Title: PROTEIN KINASE INHIBITORS

Abstract: Protein kinase inhibitors are disclosed having utility in the treatment of protein kinase-mediated diseases and conditions, such as cancer. The compounds of this invention have the following structure: (I) including stereoisomers, prodrugs and pharmaceutically acceptable salts thereof, wherein A is a ring moiety selected from (II) and wherein R1, R2, R3, X, Z, L1, Cyc1, L2 and Cyc2 are as defined herein. Also disclosed are compositions containing a compound of this invention, as well as methods relating to the use thereof.

PROTEIN KINASE INHIBITORS

BACKGROUND OF THE INVENTION

Field of the Invention

The present invention relates, in general, to compounds that inhibit protein kinase activity, and to compositions and methods related thereto.

Description of the Related Art

Cancer (and other hyperproliferative diseases) is characterized by uncontrolled cell proliferation. This loss of the normal control of cell proliferation often appears to occur as the result of genetic damage to cell pathways that control progress through the cell cycle. The cell cycle consists of DNA synthesis (S phase), cell division or mitosis (M phase), and non-synthetic periods referred to as gap 1 (G1) and gap 2 (G2). The M-phase is composed of mitosis and cytokinesis (separation into two cells). All steps in the cell cycle are controlled by an orderly cascade of protein phosphorylation and several families of protein kinases are involved in carrying out these phosphorylation steps. In addition, the activity of many protein kinases increases in human tumors compared to normal tissue and this increased activity can be due to many factors, including increased levels of a kinase or changes in expression of co-activators or inhibitory proteins.

Cells have proteins that govern the transition from one phase of the cell cycle to another. For example, the cyclins are a family of proteins whose concentrations increase and decrease throughout the cell cycle. The cyclins turn on, at the appropriate time, different cyclin-dependent protein kinases (CDKs) that phosphorylate substrates essential for progression through the cell cycle. Activity of specific CDKs at specific times is essential for both initiation and coordinated progress through the cell cycle. For example, CDK1 is the most prominent cell cycle regulator that orchestrates M-phase activities. However, a number of other mitotic protein kinases that participate in M-phase have been identified, which include members of the polo, aurora, and NIMA (Never-In-Mitosis-A) families and kinases implicated in mitotic checkpoints, mitotic exit, and cytokinesis.

Aurora kinases are a family of oncogenic serine/threonine kinases that localize to the mitotic apparatus (centrosome, poles of the bipolar spindle, or midbody) and regulate completion of centrosome separation, bipolar spindle
assembly and chromosome segregation. Three human homologs of aurora kinases have been identified (aurora-1, aurora-2 and aurora-3). They all share a highly conserved catalytic domain located in the carboxyl terminus, but their amino terminal extensions are of variable lengths with no sequence similarity. The human aurora kinases are expressed in proliferating cells and are also overexpressed in numerous tumor cell lines including breast, ovary, prostate, pancreas, and colon. Aurora-2 kinase acts as an oncogene and transforms both Rat1 fibroblasts and mouse NIH3T3 cells in vitro, and aurora-2 transforms NIH 3T3 cells grown as tumors in nude mice. Excess aurora-2 may drive cells to aneuploidy (abnormal numbers of chromosomes) by accelerating the loss of tumor suppressor genes and/or amplifying oncogenes, events known to contribute to cellular transformation. Cells with excess aurora-2 may escape mitotic check points, which in turn can activate proto-oncogenes inappropriately. Up-regulation of aurora-2 has been demonstrated in a number of pancreatic cancer cell lines. In additional, aurora-2 kinase antisense oligonucleotide treatment has been shown to cause cell cycle arrest and increased apoptosis. Therefore, aurora-2 kinase is an attractive target for rational design of novel small molecule inhibitors for the treatment of cancer and other conditions.

C-kit is a transmembrane receptor belonging to the type 3 subgroup of receptor tyrosine kinases that also includes platelet-derived growth factor receptor (PDGFR), colony-stimulating factor 1 receptor (CSF-1), and FMS-like tyrosine kinase (Flt-3). Gastrointestinal stromal tumors (GIST), which are the most common mesenchymal tumors of the gastrointestinal tract, have been demonstrated to frequently over-express c-kit. GISTs are thought to originate from the Interstitial Cells of Cajal (ICCs) that play a role in the control of gut motility. ICCs express the c-kit proto-oncogene. When c-kit binds to its ligand stem cell factor (SCF) and dimerizes with another c-kit receptor, trans-autophosphorylation on tyrosines occurs and activates a number of downstream signaling pathways that lead to a proliferative response. These events are believed to contribute to the induction of GIST.

Other GISTs are associated with excess activity of platelet-derived growth factor receptor A (PDGFR-A), which is considered a key player in the new blood vessel formation necessary for tumors to grow beyond more than a few millimeters. PDGFR-A is found in stroma and pericytes (support
cells for blood vessels). PDGFR-A levels have been found to be increased in a number of other tumor types.

Researchers have explored cancer treatment approaches that inhibit tyrosine kinases and other proteins involved in uncontrolled signal transduction. For example, the signal transduction inhibitors STI571, SU5614, CT52923 (herein HPK15) and PD1739 are known to inhibit the activity of Bcr-Abl, c-kit and PDGFR tyrosine kinases. STI571 (Gleevec; a phenylaminopyrimidine) is a small molecule inhibitor currently used in the clinic, which selectively blocks the BCR-ABL tyrosine kinase dimer in chronic myelogenous leukemia. However, Gleevec also has been shown to inhibit the c-kit and PDGFR tyrosine kinases and therefore may also be useful in tumors that over-express these receptors. Recent studies on patients with metastatic GISTs treated with STI571 have shown decreased tumor size on computed tomography and MRI and metabolic response measured with 19-fluoro-desoxyglucose positron emission tomography (FDG-PET). However, two Phase I trials with STI571 at dose levels of 400 mg or 600 mg per day showed a partial response in 54%, stable disease in 34% and progressive disease in 12% of patients assessed at 1-3 months. These initial trials indicate that although a very good partial response was initially obtained, complete responses were quite rare, and patients eventually developed progressive disease. Recent studies showed that a particular mutant (V560G) of c-kit is more sensitive to STI571, and a mutant in the c-kit kinase domain (D816V) was resistant. Therefore, the design and development of novel inhibitors of mutant c-kit and/or of PDGFR are needed for the treatment of GIST and other conditions associated with excess c-kit and/or PDGFR activity.

Quinazoline derivatives have been proposed for inhibiting protein kinase activity. For example, WO 96/09294, WO 96/33981 and EP 0837 063 describe the use of certain quinazoline compounds as receptor tyrosine kinase inhibitors. In addition, WO 01/2596 proposes the use of quinazoline derivatives to inhibit aurora-2 kinase.

What remains needed, however, are additional and improved inhibitors of protein kinase activity, particularly inhibitors of aurora-2 kinase, c-kit and/or PDGFR-A kinase activity. The present invention fulfills these needs and offers other related advantages.
BRIEF SUMMARY OF THE INVENTION

The present invention is generally directed to compounds having the following general structure (I):

![Chemical Structure](image)

including stereoisomers, prodrugs and pharmaceutically acceptable salts thereof, wherein A is a ring moiety selected from:

![Chemical Structures](image)

and wherein R₁, R₂, R₃, X, Z, L₁, Cycl₁, L₂ and Cycl₂ are as defined herein.

These compounds of the present invention have utility over a broad range of therapeutic applications, and may be used to treat diseases, such as cancer, that are mediated at least in part by protein kinase activity. Accordingly, in one aspect of the invention, the compounds described herein are formulated as pharmaceutically acceptable compositions for administration to a subject in need thereof.

In another aspect, the invention provides methods for treating or preventing a protein kinase-mediated disease, such as cancer, which method comprises administering to a patient in need of such a treatment a therapeutically effective amount of a compound described herein or a pharmaceutically acceptable composition comprising said compound. In certain embodiments, the protein kinase-mediated disease is an aurora-2 kinase-mediated disease or a c-kit-mediated disease.

Another aspect of the invention relates to inhibiting protein kinase activity in a biological sample, which method comprises contacting the biological sample with a compound described herein, or a pharmaceutically
acceptable composition comprising said compound. In certain embodiments, the protein kinase is aurora-2 kinase, PDGFR-a or c-kit kinase.

Another aspect of this invention relates to a method of inhibiting protein kinase activity in a patient, which method comprises administering to the patient a compound described herein or a pharmaceutically acceptable composition comprising said compound. In certain embodiments, the protein kinase is aurora-2 kinase or c-kit kinase.

These and other aspects of the invention will be apparent upon reference to the following detailed description and attached figures. To that end, certain patent and other documents are cited herein to more specifically set forth various aspects of this invention. Each of these documents is hereby incorporated by reference in its entirety.

BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 displays the general structures of illustrative compounds of the present invention.

FIG. 2 displays structure-based sequence alignments in the Clustal X program (multiple alignment program, EMBL-EBI, UK) of the catalytic protein kinase domains of aurora-2 (ARK1), aurora-1 (ARK2), bovine cAMP-dependent PK (1CDK), murine cAMP-dependent PK (1APM), and C. elegans twitchin kinase (1KOA). Black bars: α-helices (α1-α11); gray bars: β-sheets (β1-β11); shaded and *: identical residues; :: highly conserved residues; and #: similar residues.

FIG. 3 displays the homology model of aurora-2 kinase. Secondary structural elements include α-helix, β-sheet, coil, and turns.

FIG. 4 displays the structures of the ATP analog (AMP-PNP) and S/T kinase inhibitors (staurosporine, H-89, H-8, H-7, KN-93, ML-7, and 6,7-dimethoxyquinazoline) evaluated for inhibitory activities against aurora-2 kinase.

FIG. 5 shows the superposed structures of staurosporine, 6,7-dimethoxyquinazoline, H-89, and AMP-PNP docked into the ATP-binding pocket of aurora-2. The enzyme active site is clipped.

FIG. 6 shows the purine, quinazoline, isoquinazoline and indole ring templates used in LUDI search.

FIG. 7A displays structures of illustrative pyrimido[4,5-b]indoles. FIG. 7B displays structures of illustrative benzofuranopyrimidines. FIG. 7C
displays structures of illustrative benzothieno[3,2-d]pyrimidone. FIG. 7D displays structures of illustrative 6,7-dimethoxyquinazolines.

FIG. 8 shows schematic synthetic methods for making illustrative compounds of the invention.

FIG. 9 shows the schematic synthesis of compounds HPK 16 and HPK 62.

FIG. 10 is a bar graph showing inhibition of aurora-2 kinase by illustrative compounds (20 μM) in an in vitro assay.

FIG. 11 graphs aurora-2 kinase inhibition by five compounds at different concentrations to determine the concentration providing 50% inhibition (IC50).

FIG. 12 displays the general structures of further illustrative inventive compounds.

FIG. 13 displays structure-based sequence alignments in the Clustal X program (multiple alignment program, EMBL-EBI, UK) of the catalytic protein kinase domains of c-kit, PDGFR-α, PDGFR-β, FGFr1, VEGFR2 and BCR-ABL. Shaded and * are identical residues; "::" are highly conserved residues; and • are similar residues. The N-terminal and C-terminal extensions of c-kit are not included in the modeling.

FIG. 14 displays the homology model of c-kit bound compound 1 docked into the ATP binding site.

FIGs. 15A and 15B are molecular models of the c-kit binding site with two different prior art compounds, CT52923 and STI571, respectively.

FIG. 16 shows the purine, quinazoline, isoquinazoline, pyrimido [4,5-b]indoles, benzothieno [3,2-d], benzofuranopyrimidines and indole ring structures used in the LUDI search.

FIG. 17 shows the structures of novel 4-piprazinylpyrimido [4,5-b]indoles, benzothieno [3,2-d], benzofuranopyrimidines and quinazoline inhibitors designed as c-kit tyrosine kinase inhibitors.

FIGs. 18A and 18B show molecular models of the c-kit kinase active site pocket containing compounds 3 and 1, respectively.

FIG. 19 shows a molecular model developed with FlexX software. It shows docking and overlay of compound 3 and STI571 within the c-kit kinase active site pocket.

FIG. 20 depicts the synthesis of seven illustrative compounds.

FIG. 21 summarizes the preparation of intermediates 1c and 1d.
FIGs. 22A, 22B, and 22C display graphically the results of *in vitro* cytotoxicity testing of GIST882, MIAPaCa-2 and PANC-1 cell lines, respectively.

FIG. 23 shows the effects of compound (II-2-6) on cell cycle distribution of the MIA PaCa-2 pancreatic cancer cell line.

FIG. 24 shows the effects of compound (II-2-6) on cell proliferation of the MIA PaCa-2 pancreatic cancer cell line.

FIGs. 25A and 25B show the effects of compound (II-2-6) on *in vitro* cytotoxicity of the MIA PaCa-2 pancreatic cancer cell line.

FIGs. 26A and 26B and 26C show the effects of compound (II-2-6) on *in vitro* cytotoxicity of colon, breast, ovarian and pancreatic cancer cell lines.

FIGs. 27 shows the kinase inhibitory activity of compound (II-2-6) against multiple protein kinases.

FIGs. 28A and 28B show the results of phosphorylation assays for c-kit and PDGFR-a, respectively.

FIGs. 29 shows the inhibitory activity of illustrative compounds in the GIST cell line, GIST882.
DETAILED DESCRIPTION OF THE INVENTION

The present invention is generally directed to compounds useful as protein kinase inhibitors and to compositions and methods relating thereto. Such compounds of the invention have the following structure (I):

![Chemical Structure](image)

including stereoisomers, prodrugs and pharmaceutically acceptable salts thereof, wherein A is a ring moiety selected from:

![Chemical Structures](image)

and wherein:

- $X$ is NH, S or O;
- Z is CH or N;
- $R_1$ and $R_2$ are the same or different and are independently hydrogen, hydroxyl, halo, -CN, -NO$_2$, -NH$_2$, -R, -OR, -SCH$_3$, -CF$_3$, -C(=O)OR or -OC(=O)R, where R is alkyl or substituted alkyl;
- $R_3$ is hydrogen, -NH$_2$, alkyl, -CN, or -NO$_2$, or $R_3$ is -L$_3$-Cycl$_3$ wherein L$_3$ is a direct bond, -S- or -NH-, and Cycl$_3$ is a carbocycle, substituted carbocycle, heterocycle or substituted heterocycle;
- L$_1$ is a direct bond, -NR', -OC(=S)NH- or -NHC(=S)O-; wherein R' is H or alkyl;
- Cycl$_1$ is optional and, when present, is a carbocycle, substituted carbocycle, heterocycle or substituted heterocycle;
- L$_2$ is a direct bond or -C(=S)NH-, -NHC(=S)-, -NHC(=S)NH-, -C(=O)NH-, -NHC(=O)-, -NHC(=O)NH-, -(CH$_2$)$_n$-, -NH(CH$_2$)$_n$-, -(CH$_2$)$_n$NH-,
-NH(CH₂)ₙNH-, -C(=S)NH(CH₂)ₙ-, -NHC(=S)(CH₂)ₙ-, -(CH₂)ₙC(=S)NH(CH₂)ₙ-, -(CH₂)ₙNHC(=S)(CH₂)ₙ-, -NHC(=O) -, -S(=O)₂-, -S(=O)₂NH-, -NHS(=O)₂-, wherein n is, at each occurrence the same or different and independently 1, 2, 3 or 4; and

Cycl₂ is a carbocycle, substituted carbocycle, heterocycle or substituted heterocycle.

Unless otherwise stated the following terms used in the specification and claims have the meanings discussed below:

"Alkyl" refers to a saturated straight or branched hydrocarbon radical of one to six carbon atoms, preferably one to four carbon atoms, e.g., methyl, ethyl, propyl, 2-propyl, n-butyl, iso-butyl, tert-butyl, pentyl, hexyl, and the like, preferably methyl, ethyl, propyl, or 2-propyl. Representative saturated straight chain alkyls include methyl, ethyl, n-propyl, n-butyl, n-pentyl, n-hexyl, and the like; while saturated branched alkyls include isopropyl, sec-butyl, isobutyl, tert-butyl, isopentyl, and the like. Representative saturated cyclic alkyls include cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, -CH₂-cyclohexyl, and the like; while unsaturated cyclic alkyls include cyclopentenyl, cyclohexenyl, -CH₂-cyclohexenyl, and the like. Cyclic alkyls are also referred to herein as a "cycloalkyl." Unsaturated alkyls contain at least one double or triple bond between adjacent carbon atoms (referred to as an "alkenyl" or "alkynyl", respectively.) Representative straight chain and branched alkenyls include ethylenyl, propylenyl, 1-buteny1, 2-butenyl, isobutylene1, 1-penty1, 2-penteny1, 3-methy1-1-butenyl, 2-methy1-2-butenyl, 2,3-dimethy1-2-butenyl, and the like; while representative straight chain and branched alkynyls include acetylenyl, propynyl, 1-buty1, 2-buty1, 1-penty1, 2-penty1, 3-methy1-1-buty1, and the like.

"Alkylene" means a linear saturated divalent hydrocarbon radical of one to six carbon atoms or a branched saturated divalent hydrocarbon radical of three to six carbon atoms, e.g., methylene, ethylene, 2,2-dimethylethylene, propylene, 2-methylpropylene, butylene, penty1ene, and the like, preferably methylene, ethylene, or propylene.

