- (57) Sammendrag:
The present disclosure generally relates to managing and sharing contextually-relevant media content. In some embodiments, a device receives an input, and in response, displays a suggested collection of media items for sharing with a recipient, wherein the collection is relevant to a message conversation with the recipient. Subsequent to displaying the suggested collection, the device transmits a message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items. In some embodiments, a device receives an indication, from an external device, that a first user has shared a first collection of media items with a second user. Subsequent to receiving the indication that the first user has shared the first collection of media items with the second user, the device outputs a prompt to share, with the first user, one or more suggested media items.

FIG. 6N

USER INTERFACES FOR SHARING CONTEXTUALLY RELEVANT MEDIA CONTENT

FIELD

[0001] The present disclosure relates generally to computer user interfaces, and more
5 specifically to techniques for viewing and sharing relevant media items.

BACKGROUND

[0002] The size of user media libraries continues to grow, along with the amount of media
sharing between device users. As such, devices are increasingly expected to have thoughtfully-
designed user interfaces for handling such activity. US 2007/0271340 A1 by Goodman et al
10 describes a context enhanced messaging and collaboration system in which resources related to
the context of text messages may be automatically identified and exchanged between users in
association with the text messages. A graphical user interface (GUI) is provided for instant
messaging between client devices. The user of the GUI may enter text messages into the GUI
and may select individual ones of the retrieved resources for transmission in association with the
15 text messages.

BRIEF SUMMARY

[0003] Some techniques for viewing and sharing relevant media items using electronic
devices, however, are generally cumbersome and inefficient. For example, some existing
techniques use a complex and time-consuming user interface, which may include multiple key
20 presses or keystrokes. Existing techniques require more time than necessary, wasting user time
and device energy. This latter consideration is particularly important in battery-operated devices.

[0004] The present invention is disclosed by the subject-matter of the independent claims.
One aspect of the present invention is a method as defined in independent claim 1. Other aspects
of the invention are a computer readable storage medium and an electronic device as defined in
25 claims 32 and 33, respectively. Further aspects of the invention are the subject of the dependent
claims. Any reference throughout this disclosure to an embodiment may point to alternative
aspects relating to the invention, which are not necessarily embodiments encompassed by the

claims, rather examples and technical descriptions useful for understanding the invention. The scope of present invention is defined by the claims.

[0005] Accordingly, the present technique provides electronic devices with faster, more efficient methods and interfaces for viewing and sharing relevant media items. Such methods and interfaces optionally complement or replace other methods for viewing and sharing relevant media items. Such methods and interfaces reduce the cognitive burden on a user and produce a more efficient human-machine interface. For battery-operated computing devices, such methods and interfaces conserve power and increase the time between battery charges. Further, such methods and interfaces reduce the number of unnecessary, extraneous, or repetitive inputs by a user.

[0006] In accordance with some embodiments, a method is performed at a device with a display and one or more input devices. The method comprises: receiving, via the one or more input devices, a first input; in response to receiving the first input, displaying, on the display, a suggested collection of media items for sharing with a recipient, wherein the suggested collection is relevant to a message conversation with the recipient; subsequent to displaying the suggested collection of media items, receiving, via the one or more input devices, a second input representing a request to transmit at least a portion of the suggested collection of media items to the recipient; and in response to receiving the second input, transmitting a message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items.

[0007] In accordance with some embodiments, a non-transitory computer-readable storage medium is described. The non-transitory computer-readable storage medium stores one or more programs configured to be executed by one or more processors of an electronic device with a display and one or more input devices, the one or more programs including instructions for: receiving, via the one or more input devices, a first input; in response to receiving the first input, displaying, on the display, a suggested collection of media items for sharing with a recipient, wherein the suggested collection is relevant to a message conversation with the recipient; subsequent to displaying the suggested collection of media items, receiving, via the one or more input devices, a second input representing a request to transmit at least a portion of the suggested

collection of media items to the recipient; and in response to receiving the second input, transmitting a message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items.

[0008] In accordance with some embodiments, an electronic device is described. The electronic device comprises: a display; one or more input devices; one or more processors; and memory storing one or more programs configured to be executed by the one or more processors, the one or more programs including instructions for: receiving, via the one or more input devices, a first input; in response to receiving the first input, displaying, on the display, a suggested collection of media items for sharing with a recipient, wherein the suggested collection is relevant to a message conversation with the recipient; subsequent to displaying the suggested collection of media items, receiving, via the one or more input devices, a second input representing a request to transmit at least a portion of the suggested collection of media items to the recipient; and in response to receiving the second input, transmitting a message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items.

[0009] In accordance with some embodiments, an electronic device is described. The electronic device comprises: a display; one or more input devices; means for receiving, via the one or more input devices, a first input; means for, responsive to receiving the first input, displaying, on the display, a suggested collection of media items for sharing with a recipient, wherein the suggested collection is relevant to a message conversation with the recipient; means for, subsequent to displaying the suggested collection of media items, receiving, via the one or more input devices, a second input representing a request to transmit at least a portion of the suggested collection of media items to the recipient; and means for, responsive to receiving the second input, transmitting a message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items.

[0010] In accordance with some embodiments, a transitory computer-readable storage medium is described. The transitory computer-readable storage medium stores one or more programs configured to be executed by one or more processors of an electronic device with a display and one or more input devices, the one or more programs including instructions for:

receiving, via the one or more input devices, a first input; in response to receiving the first input, displaying, on the display, a suggested collection of media items for sharing with a recipient, wherein the suggested collection is relevant to a message conversation with the recipient; subsequent to displaying the suggested collection of media items, receiving, via the one or more
 5 input devices, a second input representing a request to transmit at least a portion of the suggested collection of media items to the recipient; and in response to receiving the second input, transmitting a message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items.

[0011] In accordance with some embodiments, a method is performed at a device with a
 10 display and one or more input devices. The method comprises: receiving an indication, from an external device, that a first user has shared a first collection of media items with a second user; subsequent to receiving the indication that the first user has shared the first collection of media items with the second user, outputting a prompt to share, with the first user, one or more suggested media items associated with the second user that are related to the first collection of
 15 media items based on a context, wherein: the context is determined based on the first collection of media items, and the one or more suggested media items are not included in the first collection.

[0012] In accordance with some embodiments, a non-transitory computer-readable storage medium is described. The non-transitory computer-readable storage medium stores one or more
 20 programs configured to be executed by one or more processors of an electronic device with a display and one or more input devices, the one or more programs including instructions for: receiving an indication, from an external device, that a first user has shared a first collection of media items with a second user; subsequent to receiving the indication that the first user has shared the first collection of media items with the second user, outputting a prompt to share, with
 25 the first user, one or more suggested media items associated with the second user that are related to the first collection of media items based on a context, wherein: the context is determined based on the first collection of media items, and the one or more suggested media items are not included in the first collection.

[0013] In accordance with some embodiments, an electronic device is described. The electronic device comprises: a display; one or more input devices; one or more processors; and memory storing one or more programs configured to be executed by the one or more processors, the one or more programs including instructions for: receiving an indication, from an external device, that a first user has shared a first collection of media items with a second user; subsequent to receiving the indication that the first user has shared the first collection of media items with the second user, outputting a prompt to share, with the first user, one or more suggested media items associated with the second user that are related to the first collection of media items based on a context, wherein: the context is determined based on the first collection of media items, and the one or more suggested media items are not included in the first collection.

[0014] In accordance with some embodiments, an electronic device is described. The electronic device comprises: a display; one or more input devices; means for receiving an indication, from an external device, that a first user has shared a first collection of media items with a second user; means for subsequent to receiving the indication that the first user has shared the first collection of media items with the second user, outputting a prompt to share, with the first user, one or more suggested media items associated with the second user that are related to the first collection of media items based on a context, wherein: the context is determined based on the first collection of media items, and the one or more suggested media items are not included in the first collection.

[0015] In accordance with some embodiments, a transitory computer-readable storage medium is described. The transitory computer-readable storage medium stores one or more programs configured to be executed by one or more processors of an electronic device with a display and one or more input devices, the one or more programs including instructions for: receiving an indication, from an external device, that a first user has shared a first collection of media items with a second user; subsequent to receiving the indication that the first user has shared the first collection of media items with the second user, outputting a prompt to share, with the first user, one or more suggested media items associated with the second user that are related to the first collection of media items based on a context, wherein: the context is determined

based on the first collection of media items, and the one or more suggested media items are not included in the first collection.

[0016] Executable instructions for performing these functions are, optionally, included in a non-transitory computer-readable storage medium or other computer program product
 5 configured for execution by one or more processors. Executable instructions for performing these functions are, optionally, included in a transitory computer-readable storage medium or other computer program product configured for execution by one or more processors.

[0017] Thus, devices are provided with faster, more efficient methods and interfaces for viewing and sharing relevant media items, thereby increasing the effectiveness, efficiency, and
 10 user satisfaction with such devices. Such methods and interfaces may complement or replace other methods for viewing and sharing relevant media items.

DESCRIPTION OF THE FIGURES

[0018] For a better understanding of the various described embodiments, reference should be made to the Description of Embodiments below, in conjunction with the following drawings in
 15 which like reference numerals refer to corresponding parts throughout the figures.

[0019] FIG. 1A is a block diagram illustrating a portable multifunction device with a touch-sensitive display in accordance with some embodiments.

[0020] FIG. 1B is a block diagram illustrating exemplary components for event handling in accordance with some embodiments.

20 [0021] FIG. 2 illustrates a portable multifunction device having a touch screen in accordance with some embodiments.

[0022] FIG. 3 is a block diagram of an exemplary multifunction device with a display and a touch-sensitive surface in accordance with some embodiments.

[0023] FIG. 4A illustrates an exemplary user interface for a menu of applications on a
 25 portable multifunction device in accordance with some embodiments.

[0024] FIG. 4B illustrates an exemplary user interface for a multifunction device with a touch-sensitive surface that is separate from the display in accordance with some embodiments.

[0025] FIG. 5A illustrates a personal electronic device in accordance with some embodiments.

5 [0026] FIG. 5B is a block diagram illustrating a personal electronic device in accordance with some embodiments.

[0027] FIGS. 5C-5D illustrate exemplary components of a personal electronic device having a touch-sensitive display and intensity sensors in accordance with some embodiments.

10 [0028] FIGS. 5E-5H illustrate exemplary components and user interfaces of a personal electronic device in accordance with some embodiments.

[0029] FIGS. 6A-6AAC illustrate exemplary techniques and interfaces for viewing and sharing relevant media items in accordance with some embodiments.

[0030] FIGS. 7A-7J is a flow diagram illustrating a process for viewing and sharing relevant media items in accordance with some embodiments.

15 [0031] FIGS. 8A-8AQ illustrate exemplary techniques and interfaces for viewing and sharing relevant media items in accordance with some embodiments.

[0032] FIGS. 9A-9G is a flow diagram illustrating a process for viewing and sharing relevant media items in accordance with some embodiments.

DESCRIPTION OF EMBODIMENTS

20 [0033] The following description sets forth exemplary methods, parameters, and the like. It should be recognized, however, that such description is not intended as a limitation on the scope of the present disclosure but is instead provided as a description of exemplary embodiments.

[0034] There is a need for electronic devices that provide efficient methods and interfaces for viewing and sharing relevant media items. For example, there is a need for electronic devices
25 that provide quick and easy access to relevant sharing suggestions, and improved interfaces for

interacting with the media of the sharing suggestion. Further, there is a need for devices that provide improved interfaces for managing and saving received shared media. Such techniques can reduce the cognitive burden on a user who accesses media items for sharing, thereby enhancing productivity. Further, such techniques can reduce processor and battery power
 5 otherwise wasted on redundant user inputs.

[0035] Below, FIGS. 1A-1B, 2, 3, 4A-4B, and 5A-5H provide a description of exemplary devices for performing the techniques for viewing and sharing relevant media items. FIGS. 6A-6AAC illustrate exemplary user interfaces for viewing and sharing relevant media items. FIGS. 7A-7J is a flow diagram illustrating methods of viewing and sharing relevant media items in
 10 accordance with some embodiments. The user interfaces in FIGS. 6A-6AAC are used to illustrate the processes described below, including the processes in FIGS. 7A-7J. FIGS. 8A-8AQ illustrate exemplary user interfaces for viewing and sharing relevant media items. FIGS. 9A-9G is a flow diagram illustrating methods of viewing and sharing relevant media items in accordance with some embodiments. The user interfaces in FIGS. 8A-8AQ are used to illustrate the
 15 processes described below, including the processes in FIGS. 9A-9G.

[0036] Although the following description uses terms “first,” “second,” etc. to describe various elements, these elements should not be limited by the terms. These terms are only used to distinguish one element from another. For example, a first touch could be termed a second touch, and, similarly, a second touch could be termed a first touch, without departing from the
 20 scope of the various described embodiments. The first touch and the second touch are both touches, but they are not the same touch.

[0037] The terminology used in the description of the various described embodiments herein is for the purpose of describing particular embodiments only and is not intended to be limiting. As used in the description of the various described embodiments and the appended claims, the
 25 singular forms “a,” “an,” and “the” are intended to include the plural forms as well, unless the context clearly indicates otherwise. It will also be understood that the term “and/or” as used herein refers to and encompasses any and all possible combinations of one or more of the associated listed items. It will be further understood that the terms “includes,” “including,” “comprises,” and/or “comprising,” when used in this specification, specify the presence of stated

features, integers, steps, operations, elements, and/or components, but do not preclude the presence or addition of one or more other features, integers, steps, operations, elements, components, and/or groups thereof.

[0038] The term “if” is, optionally, construed to mean “when” or “upon” or “in response to determining” or “in response to detecting,” depending on the context. Similarly, the phrase “if it is determined” or “if [a stated condition or event] is detected” is, optionally, construed to mean “upon determining” or “in response to determining” or “upon detecting [the stated condition or event]” or “in response to detecting [the stated condition or event],” depending on the context.

