[57]			ABSTRACT	
Certain benzaldehyde-N-formyl-phenylhydrazones and their use to control unwanted fungi.				

5 Claims, No Drawings

FUNGICIDAL BENZALDEHYDE-N-FORMYL-PHENYLHYDRA-ZONES

This application is a continuation-in-part of application Ser. No. 838,772, filed on Oct. 3, 1977, abandoned.

DESCRIPTION OF THE INVENTION

This invention relates to certain novel benzaldehyde-N-formylphenylhydrazones, useful as fungicides, characterized by the general formula:

$$\begin{array}{c}
H \\
R - C = N - N \\
O = C - H
\end{array}$$
(I)

the particular compounds contemplated in this invention being the following individual species wherein the substituent moieties are as follows (the number preceding the moieties, Z, indicating the position of the moiety on the phenyl ring):

Compound No.	R	N	z
1	phenyl	1 .	4-C1
2	4-methoxyphenyl	0	_
3	4-chlorophenyl	0	_
4	4-fluorophenyl	0	_
5	4-bromophenyl	: 0	_
6	4-methylphenyl	0	_
7	3-fluorophenyl	. 0	_
8	3-methylphenyl	0	_
9	4-methylphenyl	. 1	4-F
10	4-(isopropyl)phenyl	0	

These phenylhydrazones can be prepared by treating the appropriate precursor of the formula:

$$R-C=N-N$$

$$H$$

$$(Z)_n$$

with a formylating agent. Formic acid itself may be used as a formylating agent. However, this reagent was found to give low yields of formylated product, and improved yields of the formylated compound were obtained using the mixed anhydride of formic acid and acetic acid. A preferred formylating agent therefore is one which comprises the mixed anhydride of formic acid and acetic acid and which may be prepared by mixing appropriate amounts of formic acid and acetic anhydride according to the method of Stevens and van Es (Recueil 83, 1287–94, (1964)). Alternatively the acetic/formic anhydride may be prepared by the reaction of acetyl chloride with sodium formate according to the method of Muramatsu et al. (Bull. Chem. Soc. Jap. 38, 244, (1965)) or from ketene and formic acid (ibid).

The precursors can be prepared by treating a carbonyl compound of the formula: R—CHO, with the appropriate hydrazine:

wherein the symbols have the respective meanings already assigned. The hydrazine is used as a salt, preferably the hydrochloride, together with as appropriate base, for example, sodium acetate. The reaction is preferably carried out in a polar solvent at temperatures ranging from ambient temperature to 100° C.; suitable solvents are, for example, ethyl alcohol, diethyl ether or 30% aqueous acetic acid. The reaction may be carried out in the presence or absence of a dehydrative agent.

These phenylhydrazones are useful as fungicides, so that the invention includes the method of protecting crops from fungi, in which crops subject to or subjected to such attack, seeds of such crops or soil in which such crops are growing or are to be grown are treated with a fungicidally effective amount of one of the fungicides of the invention, the preferred fungicide being benzaldehyde-N-formyl-p-chlorophenylhydrazone (Compound 1).

The fungicides of the invention preferably are used in combination with a carrier. The term "carrier" as used herein means a solid or fluid material, which may be inorganic or organic and of synthetic or natural origin, with which the fungicide is mixed or formulated to facilitate its application to the plant, seed, soil or other object to be treated, or its storage, transport or handling. The carrier may be a solid or a fluid. Any of the materials usually applied in formulating pesticides may be used as the carrier.

Suitable solid carriers are natural and synthetic clays and silicates, for example natural silicas such as diatomacious earths; magnesium silicates, for example, talcs; magnesium aluminum silicates, for example, attapulgites and vermiculites; aluminum silicates, for example, kaolinites, montmorillinites and micas; calcium carbonates; calcium sulphate; synthetic hydrated silicon oxides and synthetic calcium or aluminum silicates; elements such as for example, carbon and sulphur; natural and synthetic resins such as, for example coumarone resins, polyvinyl chloride and styrene polymers and copolymers; solid polychlorophenols; bitumen; waxes such as for example, beeswax, paraffin wax, and chlorinated mineral waxes; and solid fertilizers, for example superphosphates.

Examples of suitable fluid carriers are water, alcohols, such as for example, isopropanol; glycols; ketones such as for example, acetone, methyl ethyl ketone, methyl isobutyl ketone and cyclohexanone; ethers; aromatic hydrocarbons such as for example, benzene toluene and xylene; petroleum fractions such as for example, kerosine; light mineral oils; chlorinated hydrocarbons, such as for example, carbon tetrachloride, perchloroethylene, trichloroethane, including liquified normally vaporous gaseous compounds. Mixtures of different liquids are often suitable.