"Cycloalkyl" refers to a saturated cyclic hydrocarbon radical of three to eight carbon atoms, e.g., cyclopropyl, cyclobutyl, cyclopentyl or cyclohexyl.
"Alkoxy" means a radical -OR₃ where R₃ is an alkyl as defined above, e.g., methoxy, ethoxy, propoxy, butoxy and the like.

"Halo" means fluoro, chloro, bromo, or iodo, preferably fluoro and chloro.

"Haloalkyl" means alkyl substituted with one or more, preferably one, two or three, same or different halo atoms, e.g., -CH₂Cl, -CF₃, -CH₂CF₃, -CH₂CCl₃, and the like.

"Haloalkoxy" means a radical -OR₆ where R₆ is an haloalkyl as defined above, e.g., trifluoromethoxy, trichloroethoxy, 2,2-dichloropropoxy, and the like.

"Acyl" means a radical -C(O)R₆ where R₆ is hydrogen, alkyl, or haloalkyl as defined herein, e.g., formyl, acetyl, trifluoroacetyl, butanoyl, and the like.

"Aryl" refers to an all-carbon monocyclic or fused-ring polycyclic (i.e., rings which share adjacent pairs of carbon atoms) groups of 6 to 12 carbon atoms having a completely conjugated pi-electron system. Examples, without limitation, of aryl groups are phenyl, naphthyl and anthracenyl. The aryl group may be substituted or unsubstituted. When substituted, the aryl group is substituted with one or more, more preferably one, two or three, even more preferably one or two substituents independently selected from the group consisting of alkyl, haloalkyl, halo, hydroxy, alkoxy, mercapto, alkylthio, cyano, acyl, nitro, phenoxy, heteroaryl, heteroaryloxy, haloalkyl, haloalkoxy, carboxy, alkoxycarbonyl, amino, alkylamino or dialkylamino.

"Heteroaryl" refers to a monocyclic or fused ring (i.e., rings which share an adjacent pair of atoms) group of 5 to 12 ring atoms containing one, two, three or four ring heteroatoms selected from N, O, or S, the remaining ring atoms being C, and, in addition, having a completely conjugated pi-electron system. Examples, without limitation, of unsubstituted heteroaryl groups are pyrrole, furan, thiophene, imidazole, oxazole, thiazole, pyrazole, pyridine, pyrimidine, quinoline, isoquinoline, purine, triazole, tetrazole, triazine, and carbazole. The heteroaryl group may be substituted or unsubstituted. When substituted, the heteroaryl group is substituted with one or more, more preferably one, two or three, even more preferably one or two substituents independently selected from the group consisting of alkyl, haloalkyl, halo, hydroxy, alkoxy, mercapto, alkylthio, cyano, acyl, nitro, haloalkyl, haloalkoxy, carboxy, alkoxycarbonyl, amino, alkylamino or dialkylamino.
"Carbocycle" refers to an aliphatic ring system having 3 to 14 ring atoms. The term "carbocycle", whether saturated or partially unsaturated, also refers to rings that are optionally substituted. The term "carbocycle" also includes aliphatic rings that are fused to one or more aromatic or nonaromatic rings, such as in a decahydronaphthyl or tetrahydronaphthyl, where the radical or point of attachment is on the aliphatic ring.

"Heterocycle" refers to a saturated cyclic ring system having 3 to 14 ring atoms in which one, two or three ring atoms are heteroatoms selected from N, O, or S(O)\textsubscript{m} (where m is an integer from 0 to 2), the remaining ring atoms being C, where one or two C atoms may optionally be replaced by a carbonyl group. The heterocyclic ring may be optionally substituted independently with one or more, preferably one, two, or three substituents selected from alkyl (wherein the alkyl may be optionally substituted with one or two substituents independently selected from carboxy or ester group), haloalkyl, cycloalkylamino, cycloalkylalkyl, cycloalkylaminoalkyl, cycloalkylalkylaminoalkyl, cyanoalkyl, halo, nitro, cyano, hydroxy, alkoxy, amino, alkylamino, dialkylamino, hydroxyalkyl, carboxyalkyl, aminoalkyl, alkylaminoalkyl, dialkylaminoalkyl, aralkyl, heteroaralkyl, aryl, heteroaryl, aralkyl, heteroaralkyl, saturated or unsaturated heterocycloamino, saturated or unsaturated heterocycloaminoalkyl, and \(-\text{COR}_\text{d}\) (where \(\text{R}_\text{d}\) is alkyl). More specifically the term heterocyclyl includes, but is not limited to, tetrahydropyranyl, 2,2-dimethyl-1,3-dioxolane, piperidino, N-methylpiperidin-3-yl, piperazino, N-methylpyrrolidin-3-yl, pyrrolidino, morpholino, 4-cyclopropylmethylpiperazino, thiomorpholino, thiomorpholino-1-oxide, thiomorpholino-1,1-dioxide, 4-ethoxyxycarbonylpiperazino, 3-oxopiperazino, 2-imidazolidone, 2-pyrrolidinone, 2-oxohomopiperazino, tetrahydropyrimidin-2-one, and the derivatives thereof. In certain embodiments, the heterocycle group is optionally substituted with one or two substituents independently selected from halo, alkyl, alkyl substituted with carboxy, ester, hydroxy, alkylamino, saturated or unsaturated heterocycloamino, saturated or unsaturated heterocycloaminoalkyl, or dialkylamino.

"Optional" or "optionally" means that the subsequently described event or circumstance may but need not occur, and that the description includes instances where the event or circumstance occurs and instances in which it does not. For example, "heterocyclic group optionally substituted with an alkyl group" means that the alkyl may but need not be present, and the
description includes situations where the heterocycle group is substituted with an alkyl group and situations where the heterocycle group is not substituted with the alkyl group.

Lastly, the term “substituted” as used herein means any of the above groups (e.g., alkyl, aryl, heteroaryl, carbocycle, heterocycle, etc.) wherein at least one hydrogen atom is replaced with a substituent. In the case of an oxo substituent (“=O”) two hydrogen atoms are replaced. “Substituents” within the context of this invention include halogen, hydroxy, oxo, cyano, nitro, amino, alkylamino, dialkylamino, alky, alkoxy, thioalkyl, haloalkyl, hydroxyalkyl, aryl, substituted aryl, arylalkyl, substituted arylalkyl, heteroaryl, substituted heteroaryl, heteroarylalkyl, substituted heteroarylalkyl, heterocycle, substituted heterocyclealkyl, substituted heterocyclealkyl, -NR_{e}R_{f}, -NR_{e}C(=O)R_{f}, -NR_{e}C(=O)NR_{e}R_{f}, -NR_{e}C(O)OR_{f}, -NR_{e}SO_{2}R_{f}, -OR_{e}, -C(=O)R_{e} -C(=O)OR_{e}, -C(=O)NR_{e}R_{f}, -OC(=O)NR_{e}R_{f}, -SH, -SR_{e}, -SOR_{e}, -S(=O)_{2}R_{e}, -OS(=O)_{2}R_{e}, -S(=O)_{2}OR_{e}, wherein R_{e} and R_{f} are the same or different and independently hydrogen, alkyl, haloalkyl, substituted alkyl, aryl, substituted aryl, arylalkyl, substituted arylalkyl, heteroaryl, substituted heteroaryl, heteroarylalkyl, substituted heteroarylalkyl, heterocycle, substituted heterocycle, substituted heterocyclealkyl or substituted heterocyclealkyl.

In one embodiment of the invention, ring moiety A of structure (I) is as shown above in (I-A), and the compounds have the following structure (II):

\[
\begin{align*}
&\text{(II)}
\end{align*}
\]

In another embodiment, the present invention provides more specific compounds of structure (II) wherein L_{1} is a direct bond, and the compounds have the following structure (II-1):

-12-
In a more specific aspect of structure II-1 above, Cycl₁ is a heterocycle or substituted heterocycle.

In a more specific aspect of structure II-1 above, Cycl₁ is a heterocycle or substituted heterocycle, and the compounds have the following structures (II-2) to (II-5):

(II-2)  
(II-3)  
(II-4)  
(II-5)

In a more specific aspect of structure (II-2), L₂ is either -C(=S)NH- or -C(=S)NHCH₂-, and the compounds have the structures (II-2-1) and (II-2-2), respectively:

(II-2-1)  
(II-2-2)

In more specific aspects of structure (II-2-1) and (II-2-2) above, X is NH and Z is CH.

In more specific aspects of structure (II-2-1) and (II-2-2) above, L₂ is either -C(=S)NH- or -C(=S)NHCH₂-.
In more specific aspects of structure (II-2-1) and (II-2-2) above, X is NH, Z is CH, L₂ is either -C(=S)NH- or -C(=S)NHCH₂⁻, and the compounds have the following structures (II-2-3) and (II-2-4), respectively:

![Chemical structures](image1)

(II-2-3)  
(II-2-4)

In more specific aspects of structures (II-2-3) and (II-2-4) above, Cycl₂ is selected from:

![Chemical structures](image2)

or

![Chemical structures](image3)

; where w is

![Chemical structures](image4)

In more specific aspects of structure (II-2-3) and (II-2-4), R₁ and R₂ are selected from -OCH₃, -OH, -Cl, -CF₃, or -OC(=O)CH₃, and R₃ is selected from hydrogen or -NH₂.

In a more specific aspect of structure (II-2-3), Cycl₂ is a substituted carbocycle.

In a more specific aspect of structure (II-2-3), Cycl₂ is a substituted carbocycle, and the compounds have the following structure (II-2-5) below:

![Chemical structures](image5)

(II-2-5)
In a more specific aspect of structure (II-2-5), R₁ and R₂ are methoxy, R₃ is H, and the compound has the following structure (II-2-6):

(II-2-6)

In a more specific aspect of structure (II-2-4) above, R₁ and R₂ are methoxy and R₃ is hydrogen.

In a more specific aspect of structure (II-2-4) above, R₁ and R₂ are methoxy, R₃ is hydrogen, and Cycl₂ is:

and the compound has the following structure (II-2-7):

(II-2-7)
In more specific aspects of structure (II-3), Z is CH and X is NH, and the compounds have the following structure (II-3-1):

![Chemical Structure](image)

(II-3-1)

In more specific aspects of structure (II-3-1), \( R_1 \) and \( R_2 \) are methoxy and \( R_3 \) is hydrogen, and the compounds have the following structure (II-3-2):

![Chemical Structure](image)

(II-3-2)

In a more specific aspect of structure (II-3-2) above, \( L_2 \) is \(-\text{NHC(=S)}\text{NH}^-\) or \(-\text{NHC(=O)}^-\) and \( \text{Cycl}_2 \) is:

![Chemical Structure](image)

In a more specific aspect of structure (II-1) above, \( \text{Cycl}_1 \) is not present, \( L_2 \) is a direct bond, and \( \text{Cycl}_2 \) is a heterocycle or substituted heterocycle.

In a more specific aspect of structure (II-1) above, \( \text{Cycl}_1 \) is not present, \( L_2 \) is a direct bond, \( \text{Cycl}_2 \) is a substituted heterocycle, and the compounds have the following structure (II-3-3) below:
In a more specific aspect structure (II-4) above, Z is CH and X is NH, and the compounds have the following structure (II-4-1):

In a more specific aspect structure (II-4-1) above, R₁ and R₂ are methoxy and R₃ is hydrogen, and the compounds have the following structure (II-4-2):

In more specific aspects of structure (II-4-2) above, L₂ is -NHC(=O)NH-, -NHC(=O) - or -HNC(=S)NH-, and Cycl₂ is selected from:
In a more specific aspect of structure (II-1) above, Cycl₁ is not present, L₂ is a direct bond, and Cycl₂ is a heterocycle or substituted heterocycle.

In a more specific aspect of structure (II-1) above, Z is CH, X is NH, Cycl₁ is not present, L₂ is a direct bond and Cycl₂ is a heterocycle or substituted heterocycle.

In a more specific aspect of structure (II-1) above, Z is CH, X is NH, Cycl₁ is not present, L₂ is a direct bond and Cycl₂ is a heterocycle or substituted heterocycle, and the compounds have the following structure (II-4-3) below:

In a more specific aspect of structure (II-4-3) above, w is -NO₂.

In a more specific aspect of structure (II-5) above, Z is CH and X is NH, and the compounds have the following structure (II-5-1):

-18-
In a more specific aspect of structure (II-5-1) above, \( R_1 \) and \( R_2 \) are methoxy and \( R_3 \) is hydrogen, and the compounds have the following structure (II-5-2):

![Structure II-5-2]

In a more specific aspect of structure (II-5-2) above, \( L_2 \) is \(-\text{NHC}(=\text{O})-\) and Cycl_2 is a carbocycle.

In a more specific aspect of structure (II-5-2) above, \( L_2 \) is \(-\text{NHC}(=\text{O})-\) and Cycl_2 is phenyl.

In another embodiment, the present invention provides compounds of structure (II) above wherein \( L_1 \) is \(-\text{NH}-\) or \(-\text{OC}(=\text{S})\text{NH}-\), and the compounds have the following structures (II-6) and (II-7), respectively:

![Structure II-6 and II-7]

In a more specific aspect of structure (II-6), Cycl_1 is a carbocycle or heterocycle, and the compounds have the following structures (II-6-1) to (II-6-6):
In more specific aspects of structure (II-6-1) to (II-6-6), Z is CH, X is NH and the compounds have the following structures (II-6-7) to (II-6-12):

In a more specific aspect of structure (II-6-7) above, R₁ and R₂ are both methoxy, and R₃ is hydrogen.

In a more specific aspect of structure (II-6-7) above, R₁ and R₂ are both methoxy, R₃ is hydrogen, and L₂ is -NHCH₂-, -NHC(=O)- or -NH-.
In a more specific aspect of structure (II-6-7) above, \( R_1 \) and \( R_2 \) are both methoxy, \( R_3 \) is hydrogen, \( L_2 \) is -NHCH$_2$-, -NHC(=O)- or -NH-, and Cycl$_2$ is:

\[
\text{[diagram]}
\]

In a more specific aspect of structure (II-6-8) above, \( R_1 \) and \( R_2 \) are both methoxy, and \( R_3 \) is hydrogen.

In a more specific aspect of structure (II-6-8) above, \( R_1 \) and \( R_2 \) are both methoxy, \( R_3 \) is hydrogen, and \( L_2 \) is -NHCH$_2$-, -NHC(=S)NH-, -NHC(=O)- or -NH-.

In a more specific aspect of structure (II-6-8) above, \( R_1 \) and \( R_2 \) are both methoxy, \( R_3 \) is hydrogen, \( L_2 \) is -NHCH$_2$-, -NHC(=S)NH-, -NHC(=O)- or -NH-, and Cycl$_2$ is:

\[
\text{[diagram]}
\]

In a more specific aspect of structure (II-6-9) above, \( R_1 \) and \( R_2 \) are both methoxy, and \( R_3 \) is hydrogen.

In a more specific aspect of structure (II-6-9) above, \( L_2 \) is -NHC(=O)-.

In a more specific aspect of structure (II-6-9) above, \( R_1 \) and \( R_2 \) are both methoxy, \( R_3 \) is hydrogen, and \( L_2 \) is -NHC(=O)-.

In a more specific aspect of structure (II-6-9) above, Cycl$_2$ is phenyl.

In a more specific aspect of structure (II-6-9) above, \( R_1 \) and \( R_2 \) are both methoxy, \( R_3 \) is hydrogen, \( L_2 \) is -NHC(=O)-, and Cycl$_2$ is phenyl.

In more specific aspects of structures (II-6-10), (II-6-11) and (II-6-12) above, \( R_1 \) and \( R_2 \) are both methoxy, and \( R_3 \) is hydrogen or -NH$_2$.

In more specific aspects of structures (II-6-10), (II-6-11) and (II-6-12) above, \( L_2 \) is -NHC(=S)NH-, -NHC(=S)- or -S(=O)$_2$-.

In more specific aspects of structures (II-6-10), (II-6-11) and (II-6-12) above, Cycl$_2$ is:
wherein \( w \) is \(-\text{NH}_2, -\text{NO}_2\) or:

\[
\text{H} \quad \text{N} \quad \text{H}
\]

In more specific aspects of structures (II-6-10), (II-6-11) and (II-6-12) above, \( R_1 \) and \( R_2 \) are both methoxy, \( R_3 \) is hydrogen or \(-\text{NH}_2\), and \( L_2 \) is \(-\text{NHC}(=\text{S})\text{NH}_2, -\text{NHC}(=\text{S})- \) or \(-\text{S}(=\text{O})_2-\).

In more specific aspects of structure (II-6-10), (II-6-11) and (II-6-12) above, \( R_1 \) and \( R_2 \) are both methoxy, \( R_3 \) is hydrogen or \(-\text{NH}_2\), \( L_2 \) is \(-\text{NHC}(=\text{S})\text{NH}_2, -\text{NHC}(=\text{S})- \) or \(-\text{S}(=\text{O})_2-\), and \( \text{Cycl}_2 \) is:

\[
\text{H} \quad \text{N} \quad \text{H}
\]

wherein \( w \) is \(-\text{NH}_2, -\text{NO}_2\) or:

\[
\text{H} \quad \text{N} \quad \text{H}
\]

In another embodiment relating to structure (I) of the invention, ring moiety \( A \) is as shown above in (I-B), and the compounds having the following structure (III):

\[
\text{(III)}
\]

In another embodiment, the present invention provides compounds of structure (III) in which \( L_1 \) is a direct bond and having structure (III-1) below:
In a more specific aspect of structure (III-1) above, Cycl₁ is a heterocycle.