[0039] Embodiments of electronic devices, user interfaces for such devices, and associated processes for using such devices are described. In some embodiments, the device is a portable communications device, such as a mobile telephone, that also contains other functions, such as PDA and/or music player functions. Exemplary embodiments of portable multifunction devices include, without limitation, the iPhone®, iPod Touch®, and iPad® devices from Apple Inc. of Cupertino, California. Other portable electronic devices, such as laptops or tablet computers with touch-sensitive surfaces (e.g., touch screen displays and/or touchpads), are, optionally, used. It should also be understood that, in some embodiments, the device is not a portable communications device, but is a desktop computer with a touch-sensitive surface (e.g., a touch screen display and/or a touchpad).

[0040] In the discussion that follows, an electronic device that includes a display and a touch-sensitive surface is described. It should be understood, however, that the electronic device optionally includes one or more other physical user-interface devices, such as a physical keyboard, a mouse, and/or a joystick.

[0041] The device typically supports a variety of applications, such as one or more of the following: a drawing application, a presentation application, a word processing application, a website creation application, a disk authoring application, a spreadsheet application, a gaming application, a telephone application, a video conferencing application, an e-mail application, an instant messaging application, a workout support application, a photo management application, a digital camera application, a digital video camera application, a web browsing application, a digital music player application, and/or a digital video player application.

[0042] The various applications that are executed on the device optionally use at least one common physical user-interface device, such as the touch-sensitive surface. One or more functions of the touch-sensitive surface as well as corresponding information displayed on the device are, optionally, adjusted and/or varied from one application to the next and/or within a
 5 respective application. In this way, a common physical architecture (such as the touch-sensitive surface) of the device optionally supports the variety of applications with user interfaces that are intuitive and transparent to the user.

[0043] Attention is now directed toward embodiments of portable devices with touch-sensitive displays. FIG. 1A is a block diagram illustrating portable multifunction device 100
 10 with touch-sensitive display system 112 in accordance with some embodiments. Touch-sensitive display 112 is sometimes called a “touch screen” for convenience and is sometimes known as or called a “touch-sensitive display system.” Device 100 includes memory 102 (which optionally includes one or more computer-readable storage mediums), memory controller 122, one or more processing units (CPUs) 120, peripherals interface 118, RF circuitry 108, audio circuitry 110,
 15 speaker 111, microphone 113, input/output (I/O) subsystem 106, other input control devices 116, and external port 124. Device 100 optionally includes one or more optical sensors 164. Device 100 optionally includes one or more contact intensity sensors 165 for detecting intensity of contacts on device 100 (e.g., a touch-sensitive surface such as touch-sensitive display system 112 of device 100). Device 100 optionally includes one or more tactile output generators 167 for
 20 generating tactile outputs on device 100 (e.g., generating tactile outputs on a touch-sensitive surface such as touch-sensitive display system 112 of device 100 or touchpad 355 of device 300). These components optionally communicate over one or more communication buses or signal lines 103.

[0044] As used in the specification and claims, the term “intensity” of a contact on a touch-sensitive surface refers to the force or pressure (force per unit area) of a contact (e.g., a finger
 25 contact) on the touch-sensitive surface, or to a substitute (proxy) for the force or pressure of a contact on the touch-sensitive surface. The intensity of a contact has a range of values that includes at least four distinct values and more typically includes hundreds of distinct values (e.g., at least 256). Intensity of a contact is, optionally, determined (or measured) using various
 30 approaches and various sensors or combinations of sensors. For example, one or more force

sensors underneath or adjacent to the touch-sensitive surface are, optionally, used to measure force at various points on the touch-sensitive surface. In some implementations, force measurements from multiple force sensors are combined (e.g., a weighted average) to determine an estimated force of a contact. Similarly, a pressure-sensitive tip of a stylus is, optionally, used to determine a pressure of the stylus on the touch-sensitive surface. Alternatively, the size of the contact area detected on the touch-sensitive surface and/or changes thereto, the capacitance of the touch-sensitive surface proximate to the contact and/or changes thereto, and/or the resistance of the touch-sensitive surface proximate to the contact and/or changes thereto are, optionally, used as a substitute for the force or pressure of the contact on the touch-sensitive surface. In some implementations, the substitute measurements for contact force or pressure are used directly to determine whether an intensity threshold has been exceeded (e.g., the intensity threshold is described in units corresponding to the substitute measurements). In some implementations, the substitute measurements for contact force or pressure are converted to an estimated force or pressure, and the estimated force or pressure is used to determine whether an intensity threshold has been exceeded (e.g., the intensity threshold is a pressure threshold measured in units of pressure). Using the intensity of a contact as an attribute of a user input allows for user access to additional device functionality that may otherwise not be accessible by the user on a reduced-size device with limited real estate for displaying affordances (e.g., on a touch-sensitive display) and/or receiving user input (e.g., via a touch-sensitive display, a touch-sensitive surface, or a physical/mechanical control such as a knob or a button).

[0045] As used in the specification and claims, the term “tactile output” refers to physical displacement of a device relative to a previous position of the device, physical displacement of a component (e.g., a touch-sensitive surface) of a device relative to another component (e.g., housing) of the device, or displacement of the component relative to a center of mass of the device that will be detected by a user with the user’s sense of touch. For example, in situations where the device or the component of the device is in contact with a surface of a user that is sensitive to touch (e.g., a finger, palm, or other part of a user’s hand), the tactile output generated by the physical displacement will be interpreted by the user as a tactile sensation corresponding to a perceived change in physical characteristics of the device or the component of the device. For example, movement of a touch-sensitive surface (e.g., a touch-sensitive display or trackpad)

is, optionally, interpreted by the user as a “down click” or “up click” of a physical actuator button. In some cases, a user will feel a tactile sensation such as an “down click” or “up click” even when there is no movement of a physical actuator button associated with the touch-sensitive surface that is physically pressed (e.g., displaced) by the user’s movements. As another
 5 example, movement of the touch-sensitive surface is, optionally, interpreted or sensed by the user as “roughness” of the touch-sensitive surface, even when there is no change in smoothness of the touch-sensitive surface. While such interpretations of touch by a user will be subject to the individualized sensory perceptions of the user, there are many sensory perceptions of touch that are common to a large majority of users. Thus, when a tactile output is described as
 10 corresponding to a particular sensory perception of a user (e.g., an “up click,” a “down click,” “roughness”), unless otherwise stated, the generated tactile output corresponds to physical displacement of the device or a component thereof that will generate the described sensory perception for a typical (or average) user.

[0046] It should be appreciated that device 100 is only one example of a portable
 15 multifunction device, and that device 100 optionally has more or fewer components than shown, optionally combines two or more components, or optionally has a different configuration or arrangement of the components. The various components shown in FIG. 1A are implemented in hardware, software, or a combination of both hardware and software, including one or more signal processing and/or application-specific integrated circuits.

20 [0047] Memory 102 optionally includes high-speed random access memory and optionally also includes non-volatile memory, such as one or more magnetic disk storage devices, flash memory devices, or other non-volatile solid-state memory devices. Memory controller 122 optionally controls access to memory 102 by other components of device 100.

[0048] Peripherals interface 118 can be used to couple input and output peripherals of the
 25 device to CPU 120 and memory 102. The one or more processors 120 run or execute various software programs and/or sets of instructions stored in memory 102 to perform various functions for device 100 and to process data. In some embodiments, peripherals interface 118, CPU 120, and memory controller 122 are, optionally, implemented on a single chip, such as chip 104. In some other embodiments, they are, optionally, implemented on separate chips.

[0049] RF (radio frequency) circuitry 108 receives and sends RF signals, also called electromagnetic signals. RF circuitry 108 converts electrical signals to/from electromagnetic signals and communicates with communications networks and other communications devices via the electromagnetic signals. RF circuitry 108 optionally includes well-known circuitry for performing these functions, including but not limited to an antenna system, an RF transceiver, one or more amplifiers, a tuner, one or more oscillators, a digital signal processor, a CODEC chipset, a subscriber identity module (SIM) card, memory, and so forth. RF circuitry 108 optionally communicates with networks, such as the Internet, also referred to as the World Wide Web (WWW), an intranet and/or a wireless network, such as a cellular telephone network, a wireless local area network (LAN) and/or a metropolitan area network (MAN), and other devices by wireless communication. The RF circuitry 108 optionally includes well-known circuitry for detecting near field communication (NFC) fields, such as by a short-range communication radio. The wireless communication optionally uses any of a plurality of communications standards, protocols, and technologies, including but not limited to Global System for Mobile Communications (GSM), Enhanced Data GSM Environment (EDGE), high-speed downlink packet access (HSDPA), high-speed uplink packet access (HSUPA), Evolution, Data-Only (EV-DO), HSPA, HSPA+, Dual-Cell HSPA (DC-HSPDA), long term evolution (LTE), near field communication (NFC), wideband code division multiple access (W-CDMA), code division multiple access (CDMA), time division multiple access (TDMA), Bluetooth, Bluetooth Low Energy (BTLE), Wireless Fidelity (Wi-Fi) (e.g., IEEE 802.11a, IEEE 802.11b, IEEE 802.11g, IEEE 802.11n, and/or IEEE 802.11ac), voice over Internet Protocol (VoIP), Wi-MAX, a protocol for e-mail (e.g., Internet message access protocol (IMAP) and/or post office protocol (POP)), instant messaging (e.g., extensible messaging and presence protocol (XMPP), Session Initiation Protocol for Instant Messaging and Presence Leveraging Extensions (SIMPLE), Instant Messaging and Presence Service (IMPS)), and/or Short Message Service (SMS), or any other suitable communication protocol, including communication protocols not yet developed as of the filing date of this document.

[0050] Audio circuitry 110, speaker 111, and microphone 113 provide an audio interface between a user and device 100. Audio circuitry 110 receives audio data from peripherals interface 118, converts the audio data to an electrical signal, and transmits the electrical signal to

speaker 111. Speaker 111 converts the electrical signal to human-audible sound waves. Audio circuitry 110 also receives electrical signals converted by microphone 113 from sound waves. Audio circuitry 110 converts the electrical signal to audio data and transmits the audio data to peripherals interface 118 for processing. Audio data is, optionally, retrieved from and/or transmitted to memory 102 and/or RF circuitry 108 by peripherals interface 118. In some embodiments, audio circuitry 110 also includes a headset jack (e.g., 212, FIG. 2). The headset jack provides an interface between audio circuitry 110 and removable audio input/output peripherals, such as output-only headphones or a headset with both output (e.g., a headphone for one or both ears) and input (e.g., a microphone).

10 [0051] I/O subsystem 106 couples input/output peripherals on device 100, such as touch screen 112 and other input control devices 116, to peripherals interface 118. I/O subsystem 106 optionally includes display controller 156, optical sensor controller 158, intensity sensor controller 159, haptic feedback controller 161, and one or more input controllers 160 for other input or control devices. The one or more input controllers 160 receive/send electrical signals from/to other input control devices 116. The other input control devices 116 optionally include physical buttons (e.g., push buttons, rocker buttons, etc.), dials, slider switches, joysticks, click wheels, and so forth. In some alternate embodiments, input controller(s) 160 are, optionally, coupled to any (or none) of the following: a keyboard, an infrared port, a USB port, and a pointer device such as a mouse. The one or more buttons (e.g., 208, FIG. 2) optionally include an up/down button for volume control of speaker 111 and/or microphone 113. The one or more buttons optionally include a push button (e.g., 206, FIG. 2).

[0052] A quick press of the push button optionally disengages a lock of touch screen 112 or optionally begins a process that uses gestures on the touch screen to unlock the device, as described in U.S. Patent Application 11/322,549, “Unlocking a Device by Performing Gestures on an Unlock Image,” filed December 23, 2005, U.S. Pat. No. 7,657,849. A longer press of the push button (e.g., 206) optionally turns power to device 100 on or off. The functionality of one or more of the buttons are, optionally, user-customizable. Touch screen 112 is used to implement virtual or soft buttons and one or more soft keyboards.

[0053] Touch-sensitive display 112 provides an input interface and an output interface between the device and a user. Display controller 156 receives and/or sends electrical signals from/to touch screen 112. Touch screen 112 displays visual output to the user. The visual output optionally includes graphics, text, icons, video, and any combination thereof (collectively
 5 termed “graphics”). In some embodiments, some or all of the visual output optionally corresponds to user-interface objects.

[0054] Touch screen 112 has a touch-sensitive surface, sensor, or set of sensors that accepts input from the user based on haptic and/or tactile contact. Touch screen 112 and display controller 156 (along with any associated modules and/or sets of instructions in memory 102)
 10 detect contact (and any movement or breaking of the contact) on touch screen 112 and convert the detected contact into interaction with user-interface objects (e.g., one or more soft keys, icons, web pages, or images) that are displayed on touch screen 112. In an exemplary embodiment, a point of contact between touch screen 112 and the user corresponds to a finger of the user.

[0055] Touch screen 112 optionally uses LCD (liquid crystal display) technology, LPD (light emitting polymer display) technology, or LED (light emitting diode) technology, although other display technologies are used in other embodiments. Touch screen 112 and display controller 156 optionally detect contact and any movement or breaking thereof using any of a plurality of touch sensing technologies now known or later developed, including but not limited to
 15 capacitive, resistive, infrared, and surface acoustic wave technologies, as well as other proximity sensor arrays or other elements for determining one or more points of contact with touch screen 112. In an exemplary embodiment, projected mutual capacitance sensing technology is used, such as that found in the iPhone® and iPod Touch® from Apple Inc. of Cupertino, California.

[0056] A touch-sensitive display in some embodiments of touch screen 112 is, optionally,
 25 analogous to the multi-touch sensitive touchpads described in the following U.S. Patents: 6,323,846 (Westerman et al.), 6,570,557 (Westerman et al.), and/or 6,677,932 (Westerman), and/or U.S. Patent Publication 2002/0015024A1. However, touch screen 112 displays visual output from device 100, whereas touch-sensitive touchpads do not provide visual output.

