect of the invention. Such reactions and modifications include, for example, introduction of a substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents and oxidation of substituents. The reagents and reaction conditions for such procedures are well known in the chemical art. Particular examples of aromatic substitution reactions include the introduction of a nitro group using concentrated nitric acid, the introduction of an acyl group using, for example, an acyl halide and a Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; the introduction of an alkyl group using an alkyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; and the introduction of a halogeno group. Particular examples of modifications include the reduction of a nitro group to an amino group by, for example, catalytic hydrogenation with a nickel catalyst or treatment with iron in the presence of hydrochloric acid with heating; oxidation of alkylthio to alkylsulphinyl or alkylsulphonyl.

It will also be appreciated that in some of the reactions mentioned herein it may be necessary/desirable to protect any sensitive groups in the compounds. The instances where protection is necessary or desirable and suitable methods for protection are known to those skilled in the art. Thus, if reactants include groups such as amino, carboxy or hydroxy it may be desirable to protect the group in some of the reactions mentioned herein.

A suitable protecting group for an amino or alkylamino group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an alkoxyacarbonyl group, for example a methoxycarbonyl, ethoxycarbonyl or t-butoxycarbonyl group, an arylmethoxycarbonyl group, for example benzoyloxycarbonyl, or an aroyl group, for example benzyol. The deprotection conditions for the above protecting groups necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or alkoxyacarbonyl group or an aroyl group may be removed for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an acyl group such as a t-butoxycarbonyl group may be removed, for example, by treatment with a suitable acid as hydrochloric, sulphuric or phosphoric acid or trifluoroacetic acid and an
arylmethoxycarbonyl group such as a benzyloxy carbonyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon, or by treatment with a Lewis acid for example boron tris(trifluoracetate). A suitable alternative protecting group for a primary amino group is, for example, a phthaloyl group which may be removed by treatment with an alkylamine, for example dimethylaminopropylamine, or with hydrazine.

A suitable protecting group for a hydroxy group is, for example, an acyl group, for example an alkanoyl group such as acetyl, an aroyl group, for example benzoyl, or an arylmethyl group, for example benzyl. The deprotection conditions for the above protecting groups will necessarily vary with the choice of protecting group. Thus, for example, an acyl group such as an alkanoyl or an aroyl group may be removed, for example, by hydrolysis with a suitable base such as an alkali metal hydroxide, for example lithium or sodium hydroxide. Alternatively an arylmethyl group such as a benzyl group may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

A suitable protecting group for a carboxy group is, for example, an esterifying group, for example a methyl or an ethyl group which may be removed, for example, by hydrolysis with a base such as sodium hydroxide, or for example a t-butyl group which may be removed, for example, by treatment with an acid, for example an organic acid such as trifluoroacetic acid, or for example a benzyl group which may be removed, for example, by hydrogenation over a catalyst such as palladium-on-carbon.

The protecting groups may be removed at any convenient stage in the synthesis using conventional techniques well known in the chemical art.

**Inhibition of Cathepsin L and S.**

The pharmaceutically-acceptable compounds of the present invention are useful in the inhibition of Cathepsin L and Cathepsin S, having a good activity in vitro against human Cathepsin L, human Cathepsin S and rabbit Cathepsin L.

**Cathepsin L Assay**
Recombinant human Cathepsin L was cloned and expressed in E Coli and purified using the method as described by Zeneca Limited, GB 2 306 961 A (published 14.05.1997).

Rabbit Cathepsin L was purified from rabbit liver as described by Maciewicz R. A. and Etherington D. J. (Biochem. J. (1988) 256, 433-440) except the liver homogenate supernatant was concentrated by fractionation with (NH₄)₂SO₄ (20-80% saturation), and the pellet taken up and dialysed against 20mM NaAcetate pH 5.5, 1mM ethylenediaminetetraacetic acid (EDTA). The supernatant was then applied to a CM Sepharose ion exchange column and Cathepsin L eluted by gradient elution (0.25-0.75M NaCl). Fraction activity was determined using the synthetic substrate NCBz-Phe-Arg-NHMec as described. Cathepsin L fractions were pooled and desalted on a Sephacryl S100 column. Active fractions were pooled, adjusted to 20% saturation (NH₄)₂SO₄ and concentrated on a phenyl sepharose column. The remaining purification steps were as described.

Cathepsin L activity was measured based on the method of Barrett and Kirschke (1981 Methods in Enzymology, 80, 535-561), using the fluorogenic substrates NCBz-Phe-Arg-NHMec. Inhibitors were identified by their ability to decrease the generation of the fluorescent leaving group (NHMec). Briefly the assay was as follows:

rHuman Cathepsin L or rabbit Cathepsin L (0.025 pmoles) was pre-incubated with or without test compound in 0.1M sodium acetate buffer pH 4.5, 10mM cysteine, 0.1% Brij 35 at 25°C for 15 minutes in a solid black 96 well plate. Synthetic substrate, 20μM NCBz-Phe-Arg-NHMec, was added and the mixture incubated at 37°C for 30 minutes. The reaction was stopped by the addition of 0.1M sodium chloroacetate pH 4.3. Fluorescence was determined
using a Fluoroskan II plate reader; excitation 355nm, emission 460nm. Compound potency was determined from the raw fluorescence data by calculating the IC$_{50}$ against each enzyme using a PC graph drawing software package.