In a more specific aspect of structure (III-1) above, Cycl₁ is a heterocycle, and the compounds have the structure (III-1-1) below:

In a more specific aspect of structure (III-1-1), R₁ and R₂ are selected from hydrogen, methoxy or hydroxyl, and R₃ is selected from hydrogen or -NH₂, and the compounds have the following structure (III-1-2) below:
In a more specific aspect of structure (III-1-2) above, X is S, O or NH, Z is CH or N.

In a more specific aspect of structure (III-1-2) above, R₁, R₂ and R₃ are hydrogen.

In a more specific aspect of structure (III-1-2) above, X is S, O or NH, Z is CH or N, and R₁, R₂ and R₃ are hydrogen.

In a more specific aspect of structure (III-1-2) above, L₂ is selected from -C(=S)NH-, -C(=S) -, -C(=S)NHCH₂- or -CH₂-.

In a more specific aspect of structure (III-1-2) Cyc₂ is selected from:

\[
\text{\includegraphics[width=0.5\textwidth]{structure1.png}}
\]

In a more specific aspect of structure (III-1-2), X is S, O or NH, Z is CH or N, R₁, R₂ and R₃ are hydrogen, and L₂ is selected from -C(=S)NH-, -C(=S) -, -C(=S)NHCH₂- or -CH₂-.

In a more specific aspect of structure (III-1-2), X is S, O or NH, Z is CH or N, R₁, R₂ and R₃ are hydrogen, L₂ is selected from -C(=S)NH-, -C(=S) -, -C(=S)NHCH₂- or -CH₂-, and Cyc₂ is selected from:

\[
\text{\includegraphics[width=0.5\textwidth]{structure2.png}}
\]

In a more specific aspect of structure (III-1-2) above, Z is CH and X is O.

In a more specific aspect of structure (III-1-2) above, Z is CH, X is O, and L₂ is -C(=S)NHCH₂-.

In a more specific aspect of structure (III-1-2) above, Z is CH, X is O, L₂ is -C(=S)NHCH₂-, and Cyc₂ is:

\[
\text{\includegraphics[width=0.5\textwidth]{structure3.png}}
\]

and the compound has the following structure (III-1-3):
In a more specific aspect of structure (III-1-2) above, Z is N and X is S.

In a more specific aspect of structure (III-1-2) above, Z is N, X is S and R₁, R₂ and R₃ are hydrogen.

In a more specific aspect of structure (III-1-2) above, Z is N, X is S, R₁, R₂ and R₃ are hydrogen, and L₂ is \(-\text{C}(=\text{S})\text{NHCH}_2^\text{−}\).

In a more specific aspect of structure (III-1-2) above, Z is N, X is S, R₁, R₂ and R₃ are hydrogen, L₂ is \(-\text{C}(=\text{S})\text{NHCH}_2^\text{−}\), and Cycl₂ is:

and the compound has the following structure (III-1-4):

In a more specific aspect of structure (III-1-2) above, Z is CH and X is O.

In a more specific aspect of structure (III-1-2) above, Z is CH and X is O, and R₁, R₂ and R₃ are hydrogen.

In a more specific aspect of structure (III-1-2) above, Z is CH and X is O, R₁, R₂ and R₃ are hydrogen, and L₂ is \(-\text{C}(=\text{S})\text{NH}^\text{−}\).
In a more specific aspect of structure (III-1-2) above, Z is CH, X is O, R₁, R₂ and R₃ are hydrogen, L₂ is -C(=S)NH⁻, and Cyc₂ is:

\[
\text{[Diagram of molecular structure]}
\]

and the compound has the following structure (III-1-5):

\[
\text{[Diagram of molecular structure]}
\]

(III-1-5)

In another embodiment relating to compounds of structure (III) above, L₁ is -NH⁻ or -OC(=S)NH⁻, and the compounds have structures (III-2) and (III-3) below:

\[
\text{[Diagram of molecular structure]}
\]

(III-2)

\[
\text{[Diagram of molecular structure]}
\]

(III-3)

In a more specific aspect of structure (III-2), R₁, R₂ and R₃ are hydrogen, and the compounds have structures (III-2-1) and (III-2-2) below:

\[
\text{[Diagram of molecular structure]}
\]

(III-2-1)

\[
\text{[Diagram of molecular structure]}
\]

(III-2-2)
In more specific aspects of structures (III-2-1) and (III-2-2) above, Cycl₁ is selected from:

- [Structure Image]

In more specific aspects of structures (III-2-1) and (III-2-2) above, L₂ is selected from -NH(S)=NH-, -NH(C(=O))-, -NH-, or -NHCH₂-.  
In more specific aspects of structures (III-2-1) and (III-2-2) above, L₂ is selected from -NH(S)=NH-, -NH(C(=O))-, -NH-, or -NHCH₂-, and Cycl₂ is selected from a carbocycle or substituted carbocycle.  
In more specific aspects of structures (III-2-1) and (III-2-2) above, L₂ is selected from -NH(S)=NH-, -NH(C(=O))-, -NH-, or -NHCH₂-, and Cycl₂ is selected from:

- [Structure Image]

In another embodiment relating to structure (I), ring moiety A is as shown above in (I-C), and the compounds have the following structure (IV):

- [Structure Image]

In another embodiment, the present invention provides compounds of structure (IV) wherein L₁ is a direct bond, and the compounds have the following structure (IV-1):
In another embodiment relating to structure (IV-1), Cycl₁ is a heterocycle or substituted heterocycle.

In another embodiment relating to structure (IV-1), Cycl₁ is a heterocycle, and the compounds have the structure (IV-1-1) below:

In a more specific aspect of structure (IV-1-1), R₁ and R₂ are both methoxy, and R₃ is hydrogen.

In a more specific aspect of structure (IV-1-1), R₁ and R₂ are both methoxy, R₃ is hydrogen, and the compounds have the structure (IV-1-2) below:

In a more specific aspect of structures (IV-1-2), L₂ is -C(=S)NH-.
In a more specific aspect of structure (IV-1-2), L₂ is -C(=S)NH- and Cycl₂ is .
and the compound has the following structure (IV-1-3):

(IV-1-3)

In another embodiment relating to compounds of structure (IV) above, L₁ is -NH-, and these compounds of the invention have the structures IV-2 below:

(IV-2)

In a more specific aspect of structure (IV-2), R₁ and R₂ are both from methoxy and R₃ is hydrogen.

In a more specific aspect of structure (IV-2), R₁ and R₂ are both methoxy, R₃ is hydrogen, and Cycl₁ is a heterocycle or substituted heterocycle.

In a more specific aspect of structure (IV-2), R₁ and R₂ are both methoxy, R₃ is hydrogen, and Cycl₁ is a heterocycle, and the compounds have the structure (IV-2-1) below:

(IV-2-1)
In a more specific aspect of structures (IV-2-1), \( L_2 \) is selected from \(-\text{NHC}(=\text{S})\text{NH}_-\), \(-\text{NH}_-\) or \(-\text{NHCH}_2^-\).

In a more specific aspect of structures (IV-2-1), \( L_2 \) is not \(-\text{NHC}(=\text{O})_2^-\).

In a more specific aspect of structures (IV-2-1), \( L_2 \) is selected from \(-\text{NHC}(=\text{S})\text{NH}_-\), \(-\text{NH}_-\) or \(-\text{NHCH}_2^-\) and \( \text{Cycl}_2 \) is selected from:

\[
\begin{array}{c}
\text{Cycl}_2 \\
\end{array}
\]

wherein \( w \) is \( L_4^\text{-Cycl}_4 \), wherein \( L_4 \) is selected from \(-\text{S}(=\text{O})_2\text{NH}_-\), \(-\text{NHC}(=\text{S})\text{NHCH}_2^-\), \(-\text{NHCH}_2^-\) or \(-\text{NHC}(=\text{S})\text{NH}_-\), and wherein \( \text{Cycl}_4 \) is:

\[
\begin{array}{c}
\text{Cycl}_4 \\
\end{array}
\]

Compounds that have the same molecular formula but differ in the nature or sequence of bonding of their atoms or the arrangement of their atoms in space are termed "isomers". Isomers that differ in the arrangement of their atoms in space are termed "stereoisomers". Stereoisomers that are not mirror images of one another are termed "diastereomers" and those that are non-superimposable mirror images of each other are termed "enantiomers". When a compound has an asymmetric center, for example, it is bonded to four different groups, a pair of enantiomers is possible. An enantiomer can be characterized by the absolute configuration of its asymmetric center and is described by the R- and S-sequencing rules of Cahn and Prelog (Cahn, R., Ingold, C., and Prelog, V. Angew. Chem. 78:413-47, 1966; Angew. Chem. Internat. Ed. Eng. 5:385-415, 511, 1966), or by the manner in which the molecule rotates the plane of polarized light and designated as dextrorotatory or levorotatory (i.e., as (+) or (-)-isomers respectively). A chiral compound can exist as either individual enantiomer or as a mixture thereof. A mixture containing equal proportions of the enantiomers is called a "racemic mixture".

The compounds of this invention may possess one or more asymmetric centers; such compounds can therefore be produced as individual (R)- or (S)-stereoisomers or as mixtures thereof. Unless indicated otherwise,
the description or naming of a particular compound in the specification and claims is intended to include both individual enantiomers and mixtures, racemic or otherwise, thereof. The methods for the determination of stereochemistry and the separation of stereoisomers are well-known in the art (see discussion in Ch. 4 of ADVANCED ORGANIC CHEMISTRY, 4th edition, March, J., John Wiley and Sons, New York City, 1992).

The compounds of the present invention may exhibit the phenomena of tautomerism and structural isomerism. For example, the compounds described herein may adopt an E or a Z configuration about the double bond connecting the 2-indolinone moiety to the pyrrole moiety or they may be a mixture of E and Z. This invention encompasses any tautomeric or structural isomeric form and mixtures thereof which possess the ability to modulate aurora-2 kinase activity and is not limited to, any one tautomeric or structural isomeric form.

It is contemplated that a compound of the present invention would be metabolized by enzymes in the body of the organism such as human being to generate a metabolite that can modulate the activity of the protein kinases. Such metabolites are within the scope of the present invention.

The compounds of this invention may be made by one skilled in this field according to the following general reaction schemes, as well as by the more detailed procedures set forth in the Examples.

Substituted tricyclic pyrimido[5,4-b]indole compounds (having structure (I) above where ring moiety A is (I-A)), benzothieno[3,2-d, benzofurano- pyrimidine compounds (having structure (I) above where ring moiety A is (I-B)) and quinazoline compounds (having structure (I) above where ring moiety A is (I-C)) can be prepared as outlined generally in Scheme 1 below.
Chlorination of (un)substituted 6-membered aromatic moieties can be carried out in the presence of sulfuryl chloride at about 0°C. The 4-chloro-(un)substituted benzene (2) can be nitrated to obtain 1-chloro-(un)substituted-2-nitrobenzene (3) with fuming nitric acid, preferably without the temperature exceeding about 25°C. Ethyl 2-cyano-2-(un)substituted-2-nitrophenyl)acetate (4) can be prepared by reacting compound 3 with ethylcyanoacetate in the presence of potassium-tert-butoxide in THF (yielded compound 4 at 23%). Further the yields can be optimized at this stage by reacting compound 3 in the presence of K₂CO₃ in DMF at a temperature of about 155°C for 6 hours to give the ethylcyano ester in high yield. Reduction of ester 4, can be carried out with excess of Zn dust (4-6 eq) using known conditions to give an ethyl 2-amino-5,6-dimethoxy-1H-indole-3-carboxylate (5) without an N-hydroxy side product.

Both the benzofuranopyrimidine and the benzothieno[3,2-d]pyrimidones (I-B) can be prepared by alkylation of (un)substituted-2-cyanophenol (11) with methyl bromoacetate followed by cyclization in the presence of NaH and DMSO, to give the benzofuran (13) in quantitative yields. Similarly, treatment of 2-chloronicotinonitrile (14) with ethyl thioglycolate in the presence of NaH/DMSO gives the cyclic methyl ester (15) in good yields. Cyclization to known dihydro-4H-pyrimido[4,5-b]indoles or the congeners; 3H-Benzofurano[3,2-d]pyrimid-4-one and 3H-thieno[3,2-d]pyrimid-4-one to the corresponding pyrimido[4,5-b]indol-4-ones respectively, can be performed by heating at about 155 to 220 °C in formamide and catalytic sodium methoxide.

The dihydro-pyrimidines can be converted to 4-chlorides (7) in good yields with Vilsmeier's reagent (oxalyl chloride/DMF) or thionyl chloride and/or POCl₃ in dioxane solvent. The 4-chlorides can be utilized in preparing either 4-amino or 4-piprazine substituted tricyclic analogues as outlined in Scheme 1. Condensation of 4-chlorides can then be carried out with substituted aromatic amines to provide various compounds of the invention. The reaction can be carried out in refluxing lower alcohol or DMA with a catalytic amount of dry HCl gas. Similarly the 4-chlorides can be reacted with piprazine in the presence of pyridine at reflux temperature to give compound 8 in good yields. The quinazolines of formula I-C can be prepared by reacting (un)substituted anthranilic acid and formamide at 190 °C to give the dihydro-quinazolines. Under similar conditions to that of tricyclic-dihydropyrimido-indoles, the 4-chloride analogues of quinazolines can be prepared. The substituent at the R₃ position can be obtained by reacting either cyclic ethyl or methyl esters in
presence of cyanoacetamide and dry HCl to give the guanidine analogues 16 and 17. These compounds can be cyclized to 3-substituted tricyclic pyrimidine in presence of aqueous NaOH.

Certain intermediates that can be utilized in the preparation of target compounds are outlined in Scheme 2. The variously substituted aromatic amines can be treated with thiophosgene in CH₂Cl₂/TEA to give thiourea analogue 20 in moderate yields. The compounds of formula I having 4-substituted piprazine analogues can be prepared by reacting compound 20 in the presence of TEA or pyridine. Similarly, 4-substituted aryl analogues can be prepared by utilizing the starting materials as outlined in Scheme 1. The variously substituted aryl chlorides can be reacted with 1,4-diamino or 1-amino-4-nitrobenzene building blocks (with 1,2-heteroatoms in the ring) in presence of TEA to give compound 22.

![Scheme 2](image)

A compound of the present invention or a pharmaceutically acceptable salt thereof, can be administered as such to a human patient or can be administered in pharmaceutical compositions in which the foregoing materials are mixed with suitable carriers or excipient(s). Techniques for formulation and administration of drugs may be found, for example, in Remington's Pharmacological Sciences, Mack Publishing Co., Easton, PA, latest edition.

A "pharmaceutical composition" refers to a mixture of one or more of the compounds described herein, or pharmaceutically acceptable salts or prodrugs thereof, with other chemical components, such as pharmaceutically acceptable excipients. The purpose of a pharmaceutical composition is to facilitate administration of a compound to an organism.

"Pharmaceutically acceptable excipient" refers to an inert substance added to a pharmaceutical composition to further facilitate administration of a compound. Examples, without limitation, of excipients
include calcium carbonate, calcium phosphate, various sugars and types of starch, cellulose derivatives, gelatin, vegetable oils and polyethylene glycols.

"Pharmaceutically acceptable salt" refers to those salts which retain the biological effectiveness and properties of the parent compound. Such salts may include: (1) acid addition salt which is obtained by reaction of the free base of the parent compound with inorganic acids such as hydrochloric acid, hydrobromic acid, nitric acid, phosphoric acid, sulfuric acid, and perchloric acid and the like, or with organic acids such as acetic acid, oxalic acid, (D)- or (L)-malic acid, maleic acid, methanesulfonic acid, ethanesulfonic acid, p-toluenesulfonic acid, salicylic acid, tartaric acid, citric acid, succinic acid or malonic acid and the like, preferably hydrochloric acid or (L)-malic acid; or (2) salts formed when an acidic proton present in the parent compound either is replaced by a metal ion, e.g., an alkali metal ion, an alkaline earth ion, or an aluminum ion; or coordinates with an organic base such as ethanolamine, diethanolamine, triethanolamine, tromethamine, N-methylglucamine, and the like.

The compound of the present invention may also act, or be designed to act, as a prodrug. A "prodrug" refers to an agent, which is converted into the parent drug in vivo. Prodrugs are often useful because, in some situations, they may be easier to administer than the parent drug. They may, for instance, be bioavailable by oral administration whereas the parent drug is not. The prodrug may also have improved solubility in pharmaceutical compositions over the parent drug. An example, without limitation, of a prodrug would be a compound of the present invention, which is, administered as an ester (the "prodrug"), phosphate, amide, carbamate or urea.

"Therapeutically effective amount" refers to that amount of the compound being administered which will relieve to some extent one or more of the symptoms of the disorder being treated. In reference to the treatment of cancer, a therapeutically effective amount refers to that amount which has the effect of: (1) reducing the size of the tumor; (2) inhibiting tumor metastasis; (3) inhibiting tumor growth; and/or (4) relieving one or more symptoms associated with the cancer.