[0057] A touch-sensitive display in some embodiments of touch screen 112 is described in the following applications: (1) U.S. Patent Application No. 11/381,313, "Multipoint Touch Surface Controller," filed May 2, 2006; (2) U.S. Patent Application No. 10/840,862, "Multipoint Touchscreen," filed May 6, 2004; (3) U.S. Patent Application No. 10/903,964, "Gestures For Touch Sensitive Input Devices," filed July 30, 2004; (4) U.S. Patent Application No. 11/048,264, "Gestures For Touch Sensitive Input Devices," filed January 31, 2005; (5) U.S. Patent Application No. 11/038,590, "Mode-Based Graphical User Interfaces For Touch Sensitive Input Devices," filed January 18, 2005; (6) U.S. Patent Application No. 11/228,758, "Virtual Input Device Placement On A Touch Screen User Interface," filed September 16, 2005; (7) U.S. Patent Application No. 11/228,700, "Operation Of A Computer With A Touch Screen Interface," filed September 16, 2005; (8) U.S. Patent Application No. 11/228,737, "Activating Virtual Keys Of A Touch-Screen Virtual Keyboard," filed September 16, 2005; and (9) U.S. Patent Application No. 11/367,749, "Multi-Functional Hand-Held Device," filed March 3, 2006.

[0058] Touch screen 112 optionally has a video resolution in excess of 100 dpi. In some embodiments, the touch screen has a video resolution of approximately 160 dpi. The user optionally makes contact with touch screen 112 using any suitable object or appendage, such as a stylus, a finger, and so forth. In some embodiments, the user interface is designed to work primarily with finger-based contacts and gestures, which can be less precise than stylus-based input due to the larger area of contact of a finger on the touch screen. In some embodiments, the device translates the rough finger-based input into a precise pointer/cursor position or command for performing the actions desired by the user.

[0059] In some embodiments, in addition to the touch screen, device 100 optionally includes a touchpad (not shown) for activating or deactivating particular functions. In some embodiments, the touchpad is a touch-sensitive area of the device that, unlike the touch screen, does not display visual output. The touchpad is, optionally, a touch-sensitive surface that is separate from touch screen 112 or an extension of the touch-sensitive surface formed by the touch screen.

[0060] Device 100 also includes power system 162 for powering the various components. Power system 162 optionally includes a power management system, one or more power sources

(e.g., battery, alternating current (AC)), a recharging system, a power failure detection circuit, a power converter or inverter, a power status indicator (e.g., a light-emitting diode (LED)) and any other components associated with the generation, management and distribution of power in portable devices.

- 5 [0061] Device 100 optionally also includes one or more optical sensors 164. FIG. 1A shows an optical sensor coupled to optical sensor controller 158 in I/O subsystem 106. Optical sensor 164 optionally includes charge-coupled device (CCD) or complementary metal-oxide semiconductor (CMOS) phototransistors. Optical sensor 164 receives light from the environment, projected through one or more lenses, and converts the light to data representing an
- 10 image. In conjunction with imaging module 143 (also called a camera module), optical sensor 164 optionally captures still images or video. In some embodiments, an optical sensor is located on the back of device 100, opposite touch screen display 112 on the front of the device so that the touch screen display is enabled for use as a viewfinder for still and/or video image acquisition. In some embodiments, an optical sensor is located on the front of the device so that
- 15 the user's image is, optionally, obtained for video conferencing while the user views the other video conference participants on the touch screen display. In some embodiments, the position of optical sensor 164 can be changed by the user (e.g., by rotating the lens and the sensor in the device housing) so that a single optical sensor 164 is used along with the touch screen display for both video conferencing and still and/or video image acquisition.
- 20 [0062] Device 100 optionally also includes one or more contact intensity sensors 165. FIG. 1A shows a contact intensity sensor coupled to intensity sensor controller 159 in I/O subsystem 106. Contact intensity sensor 165 optionally includes one or more piezoresistive strain gauges, capacitive force sensors, electric force sensors, piezoelectric force sensors, optical force sensors, capacitive touch-sensitive surfaces, or other intensity sensors (e.g., sensors used to
- 25 measure the force (or pressure) of a contact on a touch-sensitive surface). Contact intensity sensor 165 receives contact intensity information (e.g., pressure information or a proxy for pressure information) from the environment. In some embodiments, at least one contact intensity sensor is collocated with, or proximate to, a touch-sensitive surface (e.g., touch-sensitive display system 112). In some embodiments, at least one contact intensity sensor is

located on the back of device 100, opposite touch screen display 112, which is located on the front of device 100.

[0063] Device 100 optionally also includes one or more proximity sensors 166. FIG. 1A shows proximity sensor 166 coupled to peripherals interface 118. Alternately, proximity sensor 166 is, optionally, coupled to input controller 160 in I/O subsystem 106. Proximity sensor 166 optionally performs as described in U.S. Patent Application Nos. 11/241,839, “Proximity Detector In Handheld Device”; 11/240,788, “Proximity Detector In Handheld Device”; 11/620,702, “Using Ambient Light Sensor To Augment Proximity Sensor Output”; 11/586,862, “Automated Response To And Sensing Of User Activity In Portable Devices”; and 11/638,251, “Methods And Systems For Automatic Configuration Of Peripherals”. In some embodiments, the proximity sensor turns off and disables touch screen 112 when the multifunction device is placed near the user’s ear (e.g., when the user is making a phone call).

[0064] Device 100 optionally also includes one or more tactile output generators 167. FIG. 1A shows a tactile output generator coupled to haptic feedback controller 161 in I/O subsystem 106. Tactile output generator 167 optionally includes one or more electroacoustic devices such as speakers or other audio components and/or electromechanical devices that convert energy into linear motion such as a motor, solenoid, electroactive polymer, piezoelectric actuator, electrostatic actuator, or other tactile output generating component (e.g., a component that converts electrical signals into tactile outputs on the device). Contact intensity sensor 165 receives tactile feedback generation instructions from haptic feedback module 133 and generates tactile outputs on device 100 that are capable of being sensed by a user of device 100. In some embodiments, at least one tactile output generator is collocated with, or proximate to, a touch-sensitive surface (e.g., touch-sensitive display system 112) and, optionally, generates a tactile output by moving the touch-sensitive surface vertically (e.g., in/out of a surface of device 100) or laterally (e.g., back and forth in the same plane as a surface of device 100). In some embodiments, at least one tactile output generator sensor is located on the back of device 100, opposite touch screen display 112, which is located on the front of device 100.

[0065] Device 100 optionally also includes one or more accelerometers 168. FIG. 1A shows accelerometer 168 coupled to peripherals interface 118. Alternately, accelerometer 168 is,

optionally, coupled to an input controller 160 in I/O subsystem 106. Accelerometer 168 optionally performs as described in U.S. Patent Publication No. 20050190059, “Acceleration-based Theft Detection System for Portable Electronic Devices,” and U.S. Patent Publication No. 20060017692, “Methods And Apparatuses For Operating A Portable Device Based On An Accelerometer”. In some embodiments, information is displayed on the touch screen display in a portrait view or a landscape view based on an analysis of data received from the one or more accelerometers. Device 100 optionally includes, in addition to accelerometer(s) 168, a magnetometer (not shown) and a GPS (or GLONASS or other global navigation system) receiver (not shown) for obtaining information concerning the location and orientation (e.g., portrait or landscape) of device 100.

[0066] In some embodiments, the software components stored in memory 102 include operating system 126, communication module (or set of instructions) 128, contact/motion module (or set of instructions) 130, graphics module (or set of instructions) 132, text input module (or set of instructions) 134, Global Positioning System (GPS) module (or set of instructions) 135, and applications (or sets of instructions) 136. Furthermore, in some embodiments, memory 102 (FIG. 1A) or 370 (FIG. 3) stores device/global internal state 157, as shown in FIGS. 1A and 3. Device/global internal state 157 includes one or more of: active application state, indicating which applications, if any, are currently active; display state, indicating what applications, views or other information occupy various regions of touch screen display 112; sensor state, including information obtained from the device’s various sensors and input control devices 116; and location information concerning the device’s location and/or attitude.

[0067] Operating system 126 (e.g., Darwin, RTXC, LINUX, UNIX, OS X, iOS, WINDOWS, or an embedded operating system such as VxWorks) includes various software components and/or drivers for controlling and managing general system tasks (e.g., memory management, storage device control, power management, etc.) and facilitates communication between various hardware and software components.

[0068] Communication module 128 facilitates communication with other devices over one or more external ports 124 and also includes various software components for handling data

received by RF circuitry 108 and/or external port 124. External port 124 (e.g., Universal Serial Bus (USB), FIREWIRE, etc.) is adapted for coupling directly to other devices or indirectly over a network (e.g., the Internet, wireless LAN, etc.). In some embodiments, the external port is a multi-pin (e.g., 30-pin) connector that is the same as, or similar to and/or compatible with, the 30-pin connector used on iPod® (trademark of Apple Inc.) devices.

[0069] Contact/motion module 130 optionally detects contact with touch screen 112 (in conjunction with display controller 156) and other touch-sensitive devices (e.g., a touchpad or physical click wheel). Contact/motion module 130 includes various software components for performing various operations related to detection of contact, such as determining if contact has occurred (e.g., detecting a finger-down event), determining an intensity of the contact (e.g., the force or pressure of the contact or a substitute for the force or pressure of the contact), determining if there is movement of the contact and tracking the movement across the touch-sensitive surface (e.g., detecting one or more finger-dragging events), and determining if the contact has ceased (e.g., detecting a finger-up event or a break in contact). Contact/motion module 130 receives contact data from the touch-sensitive surface. Determining movement of the point of contact, which is represented by a series of contact data, optionally includes determining speed (magnitude), velocity (magnitude and direction), and/or an acceleration (a change in magnitude and/or direction) of the point of contact. These operations are, optionally, applied to single contacts (e.g., one finger contacts) or to multiple simultaneous contacts (e.g., “multitouch”/multiple finger contacts). In some embodiments, contact/motion module 130 and display controller 156 detect contact on a touchpad.

[0070] In some embodiments, contact/motion module 130 uses a set of one or more intensity thresholds to determine whether an operation has been performed by a user (e.g., to determine whether a user has “clicked” on an icon). In some embodiments, at least a subset of the intensity thresholds are determined in accordance with software parameters (e.g., the intensity thresholds are not determined by the activation thresholds of particular physical actuators and can be adjusted without changing the physical hardware of device 100). For example, a mouse “click” threshold of a trackpad or touch screen display can be set to any of a large range of predefined threshold values without changing the trackpad or touch screen display hardware. Additionally, in some implementations, a user of the device is provided with software settings for adjusting

one or more of the set of intensity thresholds (e.g., by adjusting individual intensity thresholds and/or by adjusting a plurality of intensity thresholds at once with a system-level click “intensity” parameter).

[0071] Contact/motion module 130 optionally detects a gesture input by a user. Different
 5 gestures on the touch-sensitive surface have different contact patterns (e.g., different motions, timings, and/or intensities of detected contacts). Thus, a gesture is, optionally, detected by detecting a particular contact pattern. For example, detecting a finger tap gesture includes detecting a finger-down event followed by detecting a finger-up (liftoff) event at the same position (or substantially the same position) as the finger-down event (e.g., at the position of an
 10 icon). As another example, detecting a finger swipe gesture on the touch-sensitive surface includes detecting a finger-down event followed by detecting one or more finger-dragging events, and subsequently followed by detecting a finger-up (liftoff) event.

[0072] Graphics module 132 includes various known software components for rendering and displaying graphics on touch screen 112 or other display, including components for changing the
 15 visual impact (e.g., brightness, transparency, saturation, contrast, or other visual property) of graphics that are displayed. As used herein, the term “graphics” includes any object that can be displayed to a user, including, without limitation, text, web pages, icons (such as user-interface objects including soft keys), digital images, videos, animations, and the like.

[0073] In some embodiments, graphics module 132 stores data representing graphics to be
 20 used. Each graphic is, optionally, assigned a corresponding code. Graphics module 132 receives, from applications etc., one or more codes specifying graphics to be displayed along with, if necessary, coordinate data and other graphic property data, and then generates screen image data to output to display controller 156.

[0074] Haptic feedback module 133 includes various software components for generating
 25 instructions used by tactile output generator(s) 167 to produce tactile outputs at one or more locations on device 100 in response to user interactions with device 100.

[0075] Text input module 134, which is, optionally, a component of graphics module 132, provides soft keyboards for entering text in various applications (e.g., contacts 137, e-mail 140, IM 141, browser 147, and any other application that needs text input).

[0076] GPS module 135 determines the location of the device and provides this information
5 for use in various applications (e.g., to telephone 138 for use in location-based dialing; to camera 143 as picture/video metadata; and to applications that provide location-based services such as weather widgets, local yellow page widgets, and map/navigation widgets).

[0077] Applications 136 optionally include the following modules (or sets of instructions), or a subset or superset thereof:

- 10 • Contacts module 137 (sometimes called an address book or contact list);
- Telephone module 138;
- Video conference module 139;
- E-mail client module 140;
- Instant messaging (IM) module 141;
- 15 • Workout support module 142;
- Camera module 143 for still and/or video images;
- Image management module 144;
- Video player module;
- Music player module;
- 20 • Browser module 147;
- Calendar module 148;

- Widget modules 149, which optionally include one or more of: weather widget 149-1, stocks widget 149-2, calculator widget 149-3, alarm clock widget 149-4, dictionary widget 149-5, and other widgets obtained by the user, as well as user-created widgets 149-6;
- 5 • Widget creator module 150 for making user-created widgets 149-6;
- Search module 151;
- Video and music player module 152, which merges video player module and music player module;
- Notes module 153;
- 10 • Map module 154; and/or
- Online video module 155.

[0078] Examples of other applications 136 that are, optionally, stored in memory 102 include other word processing applications, other image editing applications, drawing applications, presentation applications, JAVA-enabled applications, encryption, digital rights management, 15 voice recognition, and voice replication.

[0079] In conjunction with touch screen 112, display controller 156, contact/motion module 130, graphics module 132, and text input module 134, contacts module 137 are, optionally, used to manage an address book or contact list (e.g., stored in application internal state 192 of contacts module 137 in memory 102 or memory 370), including: adding name(s) to the address book; 20 deleting name(s) from the address book; associating telephone number(s), e-mail address(es), physical address(es) or other information with a name; associating an image with a name; categorizing and sorting names; providing telephone numbers or e-mail addresses to initiate and/or facilitate communications by telephone 138, video conference module 139, e-mail 140, or IM 141; and so forth.