The surface-active agent may be an emulsifying agent or a dispersing agent or a wetting agent; it may be nonionic or ionic. Any of the surface-active agents usually applied in formulating herbicides, fungicides, or insecticides may be used. Examples of suitable surface-active agents are the sodium or calcium salts of polyacrylic

acids and lignin sulphonic acids; the condensation products of fatty acids or aliphatic amines or amides containing at least 12 carbon atoms in the molecule with ethylene oxide and/or propylene oxide; fatty acid esters of glycerol, sorbitan sucrose or pentaerythritol; conden- 5 sates of these with ethylene oxide and/or propylene oxide; condensation products of fatty alcohols or alkyl phenols for example p-octylphenol or p-octylcresol, with ethylene oxide and/or propylene oxide; sulphates or sulphonates of these condensation products; alkali or 10 alkaline earth metal salts, preferably sodium salts, of suphuric or sulphonic acid esters containing at least 10 carbon atoms in the molecule, for example, sodium lauryl sulphate, sodium secondary alkyl sulphates, sodium salts of sulphonated castor oil, and sodium alkyl- 15 aryl sulphonates such as sodium dodecylbenzene sulphonate; and polymers of ethylene oxide and copolymers of ethylene oxide and propylene oxide.

The fungicides of the invention may be formulated as wettable powders, dusts, granules, solutions, emulsifi- 20 able concentrates, emulsions, suspensions concentrates and aerosols and will generally contain 0.5 to 95%w, preferably 0.5 to 75%w, of the fungicide. Wettable powders are usually compounded to contain 25, 50 or 75%w of the fungicide and usually contain, in addition 25 to solid carrier, 3-10%w of a dispersing agent and, where necessary, 0-10%w of stabilizer(s) and/or other additives such as penetrants or stickers. Dusts are usually formulated as a dust concentrate having a similar composition to that of a wettable powder but without a 30 dispersant, and are diluted in the field with further solid carrier to give a composition usually containing ½-10%w of the fungicide. Granules are usually prepared to have a size between 10 and 100 BS mesh (1.676-0.152 mm), and may be manufactured by ag- 35 glomeration or impregnation techniques. Generally, granules will contain ½-25%w toxicant and 0-10%w of additives such as stabilizers, slow release modifiers and binding agents. Emulsifiable concentrates usually contain, in addition to the solvent and, when necessary, 40 co-solvent, 10-50%w/v toxicant, 2-20%w/v emulsifiers and 0-20%w/v of appropriate additives such as stabilizers, penetrants and corrosion inhibitors. Suspension concentrates are compounded so as to obtain a stable, non-sedimenting, flowable product and usually 45 contain 10-75%w of the fungicide, 0.5-15%w of dispersing agents, 0.1-10%w of suspending agents such as protective colloids and thixotropic agents, 0-10%w of appropriate additives such as defoamers, corrosion inhibitors, stabilizers, penetrants and stickers, and as car- 50 rier, water or an organic liquid in which the toxicant is substantially insoluble; certain organic salts may be dissolved in the carrier to assist in preventing sedimentation or as antifreeze agents for water.

Aqueous dispersions and emulsions, for example, 55 compositions obtained by diluting a wettable powder or a concentrate according to the invention with water, also lie within the scope of the present invention. The said emulsions may be of the water-in-oil or of the oil-in-water type, and may have a thick "mayonnaise"-like 60 consistency.

The formulations may also contain other ingredients, for example, other compounds possessing pesticidal, such as insecticidal, herbicidal or acaricidal, properties.

The invention is further illustrated in the following 65 Examples. In each case, the identity of the product was confirmed by appropriate chemical and spectral analyses.

EXAMPLE 1

Preparation of

Benzaldehyde-N-formyl-p-chlorophenylhydrazone (1)

25.2 g of 4-chlorophenylhydrazine and 33.6 g of anhydrous soidum acetate were dissolved in 400 ml of 50% by volume aqueous ethanol. The resulting suspension was filtered to remove sodium chloride. 15.4 g of benzaldehyde in 20 ml of ethanol was added to the filtrate. The mixture was warmed for a few minutes, then water was added to cause a precipitate to form. The precipitate was filtered and recrystallized from aqueous ethanol to give benzaldehyde-p-chlorophenylhydrazone (1A), mp 129°-130° C.

6.91 g of 1A was dissolved in 37.5 ml of dry 1,2-dimethoxyethane and treated with 4.5 g of distilled mixed anhydride of formic acid and acetic acid prepared by mixing the appropriate amount of formic acid and acetic anhydride. The resulting mixture was left for 4 hours at room temperature and then heated up to boiling point and excess solvent removed in vacuo. The residue was triturated with 5% sodium bicarbonate solution, dried and crystallized from methanol to give 1, mp 122°-123°

Table I identifies and sets out the melting points of further individual species of the phenylhydrazones of the invention, which were prepared by the procedures illustrated in Example 1.