The term "protein kinase-mediated condition" or "disease", as used herein, means any disease or other deleterious condition in which a protein kinase is known to play a role. The term "protein kinase-mediated condition" or "disease" also means those diseases or conditions that are
alleviated by treatment with a protein kinase inhibitor. Such conditions include, without limitation, cancer and other hyperproliferative disorders. In certain embodiments, the cancer is a cancer of colon, breast, stomach, prostate, pancreas, or ovarian tissue.

The term "Aurora-2 kinase-mediated condition" or "disease", as used herein, means any disease or other deleterious condition in which Aurora is known to play a role. The term "Aurora-2 kinase-mediated condition" or "disease" also means those diseases or conditions that are alleviated by treatment with an Aurora-2 inhibitor.

The term "c-kit-mediated condition" or "disease", as used herein, means any disease or other deleterious condition in which c-kit is known to play a role. The term "c-kit-mediated condition" or "disease" also means those diseases or conditions that are alleviated by treatment with a c-kit inhibitor. Such conditions include, without limitation, cancer.

The term "PDGFR-a-mediated condition" or "disease", as used herein, means any disease or other deleterious condition in which PDGFR-a is known to play a role. The term "PDGFR-a-mediated condition" or "disease" also means those diseases or conditions that are alleviated by treatment with a PDGFR-a inhibitor. Such conditions include, without limitation, cancer.

As used herein, "administer" or "administration" refers to the delivery of an inventive compound or of a pharmaceutically acceptable salt thereof or of a pharmaceutical composition containing an inventive compound or a pharmaceutically acceptable salt thereof of this invention to an organism for the purpose of prevention or treatment of a protein kinase-related disorder.

Suitable routes of administration may include, without limitation, oral, rectal, transmucosal or intestinal administration or intramuscular, subcutaneous, intramedullary, intrathecal, direct intraventricular, intravenous, intravitreal, intraperitoneal, intranasal, or intraocular injections. In certain embodiments, the preferred routes of administration are oral and intravenous.

Alternatively, one may administer the compound in a local rather than systemic manner, for example, via injection of the compound directly into a solid tumor, often in a depot or sustained release formulation.

Furthermore, one may administer the drug in a targeted drug delivery system, for example, in a liposome coated with tumor-specific antibody. In this way, the liposomes may be targeted to and taken up selectively by the tumor.
Pharmaceutical compositions of the present invention may be manufactured by processes well known in the art, e.g., by means of conventional mixing, dissolving, granulating, dragee-making, levigating, emulsifying, encapsulating, entrapping or lyophilizing processes.

Pharmaceutical compositions for use in accordance with the present invention may be formulated in any conventional manner using one or more physiologically acceptable carriers comprising excipients and auxiliaries which facilitate processing of the active compounds into preparations which can be used pharmaceutically. Proper formulation is dependent upon the route of administration chosen.

For injection, the compounds of the invention may be formulated in aqueous solutions, preferably in physiologically compatible buffers such as Hanks' solution, Ringer's solution, or physiological saline buffer. For transmucosal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art.

For oral administration, the compounds can be formulated by combining the active compounds with pharmaceutically acceptable carriers well known in the art. Such carriers enable the compounds of the invention to be formulated as tablets, pills, lozenges, dragees, capsules, liquids, gels, syrups, slurries, suspensions and the like, for oral ingestion by a patient. Pharmaceutical preparations for oral use can be made using a solid excipient, optionally grinding the resulting mixture, and processing the mixture of granules, after adding other suitable auxiliaries if desired, to obtain tablets or dragee cores. Useful excipients are, in particular, fillers such as sugars, including lactose, sucrose, mannitol, or sorbitol, cellulose preparations such as, for example, maize starch, wheat starch, rice starch and potato starch and other materials such as gelatin, gum tragacanth, methyl cellulose, hydroxypropylmethyl-cellulose, sodium carboxymethylcellulose, and/or polyvinyl-pyrrolidone (PVP). If desired, disintegrating agents may be added, such as cross-linked polyvinyl pyrrolidone, agar, or alginic acid. A salt such as sodium alginate may also be used.

Dragée cores are provided with suitable coatings. For this purpose, concentrated sugar solutions may be used which may optionally contain gum arabic, talc, polyvinyl pyrrolidone, carbopol gel, polyethylene glycol, and/or titanium dioxide, lacquer solutions, and suitable organic solvents.
or solvent mixtures. Dyestuffs or pigments may be added to the tablets or dragee coatings for identification or to characterize different combinations of active compound doses.

Pharmaceutical compositions which can be used orally include push-fit capsules made of gelatin, as well as soft, sealed capsules made of gelatin and a plasticizer, such as glycerol or sorbitol. The push-fit capsules can contain the active ingredients in admixture with a filler such as lactose, a binder such as starch, and/or a lubricant such as talc or magnesium stearate and, optionally, stabilizers. In soft capsules, the active compounds may be dissolved or suspended in suitable liquids, such as fatty oils, liquid paraffin, or liquid polyethylene glycols. Stabilizers may be added in these formulations, also. Pharmaceutical compositions which may also be used include hard gelatin capsules. The capsules or pills may be packaged into brown glass or plastic bottles to protect the active compound from light. The containers containing the active compound capsule formulation are preferably stored at controlled room temperature (15-30°C).

For administration by inhalation, the compounds for use according to the present invention may be conveniently delivered in the form of an aerosol spray using a pressurized pack or a nebulizer and a suitable propellant, e.g., without limitation, dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane or carbon dioxide. In the case of a pressurized aerosol, the dosage unit may be controlled by providing a valve to deliver a metered amount. Capsules and cartridges of, for example, gelatin for use in an inhaler or insufflator may be formulated containing a powder mix of the compound and a suitable powder base such as lactose or starch.

The compounds may also be formulated for parenteral administration, e.g., by bolus injection or continuous infusion. Formulations for injection may be presented in unit dosage form, e.g., in ampoules or in multidose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulating materials such as suspending, stabilizing and/or dispersing agents.

Pharmaceutical compositions for parenteral administration include aqueous solutions of a water soluble form, such as, without limitation, a salt, of the active compound. Additionally, suspensions of the active compounds may be prepared in a lipophilic vehicle. Suitable lipophilic vehicles include fatty oils
such as sesame oil, synthetic fatty acid esters such as ethyl oleate and triglycerides, or materials such as liposomes. Aqueous injection suspensions may contain substances which increase the viscosity of the suspension, such as sodium carboxymethyl cellulose, sorbitol, or dextran. Optionally, the suspension may also contain suitable stabilizers and/or agents that increase the solubility of the compounds to allow for the preparation of highly concentrated solutions.

Alternatively, the active ingredient may be in powder form for constitution with a suitable vehicle, e.g., sterile, pyrogen-free water, before use.

The compounds may also be formulated in rectal compositions such as suppositories or retention enemas, using, e.g., conventional suppository bases such as cocoa butter or other glycerides.

In addition to the formulations described previously, the compounds may also be formulated as depot preparations. Such long acting formulations may be administered by implantation (for example, subcutaneously or intramuscularly) or by intramuscular injection. A compound of this invention may be formulated for this route of administration with suitable polymeric or hydrophobic materials (for instance, in an emulsion with a pharmacologically acceptable oil), with ion exchange resins, or as a sparingly soluble derivative such as, without limitation, a sparingly soluble salt.

A non-limiting example of a pharmaceutical carrier for the hydrophobic compounds of the invention is a cosolvent system comprising benzyl alcohol, a nonpolar surfactant, a water-miscible organic polymer and an aqueous phase such as the VPD cosolvent system. VPD is a solution of 3% w/v benzyl alcohol, 8% w/v of the nonpolar surfactant polysorbate 80, and 65% w/v polyethylene glycol 300, made up to volume in absolute ethanol. The VPD cosolvent system (VPD:D5W) consists of VPD diluted 1:1 with a 5% dextrose in water solution. This cosolvent system dissolves hydrophobic compounds well, and itself produces low toxicity upon systemic administration. Naturally, the proportions of such a cosolvent system may be varied considerably without destroying its solubility and toxicity characteristics. Furthermore, the identity of the cosolvent components may be varied: for example, other low-toxicity nonpolar surfactants may be used instead of polysorbate 80, the fraction size of polyethylene glycol may be varied, other biocompatible polymers may replace polyethylene glycol, e.g., polyvinyl pyrrolidone, and other sugars or polysaccharides may substitute for dextrose.
Alternatively, other delivery systems for hydrophobic pharmaceutical compounds may be employed. Liposomes and emulsions are well-known examples of delivery vehicles or carriers for hydrophobic drugs. In addition, certain organic solvents such as dimethylsulfoxide also may be employed, although often at the cost of greater toxicity.

Additionally, the compounds may be delivered using a sustained-release system, such as semipermeable matrices of solid hydrophobic polymers containing the therapeutic agent. Various sustained-release materials have been established and are well known by those skilled in the art. Sustained-release capsules may, depending on their chemical nature, release the compounds for a few weeks up to over 100 days. Depending on the chemical nature and the biological stability of the therapeutic reagent, additional strategies for protein stabilization may be employed.

The pharmaceutical compositions herein also may comprise suitable solid or gel phase carriers or excipients. Examples of such carriers or excipients include, but are not limited to, calcium carbonate, calcium phosphate, various sugars, starches, cellulose derivatives, gelatin, and polymers such as polyethylene glycols.

Many of the protein kinase-modulating compounds of the invention may be provided as physiologically acceptable salts wherein the claimed compound may form the negatively or the positively charged species. Examples of salts in which the compound forms the positively charged moiety include, without limitation, quaternary ammonium (defined elsewhere herein), salts such as the hydrochloride, sulfate, carbonate, lactate, tartrate, malate, maleate, succinate wherein the nitrogen atom of the quaternary ammonium group is a nitrogen of the selected compound of this invention which has reacted with the appropriate acid. Salts in which a compound of this invention forms the negatively charged species include, without limitation, the sodium, potassium, calcium and magnesium salts formed by the reaction of a carboxylic acid group in the compound with an appropriate base (e.g. sodium hydroxide (NaOH), potassium hydroxide (KOH), calcium hydroxide (Ca(OH)₂), etc.).

Pharmaceutical compositions suitable for use in the present invention include compositions wherein the active ingredients are contained in an amount sufficient to achieve the intended purpose, e.g., the modulation of protein kinase activity and/or the treatment or prevention of a protein kinase-related disorder.
More specifically, a therapeutically effective amount means an amount of compound effective to prevent, alleviate or ameliorate symptoms of disease or prolong the survival of the subject being treated.

Determination of a therapeutically effective amount is well within the capability of those skilled in the art, especially in light of the detailed disclosure provided herein.

For any compound used in the methods of the invention, the therapeutically effective amount or dose can be estimated initially from cell culture assays. Then, the dosage can be formulated for use in animal models so as to achieve a circulating concentration range that includes the IC$_{50}$ as determined in cell culture (i.e., the concentration of the test compound which achieves a half-maximal inhibition of the protein kinase activity). Such information can then be used to more accurately determine useful doses in humans.

Toxicity and therapeutic efficacy of the compounds described herein can be determined by standard pharmaceutical procedures in cell cultures or experimental animals, e.g., by determining the IC$_{50}$ and the LD$_{50}$ (both of which are discussed elsewhere herein) for a subject compound. The data obtained from these cell culture assays and animal studies can be used in formulating a range of dosage for use in humans. The dosage may vary depending upon the dosage form employed and the route of administration utilized. The exact formulation, route of administration and dosage can be chosen by the individual physician in view of the patient's condition. (See, e.g., GOODMAN & GILMAN'S THE PHARMACOLOGICAL BASIS OF THERAPEUTICS, Ch. 3, 9th ed., Ed. by Hardman, J., and Limbard, L., McGraw-Hill, New York City, 1996, p.46.)

Dosage amount and interval may be adjusted individually to provide plasma levels of the active species which are sufficient to maintain the kinase modulating effects. These plasma levels are referred to as minimal effective concentrations (MECs). The MEC will vary for each compound but can be estimated from in vitro data, e.g., the concentration necessary to achieve 50-90% inhibition of a kinase may be ascertained using the assays described herein. Dosages necessary to achieve the MEC will depend on individual characteristics and route of administration. HPLC assays or bioassays can be used to determine plasma concentrations.
Dosage intervals can also be determined using MEC value. Compounds should be administered using a regimen that maintains plasma levels above the MEC for 10-90% of the time, preferably between 30-90% and most preferably between 50-90%.

At present, the therapeutically effective amounts of compounds of the present invention may range from approximately 2.5 mg/m² to 1500 mg/m² per day. Additional illustrative amounts range from 0.2-1000 mg/qid, 2-500 mg/qid, and 20-250 mg/qid.

In cases of local administration or selective uptake, the effective local concentration of the drug may not be related to plasma concentration, and other procedures known in the art may be employed to determine the correct dosage amount and interval.

The amount of a composition administered will, of course, be dependent on the subject being treated, the severity of the affliction, the manner of administration, the judgment of the prescribing physician, etc.

The compositions may, if desired, be presented in a pack or dispenser device, such as an FDA approved kit, which may contain one or more unit dosage forms containing the active ingredient. The pack may for example comprise metal or plastic foil, such as a blister pack. The pack or dispenser device may be accompanied by instructions for administration. The pack or dispenser may also be accompanied by a notice associated with the container in a form prescribed by a governmental agency regulating the manufacture, use or sale of pharmaceuticals, which notice is reflective of approval by the agency of the form of the compositions or of human or veterinary administration. Such notice, for example, may be of the labeling approved by the U.S. Food and Drug Administration for prescription drugs or of an approved product insert. Compositions comprising a compound of the invention formulated in a compatible pharmaceutical carrier may also be prepared, placed in an appropriate container, and labeled for treatment of an indicated condition. Suitable conditions indicated on the label may include treatment of a tumor, inhibition of angiogenesis, treatment of fibrosis, diabetes, and the like.

As mentioned above, the compounds and compositions of the invention will find utility in a broad range of diseases and conditions mediated by protein kinases, including diseases and conditions mediated by aurora-2 kinase, c-kit and/or PDGFR-a. Such diseases may include by way of example
and not limitation, cancers such as lung cancer, NSCLC (non small cell lung cancer), oat-cell cancer, bone cancer, pancreatic cancer, skin cancer, dermatofibrosarcoma protuberans, cancer of the head and neck, cutaneous or intraocular melanoma, uterine cancer, ovarian cancer, colo-rectal cancer, cancer of the anal region, stomach cancer, colon cancer, breast cancer, gynecologic tumors (e.g., uterine sarcomas, carcinoma of the fallopian tubes, carcinoma of the endometrium, carcinoma of the cervix, carcinoma of the vagina or carcinoma of the vulva), Hodgkin's Disease, hepatocellular cancer, cancer of the esophagus, cancer of the small intestine, cancer of the endocrine system (e.g., cancer of the thyroid, pancreas, parathyroid or adrenal glands), sarcomas of soft tissues, cancer of the urethra, cancer of the penis, prostate cancer (particularly hormone-refractory), chronic or acute leukemia, solid tumors of childhood, hypereosinophilia, lymphocytic lymphomas, cancer of the bladder, cancer of the kidney or ureter (e.g., renal cell carcinoma, carcinoma of the renal pelvis), pediatric malignancy, neoplasms of the central nervous system (e.g., primary CNS lymphoma, spinal axis tumors, medulloblastoma, brain stem gliomas or pituitary adenomas), Barrett's esophagus (pre-malignant syndrome), neoplastic cutaneous disease, psoriasis, mycoses fungoides, and benign prostatic hypertrophy, diabetes related diseases such as diabetic retinopathy, retinal ischemia, and retinal neovascularization, hepatic cirrhosis, angiogenesis, cardiovascular disease such as atherosclerosis, immunological disease such as autoimmune disease and renal disease.

The inventive compound can be used in combination with one or more other chemotherapeutic agents. The dosage of the inventive compounds may be adjusted for any drug-drug reaction. In one embodiment, the chemotherapeutic agent is selected from the group consisting of mitotic inhibitors, alkylating agents, anti-metabolites, cell cycle inhibitors, enzymes, topoisomerase inhibitors such as CAMPTOSAR (irinotecan), biological response modifiers, anti-hormones, antiangiogenic agents such as MMP-2, MMP-9 and COX-2 inhibitors, anti-androgens, platinum coordination complexes (cisplatin, etc.), substituted ureas such as hydroxyurea; methylhydrazine derivatives, e.g., procarbazine; adrenocortical suppressants, e.g., mitotane, aminogluthethimide, hormone and hormone antagonists such as the adrenocorticosteroids (e.g., prednisone), progestins (e.g., hydroxyprogesterone caproate), estrogens (e.g., diethylstilbestrol), antiestrogens such as tamoxifen,
androgens, e.g., testosterone propionate, and aromatase inhibitors, such as
anastrozole, and AROMASIN (exemestane).

Examples of alkylating agents that the above method can be
carried out in combination with include, without limitation, fluorouracil (5-FU)
alone or in further combination with leukovorin; other pyrimidine analogs such as
UFT, capecitabine, gemcitabine and cytarabine, the alkyl sulfonates, e.g.,
busulfan (used in the treatment of chronic granulocytic leukemia), imposulfan
and piposulfan; aziridines, e.g., benzodepa, carboquone, meturedepa and
uredepa; ethyleneimines and methylmelamines, e.g., altretamine,
triethylenemelamine, triethylene phosphoramide, triethylenethiophosphoramide
and trimethylolmelamine; and the nitrogen mustards, e.g., chlorambucil (used in
the treatment of chronic lymphocytic leukemia, primary macroglobulinemia and
non-Hodgkin's lymphoma), cyclophosphamide (used in the treatment of
Hodgkin's disease, multiple myeloma, neuroblastoma, breast cancer, ovarian
cancer, lung cancer, Wilms tumor and rhabdomyosarcoma), estramustine,
ifosfamide, novembrichin, prednimustine and uracil mustard (used in the
treatment of primary thrombocytosis, non-Hodgkin's lymphoma, Hodgkin's
disease and ovarian cancer); and triazines, e.g., dacarbazine (used in the
treatment of soft tissue sarcoma).