[0080] In conjunction with RF circuitry 108, audio circuitry 110, speaker 111, microphone 113, touch screen 112, display controller 156, contact/motion module 130, graphics module 132, and text input module 134, telephone module 138 are optionally, used to enter a sequence of characters corresponding to a telephone number, access one or more telephone numbers in contacts module 137, modify a telephone number that has been entered, dial a respective telephone number, conduct a conversation, and disconnect or hang up when the conversation is completed. As noted above, the wireless communication optionally uses any of a plurality of communications standards, protocols, and technologies.

[0081] In conjunction with RF circuitry 108, audio circuitry 110, speaker 111, microphone 113, touch screen 112, display controller 156, optical sensor 164, optical sensor controller 158, contact/motion module 130, graphics module 132, text input module 134, contacts module 137, and telephone module 138, video conference module 139 includes executable instructions to initiate, conduct, and terminate a video conference between a user and one or more other participants in accordance with user instructions.

[0082] In conjunction with RF circuitry 108, touch screen 112, display controller 156, contact/motion module 130, graphics module 132, and text input module 134, e-mail client module 140 includes executable instructions to create, send, receive, and manage e-mail in response to user instructions. In conjunction with image management module 144, e-mail client module 140 makes it very easy to create and send e-mails with still or video images taken with camera module 143.

[0083] In conjunction with RF circuitry 108, touch screen 112, display controller 156, contact/motion module 130, graphics module 132, and text input module 134, the instant messaging module 141 includes executable instructions to enter a sequence of characters corresponding to an instant message, to modify previously entered characters, to transmit a respective instant message (for example, using a Short Message Service (SMS) or Multimedia Message Service (MMS) protocol for telephony-based instant messages or using XMPP, SIMPLE, or IMPS for Internet-based instant messages), to receive instant messages, and to view received instant messages. In some embodiments, transmitted and/or received instant messages optionally include graphics, photos, audio files, video files and/or other attachments as are

supported in an MMS and/or an Enhanced Messaging Service (EMS). As used herein, “instant messaging” refers to both telephony-based messages (e.g., messages sent using SMS or MMS) and Internet-based messages (e.g., messages sent using XMPP, SIMPLE, or IMPS).

[0084] In conjunction with RF circuitry 108, touch screen 112, display controller 156,
 5 contact/motion module 130, graphics module 132, text input module 134, GPS module 135, map
 module 154, and music player module, workout support module 142 includes executable
 instructions to create workouts (e.g., with time, distance, and/or calorie burning goals);
 communicate with workout sensors (sports devices); receive workout sensor data; calibrate
 sensors used to monitor a workout; select and play music for a workout; and display, store, and
 10 transmit workout data.

[0085] In conjunction with touch screen 112, display controller 156, optical sensor(s) 164,
 optical sensor controller 158, contact/motion module 130, graphics module 132, and image
 management module 144, camera module 143 includes executable instructions to capture still
 images or video (including a video stream) and store them into memory 102, modify
 15 characteristics of a still image or video, or delete a still image or video from memory 102.

[0086] In conjunction with touch screen 112, display controller 156, contact/motion module
 130, graphics module 132, text input module 134, and camera module 143, image management
 module 144 includes executable instructions to arrange, modify (e.g., edit), or otherwise
 manipulate, label, delete, present (e.g., in a digital slide show or album), and store still and/or
 20 video images.

[0087] In conjunction with RF circuitry 108, touch screen 112, display controller 156,
 contact/motion module 130, graphics module 132, and text input module 134, browser module
 147 includes executable instructions to browse the Internet in accordance with user instructions,
 including searching, linking to, receiving, and displaying web pages or portions thereof, as well
 25 as attachments and other files linked to web pages.

[0088] In conjunction with RF circuitry 108, touch screen 112, display controller 156,
 contact/motion module 130, graphics module 132, text input module 134, e-mail client module
 140, and browser module 147, calendar module 148 includes executable instructions to create,

display, modify, and store calendars and data associated with calendars (e.g., calendar entries, to-do lists, etc.) in accordance with user instructions.

[0089] In conjunction with RF circuitry 108, touch screen 112, display controller 156, contact/motion module 130, graphics module 132, text input module 134, and browser module 147, widget modules 149 are mini-applications that are, optionally, downloaded and used by a user (e.g., weather widget 149-1, stocks widget 149-2, calculator widget 149-3, alarm clock widget 149-4, and dictionary widget 149-5) or created by the user (e.g., user-created widget 149-6). In some embodiments, a widget includes an HTML (Hypertext Markup Language) file, a CSS (Cascading Style Sheets) file, and a JavaScript file. In some embodiments, a widget includes an XML (Extensible Markup Language) file and a JavaScript file (e.g., Yahoo! Widgets).

[0090] In conjunction with RF circuitry 108, touch screen 112, display controller 156, contact/motion module 130, graphics module 132, text input module 134, and browser module 147, the widget creator module 150 are, optionally, used by a user to create widgets (e.g., turning a user-specified portion of a web page into a widget).

[0091] In conjunction with touch screen 112, display controller 156, contact/motion module 130, graphics module 132, and text input module 134, search module 151 includes executable instructions to search for text, music, sound, image, video, and/or other files in memory 102 that match one or more search criteria (e.g., one or more user-specified search terms) in accordance with user instructions.

[0092] In conjunction with touch screen 112, display controller 156, contact/motion module 130, graphics module 132, audio circuitry 110, speaker 111, RF circuitry 108, and browser module 147, video and music player module 152 includes executable instructions that allow the user to download and play back recorded music and other sound files stored in one or more file formats, such as MP3 or AAC files, and executable instructions to display, present, or otherwise play back videos (e.g., on touch screen 112 or on an external, connected display via external port 124). In some embodiments, device 100 optionally includes the functionality of an MP3 player, such as an iPod (trademark of Apple Inc.).

[0093] In conjunction with touch screen 112, display controller 156, contact/motion module 130, graphics module 132, and text input module 134, notes module 153 includes executable instructions to create and manage notes, to-do lists, and the like in accordance with user instructions.

5 **[0094]** In conjunction with RF circuitry 108, touch screen 112, display controller 156, contact/motion module 130, graphics module 132, text input module 134, GPS module 135, and browser module 147, map module 154 are, optionally, used to receive, display, modify, and store maps and data associated with maps (e.g., driving directions, data on stores and other points of interest at or near a particular location, and other location-based data) in accordance with user
10 instructions.

[0095] In conjunction with touch screen 112, display controller 156, contact/motion module 130, graphics module 132, audio circuitry 110, speaker 111, RF circuitry 108, text input module 134, e-mail client module 140, and browser module 147, online video module 155 includes instructions that allow the user to access, browse, receive (e.g., by streaming and/or download),
15 play back (e.g., on the touch screen or on an external, connected display via external port 124), send an e-mail with a link to a particular online video, and otherwise manage online videos in one or more file formats, such as H.264. In some embodiments, instant messaging module 141, rather than e-mail client module 140, is used to send a link to a particular online video. Additional description of the online video application can be found in U.S. Provisional Patent
20 Application No. 60/936,562, "Portable Multifunction Device, Method, and Graphical User Interface for Playing Online Videos," filed June 20, 2007, and U.S. Patent Application No. 11/968,067, "Portable Multifunction Device, Method, and Graphical User Interface for Playing Online Videos," filed December 31, 2007.

[0096] Each of the above-identified modules and applications corresponds to a set of
25 executable instructions for performing one or more functions described above and the methods described in this application (e.g., the computer-implemented methods and other information processing methods described herein). These modules (e.g., sets of instructions) need not be implemented as separate software programs, procedures, or modules, and thus various subsets of these modules are, optionally, combined or otherwise rearranged in various embodiments. For

example, video player module is, optionally, combined with music player module into a single module (e.g., video and music player module 152, FIG. 1A). In some embodiments, memory 102 optionally stores a subset of the modules and data structures identified above. Furthermore, memory 102 optionally stores additional modules and data structures not described above.

- 5 **[0097]** In some embodiments, device 100 is a device where operation of a predefined set of functions on the device is performed exclusively through a touch screen and/or a touchpad. By using a touch screen and/or a touchpad as the primary input control device for operation of device 100, the number of physical input control devices (such as push buttons, dials, and the like) on device 100 is, optionally, reduced.
- 10 **[0098]** The predefined set of functions that are performed exclusively through a touch screen and/or a touchpad optionally include navigation between user interfaces. In some embodiments, the touchpad, when touched by the user, navigates device 100 to a main, home, or root menu from any user interface that is displayed on device 100. In such embodiments, a “menu button” is implemented using a touchpad. In some other embodiments, the menu button is a physical
- 15 push button or other physical input control device instead of a touchpad.

[0099] FIG. 1B is a block diagram illustrating exemplary components for event handling in accordance with some embodiments. In some embodiments, memory 102 (FIG. 1A) or 370 (FIG. 3) includes event sorter 170 (e.g., in operating system 126) and a respective application 136-1 (e.g., any of the aforementioned applications 137-151, 155, 380-390).

- 20 **[0100]** Event sorter 170 receives event information and determines the application 136-1 and application view 191 of application 136-1 to which to deliver the event information. Event sorter 170 includes event monitor 171 and event dispatcher module 174. In some embodiments, application 136-1 includes application internal state 192, which indicates the current application view(s) displayed on touch-sensitive display 112 when the application is active or executing. In
- 25 some embodiments, device/global internal state 157 is used by event sorter 170 to determine which application(s) is (are) currently active, and application internal state 192 is used by event sorter 170 to determine application views 191 to which to deliver event information.

[0101] In some embodiments, application internal state 192 includes additional information, such as one or more of: resume information to be used when application 136-1 resumes execution, user interface state information that indicates information being displayed or that is ready for display by application 136-1, a state queue for enabling the user to go back to a prior state or view of application 136-1, and a redo/undo queue of previous actions taken by the user.

[0102] Event monitor 171 receives event information from peripherals interface 118. Event information includes information about a sub-event (e.g., a user touch on touch-sensitive display 112, as part of a multi-touch gesture). Peripherals interface 118 transmits information it receives from I/O subsystem 106 or a sensor, such as proximity sensor 166, accelerometer(s) 168, and/or microphone 113 (through audio circuitry 110). Information that peripherals interface 118 receives from I/O subsystem 106 includes information from touch-sensitive display 112 or a touch-sensitive surface.

[0103] In some embodiments, event monitor 171 sends requests to the peripherals interface 118 at predetermined intervals. In response, peripherals interface 118 transmits event information. In other embodiments, peripherals interface 118 transmits event information only when there is a significant event (e.g., receiving an input above a predetermined noise threshold and/or for more than a predetermined duration).

[0104] In some embodiments, event sorter 170 also includes a hit view determination module 172 and/or an active event recognizer determination module 173.

[0105] Hit view determination module 172 provides software procedures for determining where a sub-event has taken place within one or more views when touch-sensitive display 112 displays more than one view. Views are made up of controls and other elements that a user can see on the display.

[0106] Another aspect of the user interface associated with an application is a set of views, sometimes herein called application views or user interface windows, in which information is displayed and touch-based gestures occur. The application views (of a respective application) in which a touch is detected optionally correspond to programmatic levels within a programmatic or view hierarchy of the application. For example, the lowest level view in which a touch is

detected is, optionally, called the hit view, and the set of events that are recognized as proper inputs are, optionally, determined based, at least in part, on the hit view of the initial touch that begins a touch-based gesture.

[0107] Hit view determination module 172 receives information related to sub-events of a touch-based gesture. When an application has multiple views organized in a hierarchy, hit view determination module 172 identifies a hit view as the lowest view in the hierarchy which should handle the sub-event. In most circumstances, the hit view is the lowest level view in which an initiating sub-event occurs (e.g., the first sub-event in the sequence of sub-events that form an event or potential event). Once the hit view is identified by the hit view determination module 172, the hit view typically receives all sub-events related to the same touch or input source for which it was identified as the hit view.

[0108] Active event recognizer determination module 173 determines which view or views within a view hierarchy should receive a particular sequence of sub-events. In some embodiments, active event recognizer determination module 173 determines that only the hit view should receive a particular sequence of sub-events. In other embodiments, active event recognizer determination module 173 determines that all views that include the physical location of a sub-event are actively involved views, and therefore determines that all actively involved views should receive a particular sequence of sub-events. In other embodiments, even if touch sub-events were entirely confined to the area associated with one particular view, views higher in the hierarchy would still remain as actively involved views.

[0109] Event dispatcher module 174 dispatches the event information to an event recognizer (e.g., event recognizer 180). In embodiments including active event recognizer determination module 173, event dispatcher module 174 delivers the event information to an event recognizer determined by active event recognizer determination module 173. In some embodiments, event dispatcher module 174 stores in an event queue the event information, which is retrieved by a respective event receiver 182.

[0110] In some embodiments, operating system 126 includes event sorter 170. Alternatively, application 136-1 includes event sorter 170. In yet other embodiments, event sorter 170 is a

stand-alone module, or a part of another module stored in memory 102, such as contact/motion module 130.

[0111] In some embodiments, application 136-1 includes a plurality of event handlers 190 and one or more application views 191, each of which includes instructions for handling touch events that occur within a respective view of the application's user interface. Each application view 191 of the application 136-1 includes one or more event recognizers 180. Typically, a respective application view 191 includes a plurality of event recognizers 180. In other embodiments, one or more of event recognizers 180 are part of a separate module, such as a user interface kit (not shown) or a higher level object from which application 136-1 inherits methods and other properties. In some embodiments, a respective event handler 190 includes one or more of: data updater 176, object updater 177, GUI updater 178, and/or event data 179 received from event sorter 170. Event handler 190 optionally utilizes or calls data updater 176, object updater 177, or GUI updater 178 to update the application internal state 192. Alternatively, one or more of the application views 191 include one or more respective event handlers 190. Also, in some embodiments, one or more of data updater 176, object updater 177, and GUI updater 178 are included in a respective application view 191.

[0112] A respective event recognizer 180 receives event information (e.g., event data 179) from event sorter 170 and identifies an event from the event information. Event recognizer 180 includes event receiver 182 and event comparator 184. In some embodiments, event recognizer 180 also includes at least a subset of: metadata 183, and event delivery instructions 188 (which optionally include sub-event delivery instructions).