Compound No.	Melting Point, *C.
2	114-116
3	107-109
4	81-83
5 .	110-113.5
6	97-99
7	64-66
8	72-73.5
9	114-117
11	83.5-85

Fungicidal activity of the phenylhydrazones of the invention was established as follows:

Activity against vine downy mildew (*Plasmopara* viticola)

The test was a direct antisporulant one using a foliar spray. The lower surfaces of leaves of whole vine plants were inoculated by spraying with an aqueous suspension containing 105 zoosporangia per milliliter 4 days prior to treatment with the test compound. The inoculated plants were kept for 24 hours in a high humidity compartment, 48 hours at glasshouse ambient temperature and humidity, and then were returned for a further 24 hours to high humidity. The plants were then dried and the infected leaves detached and sprayed on the lower surfaces at a dosage of 1 kilogram of the test compound per hectare using a track sprayer. After drying, the petioles of the sprayed leaves were dipped in water and the leaves returned to high humidity for a further 72 hours incubation, followed by assessment. Assessment was based on the percentage of the leaf area covered by sporulation compared with that on control

Activity against barley powder mildew (Erysiphe graminis)

The test measured the direct antisporulant activity of the test compounds, applied as a foliar spray. For each one-leaf stage in a plastic pot of sterile potting compost. Inoculation was effected by dusting the leaves with conidia of Erysiphe graminis. 24 hours after inoculation the seedlings were sprayed with a solution of the test compound in a mixture of acetone (50%) surfactant (0.04%) and water using a track sprayer. The rate of application was equivalent to 1 kilogram of test compound per hectare. First assessment of disease was made 5 days after treatment, when the overall level of sporulation on treated posts were compared with that on Table II

We claim:

1. A compound, being one of ten having the formula:

$$\begin{array}{c} H \\ R-C=N-N \\ O=C-H \end{array} \hspace{1cm} (Z)_n \hspace{1cm} (I)$$

the ten being individual species wherein the substituent moieties are as follows, the number preceding the moiety, Z, indicating the position of that moiety on the phenyl ring:

	R	N	Z
	phenyl	1	4-Cl
	4-methoxyphenyl	0	
	4-chlorophenyl	0	
	4-fluorophenyl	0	
	4-bromophenyl	0	
A.	4-methylphenyl	0	
	3-fluorophenyl	0	
	3-methylphenyl	0	_
	4-methylphenyl	1	4-F
	4-(isopropyl)phenyl	0	

2. A compound according to claim 1 wherein R is phenyl, n is 1 and Z is 4-chloro.

3. A method for killing unwanted fungi on plants which comprises subjecting such fungi to a fungicidal

4. A method for killing unwanted fungi on plants which comprises subjecting such fungi to a fungicidal amount of a compound as defined in claim 2.

5. A fungicidal composition comprising a fungicidal 50 amount of a compound of claim 1 together with a carrier therefor.

Activity against wheat brown rust (Puccinia recondita)

control pots.

The test was a direct antisporulant one using a foliar 15 spray. Pots containing about 25 wheat seedlings per pot, at first leaf stage, were inoculated by spraying the leaves with an aqueous suspension containing 105 spores per milliliter plus a little Triton X-155, 20-24 hours before treatment with the compound under test. The inoculated plants were kept overnight in a high humidity compartment, dried at glasshouse ambient temperature, and then sprayed at a dosage of 1 kilogram of the test compound per hectare using a track sprayer. After treatment the plants were kept at glass-house ambient temperature and assessment made 11 days after treatment. Assessment was based on the relative density of sporulating pustules per plant compared with that on control plants. 30

Activity against broad bean rust (Uromyces fabae)

The test was a translaminar antisporulant one using foliar spray. Pots containing 1 plant per pot were inoculated by spraying an aqueous suspension, containing 35 5×10⁴ spores per milliliter plus a little Triton X-155, onto the undersurface of each leaf 20-24 hours before treatment with the test compound. The inoculated plants were kept overnight in a high humidity compartment, dried at glass-house ambient temperature and 40 then sprayed, on the leaf upper surfaces, at a dosage of 1 kilogram per hectare of active material using a track sprayer. After treatment the plants were kept at glasshouse temperature and assessment made 11 days after treatment. Symptoms were assessed on the relative 45 amount of a compound of claim 1. density of sporulation per plant compared with that on control plants.

The extent of disease control is set out in Table II and expressed as a control rating according to the criteria:

0=less than 50% disease control

1 = 50 - 80% disease control

2=greater than 80% disease control