Examples of antimetabolite chemotherapeutic agents that the
above method can be carried out in combination with include, without limitation,
folic acid analogs, e.g., methotrexate (used in the treatment of acute
lymphocytic leukemia, choriocarcinoma, mycosis fungoides, breast cancer,
head and neck cancer and osteogenic sarcoma) and pteropterin; and the purine
analogs such as mercaptopurine and thioguanine which find use in the
treatment of acute granulocytic, acute lymphocytic and chronic granulocytic
leukemias.

Examples of natural product-based chemotherapeutic agents that
the above method can be carried out in combination with include, without
limitation, the vinca alkaloids, e.g., vinblastine (used in the treatment of breast
and testicular cancer), vincristine and vindesine; the epipodophyllotoxins, e.g.,
etoposide and teniposide, both of which are useful in the treatment of testicular
cancer and Kaposi's sarcoma; the antibiotic chemotherapeutic agents, e.g.,
daunorubicin, doxorubicin, epirubicin, mitomycin (used to treat stomach, cervix,
colon, breast, bladder and pancreatic cancer), dactinomycin, temozolomide,
plicamycin, bleomycin (used in the treatment of skin, esophagus and
genitourinary tract cancer); and the enzymatic chemotherapeutic agents such as L-asparaginase.

Examples of useful COX-II inhibitors include Vioxx, CELEBREX (celecoxib), valdecoxib, paracoxib, rofecoxib, and Cox 189.

Some specific examples of MMP inhibitors useful in the present invention are AG-3340, RO 32-3555, RS 13-0830, and compounds selected from: 3-[[4-(4-fluoro-phenoxy)-benzenesulfonyl]-(1-hydroxycarbamoyl-cyclopentyl)- amino]-propionic acid; 3-exo-3-[4-(4-fluoro-phenoxy)-benzenesulfonylamino]-8-oxa-bicyclo[3.2.1]octane-3-carboxylic acid hydroxyamide; (2R,3R) 1-[4-(2-chloro-4-fluoro-benzylxoy)-benzenesulfonyl]-3-hydroxy-3-methyl-piperidine-2-carboxylic acid hydroxyamide; 4-[4-(4-fluoro-phenoxy)-benzenesulfonylamino]-tetrahydro-pyran-4-carboxylic acid hydroxyamide; 3-[4-(4-fluoro-phenoxy)-benzenesulfonyl]-(1-hydroxycarbamoyl-cyclobutyl)- amino]-propionic acid; 4-[4-(4-chloro-phenoxy)-benzenesulfonylamino]-tetrahydro-pyran-4-carboxylic acid hydroxyamide; (R) 3-
[4-(4-chloro-phenoxy)-benzenesulfonylamino]-tetrahydro-pyran-3-carboxylic acid hydroxyamide; (2R,3R) 1-[4-(4-fluoro-2-methylbenzyl oxy)-benzenesulfonyl]-3-hydroxy-3-methyl-piperidine-2-carboxylic acid hydroxyamide; 3-[[4-(4-fluoro-phenoxy)-benzenesulfonyl]-(1-hydroxycarbamoyl-1-methyl-ethyl)-amino]-propionic acid; 3-[[4-(4-fluorophenoxy)-benzenesulfonyl]-(4-hydroxycarbamoyl-tetrahydro-pyran-4-yl)-amino]-propionic acid; 3-exo-3-[4-(4-chloro-phenoxy)-benzenesulfonylamino]-8-oxabicyclo[3.2.1]octane-3-carboxylic acid hydroxyamide; 3-endo-3-[4-(4-fluorophenoxy)-benzenesulfonylamino]-8-oxa-bicyclo[3.2.1]octane-3-carboxylic acid hydroxyamide; and (R) 3-[4-(4-fluoro-phenoxy)-benzenesulfonylamino]-tetrahydro-furan-3-carboxylic acid hydroxyamide; and pharmaceutically acceptable salts and solvates of these compounds.

Other anti-angiogenesis agents, other COX-II inhibitors and other MMP inhibitors, can also be used in the present invention.

An inventive compound can also be used with other signal transduction inhibitors, such as agents that can inhibit EGFR (epidermal growth factor receptor) responses, such as EGFR antibodies, EGF antibodies, and molecules that are EGFR inhibitors; VEGF (vascular endothelial growth factor) inhibitors; and erbB2 receptor inhibitors, such as organic molecules or antibodies that bind to the erbB2 receptor, such as HERCEPTIN (Genentech, Inc., South San Francisco, CA). EGFR inhibitors are described in, for example in WO 95/19970 (published Jul. 27, 1995), WO 98/14451 (published Apr. 9, 1998), WO 98/02434 (published Jan. 22, 1998), and U.S. Pat. No. 5,747,498 (issued May 5, 1998), and such substances can be used in the present invention as described herein.

EGFR-inhibiting agents include, but are not limited to, the monoclonal antibodies C225 and anti-EGFR 22Mab (ImClone Systems, Inc., New York, NY), the compounds ZD-1839 (AstraZeneca), BIBX-1382 (Boehringer Ingelheim), MDX-447 (Medarex Inc., Annandale, NJ), and OLX-103 (Merck & Co., Whitehouse Station, NJ), and EGF fusion toxin (SeraGen Inc., Hopkinton, MA).

These and other EGFR-inhibiting agents can be used in the present invention. VEGF inhibitors, for example SU-5416 and SU-6668 (Sugen Inc., South San Francisco, CA), can also be combined with an inventive compound. VEGF inhibitors are described in, for example, WO 01/60814 A3 (published Aug. 23, 2001), WO 99/24440 (published May 20, 1999), PCT

An inventive compound can also be used with other agents useful in treating cancer, including, but not limited to, agents capable of enhancing antitumor immune responses, such as CTLA4 (cytotoxic lymphocyte antigen 4) antibodies, and other agents capable of blocking CTLA4; and anti-proliferative agents such as other farnesyl protein transferase inhibitors, for example the
farnesyl protein transferase inhibitors described in the references cited in the "Background" section, of U.S. Pat. No., 6,258,824 B1.

The above method can be also be carried out in combination with radiation therapy, wherein the amount of an inventive compound in combination with the radiation therapy is effective in treating the above diseases.

Techniques for administering radiation therapy are known in the art, and these techniques can be used in the combination therapy described herein. The administration of the compound of the invention in this combination therapy can be determined as described herein.

The invention will be better understood upon consideration of the following non-limiting Examples.

EXAMPLES

A structure-based design approach was used employing three-dimensional structural modeling of protein kinase catalytic sites and their binding relationship with inhibitor compounds to design the inventive compounds described herein. Homology modeling of protein kinases has been used to predict and analyze the three-dimensional structures of these proteins. A suite of programs that employs PSI-BLAST (NCBI), THREADER (HGMP Resource Center, Hinxton, Cambs, CB10 1SA, UK), 3D-PSSM (three-dimensional position scoring matrix) (HGMP) and SAP programs was used to determine the optimal template for homology modeling of aurora-1 and aurora-2 kinases, c-kit tyrosine kinase receptor and PDGFR-A. The crystal structure of the activated form of bovine cAMP-dependent protein kinase was identified as the best template and subsequently used for aurora kinase homology modeling using molecular dynamics (MD) simulations in INSIGHT II (version 2000, Accelrys Inc.) running on an Indigo2 workstation (Silicon Graphics, Inc.). The modeled aurora-2 structure was docked with known S/T kinase and aurora-2 kinase inhibitors using the binary complex of cAMP-dependent PK-Mn\(^{2+}\)-adenyllyl imidodiphosphate (AMP-PNP). The calculated binding energies from the docking analysis are in agreement with experimental IC\(_{50}\) values obtained from an in vitro kinase assay, which uses histone H1 or myelin basic protein (MBP) phosphorylation to assess inhibitory activity. The aurora-2 structural model provided a rational basis for site-directed mutagenesis studies of the active site and in silico screening of chemical databases, thereby allowing the design of novel aurora-2 kinase inhibitors described herein, e.g., pyrimido[4,5-
b) indoles, benzothieno[3,2-d]pyrimidones, benzofuranopyrimidines and 6,7-quinazolines.

The crystal structures of the activated forms of VEGFR2 and FGFR1 protein kinase receptors were identified as the best templates and subsequently used for c-kit homology modeling using molecular dynamics (MD) simulations in INSIGHT II (version 2000, Accelrys Inc.) running on an Indigo2 workstation (Silicon Graphics, Inc.). Then the modeled c-kit binding site structure was docked with known c-kit inhibitors (STI571, CT52923, PD173955 and SU5614).

The c-kit structural model provided a basis for electronically mutating the active site and using another computer program to screen chemical databases, thereby allowing the design of novel c-kit kinase inhibitors. For example, on the basis of docking chemicals in the active site, it was determined that certain compound classes (4-piprazinylpyrimido [4,5-b]indoles, benzothieno [3,2-d], benzofuranopyrimidines and quinazolines containing analogs, see FIG. 12) could replace the 6,7-dimethoxy quinazoline and the adenine base of ATP, thereby allowing new hydrogen bonding and hydrophobic interactions within the ATP binding pocket.

EXAMPLE 1

Aurora Sequence and Structure Analysis

A PSI-BLAST search (NCBI) was performed with the sequence of the kinase portion of human aurora-1 and aurora-2 kinases and high sequence similarities were found to porcine heart bovine cAMP-dependent kinase (PDB code 1CDK), murine cAMP-dependent kinase (1APM), and C. elegans twitchin kinase (1KOA), whose three-dimensional structures have been solved. The three manually aligned S/T kinase domain sequences with their respective secondary structures were viewed in Clustal X (FIG. 2).

The aurora-1 or aurora-2 sequences were inputted into the tertiary structure prediction programs THREADER and 3D-PSSM, which compare primary sequences with all of the known three-dimensional structures in the Brookhaven Protein Data Bank. The output is composed of the optimally aligned, lowest-energy, three-dimensional structures that are similar to the aurora kinases. The top structural matches were bovine 1CDK, murine 1APM and 1KOA, confirming that the aurora kinase proteins are structurally conserved.
EXAMPLE 2

Aurora Homology Modeling

The 1CDK, 1APM and 1KO8 tertiary structures provided the three-dimensional templates for the homology modeling of aurora-1 and aurora-2 kinases. The crystal structure coordinates for the above serine/tyrosine kinase domains were obtained from the Protein Data Bank. These domains were pair-wise superimposed onto each other using the program SAP. The structural alignments produced by the SAP program were fine-tuned manually to better match residues within the regular secondary structural elements.

Structural models were built of aurora-1 and 2 using 1CDK as the template structure. The final aurora-2 model (FIG. 3) was analyzed using Profile-3D. The Profile-3D and 3D-1D score plots of the model were positive over the entire length of protein in a moving-window scan to the template structure. Additionally, the PROCHECK program was used to verify the correct geometry of the dihedral angles and the handedness of the aurora-2 model.

EXAMPLE 3

Aurora Molecular Dynamics (MD) and Docking Analysis

MD simulations were performed in the canonical ensemble (NVT) at 300°K using the CFF force field implemented in the Discover_3 program (version 2.9.5). Dynamics were equilibrated for 10 picoseconds with time steps of 1 femtosecond and continued for 10-picosecond simulations. A nonbonded cutoff distance of 8Å and a distance-dependent dielectric constant (ε = 5rij) for water were used to simulate the aqueous media. All of the bonds to hydrogen were constrained. Dynamic trajectories were recorded every 0.5 picoseconds for analysis. The resulting low energy structure was extracted and energy-minimized to 0.001 kcal/mol/Å. To examine the conformational changes that occur during MD, the root mean square (rms) deviations were calculated from trajectories at 0.5-picosecond intervals and compared to the Cα backbone of cAMP-dependent PK. The rms deviation for the two superimposed structures was 0.42 Å. Furthermore, the rms deviations were calculated for the protein backbone (0.37 Å) and the active-site pocket (0.41 Å) and were compared with crystal structure before the docking experiments. The resulting aurora-2 structure served as the starting model for docking studies.
For docking analysis, the ligand structures were obtained from five crystal structure complexes of cAMP-dependent PK bound with AMP-PNP, staurosporine, H-89, H-7, or H-8 and from structures that were empirically built and energy minimized (KN-93, ML-7, and 6,7-dimethoxyquinazoline) (FIG. 4) in the INSIGHT II program. The heavy atoms from AMP-PNP were used as sphere centers for the docking procedures. Docking simulations were performed at 500° K with 100 femtosecond/stage (total of 50 stages), quenching the system to a final temperature of 300° K. The whole complex structure was energy minimized using 1000 steps. This provided 10 structures from the simulated annealing (SA) docking, and their generated conformers were clustered according to rms deviation. The lowest global structure complexes were used to calculate intermolecular binding energies.

EXAMPLE 4
Design Strategy for Aurora-2 Kinase Inhibitors

Based on the binding mode of several competitive inhibitors of aurora-2 kinase depicted in FIG. 5, we explored the structural moieties required for aurora-2 kinase inhibition. The structures are shown superimposed. The enzyme active site has been clipped. We evaluated the functional relationship among the known serine/threonine kinase inhibitors by structure-based design and molecular modeling approaches. In aurora-2 kinase, the NH and C=O groups in Glu211 and Ala213 and the Gly-rich pocket residues appear to be most important in inhibitor binding. These structures are hydrogen-bond donors/acceptors and are in all reported S/T kinase structures. Residues Asp274 and Lys141 are also very important in hydrogen bonding. Additionally, our modeling indicated that the flat aromatic rings of the aurora-2 inhibitors occupy the ATP binding pocket around Glu211 and are surrounded by residues Val147 and Ala213. Also, structural alignments of known S/T kinase inhibitors show two shared structural motifs with similarly placed nitrogens and six-membered aromatic rings, suggesting that these compounds have similar binding patterns.

To identify new chemicals that satisfy these structural requirements, a de novo design approach was employed using the graphical chemical modeling program LUDI (Accelrys). Initially, lead structures (purine base, quinazoline, isoquinazoline and indole rings) were dissected into core templates and two additional fragments (FIG. 6), which formed the basis of a
built-in compound library. Then template structures were obtained from the Available Chemical Directory (ACD). The compounds with molecular weight >350 were selected, and chemical skeletons or functional groups that were unacceptable for the development of lead compounds were omitted from the library. An in-house compound library containing the identified templates was built and utilized in LUDI search procedures. Additionally, three tricyclic quinazoline type templates were identified apart from the isoquinolines and quinazolines. From the LUDI fragment library, structurally similar fragments were obtained for fragments 1 and 2 (FIG. 6). Fragment selection was based on the following criteria: (1) molecular weight <350, (2) at least two hydrogen bond donor/acceptor groups, (3) at least three rings, and (4) correct position and orientation with respect to lead compounds within the ATP binding pocket. The template and fragments were linked in LUDI link mode to confirm their binding mode for the newly built structures. Several combinations of structures were designed by keeping the required pharmacophores identified from ACD and LUDI fragment searches. More than 90 compounds were built using this structure-based scaffold approach. Further, these compounds were screened to exclude molecules that were not complementary to the ATP binding pocket by the FlexX docking method (Tripos, St. Louis, MO). Forty-two compounds (FIGs. 7A-7D) were found to have the optimal number of H-bonds, position and orientation within the ATP binding pocket and FlexX scoring.

EXAMPLE 5

Chemical Synthesis of Kinase Inhibitors

General Methods. ¹HNMR was run on a Unity 300-MHz NMR Spectrophotometer (Varian, Palo Alto, CA). The chemical shifts are relative to the trace proton signals of the deuterated solvent. Coupling constants, J, are reported in Hz and refer to apparent peak multiplicity rather than coupling constants. Fast atom bombardment (FAB) measurements have been carried out on a mass spectrometer HX-110 instrument (JEOL, Akishima, Japan) equipped with a conventional Xe gun. A mixture matrix of glycerol:thioglycerol:mNBA (meta-nitrobenzyl alcohol) 50:25:25 containing 0.1% of trifluoroacetic acid (TFA) was used as the matrix for fast atom bombardment (FAB). For accurate mass measurements, polyethylene glycol (PEG) was used as the internal standard. Flash column chromatography was performed on silica gel 60, purchased from Spectrum. Combustion analysis
(CHNS) was performed by Desert Analytics Laboratory, Tucson, AZ. Synthesis of 4-chloro-6,7-dimethoxyquinazoline, 4-chloro-benzothieno[3,2-d]pyrimidone, 4-chloro-benzofuranopyrimidone and 4-chloropyrimido[4,5-b]indole is carried out by reaction with various dihydro-quinazolines using formamide HCl/formamide at 180-190°C followed by the addition of Vilsmeier’s reagent to obtain 4-chloro-quinazolines. General methods for synthesizing these building blocks are illustrated in FIG. 8.