[0113] Event receiver 182 receives event information from event sorter 170. The event information includes information about a sub-event, for example, a touch or a touch movement. Depending on the sub-event, the event information also includes additional information, such as location of the sub-event. When the sub-event concerns motion of a touch, the event information optionally also includes speed and direction of the sub-event. In some embodiments, events include rotation of the device from one orientation to another (e.g., from a portrait orientation to a landscape orientation, or vice versa), and the event information includes corresponding information about the current orientation (also called device attitude) of the device.

[0114] Event comparator 184 compares the event information to predefined event or sub-event definitions and, based on the comparison, determines an event or sub-event, or determines or updates the state of an event or sub-event. In some embodiments, event comparator 184 includes event definitions 186. Event definitions 186 contain definitions of events (e.g., predefined sequences of sub-events), for example, event 1 (187-1), event 2 (187-2), and others. In some embodiments, sub-events in an event (187) include, for example, touch begin, touch end, touch movement, touch cancellation, and multiple touching. In one example, the definition for event 1 (187-1) is a double tap on a displayed object. The double tap, for example, comprises a first touch (touch begin) on the displayed object for a predetermined phase, a first liftoff (touch end) for a predetermined phase, a second touch (touch begin) on the displayed object for a predetermined phase, and a second liftoff (touch end) for a predetermined phase. In another example, the definition for event 2 (187-2) is a dragging on a displayed object. The dragging, for example, comprises a touch (or contact) on the displayed object for a predetermined phase, a movement of the touch across touch-sensitive display 112, and liftoff of the touch (touch end). In some embodiments, the event also includes information for one or more associated event handlers 190.

[0115] In some embodiments, event definition 187 includes a definition of an event for a respective user-interface object. In some embodiments, event comparator 184 performs a hit test to determine which user-interface object is associated with a sub-event. For example, in an application view in which three user-interface objects are displayed on touch-sensitive display 112, when a touch is detected on touch-sensitive display 112, event comparator 184 performs a hit test to determine which of the three user-interface objects is associated with the touch (sub-event). If each displayed object is associated with a respective event handler 190, the event comparator uses the result of the hit test to determine which event handler 190 should be activated. For example, event comparator 184 selects an event handler associated with the sub-event and the object triggering the hit test.

[0116] In some embodiments, the definition for a respective event (187) also includes delayed actions that delay delivery of the event information until after it has been determined whether the sequence of sub-events does or does not correspond to the event recognizer's event type.

[0117] When a respective event recognizer 180 determines that the series of sub-events do not match any of the events in event definitions 186, the respective event recognizer 180 enters an event impossible, event failed, or event ended state, after which it disregards subsequent sub-events of the touch-based gesture. In this situation, other event recognizers, if any, that remain
 5 active for the hit view continue to track and process sub-events of an ongoing touch-based gesture.

[0118] In some embodiments, a respective event recognizer 180 includes metadata 183 with configurable properties, flags, and/or lists that indicate how the event delivery system should perform sub-event delivery to actively involved event recognizers. In some embodiments,
 10 metadata 183 includes configurable properties, flags, and/or lists that indicate how event recognizers interact, or are enabled to interact, with one another. In some embodiments, metadata 183 includes configurable properties, flags, and/or lists that indicate whether sub-events are delivered to varying levels in the view or programmatic hierarchy.

[0119] In some embodiments, a respective event recognizer 180 activates event handler 190
 15 associated with an event when one or more particular sub-events of an event are recognized. In some embodiments, a respective event recognizer 180 delivers event information associated with the event to event handler 190. Activating an event handler 190 is distinct from sending (and deferred sending) sub-events to a respective hit view. In some embodiments, event recognizer 180 throws a flag associated with the recognized event, and event handler 190 associated with
 20 the flag catches the flag and performs a predefined process.

[0120] In some embodiments, event delivery instructions 188 include sub-event delivery instructions that deliver event information about a sub-event without activating an event handler. Instead, the sub-event delivery instructions deliver event information to event handlers
 associated with the series of sub-events or to actively involved views. Event handlers associated
 25 with the series of sub-events or with actively involved views receive the event information and perform a predetermined process.

[0121] In some embodiments, data updater 176 creates and updates data used in application 136-1. For example, data updater 176 updates the telephone number used in contacts module 137, or stores a video file used in video player module. In some embodiments, object updater

177 creates and updates objects used in application 136-1. For example, object updater 177 creates a new user-interface object or updates the position of a user-interface object. GUI updater 178 updates the GUI. For example, GUI updater 178 prepares display information and sends it to graphics module 132 for display on a touch-sensitive display.

- 5 **[0122]** In some embodiments, event handler(s) 190 includes or has access to data updater 176, object updater 177, and GUI updater 178. In some embodiments, data updater 176, object updater 177, and GUI updater 178 are included in a single module of a respective application 136-1 or application view 191. In other embodiments, they are included in two or more software modules.
- 10 **[0123]** It shall be understood that the foregoing discussion regarding event handling of user touches on touch-sensitive displays also applies to other forms of user inputs to operate multifunction devices 100 with input devices, not all of which are initiated on touch screens. For example, mouse movement and mouse button presses, optionally coordinated with single or multiple keyboard presses or holds; contact movements such as taps, drags, scrolls, etc. on
- 15 touchpads; pen stylus inputs; movement of the device; oral instructions; detected eye movements; biometric inputs; and/or any combination thereof are optionally utilized as inputs corresponding to sub-events which define an event to be recognized.

- [0124]** FIG. 2 illustrates a portable multifunction device 100 having a touch screen 112 in accordance with some embodiments. The touch screen optionally displays one or more graphics
- 20 within user interface (UI) 200. In this embodiment, as well as others described below, a user is enabled to select one or more of the graphics by making a gesture on the graphics, for example, with one or more fingers 202 (not drawn to scale in the figure) or one or more styluses 203 (not drawn to scale in the figure). In some embodiments, selection of one or more graphics occurs when the user breaks contact with the one or more graphics. In some embodiments, the gesture
- 25 optionally includes one or more taps, one or more swipes (from left to right, right to left, upward and/or downward), and/or a rolling of a finger (from right to left, left to right, upward and/or downward) that has made contact with device 100. In some implementations or circumstances, inadvertent contact with a graphic does not select the graphic. For example, a swipe gesture that

sweeps over an application icon optionally does not select the corresponding application when the gesture corresponding to selection is a tap.

[0125] Device 100 optionally also include one or more physical buttons, such as “home” or menu button 204. As described previously, menu button 204 is, optionally, used to navigate to any application 136 in a set of applications that are, optionally, executed on device 100. Alternatively, in some embodiments, the menu button is implemented as a soft key in a GUI displayed on touch screen 112.

[0126] In some embodiments, device 100 includes touch screen 112, menu button 204, push button 206 for powering the device on/off and locking the device, volume adjustment button(s) 208, subscriber identity module (SIM) card slot 210, headset jack 212, and docking/charging external port 124. Push button 206 is, optionally, used to turn the power on/off on the device by depressing the button and holding the button in the depressed state for a predefined time interval; to lock the device by depressing the button and releasing the button before the predefined time interval has elapsed; and/or to unlock the device or initiate an unlock process. In an alternative embodiment, device 100 also accepts verbal input for activation or deactivation of some functions through microphone 113. Device 100 also, optionally, includes one or more contact intensity sensors 165 for detecting intensity of contacts on touch screen 112 and/or one or more tactile output generators 167 for generating tactile outputs for a user of device 100.

[0127] FIG. 3 is a block diagram of an exemplary multifunction device with a display and a touch-sensitive surface in accordance with some embodiments. Device 300 need not be portable. In some embodiments, device 300 is a laptop computer, a desktop computer, a tablet computer, a multimedia player device, a navigation device, an educational device (such as a child’s learning toy), a gaming system, or a control device (e.g., a home or industrial controller). Device 300 typically includes one or more processing units (CPUs) 310, one or more network or other communications interfaces 360, memory 370, and one or more communication buses 320 for interconnecting these components. Communication buses 320 optionally include circuitry (sometimes called a chipset) that interconnects and controls communications between system components. Device 300 includes input/output (I/O) interface 330 comprising display 340, which is typically a touch screen display. I/O interface 330 also optionally includes a keyboard

and/or mouse (or other pointing device) 350 and touchpad 355, tactile output generator 357 for generating tactile outputs on device 300 (e.g., similar to tactile output generator(s) 167 described above with reference to FIG. 1A), sensors 359 (e.g., optical, acceleration, proximity, touch-sensitive, and/or contact intensity sensors similar to contact intensity sensor(s) 165 described above with reference to FIG. 1A). Memory 370 includes high-speed random access memory, such as DRAM, SRAM, DDR RAM, or other random access solid state memory devices; and optionally includes non-volatile memory, such as one or more magnetic disk storage devices, optical disk storage devices, flash memory devices, or other non-volatile solid state storage devices. Memory 370 optionally includes one or more storage devices remotely located from CPU(s) 310. In some embodiments, memory 370 stores programs, modules, and data structures analogous to the programs, modules, and data structures stored in memory 102 of portable multifunction device 100 (FIG. 1A), or a subset thereof. Furthermore, memory 370 optionally stores additional programs, modules, and data structures not present in memory 102 of portable multifunction device 100. For example, memory 370 of device 300 optionally stores drawing module 380, presentation module 382, word processing module 384, website creation module 386, disk authoring module 388, and/or spreadsheet module 390, while memory 102 of portable multifunction device 100 (FIG. 1A) optionally does not store these modules.

[0128] Each of the above-identified elements in FIG. 3 is, optionally, stored in one or more of the previously mentioned memory devices. Each of the above-identified modules corresponds to a set of instructions for performing a function described above. The above-identified modules or programs (e.g., sets of instructions) need not be implemented as separate software programs, procedures, or modules, and thus various subsets of these modules are, optionally, combined or otherwise rearranged in various embodiments. In some embodiments, memory 370 optionally stores a subset of the modules and data structures identified above. Furthermore, memory 370 optionally stores additional modules and data structures not described above.

[0129] Attention is now directed towards embodiments of user interfaces that are, optionally, implemented on, for example, portable multifunction device 100.

[0130] FIG. 4A illustrates an exemplary user interface for a menu of applications on portable multifunction device 100 in accordance with some embodiments. Similar user interfaces are,

optionally, implemented on device 300. In some embodiments, user interface 400 includes the following elements, or a subset or superset thereof:

- Signal strength indicator(s) 402 for wireless communication(s), such as cellular and Wi-Fi signals;
- 5 • Time 404;
- Bluetooth indicator 405;
- Battery status indicator 406;
- Tray 408 with icons for frequently used applications, such as:
 - 10 ○ Icon 416 for telephone module 138, labeled “Phone,” which optionally includes an indicator 414 of the number of missed calls or voicemail messages;
 - Icon 418 for e-mail client module 140, labeled “Mail,” which optionally includes an indicator 410 of the number of unread e-mails;
 - Icon 420 for browser module 147, labeled “Browser;” and
 - Icon 422 for video and music player module 152, also referred to as iPod
 - 15 (trademark of Apple Inc.) module 152, labeled “iPod;” and
 - Icons for other applications, such as:
 - Icon 424 for IM module 141, labeled “Messages;”
 - Icon 426 for calendar module 148, labeled “Calendar;”
 - Icon 428 for image management module 144, labeled “Photos;”
 - 20 ○ Icon 430 for camera module 143, labeled “Camera;”
 - Icon 432 for online video module 155, labeled “Online Video;”
 - Icon 434 for stocks widget 149-2, labeled “Stocks;”
 - Icon 436 for map module 154, labeled “Maps;”

- Icon 438 for weather widget 149-1, labeled “Weather;”
- Icon 440 for alarm clock widget 149-4, labeled “Clock;”
- Icon 442 for workout support module 142, labeled “Workout Support;”
- Icon 444 for notes module 153, labeled “Notes;” and
- 5 ○ Icon 446 for a settings application or module, labeled “Settings,” which provides access to settings for device 100 and its various applications 136.

[0131] It should be noted that the icon labels illustrated in FIG. 4A are merely exemplary. For example, icon 422 for video and music player module 152 is labeled “Music” or “Music Player.” Other labels are, optionally, used for various application icons. In some embodiments,
 10 a label for a respective application icon includes a name of an application corresponding to the respective application icon. In some embodiments, a label for a particular application icon is distinct from a name of an application corresponding to the particular application icon.

[0132] FIG. 4B illustrates an exemplary user interface on a device (e.g., device 300, FIG. 3) with a touch-sensitive surface 451 (e.g., a tablet or touchpad 355, FIG. 3) that is separate from
 15 the display 450 (e.g., touch screen display 112). Device 300 also, optionally, includes one or more contact intensity sensors (e.g., one or more of sensors 359) for detecting intensity of contacts on touch-sensitive surface 451 and/or one or more tactile output generators 357 for generating tactile outputs for a user of device 300.

[0133] Although some of the examples that follow will be given with reference to inputs on
 20 touch screen display 112 (where the touch-sensitive surface and the display are combined), in some embodiments, the device detects inputs on a touch-sensitive surface that is separate from the display, as shown in FIG. 4B. In some embodiments, the touch-sensitive surface (e.g., 451 in FIG. 4B) has a primary axis (e.g., 452 in FIG. 4B) that corresponds to a primary axis (e.g., 453 in FIG. 4B) on the display (e.g., 450). In accordance with these embodiments, the device detects
 25 contacts (e.g., 460 and 462 in FIG. 4B) with the touch-sensitive surface 451 at locations that correspond to respective locations on the display (e.g., in FIG. 4B, 460 corresponds to 468 and 462 corresponds to 470). In this way, user inputs (e.g., contacts 460 and 462, and movements thereof) detected by the device on the touch-sensitive surface (e.g., 451 in FIG. 4B) are used by

the device to manipulate the user interface on the display (e.g., 450 in FIG. 4B) of the multifunction device when the touch-sensitive surface is separate from the display. It should be understood that similar methods are, optionally, used for other user interfaces described herein.