5 **Cathepsin S assay.**

Cloning and Expression of human Cathepsin S:

Recombinant human Cathepsin S was cloned and expressed in Baculovirus, by the following method. The cDNA sequence for human Cathepsin S is available in the EMBL database Accession Number M90696. This database sequence was used to prepare, by PCR on mRNA from human tissues, a recombinant plasmid carrying an insert with a DNA sequence identical to that of Cathepsin S in the EMBL database (Acc No M90696). The techniques for mRNA isolation, PCR and cloning are standard techniques known by those skilled in the art. Sequence determination of the recombinant insert was carried out using established DNA sequencing techniques.

The PCR was done so as to introduce an EcoRI cloning site 5' of the 'ATG' of Cathepsin S and an XbaI cloning site 3' of the 'Stop' codon. The PCR product was cloned between the EcoRI and XbaI sites of the baculovirus transfer vector pFASTBAC-1 (Bac-to-Bac Expression System commercially available from Gibco BRL –Life Technologies (cat no 10359-016)). This recombinant construct was used to generate, by standard techniques, a recombinant baculovirus capable of expressing preprocathepsin S.

Expression of recombinant Cathepsin S was tested for the baculoviral constructs by infection of two insect cell lines: Sf9 cells (ATCC No CRL-1711) and T.ni cells (Invitrogen, Cat No B855-02).

25 **Purification of Cathepsin S**

Method 1.

Procathepsin S was found in the insect cell medium and acid activated. The medium was mixed with an equal volume of 100mM Sodium Acetate buffer pH 4.5, 5mM dithiothreitol (DTT) and 5mM EDTA and incubated for one hour at 37°C method of Maubach et al (Eur. J. Biochem., 250, 745-750, 1997).
Method 2.

The pH of insect cell medium (10ml) containing procathepsin S was adjusted to 4.5 with glacial acetic acid and DTT and EDTA added to 5mM. The sample was then incubated at 37°C for 150min to enable conversion to the active enzyme. Ammonium sulphate was then added to 80% saturation and a pellet obtained by centrifugation. This pellet was redissolved in 2ml buffer A (100mM Tris, 500mM NaCl, 1mM EDTA, pH7.5) and mixed in a batchwise fashion with 100μl thiopropyl-Sepharose for 15min at 4°C. The non bound fraction was removed by a brief centrifugation and the gel washed with 2x1ml buffer A. Cathepsin S was then eluted by batch mixing with 0.4ml 20mM DTT in buffer A for 15min at 4°C.

Measurement of Cathepsin S Activity.

Cathepsin S activity was measured based on the method of Maubach et al (Eur. J. Biochem., 250, 745-750, 1997), using the fluorogenic substrate Z-Val-Val-Arg-NHMec. Inhibitors were identified by their ability to decrease the generation of the fluorescent leaving group (NHMec). Briefly the assay was as follows:

rHuman Cathepsin S (1.5 nmoles) was pre-incubated with or without compounds in 50mM Potassium phosphate buffer pH 6.0-6.2, 20mM Na₂EDTA, 0.1% Brij at 25°C for 5 minutes in a solid black 96 well plate. Synthetic substrate, 20μM Z-Val-Val-Arg-NHMec, was added and the mixture incubated at 30°C for 20 minutes. The reaction was stopped by the addition of 0.1M sodium chloroacetate pH 4.3. Fluorescence was determined using a Fluoroskan II plate reader; excitation 355nm, emission 460nm. Compound potency was determined from the raw fluorescence data by calculating the IC₅₀ against Cathepsin S using a PC graph drawing software package.

The following results were obtained on a standard in-vitro test system for the inhibition of Cathepsin L. The activity is described in terms of IC₅₀.

When tested in the above in-vitro tests the compounds of this invention give IC₅₀ₐₕ in the range 1-10,000 nM.
The following data was obtained for Examples 1, 19 and 26:

Continuation of Box I.2

Claims Nos.: 1-10 (partially), 11, 12 (partially)

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claims may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). For these reasons, a meaningful search over the whole breadth of the claims is impossible. Consequently, the search has been restricted to compounds for which a pharmaceutical use is indicated (particularly as cysteine protease inhibitors).

Claim 11 deals with synthetic intermediates which are amides of di- and tripeptides, a group of compounds which are well-known in the prior art so that it is impossible to determine which parts of the claim may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). No attempt was made to search this claim, but where documents relevant to this claim were found during the search in relation to the other claims, this has been noted in the International Search Report.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