The 4-chloro-quinazoline building blocks are reacted with 2-amino-5-nitropyrimidines, and various unsubstituted o-, m- or p-6-membered aromatic rings, or containing a direct bond, NHCO, NHCSNH, SO₂NH, NHSO₂, NHCH₂Ph, aminopyrazoles, amino-substituted oxadiazoles, thiadiazoles or triazoles, to give the 4-substituted tricyclic and quinazoline series of compounds (e.g., FIG. 8).

The synthesis of the thiourea-containing compounds was carried out using the following general procedure. Piprenolamine, sulfadiazine and/or substituted aromatic amines were slowly added to a solution of thiophosgene in dichloromethane, followed by the addition of triethylamine on an ice bath. After the reaction mixture was stirred for 4 hours, 4-chloro-quinazolines or tricyclic building blocks were added and the resulting mixture was stirred overnight at room temperature. Methanol was added to quench the excess thiophosgene, and the residue was purified by silica gel column chromatography after removal of solvent.

**EXAMPLE 6**

**4-chloro-tricyclic and quinazoline building blocks**

EXAMPLE 7
N-Pyrimidin-2-yl-4-thioformylamino-benzenesulfonamide chloride (1d)

To a stirred solution of sulfadiazine (192 mg, 0.77 mmol) in dichloromethane (20 mL) were slowly added thiophosgene (0.06 mL, 0.83 mmol) and triethylamine (0.05 mL, 0.32 mmol) under cooling with an ice bath. After the reaction mixture was stirred for 5 hours at room temperature, it was washed with water and brine, dried over anhydrous sodium sulfate, filtered, evaporated and dried under vacuum; and the product was used immediately for the next reaction.

EXAMPLE 8
4-(6,7-Dimethoxy-quinazolin-4-yl)-piperazine-1-carbothioic acid [4-(pyrimidin-2ylsulfamyl)-phenyl]-amide (HPK16)

To a solution of 4-(1-piperazinyl)-6,7-dimethoxy quinazoline (200 mg, 0.73 mmol) and pyridine (0.5 mL, 6.4 mmol) in dichloromethane (20 mL) was added a solution of product 1d in dichloromethane (20 mL) and stirred overnight. Methanol was added for quenching excess thiophosgene, and the residue after removal of solvent was purified by silica gel column chromatography eluting with 5% methanol/dichloromethane and further recrystallized from dichloromethane/hexane to give 80 mg (20%).

$^1$H NMR (CDCl₃, 300MHZ) δ 3.85(s, 4H), 3.98(s,3H), 4.02(s,3H), 4.11(s, 4H), 6.98(m, 1H), 7.08(s, 1H), 7.32(d, 2H), 7.88(s, 1H), 8.00(d, J = 6.7 Hz, 2H), 8.62(d, 2H), 8.66(s, 1H).

FAB HRMS [M+H]$^+$ calcd for C$_{25}$H$_{26}$N$_8$O$_4$S$_2$: 566.1518; found 567.1597.

**EXAMPLE 10**

**Aurora-2 Kinase Inhibition Assay**

In this assay kinase activity is determined by quantifying the amount of ATP remaining in solution following the kinase reaction by measuring the light units (LU) produced by luciferase using a luminometer. Percent inhibition was determined for individual compounds by comparing luminometer readings of drug-treated reactions to controls containing no drug (DMSO control) and no Aurora-2 enzyme (ATP control) in the following equation:

$$\text{Percent Inhibition} = \frac{\text{LU}_{\text{drug}} - \text{LU}_{\text{DMSO}}}{\text{LU}_{\text{ATP}} - \text{LU}_{\text{DMSO}}} \times 100$$

In a 50 µl reaction, recombinant aurora-2 kinase produced in sf9 cells (Imgenex, San Diego, CA) was incubated at 30 °C for two hours with 62.5 µM Kemptide (Calbiochem, San Diego, CA), 3 µM ATP (Invitrogen, Carlsbad, CA) and kinase reaction buffer (40 mM Tris-HCl, 10 mM MgCl$_2$ and 0.1 µg/µl bovine serum albumin (BSA)). This reaction was carried out in the presence of drug substances, which had been previously diluted to desired concentrations in DMSO. After incubation, 50 µl of Kinase-Glo® (Promega, Inc., Madison, WI) solution was added to each reaction mixture and allowed to equilibrate for 10 minutes at room temperature. Kinase-Glo solution contains luciferase enzyme and luciferin, which react with ATP to produce light. Kinase activity is
determined by quantifying the amount of ATP remaining in solution following the kinase reaction by measuring the light units (LU) produced by luciferase using a luminometer (PerkinElmer, Boston, MA). FIG. 10 shows the degree of inhibition of aurora-2 kinase activity by illustrative compounds of the invention, including HPK56 (Structure III-1-3), HPK61 (Structure II-2-7), HPK60 (Table 4; Structure 34-4), HPK59 (Structure III-1-5), AKS301 (Table 6; Structure 38-16), AKS110 (Table 6, Structure 38-14), AKS300 (Table 6, Structure 38-15), AKS302 (Table 6, Structure 38-17), HPK16 (Structure IV-1-3) and HPK62 (Structure II-2-6), in addition to several precursors and known kinase inhibitors (e.g., HMN-176, Quincl, trioxd, trithiad, azpyram, Quinam, Sulzd, Gmocnhcl and trinhcl). The synthesized compound HPK62 had the highest inhibition, and compound HPK16 had the second highest inhibition of the tested compounds.

The drug concentration at which 50% of aurora-2 kinase activity was inhibited (IC$_{50}$) was determined for illustrative compounds and the results shown in FIG. 11. HPK16 (Structure IV-1-3) and HPK62 (Structure II-2-6) were particularly effective inhibitors. A range of chemical doses was tested, and graphed, as shown in FIG. 11. The IC$_{50}$ values for the compounds are shown below in Table 1.

**EXAMPLE 11**

**c-kit Sequence and Structure Analysis**

The known sequence of the c-kit tyrosine kinase active domain was used in a PSI-BLAST search (NCBI) of non-redundant database of sequences. Top-ranked sequences for which three-dimensional structures of tyrosine kinase (TK) domains also were available were the vascular endothelial growth factor receptor (VEGFR2, or 1VR2) and fibroblast growth factor receptor 1 (FGFr1, or 1FGI). These sequences, along with those of PDGFR-α, PDGFR-β and c-Abl, were manually aligned by their kinase domain sequences and their respective secondary structures and viewed in Clustal X (FIG. 13).
The c-kit TK domain sequence was inputted into the tertiary structure prediction programs THREADER and 3D-PSSM, which compare primary sequences with all of the known three-dimensional structures in the Brookhaven Protein Data Bank. The output was composed of the optimally aligned, lowest-energy, three-dimensional structures that were similar to c-kit. The top structural matches were VEGFR2 and FGFr1, confirming that these proteins are structurally conserved.

**EXAMPLE 12**

**c-kit Homology Modeling**

VEGFR2 and FGFr1 structures provided the three-dimensional templates for the homology modeling of c-kit. The crystal structure coordinates for the above TK domains were obtained from the Protein Data Bank. These domains were pair-wise superimposed onto each other using the SAP program. The structural alignments from SAP were fine-tuned manually to better match residues within the regular secondary structural elements. The modeling software used was Insight II (version 2000, Accelrys Inc.), running on a Silicon Graphics Indigo2 workstation under the Unix operating system. After the model building processes were complete, a series of minimizations were performed to relax the structure. The final c-kit model (FIG. 14) was examined using 3D-profile. Additionally, PROCHECK was used to verify the correct geometry of the dihedral angles and the handedness of the model-built structure.

**EXAMPLE 13**

**c-kit Molecular Dynamics (MD) and Docking Analysis**

The 3D c-kit model served as the starting point for docking studies of CT662923 and STI571 (Gleevec). MD simulations were performed in the canonical ensemble (NVT) at 300°K using the CFF force field implemented in Discover_3 (version 2.9.5; Accelrys). Dynamics were equilibrated for 10 picoseconds with time steps of 1 femtosecond and continued for 10-picosecond simulations. The nonbonded cutoff distance of 8Å and a distance-dependent dielectric constant (ε = 5r) for water were used to simulate the aqueous media. All of the bonds to hydrogen were constrained. Dynamic trajectories were recorded every 0.5 picoseconds for analysis. The resulting low energy structure was extracted and energy-minimized to 0.001 kcal/molÅ. To examine the conformational changes that occur during MD, the root mean square (rms)
deviations were calculated from trajectories at 0.5-picosecond intervals and compared to the Cα backbones of VDGFR and FDFr TK. The resulting c-kit structure served as the starting model for docking studies.

For docking studies, the starting model structures of ligands were from the known c-kit tyrosine kinase inhibitors of CT52923 (FIG. 15A) and STI571 (Gleevec) (FIG. 15B) and were empirically built and energy minimized. The heavy atoms from FGFr kinase domain were used as sphere centers for the docking procedures. Docking simulations were performed at 500° K with 100 femtosecond/stage (total of 50 stages), quenching the system to a final temperature of 300° K. The whole complex structure was energy minimized using 1000 steps. This provided 10 structures from the simulated annealing (SA) docking, and their generated conformers were clustered according to rms deviation. The lowest energy global structure complexes were used to calculate intermolecular binding energies.

EXAMPLE 14

**c-kit FlexX Docking**

FlexX docking was performed in the Sybyl 6.8 program (Tripos, St. Louis, MO). The structures of ligands used for docking were the crystal structure of STI571 with the Abl tyrosine kinase and the CT52923 which was empirically built and energy-minimized in Insight II. Systematic conformational searches were performed on each of the minimized ligands using 10-picosecond MD simulations at 300° K. For docking with CT 52923 and STI571, the position of the SU5402, an indolinone analog was retained from its crystal structure of 1FGI in which the indolinone served as a template for field-fit alignments with the quinazoline and pyrimidoindole-containing compounds. The indolinone analog was then removed from the field-fit alignment, and each of the other ligands was docked into the active site pocket with a similar position and orientation to that of CT52923 (FIG. 15A) and STI571 (FIG. 15B) using FlexX multiple molecule docking methodology.

Based on our analysis of the binding mode of CT52923 and STI571 depicted in FIGs. 15A and 15B, respectively, the presence of two shared structural motifs of similarly placed hydrogen bond acceptors and six-membered aromatic rings suggested that these compounds may be exhibiting some common binding regions. Based on these two sets of alignments, a phenylamine-pyrimidine moiety was introduced at position 4 of CT52923 and
the position of this substitution was further rationalized by FlexX docking and molecular dynamics simulation.

EXAMPLE 15

Design Strategy

To identify new chemicals that satisfy the above-identified structural requirements, a de novo design approach was employed using the graphical chemical modeling program LUDI (Accelrys). Initially, the lead structures (purine base, phenylamino pyrimidines, pyrimido[4,5-b]indoles, benzofuran and benzothieno[3,2-d]pyrimidenes, pyrido[3,2-d]pyrimidenes, quinazolines, and indole rings) were dissected into core templates and two additional fragments (FIG. 16), which formed the basis of our built-in compound library. This built-in library, containing the identified templates, together with the LUDI/ACD databases, was used in the search procedures within the Insight II program (Accelrys). In addition to the known quinazoline and phenylamino-pyrimidine moieties, which are the tricyclic pyrimido[4,5-b]indoles, benzofuranopyrimidines, and benzothieno[3,2-d]pyrimidines (Scheme 1), three novel hits were identified from the LUDI search. Further, fragment searches were performed for the replacement of the sugar and α-, β-, and γ-phosphate binding regions (e.g., Mohammedi, M., et al., Science, 1997, 276: 955-960). The piperazine, thiourea, and piperonylamine fragments of CT52923 were bonded in the LUDI link model at the 4-position of the new tricyclic moieties. The position and orientation of this substitution were further rationalized by LUDI FlexX docking (Tripos, St. Louis, MO) within the Sybyl software, and molecular dynamics simulations. Finally, 4-amino-N-(2-pyrimidinyl)benzene sulfonamide (sulphadiazine) fragments were identified from the LUDI/ACD databases. These fragments were also linked at the 4-position of the tricyclic structural moieties. The fragment selection was based on hydrogen bond donor/acceptor groups and correct position and orientation with respect to the lead compounds (FIG. 12) within the ATP binding pocket.

Several combinations of structures were designed by keeping the required core structures identified from ACD and LUDI fragment searches. More than 60 compounds were built using this structure-based scaffold approach. Further, these compounds were screened to exclude molecules that were not complementary to the ATP binding pocket (Leu595, Phe600, Val603, Ala621, Val654, Thr670, Glu671, Tyr672, Cys673, Gly676, Asp677, Asn739,
Leu741, and Asp752) by the FlexX docking method. Compounds 1-7 of FIG. 17 (HPK61 (II-2-7), HPK62 (II-2-6), HPK56 (III-1-3), HPK59 (III-1-5), HPK57 (III-1-4), HPK60 (34-4) and HPK16 (IV-1-3), respectively) were found to have the optimal number of hydrogen bonds, positions and orientations within the ATP binding pocket and the optimal FlexX scoring (kJ/mol). These seven compounds were synthesized and evaluated for c-kit and PDGFR tyrosine kinase inhibitory activity.

**EXAMPLE 16**

**Chemical Synthesis**

General Methods. $^1$H NMR was run on a Unity 300-MHz NMR Spectrophotometer (Varian, Palo Alto, CA). The chemical shifts are relative to the trace proton signals of the deuterated solvent. Coupling constants, $J$, are reported in Hz and refer to apparent peak multiplicity rather than coupling constants. Fast atom bombardment (FAB) measurements have been carried out on a mass spectrometer HX-110 instrument (JEOL, Akishima, Japan) equipped with a conventional Xe gun. A mixture matrix of glycerol:thioglycerol:mNBA (meta-nitrobenzyl alcohol) 50:25:25 containing 0.1 % of trifluoroacetic acid (TFA) was used as the fast atom bombardment (FAB) matrix. For accurate mass measurements, polyethylene glycol (PEG) was used as the internal standard. Flash column chromatography was performed on silica gel 60, purchased from Spectrum. Combustion analysis (CHNS) was performed by Desert Analytics Laboratory, Tucson, AZ.

The synthesis of 4-piperazinylpyrimido[4,5-b]indoles (1b), benzofuranopyrimidines (2b), benzothieno[3,2-d]pyrimidines (3b), and quinazoline (4b) derivatives is depicted in FIG. 20. 4-Chloro-tricyclic and quinazoline building blocks (1a–4a) were synthesized using literature methods. (Pandey, A., et al., J. Med. Chem. 2002, 45:3772-93; Matsuno, K., et al., J. Med. Chem. 2002, 45:3057-66; Matsuno, K., et al., J. Med. Chem. 2002, 45:4513-23; and Venugopalan, B., et al., J. Heterocycl. Chem. 1988, 25:1633-39.) These were converted to the corresponding 4-piperazine derivatives by refluxing with piperazine in pyridine or dioxane. Piperonylamine or sulfadiazine were slowly added to a solution of thiophosgene in dichloromethane while cooling with an ice bath. The resulting mixture was stirred for four hours at room temperature, which gave 1c or 1d, as shown in FIG. 21. Compounds 1c or 1d were further reacted with 4-piperazine-substituted tricyclic or quinazoline
derivatives in dichloromethane and stirred overnight at room temperature. To
quench excess isothiocyanate, methanol was added, and after removal of
solvent, the residue was purified by silica gel chromatography to give
compounds 1–7 of FIG. 17 in approximately 20–40% yields.

EXAMPLE 17
N-Benzoyl[1,3]dioxol-5-ylmethyl-thioformamide chloride (1c)
To a stirred solution of piperonylamine (0.1 mL, 0.77 mmol) in
dichloromethane (20 mL) was slowly added thiophosgene (0.06 mL, 0.83 mmol)
under cooling with an ice bath. After the reaction mixture was stirred for four
hours at room temperature, it was washed with water and brine, dried over
anhydrous sodium sulfate, filtered, evaporated and dried under vacuum; and
the product was used immediately for the next reaction.

EXAMPLE 18
N-Pyrimidin-2-yl-4-thioformylamino-benzenesulfonamide chloride (1d)
To a stirred solution of sulfadiazine (192 mg, 0.77 mmol) in
dichloromethane (20 mL) were slowly added thiophosgene (0.06 mL, 0.83
mmol) and triethylamine (0.05 mL, 0.32 mmol) under cooling with an ice bath.
After the reaction mixture was stirred for five hours at room temperature, it was
washed with water and brine, dried over anhydrous sodium sulfate, filtered,
evaporated and dried under vacuum. The product was used immediately for
the next reaction.

EXAMPLE 19
4-(6,7-Dimethoxy-9H-1,3,9-triacafluoren-4-yl)piperazine-1-carbothioic acid
(benzo[1,3]dioxol-5-ylmethyl)-amide (1)
To a solution of 6,7-dimethoxy-4-piperazino-9H-
pyrimido[4,5-b]indole (200 mg, 0.64 mmol) and pyridine (0.5 mL, 6.4 mmol) in
dichloromethane (20 mL) was added the solution of product 1c in
dichloromethane (20 mL) and the mixture was stirred overnight. Methanol was
added to quench excess thiophosgene, and the residue after removal of solvent
was purified by silica gel column chromatography eluting with 5%
methanol/dichloromethane and further recrystallized from
dichloromethane/hexane to give 130 mg (40%).