[0134] Additionally, while the following examples are given primarily with reference to

5 finger inputs (e.g., finger contacts, finger tap gestures, finger swipe gestures), it should be understood that, in some embodiments, one or more of the finger inputs are replaced with input from another input device (e.g., a mouse-based input or stylus input). For example, a swipe gesture is, optionally, replaced with a mouse click (e.g., instead of a contact) followed by movement of the cursor along the path of the swipe (e.g., instead of movement of the contact).

10 As another example, a tap gesture is, optionally, replaced with a mouse click while the cursor is located over the location of the tap gesture (e.g., instead of detection of the contact followed by ceasing to detect the contact). Similarly, when multiple user inputs are simultaneously detected, it should be understood that multiple computer mice are, optionally, used simultaneously, or a mouse and finger contacts are, optionally, used simultaneously.

15 **[0135]** FIG. 5A illustrates exemplary personal electronic device 500. Device 500 includes body 502. In some embodiments, device 500 can include some or all of the features described with respect to devices 100 and 300 (e.g., FIGS. 1A-4B). In some embodiments, device 500 has touch-sensitive display screen 504, hereafter touch screen 504. Alternatively, or in addition to touch screen 504, device 500 has a display and a touch-sensitive surface. As with devices 100
20 and 300, in some embodiments, touch screen 504 (or the touch-sensitive surface) optionally includes one or more intensity sensors for detecting intensity of contacts (e.g., touches) being applied. The one or more intensity sensors of touch screen 504 (or the touch-sensitive surface) can provide output data that represents the intensity of touches. The user interface of device 500 can respond to touches based on their intensity, meaning that touches of different intensities can
25 invoke different user interface operations on device 500.

[0136] Exemplary techniques for detecting and processing touch intensity are found, for example, in related applications: International Patent Application Serial No. PCT/US2013/040061, titled “Device, Method, and Graphical User Interface for Displaying User Interface Objects Corresponding to an Application,” filed May 8, 2013, published as WIPO

Publication No. WO/2013/169849, and International Patent Application Serial No. PCT/US2013/069483, titled “Device, Method, and Graphical User Interface for Transitioning Between Touch Input to Display Output Relationships,” filed November 11, 2013, published as WIPO Publication No. WO/2014/105276.

5 [0137] In some embodiments, device 500 has one or more input mechanisms 506 and 508. Input mechanisms 506 and 508, if included, can be physical. Examples of physical input mechanisms include push buttons and rotatable mechanisms. In some embodiments, device 500 has one or more attachment mechanisms. Such attachment mechanisms, if included, can permit attachment of device 500 with, for example, hats, eyewear, earrings, necklaces, shirts, jackets,
10 bracelets, watch straps, chains, trousers, belts, shoes, purses, backpacks, and so forth. These attachment mechanisms permit device 500 to be worn by a user.

[0138] FIG. 5B depicts exemplary personal electronic device 500. In some embodiments, device 500 can include some or all of the components described with respect to FIGS. 1A, 1B, and 3. Device 500 has bus 512 that operatively couples I/O section 514 with one or more
15 computer processors 516 and memory 518. I/O section 514 can be connected to display 504, which can have touch-sensitive component 522 and, optionally, intensity sensor 524 (e.g., contact intensity sensor). In addition, I/O section 514 can be connected with communication unit 530 for receiving application and operating system data, using Wi-Fi, Bluetooth, near field communication (NFC), cellular, and/or other wireless communication techniques. Device 500
20 can include input mechanisms 506 and/or 508. Input mechanism 506 is, optionally, a rotatable input device or a depressible and rotatable input device, for example. Input mechanism 508 is, optionally, a button, in some examples.

[0139] Input mechanism 508 is, optionally, a microphone, in some examples. Personal electronic device 500 optionally includes various sensors, such as GPS sensor 532, accelerometer
25 534, directional sensor 540 (e.g., compass), gyroscope 536, motion sensor 538, and/or a combination thereof, all of which can be operatively connected to I/O section 514.

[0140] Memory 518 of personal electronic device 500 can include one or more non-transitory computer-readable storage mediums, for storing computer-executable instructions, which, when executed by one or more computer processors 516, for example, can cause the

computer processors to perform the techniques described below, including processes 700 and 900 (FIGS. 7A-7J and 9A-9G). A computer-readable storage medium can be any medium that can tangibly contain or store computer-executable instructions for use by or in connection with the instruction execution system, apparatus, or device. In some examples, the storage medium is a transitory computer-readable storage medium. In some examples, the storage medium is a non-transitory computer-readable storage medium. The non-transitory computer-readable storage medium can include, but is not limited to, magnetic, optical, and/or semiconductor storages. Examples of such storage include magnetic disks, optical discs based on CD, DVD, or Blu-ray technologies, as well as persistent solid-state memory such as flash, solid-state drives, and the like. Personal electronic device 500 is not limited to the components and configuration of FIG. 5B, but can include other or additional components in multiple configurations.

[0141] As used here, the term “affordance” refers to a user-interactive graphical user interface object that is, optionally, displayed on the display screen of devices 100, 300, and/or 500 (FIGS. 1A, 3, and 5A-5B). For example, an image (e.g., icon), a button, and text (e.g., hyperlink) each optionally constitute an affordance.

[0142] As used herein, the term “focus selector” refers to an input element that indicates a current part of a user interface with which a user is interacting. In some implementations that include a cursor or other location marker, the cursor acts as a “focus selector” so that when an input (e.g., a press input) is detected on a touch-sensitive surface (e.g., touchpad 355 in FIG. 3 or touch-sensitive surface 451 in FIG. 4B) while the cursor is over a particular user interface element (e.g., a button, window, slider, or other user interface element), the particular user interface element is adjusted in accordance with the detected input. In some implementations that include a touch screen display (e.g., touch-sensitive display system 112 in FIG. 1A or touch screen 112 in FIG. 4A) that enables direct interaction with user interface elements on the touch screen display, a detected contact on the touch screen acts as a “focus selector” so that when an input (e.g., a press input by the contact) is detected on the touch screen display at a location of a particular user interface element (e.g., a button, window, slider, or other user interface element), the particular user interface element is adjusted in accordance with the detected input. In some implementations, focus is moved from one region of a user interface to another region of the user interface without corresponding movement of a cursor or movement of a contact on a touch

screen display (e.g., by using a tab key or arrow keys to move focus from one button to another button); in these implementations, the focus selector moves in accordance with movement of focus between different regions of the user interface. Without regard to the specific form taken by the focus selector, the focus selector is generally the user interface element (or contact on a touch screen display) that is controlled by the user so as to communicate the user's intended interaction with the user interface (e.g., by indicating, to the device, the element of the user interface with which the user is intending to interact). For example, the location of a focus selector (e.g., a cursor, a contact, or a selection box) over a respective button while a press input is detected on the touch-sensitive surface (e.g., a touchpad or touch screen) will indicate that the user is intending to activate the respective button (as opposed to other user interface elements shown on a display of the device).

[0143] As used in the specification and claims, the term “characteristic intensity” of a contact refers to a characteristic of the contact based on one or more intensities of the contact. In some embodiments, the characteristic intensity is based on multiple intensity samples. The characteristic intensity is, optionally, based on a predefined number of intensity samples, or a set of intensity samples collected during a predetermined time period (e.g., 0.05, 0.1, 0.2, 0.5, 1, 2, 5, 10 seconds) relative to a predefined event (e.g., after detecting the contact, prior to detecting liftoff of the contact, before or after detecting a start of movement of the contact, prior to detecting an end of the contact, before or after detecting an increase in intensity of the contact, and/or before or after detecting a decrease in intensity of the contact). A characteristic intensity of a contact is, optionally, based on one or more of: a maximum value of the intensities of the contact, a mean value of the intensities of the contact, an average value of the intensities of the contact, a top 10 percentile value of the intensities of the contact, a value at the half maximum of the intensities of the contact, a value at the 90 percent maximum of the intensities of the contact, or the like. In some embodiments, the duration of the contact is used in determining the characteristic intensity (e.g., when the characteristic intensity is an average of the intensity of the contact over time). In some embodiments, the characteristic intensity is compared to a set of one or more intensity thresholds to determine whether an operation has been performed by a user. For example, the set of one or more intensity thresholds optionally includes a first intensity threshold and a second intensity threshold. In this example, a contact with a characteristic

intensity that does not exceed the first threshold results in a first operation, a contact with a characteristic intensity that exceeds the first intensity threshold and does not exceed the second intensity threshold results in a second operation, and a contact with a characteristic intensity that exceeds the second threshold results in a third operation. In some embodiments, a comparison
 5 between the characteristic intensity and one or more thresholds is used to determine whether or not to perform one or more operations (e.g., whether to perform a respective operation or forgo performing the respective operation), rather than being used to determine whether to perform a first operation or a second operation.

[0144] FIG. 5C illustrates detecting a plurality of contacts 552A-552E on touch-sensitive
 10 display screen 504 with a plurality of intensity sensors 524A-524D. FIG. 5C additionally includes intensity diagrams that show the current intensity measurements of the intensity sensors 524A-524D relative to units of intensity. In this example, the intensity measurements of intensity sensors 524A and 524D are each 9 units of intensity, and the intensity measurements of intensity sensors 524B and 524C are each 7 units of intensity. In some implementations, an
 15 aggregate intensity is the sum of the intensity measurements of the plurality of intensity sensors 524A-524D, which in this example is 32 intensity units. In some embodiments, each contact is assigned a respective intensity that is a portion of the aggregate intensity. FIG. 5D illustrates assigning the aggregate intensity to contacts 552A-552E based on their distance from the center of force 554. In this example, each of contacts 552A, 552B, and 552E are assigned an intensity
 20 of contact of 8 intensity units of the aggregate intensity, and each of contacts 552C and 552D are assigned an intensity of contact of 4 intensity units of the aggregate intensity. More generally, in some implementations, each contact j is assigned a respective intensity I_j that is a portion of the aggregate intensity, A , in accordance with a predefined mathematical function, $I_j = A \cdot (D_j / \sum D_i)$, where D_j is the distance of the respective contact j to the center of force, and $\sum D_i$ is the sum of
 25 the distances of all the respective contacts (e.g., $i=1$ to last) to the center of force. The operations described with reference to FIGS. 5C-5D can be performed using an electronic device similar or identical to device 100, 300, or 500. In some embodiments, a characteristic intensity of a contact is based on one or more intensities of the contact. In some embodiments, the intensity sensors are used to determine a single characteristic intensity (e.g., a single characteristic intensity of a

single contact). It should be noted that the intensity diagrams are not part of a displayed user interface, but are included in FIGS. 5C-5D to aid the reader.

[0145] In some embodiments, a portion of a gesture is identified for purposes of determining a characteristic intensity. For example, a touch-sensitive surface optionally receives a continuous swipe contact transitioning from a start location and reaching an end location, at which point the intensity of the contact increases. In this example, the characteristic intensity of the contact at the end location is, optionally, based on only a portion of the continuous swipe contact, and not the entire swipe contact (e.g., only the portion of the swipe contact at the end location). In some embodiments, a smoothing algorithm is, optionally, applied to the intensities of the swipe contact prior to determining the characteristic intensity of the contact. For example, the smoothing algorithm optionally includes one or more of: an unweighted sliding-average smoothing algorithm, a triangular smoothing algorithm, a median filter smoothing algorithm, and/or an exponential smoothing algorithm. In some circumstances, these smoothing algorithms eliminate narrow spikes or dips in the intensities of the swipe contact for purposes of determining a characteristic intensity.

[0146] The intensity of a contact on the touch-sensitive surface is, optionally, characterized relative to one or more intensity thresholds, such as a contact-detection intensity threshold, a light press intensity threshold, a deep press intensity threshold, and/or one or more other intensity thresholds. In some embodiments, the light press intensity threshold corresponds to an intensity at which the device will perform operations typically associated with clicking a button of a physical mouse or a trackpad. In some embodiments, the deep press intensity threshold corresponds to an intensity at which the device will perform operations that are different from operations typically associated with clicking a button of a physical mouse or a trackpad. In some embodiments, when a contact is detected with a characteristic intensity below the light press intensity threshold (e.g., and above a nominal contact-detection intensity threshold below which the contact is no longer detected), the device will move a focus selector in accordance with movement of the contact on the touch-sensitive surface without performing an operation associated with the light press intensity threshold or the deep press intensity threshold. Generally, unless otherwise stated, these intensity thresholds are consistent between different sets of user interface figures.

[0147] An increase of characteristic intensity of the contact from an intensity below the light press intensity threshold to an intensity between the light press intensity threshold and the deep press intensity threshold is sometimes referred to as a “light press” input. An increase of characteristic intensity of the contact from an intensity below the deep press intensity threshold to an intensity above the deep press intensity threshold is sometimes referred to as a “deep press” input. An increase of characteristic intensity of the contact from an intensity below the contact-detection intensity threshold to an intensity between the contact-detection intensity threshold and the light press intensity threshold is sometimes referred to as detecting the contact on the touch-surface. A decrease of characteristic intensity of the contact from an intensity above the contact-detection intensity threshold to an intensity below the contact-detection intensity threshold is sometimes referred to as detecting liftoff of the contact from the touch-surface. In some embodiments, the contact-detection intensity threshold is zero. In some embodiments, the contact-detection intensity threshold is greater than zero.

[0148] In some embodiments described herein, one or more operations are performed in response to detecting a gesture that includes a respective press input or in response to detecting the respective press input performed with a respective contact (or a plurality of contacts), where the respective press input is detected based at least in part on detecting an increase in intensity of the contact (or plurality of contacts) above a press-input intensity threshold. In some embodiments, the respective operation is performed in response to detecting the increase in intensity of the respective contact above the press-input intensity threshold (e.g., a “down stroke” of the respective press input). In some embodiments, the press input includes an increase in intensity of the respective contact above the press-input intensity threshold and a subsequent decrease in intensity of the contact below the press-input intensity threshold, and the respective operation is performed in response to detecting the subsequent decrease in intensity of the respective contact below the press-input threshold (e.g., an “up stroke” of the respective press input).