EXAMPLE 26

Cancer Cell Cytotoxicity Assay

To validate the hypothesis that the designed c-kit/PDGFR tyrosine kinase inhibitors mediate GIST882 cell killing and PDGFR-mediated cell killing of pancreatic cancer cell lines (CFPAC-1, PANC-1 and MIA PaCa-2), an in vitro cytotoxicity assay was performed. The GIST882 cell line used in this study has a c-kit gain-of-function mutation (K642E). The assay utilized the Cell Titer 965 Non-Radioactive Cell Proliferation Assay (Promega Corp., Madison, WI). First the cells were cultured. GIST882 cells were provided by Dr. Jonathan A. Fletcher (Dana-Farber Cancer Institute, Boston, MA). PANC-1 and MIAPaCa-2 cells were provided by Dr. Daniel Von Hoff (Arizona Cancer Center, Tucson, AZ). GIST882 cells were cultured in RPMI 1640 medium (Cat# 21870-076, Invitrogen Corporation) supplemented with 300mg/L L-glutamine, 100 unit/ml penicillin, 100 µg/ml streptomycin and 15% fetal bovine serum. PANC-1 and MIAPaCa-2 cells were maintained in RPMI 1640 medium (cat# 10-040, Mediatech, Inc.) supplemented with 100 unit/ml penicillin, 100 µg/ml streptomycin and 10% fetal bovine serum. All the cell lines were incubated in a humidified incubator at 37°C with 5% CO₂ atmosphere.

Cells were plated at a density of 2000 to 10000 cells per well, depending on their growth rate, in 0.1mL medium on day 0 in 96-well Falcon microtiter plates (#3072, Becton-Dickinson Labware, Lincoln Park, NJ). On day 1, 10 µL of serial dilutions of the individual compounds were added to the plates in replicates of 4. After incubation for 4 days at 37 °C in a humidified incubator, the cells were fixed with 10% Trichloroacetic acid solution (Catalog No. 490-10, Sigma). Subsequently, they were labeled with 0.04% Sulforhodamine B (S9012, Sigma) in 1% acetic acid. After multiple washes to remove excess dye, 100 µl of 50 mM Tris solution was added to each well in order to dissolve the dye. The absorbance of each well was read on a plate reader (Wallac Vector², PerkinElmer) at the wavelength of 570 nm. Data were expressed as the percentage of survival of control calculated from the absorbance corrected for background absorbance. The surviving percent of cells was determined by dividing the mean absorbance values of the monoclonal antibody by the mean absorbance values of the control and multiplying by 100.

The calculated FlexX scoring and IC₅₀ values for these novel and prior art c-kit inhibitors are shown in Table 2 below. Not all of the novel compounds evaluated exhibited cytotoxicity against GIST882 cells. Moreover,
in an *in vitro* assay of aurora 2 kinase, a serine/threonine kinase, these compounds showed no activity (data not shown). Taken together, these results validate compounds of the invention, such as HPK61 (II-2-7) and HPK56 (III-1-3), as potent, specific c-kit and PDGFR tyrosine kinase inhibitors.

A comparison of the cytotoxicity profiles of the designed and synthesized compounds 1–7 (FIG. 17), as well as known kinase inhibitors STI571 and CT52923, is shown in FIGs. 22A, 22B and 22C, and the calculated IC$_{50}$ values are shown below in Table 2. For the GIST882 cell line, HPK61 (II-2-7), HPK56 (III-1-3), STI571, and CT52923 were similarly potent, with IC$_{50}$ values ranging from 0.1 to 1.8 µM and with a potency order of STI571 (0.1 µM) > HPK61 (II-2-7) (0.45 µM) > HPK56 (III-1-3) (1.60 µM) > CT52923 (1.80 µM). Although STI571 killed cells early, 25% of cells exposed to STI571 were alive at day 4. In contrast, HPK61 (II-2-7) and HPK56 (III-1-3) had a more prolonged effect, with 5% of cells alive at day 4. For the pancreatic cancer cell lines MiaPaCa-2 and PANC-1, HPK56 (III-1-3) was the most potent, with IC$_{50}$ values of 2.10 and 3.00 µM, respectively, and a potency order of HPK56 (III-1-3) (2.1–3.0 µM) > HPK61 (II-2-7) (15.5–16.0 µM) > STI571 (20.0–24.0 µM) > CT52923 (25.0–26.6 µM).

**Table 2.** Activity (IC$_{50}$ µM) and FlexX (kJ/mol) results of lead compounds and tricyclic and quinazoline inhibitors against c-kit and PDGFR tyrosine kinases.

$^a$FlexX score for c-kit tyrosine kinase. FlexX belongs to the category of empirical free energy scoring function (energy decomposition into various scores to which a
coefficient has been assigned). The drug score combines drug likeness, cLogP, molecular weight, and toxicity risks in one handy value than may be used to judge the compound’s overall potential to qualify for a drug.

\[ \text{ND: not determined.} \]

\[ \text{NA: not available.} \]

Furthermore, a recent study reported that approximately 35% of GIST samples lacked c-kit mutations and had activation mutations in PDGFR-A (Heinrich, M., et al., Science 299(5607):708-10, 2003). Docking studies demonstrated that HPK61 (II-2-7) and HPK56 (III-1-3) interact equally with the tyrosine kinase domains of c-kit and PDGFR. Cellular cytotoxicity assays demonstrated that HPK61 (II-2-7) and HPK56 (III-1-3) are highly selective for c-kit and PDGFR tyrosine kinases and are superior to STI571 and CT52923 in pancreatic cancer cell lines. Therefore, it is expected that HPK61 (II-2-7) and HPK56 (III-1-3), as well as other related compounds of the invention, will be effective in treating both c-kit- and PDGFR-mediated GIST.

**EXAMPLE 27**

**Kinase Inhibition Assay**

This example describes the inhibitory activity of compound (II-2-6), also referred to herein as HPK62), against various kinase proteins, including Aurora-A, cAMP-PK, M KK6 and CDK1.

![Chemical Structure](image)

In **vitro** (II-2-6) enzyme assays were performed using the Kinase-Glo™ Luminescent Kinase Assay from Promega Corporation (Madison, WI). The following conditions were used:

-68-
<table>

**EXAMPLE 28**

**Effects of Compound (II-2-6) on Cell Cycle Distribution**

The effects of Structure (II-2-6) on cell cycle distribution were assayed using flow cytometry, using the following procedure: MIA PaCa-2 cells (American Type Culture Collection, Manassas, VA) were grown to ~40% confluence. At this point, MP-235 at various concentrations, or an equal volume of DMSO (drug diluent) was added. Cells were grown in the presence of drug for 48 hours, and harvested using trypsin. 1 million cells were washed in 1mL of Modified Krishan’s Buffer (0.1% sodium citrate, 0.3% NP-40, 0.05mg/ml propidium iodide, 0.02 mg/ml RNase A), and resuspended in 1mL of fresh Modified Krishan’s Buffer. Cell pellets were kept at 4°C for no more than 24 hours before flow cytometric analysis was performed by the University of Arizona Flow Cytometry Core Facility. The cell cycle profile obtained from this analysis is illustrated in FIG. 23.
EXAMPLE 29
Effects of Compound (II-2-6) on Cell Proliferation
The ability of compound (II-2-6) at various concentrations to inhibit cell proliferation was also tested, using the MIA PaCa-2 cell line. 200,000 MIA PaCa-2 cells were plated into each well of a six-well plate and incubated overnight. At this point, MP-235 at various concentrations, or an equal volume of DMSO (drug diluent) was added. Cells were grown in the presence of drug for 48 hours, and harvested using trypsin. The number of cells in each well was determined by a cell counting assay using a hematocytometer. Each drug concentration was tested in triplicate and each well was counted in triplicate. Reduction in cell proliferation was determined by dividing the number of cells in drug-treated wells by the number in equivalent DMSO-treated wells. Results from this analysis are illustrated in FIG. 24.

EXAMPLE 30:
Effects of Structure (II-2-6) on Cytotoxicity of Pancreatic Cancer Cell Lines
To determine if the reduction in cell number was due to slowing of cell growth or outright cell killing, the cytotoxicity of Structure (II-2-6) was determined, using an MTS-based assay in cultured MIA PaCa-2 and Panc-1 pancreatic cancer cells. In vitro cytotoxicity assays were performed using the CellTiter 96 Non-Radioactive Cell Proliferation Assay (Promega Corp., Madison, WI). Cells were plated in 0.1 ml medium on day 0 in 96-well microtiter plates (Falcon, #3072). On day 1, 10 µL of serial dilutions of the test agent were added in replicates of 4 to the plates. After incubation for 4 days at 37 °C in a humidified incubator, 20 µl of a 20:1 mixture of [3-(4,5-dimethyl-2-yl)-5-(3-carboxymethoxyphenyl)-2-(4-sulfophenyl)-2H-tetrazolium, inner salt; MTS], 2mg/ml, and an electron coupling reagent, phenazine methosulfate (PMS, 0.92mg/ml in DPBS), was added to each well and incubated for 1 or 2 hours at 37 °C. Absorbance was measured using Model 7520 microplate reader (Cambridge Technology, Inc.) at 490 nm. Data were expressed as the percentage of survival of control calculated from the absorbance corrected for background absorbance. The surviving fraction of cells was determined by dividing the mean absorbance values of the test agents by the mean absorbance values of untreated control. Plate readings at 490nm were taken
after 60 and 120 minutes of incubation with the MTS substrate, and the results are illustrated in FIGs. 25A-B, respectively.

**EXAMPLE 31**

**Effects of Compound (II-2-6) on Cytotoxicity of Colon, Breast, Ovarian and Pancreatic Cancer Cell Lines**

These cytotoxicity data were further complemented by performing the same MTS assay described above in a number of different cell lines from various sources. The results obtained from these experiments are illustrated in FIGs. 26A-C.

**EXAMPLE 32**

**Further Illustrative Inhibitory Compounds**

Compound (II-2-6) is an illustrative kinase inhibitory compound of the invention belonging to a class of 4-Piprazinylpyrimido[4,5-b]indoles. This series of compounds was designed as inhibitors of both aurora-2 and c-kit kinases and Structure (II-2-6) was confirmed to have low nanomolar inhibitory activity against Aurora-2 kinase and to have low μM inhibitory activity against c-kit kinase.

![Chemical structure of (II-2-6)](image)

Compound (II-2-6) analogues were designed and synthesized according to Schemes 3-5 below in order to evaluate and optimize aurora-2 kinase activity, aqueous solubility and pharmacokinetic/pharmacodynamic profiles. The compounds belong to the class of pyrimido[4,5-b]indoles (Ia to Id) and quinazolines (IIa to IId below). Detailed structural information of illustrative compounds is provided in Table 3 below. Analogues were made in which R1, R2, R3 and R4 (1)-4-Piprazinylpyrimido[4,5-b]indoles, pyrimido[4,5-b]indoles of
formula Ia-IId and R₁, R₂, R₃ and R₄ (1)-4-piperazin-1-yl-quinazolines and substituted quinazoline compounds of Ila-IIId were synthesized.

Based on the docking results, (II-2-6) binds to the ATP-binding pocket and is involved in several Van der Waals contacts and hydrogen bonding interactions with the active site pocket. The 6,7-dimethoxy pyrimido[4,5-b]indole moiety positioned into the adenine binding pocket, the 6,7-substituents of the pyrimido[4,5-b]indole orients from the hinge region into the solvent pocket and the benzenesulfonamide group is involved in interactions with the β and γ phosphate regions, whereas the piprazine group occupies the sugar binding pocket. Structure (II-2-6) had strong hydrogen bonding interactions with Pro214, Arg220 and is in close contact with Glu211 and Ala213 residues. The sulfonamide –S=O group forms hydrogen bonds with Lys258. In terms of hydrophobicity, areas deep in the ATP pocket around Phe144 are occupied by the flat aromatic ring and pyrimidine ring of (II-2-6).

Several analogues of (II-2-6) were studied using virtual docking to predict their binding mode. The compounds developed based on the mode of binding of (II-2-6) were undertaken for synthesis. Synthetic approaches for generating substitutions at R₁, R₂, R₃, R₄, R₅, R₆ and X are set forth in the following Schemes 3 to 7, and illustrative compounds are depicted in Table 3.

**EXAMPLE 33**

**Compound (II-2-6) Protein Kinase Inhibitory Activity**

The protein serine-threonine kinases cAMP PK, MKK6 and Cdk1 were tested alongside Aurora-2 kinase to evaluate the activity of compound (II-2-6) against these protein kinases. Briefly, in this assay kinase activity is determined by quantifying the amount of ATP remaining in solution following the kinase reaction by measuring the relative light units (RLU) produced by luciferase using a luminometer. Percent activity was determined for individual compounds by comparing luminometer readings of drug-treated reactions to controls containing no drug (RLU<sub>No Inhib</sub>) and no Aurora-2 enzyme (RLU<sub>No Kinase</sub>) in the following equation:
\[
\text{Percent Inhibition} = \frac{\text{RLU}_{\text{No Kinase}} - \text{RLU}_{\text{drug}}}{\text{RLU}_{\text{No Kinase}} - \text{RLU}_{\text{No Inhib}}} \times 100
\]

In a 50 μl reaction, 20ng of recombinant aurora-2 kinase (Upstate, Lake Placid, NY) was incubated at 30 °C for two hours with shaking (360rpm) with 62.5μM Kemptide (Calbiochem, San Diego, CA), 3 μM ATP (Invitrogen, Carlsbad, CA) and kinase reaction buffer (40 mM Tris-HCl, 20 mM MgCl₂ and 0.1 μg/μl bovine serum albumin). The value of 3μM ATP was determined to be the \( \text{Km} \) (concentration at which the enzyme is working at 50% maximum velocity) for the amount of enzyme used in this assay. This reaction was carried out in the presence of drug substances, which had been previously diluted to desired concentrations in DMSO. After incubation, 50 μl of Kinase-Glo® (Promega, Inc., Madison, WI) solution was added to each reaction mixture and allowed to equilibrate for 10 minutes at room temperature. Kinase-Glo solution contains luciferase enzyme and luciferin, which react with ATP to produce light. Kinase activity is determined by quantifying the amount of ATP remaining in solution following the kinase reaction by measuring the relative light units (RLU) produced by luciferase using a luminometer (Thermo Electron Corporation, Vantaa, Finland).

The results of these experiments are shown in FIG. 27. Compound (II-2-6) had inhibitory activity against each of the kinases tested, with highest activity against Aurora-2 kinase.

**EXAMPLE 34**

**Synthesis and Analysis of Further Illustrative Compounds**

Compound (III-1-3), also referred to herein as HPK56/MP-470, is an illustrative compound of the present invention having the following structure:
Analogues of (III-1-3) were designed and synthesized in order to evaluate and optimize kinase selectivity, aqueous solubility, and to improve pharmacokinetic and pharmacodynamic profiles. Illustrative synthesis approaches for generating (III-1-3) analogues are depicted in the synthesis schemes below. Synthesis of R1 substituted benzofuranopyrimidines was undertaken. The methyl 3-guanidinobenzofuran-2-carboxylate is prepared from methyl 3-aminobenzofuran-2-carboxylate by reacting with cyanoacetamide in presence of dioxane and dry HCl gas. The obtained guanidine is cyclized in the presence of aqueous NaOH. Similar procedures were utilized for preparing 2-substituted (III-1-3) and its analogues as depicted in the Schemes 8-10 set forth below. Introduction of –NH₂ at the 2 position was utilized for various sulfonic, inorganic and hydroxyacid salts. Illustrative compounds are shown in Table 4 below.

EXAMPLE 35
Analysis of Compound Binding and Inhibitory Activity against c-kit Mutants

The published crystal structure of c-kit kinase (pdb code:1PKG) and its mutated structure were used to study the mode of binding of compound (III-1-3) (HPK56/MP-470), a benzofuranopyrimidine compound, its 2-substituted analogs, and quinazoline derivatives.

\[

\text{N} \\
\text{O} \\
\text{O} \\
\text{N} \\
\text{N}
\]

(III-1-3)

All molecular modeling studies including docking were carried out using SCHRÖDINGER software (SCHRÖDINGER L.L.C, New York) running on RedHat Linux. The published crystal structure of c-kit kinase (1) was used for protein preparation, generation of grids and docking using a program, Glide, which is implemented in the SCHRÖDINGER software.

The c-kit mutations in GIST tumors and their interactions with (III-1-3) and its analogues were studied on wild type c-kit, K642E (an exon 13 mutant) and D816V (an exon 17 mutant). Glide scores were generated for each compound for both wild-type and c-kit mutants. A more negative glide score is predictive of stronger binding. The determined Glide scores are shown below in Table 5. The mode of binding of (III-1-3) with these mutated c-Kit proteins predicts that (III-1-3) is more effective in binding both K642E and D816V mutations relative to wild-type c-kit.