[0149] FIGS. 5E-5H illustrate detection of a gesture that includes a press input that corresponds to an increase in intensity of a contact 562 from an intensity below a light press intensity threshold (e.g., “IT_L”) in FIG. 5E, to an intensity above a deep press intensity threshold (e.g., “IT_D”) in FIG. 5H. The gesture performed with contact 562 is detected on touch-sensitive

surface 560 while cursor 576 is displayed over application icon 572B corresponding to App 2, on a displayed user interface 570 that includes application icons 572A-572D displayed in predefined region 574. In some embodiments, the gesture is detected on touch-sensitive display 504. The intensity sensors detect the intensity of contacts on touch-sensitive surface 560. The device
 5 determines that the intensity of contact 562 peaked above the deep press intensity threshold (e.g., “IT_D”). Contact 562 is maintained on touch-sensitive surface 560. In response to the detection of the gesture, and in accordance with contact 562 having an intensity that goes above the deep press intensity threshold (e.g., “IT_D”) during the gesture, reduced-scale representations 578A-578C (e.g., thumbnails) of recently opened documents for App 2 are displayed, as shown in
 10 FIGS. 5F-5H. In some embodiments, the intensity, which is compared to the one or more intensity thresholds, is the characteristic intensity of a contact. It should be noted that the intensity diagram for contact 562 is not part of a displayed user interface, but is included in FIGS. 5E-5H to aid the reader.

[0150] In some embodiments, the display of representations 578A-578C includes an
 15 animation. For example, representation 578A is initially displayed in proximity of application icon 572B, as shown in FIG. 5F. As the animation proceeds, representation 578A moves upward and representation 578B is displayed in proximity of application icon 572B, as shown in FIG. 5G. Then, representations 578A moves upward, 578B moves upward toward representation 578A, and representation 578C is displayed in proximity of application icon 572B, as shown in
 20 FIG. 5H. Representations 578A-578C form an array above icon 572B. In some embodiments, the animation progresses in accordance with an intensity of contact 562, as shown in FIGS. 5F-5G, where the representations 578A-578C appear and move upwards as the intensity of contact 562 increases toward the deep press intensity threshold (e.g., “IT_D”). In some embodiments, the intensity, on which the progress of the animation is based, is the characteristic intensity of the
 25 contact. The operations described with reference to FIGS. 5E-5H can be performed using an electronic device similar or identical to device 100, 300, or 500.

[0151] In some embodiments, the device employs intensity hysteresis to avoid accidental inputs sometimes termed “jitter,” where the device defines or selects a hysteresis intensity threshold with a predefined relationship to the press-input intensity threshold (e.g., the hysteresis
 30 intensity threshold is X intensity units lower than the press-input intensity threshold or the

hysteresis intensity threshold is 75%, 90%, or some reasonable proportion of the press-input intensity threshold). Thus, in some embodiments, the press input includes an increase in intensity of the respective contact above the press-input intensity threshold and a subsequent decrease in intensity of the contact below the hysteresis intensity threshold that corresponds to the press-input intensity threshold, and the respective operation is performed in response to detecting the subsequent decrease in intensity of the respective contact below the hysteresis intensity threshold (e.g., an “up stroke” of the respective press input). Similarly, in some embodiments, the press input is detected only when the device detects an increase in intensity of the contact from an intensity at or below the hysteresis intensity threshold to an intensity at or above the press-input intensity threshold and, optionally, a subsequent decrease in intensity of the contact to an intensity at or below the hysteresis intensity, and the respective operation is performed in response to detecting the press input (e.g., the increase in intensity of the contact or the decrease in intensity of the contact, depending on the circumstances).

[0152] For ease of explanation, the descriptions of operations performed in response to a press input associated with a press-input intensity threshold or in response to a gesture including the press input are, optionally, triggered in response to detecting either: an increase in intensity of a contact above the press-input intensity threshold, an increase in intensity of a contact from an intensity below the hysteresis intensity threshold to an intensity above the press-input intensity threshold, a decrease in intensity of the contact below the press-input intensity threshold, and/or a decrease in intensity of the contact below the hysteresis intensity threshold corresponding to the press-input intensity threshold. Additionally, in examples where an operation is described as being performed in response to detecting a decrease in intensity of a contact below the press-input intensity threshold, the operation is, optionally, performed in response to detecting a decrease in intensity of the contact below a hysteresis intensity threshold corresponding to, and lower than, the press-input intensity threshold.

[0153] As used herein, an “installed application” refers to a software application that has been downloaded onto an electronic device (e.g., devices 100, 300, and/or 500) and is ready to be launched (e.g., become opened) on the device. In some embodiments, a downloaded application becomes an installed application by way of an installation program that extracts

program portions from a downloaded package and integrates the extracted portions with the operating system of the computer system.

[0154] As used herein, the terms “open application” or “executing application” refer to a software application with retained state information (e.g., as part of device/global internal state 157 and/or application internal state 192). An open or executing application is, optionally, any one of the following types of applications:

- an active application, which is currently displayed on a display screen of the device that the application is being used on;
- a background application (or background processes), which is not currently displayed, but one or more processes for the application are being processed by one or more processors; and
- a suspended or hibernated application, which is not running, but has state information that is stored in memory (volatile and non-volatile, respectively) and that can be used to resume execution of the application.

[0155] As used herein, the term “closed application” refers to software applications without retained state information (e.g., state information for closed applications is not stored in a memory of the device). Accordingly, closing an application includes stopping and/or removing application processes for the application and removing state information for the application from the memory of the device. Generally, opening a second application while in a first application does not close the first application. When the second application is displayed and the first application ceases to be displayed, the first application becomes a background application.

[0156] Attention is now directed towards embodiments of user interfaces (“UI”) and associated processes that are implemented on an electronic device, such as portable multifunction device 100, device 300, or device 500.

[0157] FIGS. 6A-6AAC illustrate exemplary user interfaces for sharing a suggested collection of media items, in accordance with some embodiments. The user interfaces in these

figures are used to illustrate the processes described below, including the processes in FIGS. 7A-7J.

[0158] FIG. 6A illustrates an exemplary message interface 604, displayed on display 602 of electronic device 600. In some embodiments, device 600 includes one or more features of device 100, 300, or 500. In some embodiments, device 600 includes one or more input devices (e.g., a touch-screen display, a touch-screen surface). Message interface 604 is associated with a messaging application (e.g., executing on device 600). A messaging application, for example, is any application that can be used to send and/or receive electronic messages to a recipient. Exemplary electronic messages include messages sent using Short Message Service (“SMS”), Multimedia Messaging Service (“MMS”), and/or an internet-based messaging protocol (such as iMessage by Apple Inc. of Cupertino, CA).

[0159] In FIG. 6A, message interface 604 includes an exemplary transcript 604A representing a message conversation. In some embodiments, a transcript includes content (e.g., text, media, shared locations, or other data) that is shared between one or more parties to an electronic message conversation (also referred to herein as a message conversation). In the example shown in FIG. 6A, the conversation is between three parties, Lynne (e.g., user 603A), William (e.g., user 603B), and Gregg (e.g., user 603C), indicators for each of which are displayed in region 604E. The displayed transcript 604A includes messages aligned to the right side of the display, representing messages sent by the user of device 600 (in this example, user 603A named Lynne), and messages aligned on the left side of the display, representing message received by the user of device 600 (e.g., from either William or Gregg).

[0160] At FIG. 6A, device 600 receives user input 605, corresponding to selection of a text entry field 604D of message interface 604. In some embodiments, the device (e.g., 600) receives user input associated with the message interface, and in response displays one or more input affordances (e.g., a shown in FIGS. 6B and 6C, described below).

[0161] FIG. 6B illustrates message user interface 604 with several exemplary input affordances. In some embodiments, the one or more input affordances include one or more input suggestions for sharing content with the participants of the message conversation. For example, FIG. 6B illustrates message interface 604 with sharing suggestion region 606 displayed, which

includes input suggestion 606A (suggesting the input of text “Sure”) and input suggestion 606B (suggesting the input of text “OK”). In this example, input suggestions 606A and 606B are affordances, that in response to selection, cause device 600 to insert a pre-selected phrase into a message conversation (e.g., selection of 606B causes device 600 to insert the text “OK” into the transcript 604A or the text entry field 604D).

[0162] In some embodiments, the one or more input affordances include a keyboard (e.g., 604D). For example, keyboard 604E shown in FIG. 6B can be used to insert text, emoji, or dictation content into the transcript of the conversation.

[0163] FIG. 6C illustrates an exemplary message interface 604 where an input suggestion has been replaced with an input suggestion to share media content. In some embodiments, the device (e.g., 600) displays an input suggestion that suggests sharing of media content (e.g., a collection of one or more media items). For example, as shown in FIG. 6C, device 600 has replaced display of input suggestion 606B with an exemplary input suggestion 606C. Input suggestion 606C includes the text “Share Photos”, and represents a quick and easy way to access interfaces for sharing suggested media items with the participants of the current conversation, described in more detail below (e.g., with respect to FIG. 6E).

[0164] In some embodiments, the suggestion is based on (e.g., one or more) participants in the conversation. For example, device 600 displays input suggestion 606B because there are media items (e.g., in a media library associated with device 600) that include depictions of the participants (e.g., users 603A, 603B, and/or 603C) of the conversation represented by transcript 604A. For example, device 600 displays input suggestion 606B because there are media items (e.g., in a media library associated with device 600) associated with an event known to have been attended by the participants (e.g., users 603A, 603B, and/or 603C) of the conversation represented by transcript 604A. Thus, in the example shown in FIG. 6C, device 600 displays input suggestion 606C prompting the user to share photos because the user has media items (e.g., photos and/or videos) in their media library that would be appropriate to share with the participants of the current conversation. The basis for suggestions, and for suggesting particular media items, are discussed in more detail below.

[0165] FIG. 6D illustrates an exemplary message interface after receiving one or more messages from a recipient (e.g., user 603B). As shown in FIG. 6D, William (user 603B) has added content 604B into the transcript (e.g., which is received by device 600), representing a collection of media items (e.g., one or more media items) that has been shared with the other participants in the current message conversation, Lynne (user 603A) and Gregg (user 603C) in this example. In some embodiments, an input suggestion (e.g., 606C) is displayed based on media content in the transcript (e.g., 604A). For example, input suggestion 606C is displayed because William (user 603B) shared some media related to media that exists in a media library of the user (603A) of device 600. In some embodiments, an input suggestion (e.g., 606C) is displayed in response to receiving media content that has been shared with the device (e.g., 600) (e.g., such as the collection of media items represented by 604B from William). For example, device 600 can display input suggestion 606C immediately in response to receiving the representation 604B in transcript 604A, indicating that that William has shared media content.

[0166] As shown in FIG. 6D, William has also inserted a message 604C in the transcript requesting that the other participants in the conversation (e.g., the user of device 600, Lynne in this example) share media back. Message 604C reads: “Hi! Could you send me the photos from Lake Tahoe last weekend?” In some embodiments, an input suggestion (e.g., 606C) is displayed based on text content in the transcript (e.g., 604A). In some embodiments, an input suggestion (e.g., 606B) is displayed in response to receiving text content (e.g., text, such as 604C from William) (e.g., representing a request that the user of device 600 share media related to the Lake Tahoe trip last weekend). For example, device 600 can display input suggestion 606C immediately in response to receiving the message 604C in the transcript 604A that mentions photos (e.g., from Lake Tahoe).

[0167] In some embodiments, an input suggestion (e.g., 606C) is displayed in response to receiving entry at a keyboard (e.g., 604E). For example, as shown in FIG. 6D, device 600 receives user input 607 representing selection of a key (for the letter O). In response, the letter O has been entered into a text entry field. For example, input suggestion 606C can be displayed in response to the user (e.g., beginning) typing (e.g., user input 607).

[0168] FIG. 6E illustrates selection of an exemplary input suggestion affordance 606C. In some embodiments, the device (e.g., 600) receives user input corresponding to selection of an input suggestion affordance (e.g., 606C) and, in response, displays a sharing interface (e.g., that includes a depiction of at least a portion of a suggested collection of media items for sharing).

5 For example, at FIG. 6E, device 600 receives user input 608 corresponding to selection of input suggestion affordance 606C. In response to receiving user input 608, device 600 displays sharing interface 610 as shown in FIG. 6F.

[0169] FIG. 6F illustrates an exemplary sharing interface 610. Sharing interface 610 is associated with a photos application for managing media items (e.g., photos, videos, or the like) associated with device 600 (e.g., a media library stored locally on device 600, and/or stored remotely and associated with device 600). A user of device 600 can use sharing interface 610 to select one or more media items for sharing with one or more recipients. For example, sharing interface 610 is displayed concurrently with the transcript 604A of the conversation with William and Gregg, and conveniently allows the user access to selecting media items for sharing, while continuing to view the relevant message conversation transcript (e.g., to view new messages that are received).

[0170] In some embodiments, a sharing interface includes multiple pages. For example, as shown in FIG. 6F, paging dots 610D indicate that sharing interface 610 includes three pages, with the second page (e.g., 612) being the currently selected page in this example (e.g., the second paging dot is filled in). In some embodiments, the device receives a user input (e.g., a swipe gesture), and in response to the user input, replaces display with the second page. One of skill would appreciate that other arrangements of content can be used, which are intended to be within the scope of this disclosure. For example, the content of the three pages in this example can be arranged in a single page, and viewed, for example, by vertically scrolling the single page.

25 **[0171]** FIG. 6F illustrates an exemplary suggested collection interface 612. Suggested collection interface 612 represents one or more media items (also referred to hereinafter as a “collection of media items”, or a “suggested collection”) available for sharing. In some embodiments, the device (e.g., 600) displays suggested collection interface 612 in response to detecting one of user inputs 608, 614, 616, or 620.

[0172] As shown in FIG. 6F, suggested collection interface 612 includes a title card 612A and descriptive elements 612B and 612C. In some embodiments, a title card and/or descriptive elements are optionally included in a suggested collection interface. Title card 612A includes a representative image from the suggested collection. Element 612B indicates a location (Lake Tahoe) associated with the suggested collection. Element 612C indicates a time associated with the suggested collection (the time range December 1st to December 4th). In this example, the year is not shown (e.g., because the date refers to the current year or relatively recent dates, such as within the last year). In other examples, a year associated with a date can be shown.