Table 5 also shows IC \(_{50}\) values in the GIST882 cell line determined for the same compounds. Briefly, cells are seeded into 96-well, tissue-culture treated, opaque white plates (Thermo Electron, Vantaa, Finland), at between 5000 and 7500 cells per well, depending on the speed of cell proliferation, in 100\(\mu\)l of appropriate growth medium (determined by the ATCC). Cells are then exposed to the appropriate concentration of drug or an equal amount of DMSO (drug diluent) and allowed to grow in its presence for 96 hours. Following this, 100\(\mu\)l of Cell-Titer-Glo reagent (Promega, Inc., Madison, WI) is added to each well. Plates are then shaken for 2 minutes at room temperature to allow for cell lysis and incubated for 10 minutes to stabilize the
luminescent signal. Similar to the Kinase-Glo assay reagent, this reagent contains both luciferase enzyme and its substrate luciferin. Luciferase, activated by ATP in the cell lysate, catalyzes the conversion of luciferin to oxyluciferin, a reaction which produces light. The amount of light produced is proportionate to the amount of ATP in the cell lysate, which is itself proportional to cell number and gives an index of cellular proliferation. The IC_{50} is defined as the concentration of drug that yields a 50% inhibition of cell growth, as compared to wells containing untreated cells.

**Table 5** Activity (IC_{50} μM) and Glide score results of inhibitors against WT and mutated c-kit tyrosine kinases.

EXAMPLE 36
Kinase Inhibitory Activity of Compounds (III-1-3) and (II-2-7)
Compounds (III-1-3) and (II-2-7) are illustrative compounds of the present invention having the structures shown below:

These compounds were tested for their inhibitory activity against c-Kit and the related receptor tyrosine kinase, PDGFRa. Enzymes were incubated with the appropriate concentration of inhibitor and radiolabeled $\gamma^{32}\text{P}}$-ATP. After 30 minutes, the reaction mixtures were electrophoresed on an acrylamide gel and autophosphorylation, quantitated by the amount of radioactivity incorporated into the enzyme, was assayed. Results from these experiments are shown in FIGs. 28A and 28B. Both (III-1-3) and (II-2-7) demonstrated dose-dependent c-kit inhibitory activity against c-Kit and PDGFRa.

EXAMPLE 37
Inhibitory Activity of Additional Illustrative Compounds
Various compounds of the invention, including (IV-1-3) (also referred to as HPK16), (III-1-3) (also referred to as HPK56), (III-1-4) (also referred to as HPK57), (III-1-5) (also referred to as HPK59), and (II-2-7) (also referred to as HPK61) were tested for activity against GIST tumor cells using the GIST882 cell line. Briefly, cells are seeded into 96-well, tissue-culture treated, opaque white plates (Thermo Electron, Vantaa, Finland), at between 5000 and 7500 cells per well, depending on the speed of cell proliferation, in 100µl of appropriate growth medium (determined by the ATCC). Cells are then exposed to the appropriate concentration of drug or an equal amount of DMSO.
(drug diluent) and allowed to grow in its presence for 96 hours. Following this, 100μl of Cell-Titer-Glo reagent (Promega, Inc., Madison, WI) is added to each well. Plates are then shaken for 2 minutes at room temperature to allow for cell lysis and incubated for 10 minutes to stabilize the luminescent signal. Similar to the Kinase-Glo assay reagent, this reagent contains both luciferase enzyme and its substrate luciferin. Luciferase, activated by ATP in the cell lysate, catalyzes the conversion of luciferin to oxyluciferin, a reaction which produces light. The amount of light produced is proportionate to the amount of ATP in the cell lysate, which is itself proportional to cell number and gives an index of cellular proliferation. The IC_{50} is defined as the concentration of drug that yields a 50% inhibition of cell growth, as compared to wells containing untreated cells. The results of these experiments are shown in FIG. 29, demonstrating that all of the compounds tested had dose-dependent inhibitory activity, while HPK56 (III-1-3) and HPK61 (II-2-7) had the highest inhibitory activity of the inventive compounds tested.

**EXAMPLE 38**

*Synthesis of Additional Illustrative Protein Kinase Inhibitors*

The following example describes the synthesis of the illustrative compounds of the present invention set forth below in Table 6, using the general synthesis Schemes 11-15 also shown below. The synthesis methods below are illustrative in nature and can be readily modified using routine and established principles of synthetic organic chemistry to produce the inventive compounds described herein.

All experiments were carried out under an inert atmosphere and at reflux and or room temperature unless otherwise stated. The purities of compounds were assessed by routine analytical HPLC. TLCs were performed on precoated silica gel plates (Merck), and the resulting chromatograms were visualized under UV light at 254 nm. Melting points were determined on a Kofler Block or with a Büchi melting point apparatus on compounds isolated as described in the experimental procedures and are uncorrected. The NMR spectra were determined in DMSO-d_6 solution (unless otherwise stated) on a Bruker AM 300 (300 MHz) spectrometer or on a Varian 400 (400 MHz). Chemical shifts are expressed in unit of δ (ppm), and peak multiplicities are expressed as follows: s, singlet; d, doublet; dd, doublet of doublet; t, triplet; br s, broad singlet; m, multiplet. FAB measurements have been carried out on a
mass spectrometer HX-110 instrument (JEOL, Akishima, Japan) equipped with a conventional Xe gun. A mixture matrix of glycerol:thioglycerol:mNBA (meta-nitrobenzyl alcohol) 50:25:25 containing 0.1 % of trifluoroacetic acid (TFA) was used. For accurate mass measurements, polyethylene glycol (PEG) was used as the internal standard. Combustion analysis (CHNS) was performed by Desert Analytics Laboratory, Tucson, AZ.

A. 4-(6,7-dimethoxy-9H-1,3,9-triaza-fluoren-4-yl)-piperazine-1-carbothioic acid [4-(pyrimidin-2-ylsulfamoyl)-phenyl]-amide (1). (see Scheme 11)

7-dimethoxy-4-(piperazin-1-yl)-9H-pyrimido[4,5-b]indole 8 in DCM was added dropwise to compound 10 in DCM over a period of 15 minutes followed by the addition of excess pyridine. The resulting reaction mixture was stirred at RT for 24 hours. After the completion of the reaction, MeOH was added to quench the excess of compound 10 and the solvents were evaporated. The crude product was purified by column chromatography using a DCM/5% MeOH solvent system. The obtained product 1 (Table 6) (compound 9 in Scheme 11) is a half white solid with a yield of 37.6%.

^1HNMR (DMSO-d6, 300MHz): δ 3.75(s, 4H), 3.87(s,3H), 3.88(s,3H), 4.19(s, 4H), 7.04–7.06 (m, 1H), 7.07(s, 1H), 7.24(s, 1H), 7.37(d, J = 8.4 Hz, 2H), 7.90(d, J = 8.4Hz, 2H), 8.44(s, 1H), 9.51(d, J = 4.8Hz, 2H), 9.72(s, 1H, –NH), 12.01(s, 1H, –NH).

FAB HRMS [M+H]^+ calcld for C_{27}H_{27}N_{9} O_{5}S_{2}: 605.1627; found 606.1699

B. 7-dimethoxy-4-(piperazin-1-yl)-9H-pyrimido[4,5-b]indole:

4-Chloro-6,7-dimethoxy-9,9a-dihydro-4aH-pyrimido[4,5-b]indole 7 was dissolved in p-dioxane (50 mL), and pipazine (3.9 g) was added following the addition of pyridine (5 mL) under argon at RT. The reaction mixture was heated to reflux for 16 hours and it was cooled. The solvents were removed under vacuum and the obtained crude product was purified by flash column chromatography using a DCM/10% MeOH solvent system. The compound 8 obtained after purification yielded 66% (3.9 g) as half white solid.

C. 4-Chloro-6,7-dimethoxy-9,9a-dihydro-4aH-pyrimido[4,5-b]indole:

A suspension of 6,7-dimethoxy-3H-pyrimido[4,5-b]indol-4(9H)-one 6 (2.8 g), POCl₃ (20 mL) and p-dioxane 65 mL was heated at reflux for 6 hrs, then stirred at 25 °C for 36 hrs. The obtained mixture was filtered and concentrated. The crude product was purified by column chromatography using 1% MeOH/DCM to give title compound 7 73.3% (2.2 g) as pale yellow solid.

D. [4-(Pyrimidin-2-ylsulfamoyl)-phenyl]-thiophosgene chloride:

Thiophosgene (0.78 mL) was slowly added to the stirred solution of sulfadiazine (1.71 g) in DCM (50 mL) following the addition of triethylamine
(0.47 mL) at 0 °C. After the additions, the reaction mixture was stirred at RT for 5 hrs. The reaction mixture is diluted with more DCM and is washed with water and brine and the obtained solvent was dried over Na₂SO₄. Solvent is evaporated and dried under vacuum to give compound 15 (Scheme 12) as yellowish orange solid in 64.5% yield and it was used directly in the next step.

E. N-(4-[[4-(6,7-Dimethoxy-9H-1,3,9-triaza-fluoren-4-yl)-piperazine-1-carb-thiolyl]-amino]-phenyl)-benzamide (2)

From the foregoing it will be appreciated that, although specific embodiments of the invention have been described herein for purposes of illustration, various modifications may be made without deviating from the spirit and scope of the invention. Accordingly, the invention is not limited except as by the appended claims.
CLAIMS

We claim:

1. A compound having the following structure (I):

\[ \text{Structure (I)} \]

or a sterioisomer, prodrug or pharmaceutically acceptable salt thereof,

wherein

A is a ring moiety selected from:

\[ \text{Structures (I-A), (I-B), or (I-C)} \]

\( X \) is NH, S or O;
\( Z \) is CH or N;
\( R_1 \) and \( R_2 \) are the same or different and are independently hydrogen, hydroxyl, halo, -CN, -NO2, -NH2, -R, -OR, -SCH3, -CF3, -C\( (=O) \)OR or -OC\( (=O) \)R, where \( R \) is alkyl or substituted alkyl;
\( R_3 \) is hydrogen, -NH2, alkyl, -CN, or -NO2, or \( R_3 \) is -L3-Cycl3 wherein \( L_3 \) is a direct bond, S or NH, and Cycl3 is a carbocycle, substituted carbocycle, heterocycle or substituted heterocycle;
\( L_1 \) is a direct bond, -NR\( ^+- \), -OC\( (=S) \)NH- or -NHC\( (=S) \)O-, wherein \( R' \) is H or alkyl;
Cycl1 is a carbocycle, substituted carbocycle, heterocycle or substituted heterocycle;
\( L_2 \) is a direct bond or -C\( (=S) \)NH-, -NHC\( (=S) \)-, -NHC\( (=S) \)NH-, -C\( (=O) \)NH-, -NHC\( (=O) \)-, -NHC\( (=O) \)NH-, -(CH2)\( n \)-, -NH(CH2)\( n \)-, -(CH2)\( n \)NH-, 

-123-
-NH(CH₂)ₙNH-, -C(=S)NH(CH₂)ₙ-, -NH-C(=S)(CH₂)ₙ-, -(CH₂)ₙC(=S)NH(CH₂)ₙ-,  
-(CH₂)ₙNH-C(=S)(CH₂)ₙ-, -NH-C(=O)-, -S(=O)₂-, -S(=O)₂NH-, -NHS(=O)₂-, 
wherein n is, at each occurrence the same or different and independently 1, 2, 
3 or 4; and 

Cycl₂ is a carbocycle, substituted carbocycle, heterocycle or 
substituted heterocycle.

2. The compound of claim 1, wherein ring moiety A is (I-A).

3. The compound of claim 2 wherein L₁ is a direct bond.

4. The compound of claim 3 wherein X is NH and Z is CH.

5. The compound of claim 3 wherein R₁ and R₂ are selected 
from -OCH₃, -OH, -Cl, -CF₃ or -OC(=O)CH₃, and R₃ is hydrogen or -NH₂.

6. The compound of claim 3 wherein Cycl₁ is selected from:

    \[
    \text{\includegraphics[width=\textwidth]{cycl1.png}}
    \]

7. The compound of claim 3 wherein L₂ is selected from -  
-C(=S)NH-, -C(=S)NHCH₂-, -NHC(=S)NH-, -NHC(=O)-, and -NHC(=O)NH-.

8. The compound of claim 3 wherein Cycl₂ is selected from:

    \[
    \text{\includegraphics[width=\textwidth]{cycl2.png}}
    \]

    where w is
9. The compound of claim 2, wherein \( L_1 \) is -NH- or -OC(=S)NH-.

10. The compound of claim 9, wherein \( X \) is NH and \( Z \) is CH.

11. The compound of claim 9, wherein \( R_1 \) and \( R_2 \) are methoxy, and \( R_3 \) is hydrogen or -NH2.

12. The compound of claim 9, wherein \( \text{Cycl}_1 \) is selected from:

\[
\begin{align*}
\text{\includegraphics[width=1cm]{thiophene.png}}, \quad & \quad \text{\includegraphics[width=1cm]{pyrazole.png}}, \quad \text{or} \quad \text{\includegraphics[width=1cm]{imidazole.png}} \\
\text{\includegraphics[width=1cm]{phenyl.png}}, \quad & \quad \text{\includegraphics[width=1cm]{pyridine.png}}
\end{align*}
\]

13. The compound of claim 9, wherein \( L_2 \) is selected from –NHCH2–, –NH–, –C(=S)NH–, –NHC(=S)–, –C(=S)NHCH2–, –NHC(=S)NH–, –NHC(=O)–, –NHC(=O)NH–, –S(=O)2–; and

14. The compound of claim 9, wherein \( \text{Cycl}_2 \) is selected from:

\[
\begin{align*}
\text{\includegraphics[width=1cm]{benzofuran.png}}, \quad & \quad \text{\includegraphics[width=1cm]{phenyl.png}}, \quad \text{or} \quad \text{\includegraphics[width=1cm]{phenyl.png}} \\
\text{\includegraphics[width=1cm]{methyl.png}}, & \quad \text{\includegraphics[width=1cm]{ethyl.png}}
\end{align*}
\]

where \( w \) is –NH2, –NO2 or :

\[
\begin{align*}
\text{\includegraphics[width=1cm]{sulfonylamine.png}}
\end{align*}
\]
15. The compound of claim 9 having the following structure (II-2-6):

(II-2-6)

16. The compound of claim 9 having the following structure (II-2-7):

(II-2-7)

17. The compound of claim 1, wherein ring moiety A is (I-B).

18. The compound of claim 17 wherein L₁ is a direct bond.

19. The compound of claim 18 wherein R₁, R₂ and R₃ are hydrogen.

20. The compound of claim 18 wherein Cyc₁ is:

   -N=O-

21. The compound of claim 18 wherein L₂ is selected from -C(=S)NH-, -C(=S) -, -C(=S)NHCH₂- or -CH₂-. 
22. The compound of claim 18 wherein Cycl₂ is selected from:

![Chemical Structure]

23. The compound of claim 17 wherein L₁ is -NH- or -OC(=S)NH-.

24. The compound of claim 23 wherein R₁, R₂ and R₃ are hydrogen.

25. The compound of claim 23 wherein Cycl₁ is selected from:

![Chemical Structure]

26. The compound of claim 23 wherein L₂ is selected from -NHC(=S)NH-, -NHC(=O)-, -NH- or -NHCH₂-.

27. The compound of claim 23 wherein Cycl₂ is selected from:

![Chemical Structure]

28. The compound of claim 23 having the following structure (III-1-3):

![Chemical Structure (III-1-3)]
29. The compound of claim 23 having the following structure (III-1-4):

![Chemical Structure](III-1-4)

30. The compound of claim 23 having the following structure (III-1-5):

![Chemical Structure](III-1-5)

31. The compound of claim 1, wherein ring moiety A is (I-C).

32. The compound of claim 31 wherein L₁ is a direct bond.

33. The compound of claim 32 wherein R₁ and R₂ are methoxy and R₃ is hydrogen.

34. The compound of claim 32 wherein Cycl₁ is:

![Chemical Structure](Diagram)

35. The compound of claim 32 wherein L₂ is –C(=S)NH–.
36. The compound of claim 32 wherein Cycl₁ is:

\[ \text{structure 1} \], where w is \[ \text{structure 2} \].

37. The compound of claim 31 wherein \( L_1 \) is \(-\text{NH}^-\).

38. The compound of claim 37 wherein \( R_1 \) and \( R_2 \) are methoxy; and \( R_3 \) is hydrogen.

39. The compound of claim 37 wherein Cycl₁ is:

\[ \text{structure 3} \]

40. The compound of claim 37 wherein \( L_2 \) is selected from \(-\text{NHC(=S)NH}^-\), \(-\text{NH}^-\) or \(-\text{NHCH}_2^-\).

41. The compound of claim 37 wherein Cycl₂ is selected from:

\[ \text{structure 4} \], \[ \text{structure 5} \] or \[ \text{structure 6} \],

wherein \( w \) is \( L_4\)-Cycl₄, wherein \( L_4 \) is selected from \(-\text{S(=O)}_2\text{NH}^-\), \(-\text{NHC(=S)NHCH}_2^-\), \(-\text{NHCH}_2^-\) or \(-\text{NHC(=S)NH}^-\), and wherein Cycl₄ is:

\[ \text{structure 7} \] or \[ \text{structure 8} \].

42. A composition comprising a compound of claim 1 in combination with a pharmaceutically acceptable excipient.
43. A method for treating a protein kinase-mediated disease comprising administering to a subject in need thereof a therapeutically effective amount of a compound of claim 1 or a composition of claim 42.

44. The method of claim 43, wherein the protein kinase-mediated disease is an aurora-2 kinase-mediated disease, a c-kit-mediated disease or a PDGFR-a-mediated disease.

45. The method of claim 44 wherein the protein-kinase mediated disease is cancer.

46. The method of claim 45 wherein the cancer is a cancer of the pancreas, breast, ovary or colon.