[0173] In some embodiments, a suggested collection (e.g., such represented by interface 612) is suggested (e.g., by device 600) based on one or more factors. In some embodiments, a suggested collection is determined to be relevant to a message conversation (e.g., represented by transcript 604A). In some embodiments, suggesting a collection includes displaying a suggested collection interface for a suggested collection determined to be relevant to the message conversation. In some embodiments, a suggested collection is suggested based on content (e.g., text, or one or media items) in a transcript (e.g., 604A) of the message conversation.

[0174] In some embodiments, content in the transcript is textual content. In some embodiments, a suggested collection is determined to be relevant to the textual content. In some embodiments, the suggested collection of media items is determined to be relevant to the message conversation with the recipient based on a geographic location mentioned (e.g. included) in the transcript of the message conversation. For example, device 600 can suggest the collection in suggested collection interface 612 based on the message text 604C from William that mentions the geographic location “Lake Tahoe” (e.g., requesting photos from Lake Tahoe last weekend) as shown in FIG. 6D. Because the suggested collection of 612 corresponds to the geographic location of Lake Tahoe (e.g., includes media captured at that location), device 600 suggests the collection to share in the message conversation.

[0175] The text relevant to the suggested collection does not need to relate to geography. In some embodiments, the suggested collection of media items is determined to be relevant to the message conversation with the recipient based on a reference to a time (e.g., a textual reference to a particular time, date or date range, or relative description (e.g., last week)) mentioned (e.g.

included) in the transcript of the message conversation. For example, device 600 can suggest the collection in suggested collection interface 612 based on the message text 604C from William that mentions the time “last weekend” (requesting photos from Lake Tahoe last weekend) as shown in FIG. 6D. Because the suggested collection of 612 corresponds to the time (e.g., the
 5 dates that represent the most recent previous weekend) mentioned in the transcript (e.g., the suggested collection includes media captured during and/or near in time to the mentioned time), device 600 suggests the collection to share in the message conversation.

[0176] The text relevant to the suggested collection does not need to relate to time or geography. For example, other text (e.g., phrases or keywords) in a message conversation can
 10 cause a relevant collection of media items to be suggested for sharing. For instance, mention of the term “birthday” can cause a suggestion of a collection of media from a birthday celebration (e.g., includes birthday in the title, or is on a date known to be the birthday of one or more persons depicted in the collection). Of course, other text in a message conversation can be relevant to a collection of media items.

[0177] In some embodiments, content in the transcript is media content. In some
 15 embodiments, a suggested collection is determined to be relevant to the media content. For example, the suggested collection of interface 612 can be suggested by device 600 based on the received media items shared by William. In this example, the received media items shared by William (represented by 604B) are associated with the location Lake Tahoe and the time range
 20 December 1 to December 4. Notably, device 600 can suggest the suggested collection represented by suggested collection interface 612 because the suggested collection is also associated with the location Lake Tahoe and the time range December 1 to December 4.

[0178] In some embodiments, the suggested collection of media items is determined to be relevant to the message conversation with the recipient based on the identity of one or more
 25 participants in the message conversation. In some embodiments, a participant is a user associated with a user account (e.g., of cloud based service, of social media). In some embodiments, a participant is a contact (e.g., from an address book) associated with the device (e.g., 600) or a user of the device. In some embodiments, the suggested collection of media items is a collection of media items in which one or more of the participants (or more than a

threshold number of the participants) in the conversation appear in media items in the suggested collection. For example, the suggested collection of media items (of 612) includes media items taken during a camping trip (e.g., to Lake Tahoe) that some or all of the participants (e.g., 603A, 603B, and 603C) in the conversation attended. Thus the collection of media items is suggested
 5 for sharing with the participants in the conversation because the participants in the conversation attended the camping trip.

[0179] In some embodiments, the suggested collection of media items is determined to be relevant to the message conversation with the recipient based on an event known to have been attended by one or more participants in the message conversation. In some embodiments, an
 10 event includes media items captured at one or more geographic locations and within a particular time range. For example, the suggested collection of interface 612 corresponds to an event defined by, and optionally includes media items captured at, the geographic location “Lake Tahoe” and the time range December 1 to December 4. In some embodiments, an event is automatically determined (e.g., based on geographic locations and capture times of the media
 15 items). In some embodiments, the event is user-created (e.g., a user creates a collection manually using device 600). As an example, suggested collection interface 612 can be suggested based on data associated with the suggested collection that indicates the participants in the conversation attended an event associated with the suggested collection. For instance, the suggested collection of media items, represented by suggested collection interface 612, can
 20 correspond to an event (e.g., Lake Tahoe media taken between December 1 and December 4) known to have been attended by William (e.g., based on identification of a face associated with William in media items of the suggested collection, or based on other metadata associated with the media items of the suggested collection).

[0180] FIGS. 6G-6K illustrate other techniques for accessing a suggested collection
 25 interface. FIG. 6G illustrates an exemplary technique for selecting message text to view a suggested collection for sharing. In some embodiments, a portion of message text in the transcript is selectable. For example, as shown in FIG. 6G, a portion 604F of message 604C is visually emphasized (e.g., underlined) and selectable—the portion that reads “photos from Lake Tahoe”. In some embodiments, the device (e.g., 600) (or a cloud-based service in
 30 communication with the device) detects that the text of a message (e.g., message 604C) includes

text related to an action that can be performed by the device. For example, device 600 detects that the message 604C includes text related to sharing media items, and that device 600 is able to share (e.g., is associated with sharable media). In such case, the text 604F of the message is made selectable, and is optionally displayed with a visual indication that such text is selectable.

5 As shown in FIG. 6G, the portion 604F “photos from Lake Tahoe” is displayed with underlining, and is selected by user input 614. In some embodiments, in response to receiving user input corresponding to selection of selectable text (e.g., 604F), the device (e.g., 600) displays a sharing interface (e.g., 610 as shown in FIG. 6F) and/or a suggested collection interface (e.g., as shown in FIG. 6F). At FIG. 6G, device 600 receives user input 614, corresponding to selection of
10 portion 604F of message 604C.

[0181] At FIG. 6H (e.g., the same interface as in FIG. 6D), device 600 receives user input 616, corresponding to selection of application selection affordance 604G. Application selection affordance 604G can be used to access one or more sharing interfaces (e.g., 610) associated with one or more applications for sharing content in a message conversation. In some embodiments,
15 in response to receiving user input 612, device 600 displays sharing interface 610 (e.g., as shown in FIGS. 6I or 6F).

[0182] In some embodiments, the device (e.g., 600) displays one or more interfaces associated with applications other than the photos application. For example, application selector region 610A in FIG. 6I depicts photos application affordance 610B selected (e.g., is surrounded
20 by a box). In FIG. 6I, music application affordance 610C is associated with a music application, and is not selected. In some embodiments, user input corresponding to selection of an application affordance causes display of a sharing interface associated with the corresponding application. For example, in response to selection of music application affordance 614C, device 600 replaces display of sharing interface 610 with a sharing interface associated with the music
25 application.

[0183] In some embodiments, in response to selection of the application affordance (e.g., 604G), the device (e.g., 600) displays a sharing interface not associated with a photos application. For example, in response to user input 616, device 600 can display an interface associated with affordance 610A (e.g., an application storefront for accessing interfaces to

download one or more applications) or with affordance 610C (e.g., interfaces for sharing content music-related). In some embodiments, while displaying a sharing affordance not associated with a photos application, the device displays a sharing interface associated with the photos application in response to user input. For example, the user input can be one or more swipes at a location of one or more other sharing interfaces. For instance, two left swipes from an interface of the music application (represented by affordance 610C) causes sharing interface 610 associated with the photos application to be displayed (e.g., because the respective affordances 610B and 60C are separated by one icon). For example, if a sharing interface includes multiple pages (e.g., like 610), a swipe received while displaying an end page in a direction away from the other pages causes the device to display a sharing interface for the next adjacent application. In some embodiments, the most recent sharing interface is displayed in response to selection (e.g., 616) of an application affordance (e.g., 604G). For example, if the sharing interface 610 was the most recently displayed sharing interface that was previously displayed, device 600 displays sharing interface 610 in response to user input 616.

[0184] FIG. 6I illustrates an exemplary sharing interface 610 that includes an exemplary recent photos page 618. In this example, recent photos page 618 includes the most recent media items associated with a media library associated with device 600 (e.g., arranged in a chronological ordering by the most recently captured media item). In this example, page 618 is the first page (e.g., associated with a first page dot of 610D). At FIG. 6J, device 600 receives user input 620. User input 620 is a left swipe gesture at recent photos page 618. In response to receiving user input 620, device 600 replaces display of recent photos page 618 with display of an adjacent page, suggestion page 612 (also referred to as suggested collection interface 612). For example, FIG. 6K shows that user input 620, representing a contact on a touch-sensitive display of device 600, continues to be applied but has moved to the left (relative to FIG. 6J). In FIG. 6K, a portion of suggested collection interface 612 is now displayed, while a portion of recent photos page 618 is no longer displayed.

[0185] In some embodiments, the device (e.g., 600) displays a suggested collection interface (e.g., 612) without displaying a sharing interface (e.g., 610). For example, as described herein throughout, device 600 can display one or more elements of a suggested collection interface

(e.g., 612) without displaying a sharing interface (e.g., 610) (e.g., without displaying paging dots, or application affordances).

[0186] FIGS. 6L-6N illustrate an exemplary technique for expanding a suggested collection interface (e.g., 612). As shown in FIG. 6L, suggested collection interface 612 is displayed concurrently with transcript 604A. In some embodiments, the device (e.g., 600) expands a suggested collection interface in response to user input. For example, at FIG. 6L, device 600 receives user input 622 (e.g., an upward swipe on a graphical handle associated with suggested collection interface 612). As shown in FIG. 6M, in response to detecting user input 622, device 600 expands the displayed suggested collection interface 612 (e.g., so that more of suggested collection interface 612 is displayed). In FIG. 6M, user input 622 continues to be detected and has moved upward (relative to FIG. 6L) on the touch-sensitive display, and suggested collection interface 612 has expanded while less of transcript 604A is displayed.

[0187] FIG. 6N illustrates a suggested collection interface fully expanded. For example, in response to completion of the upward swipe gesture of user input 622, device 600 displays suggested collection interface 612 fully expanded. In some embodiments, displaying a suggested collection interface fully expanded causes a reduction (e.g., partial or full) of the amount of the transcript that is displayed. For example, as shown in FIG. 6N, transcript of the message conversation is no longer concurrently displayed with suggested collection interface 612. In some embodiments, the transcript is concurrently displayed with a fully expanded suggested collection interface. For example, some portion of the transcript can be displayed concurrently with the fully expanded suggested collection interface, wherein the portion is less than what is displayed when the suggested collection interface is not fully expanded. In some embodiments, a suggested collection of media items (e.g., as shown in interface 612) is scrollable (e.g., to reveal additional content or elements as described herein with respect to interface 612). For example, user input representing a request to scroll (e.g., upward or downward swipe on 612) causes additional media items in the collection to be displayed.

[0188] FIGS. 6O-6R illustrate an exemplary technique for navigation between pages associated with a photos application in a sharing interface. While viewing suggested collection interface 612 fully expanded, the user can still move between pages associated with the photos

application (e.g., sharing interface 610). In some embodiments, the device (e.g., 600) displays a different suggested collection for a different suggested collection in response to receiving user input. For example, at FIG. 6O, device 600 receives user input 624 at suggested collection interface 612, representing a left swipe gesture on a location of interface 612 (e.g., title card 612A). In response to receiving user input 624, device 600 replaces display of suggested collection interface 612 with display of an adjacent page associated with another suggested collection, suggestion page 626 (also referred to as suggested collection interface 626) as shown in FIG. 6P.

[0189] FIG. 6P illustrates an exemplary suggested collection interface 626. In some embodiments, suggested collection interface 626 includes one or more of the features of suggested collection interface 612 as described herein. Similar to suggested collection interface 612, suggested collection interface 626 represents a suggested collection (e.g., a “second” suggested collection) of media items (different than the suggested collection represented by suggested collection interface 612). Suggested collection interface 626 also includes a title card 626A (e.g., with a representative image from its respective suggested collection), an indication of location 626B (Tahoe Forest), and an indication of date 626C (July 3rd to July 8th). Suggested collection interface 626 also includes a representation of one or more media items in the respective collection (e.g., representation 626D). In this example, the suggested collection represented by suggested collection interface 626 is determined to be relevant to the message conversation represented by transcript 804A and suggested based on a geographic location included in the text of the transcript 604A of the conversation with William and Gregg—William asked for photos of Lake Tahoe, and the suggested collection is associated with a nearby geographic location called “Tahoe Forest”. Thus, suggested collection interface 626 offers a second suggested collection of media items that is available for sharing, and that is relevant to the potential recipients William and Gregg (e.g., is related to the text of the conversation with participants William and Gregg).

[0190] In some embodiments, suggested collections determined to be relevant to the message conversation are displaying in an order (e.g., of descending relevance). In some embodiments, the order is based on relevance to the message conversation. For example, if the suggested collection of interface 612 is related to the transcript 604A in FIG. 6D because it depicts

participants 603B and 603C and relates to the geographic location mentioned in the text, but the suggested collection 612 is only related to the transcript 604A based on geographic location (e.g., Tahoe Forest is near Lake Tahoe) but does not depict the participants, interface 612 is more relevant to the conversation. Thus, for example, interface 612 can be displayed immediately in response to selection of an input suggestion affordance (e.g., 606C), while interface 626 can be accessed using a swipe over from 612. Additionally, interface 612 can be assigned a second page (e.g., of paging dots 610D) while interface 626 is assigned to a third (later) page dot.

[0191] In this example, the photos requested by William in transcript 604A correspond to the suggested collection represented by suggested collection interface 612 (e.g., the “first” suggested collection). Thus, the user can swipe to return to interface 612. At FIG. 6Q, device 600 receives user input 628 (e.g., representing a right swipe gesture) at a location associated with interface 626. In response to receiving user input 628, device 600 displays suggested collection interface 612 again, as shown in FIG. 6R.

[0192] FIG. 6R illustrates exemplary suggested collection interface 612. In some embodiments, a suggested collection interface (e.g., 612) includes an indication of the amount of media items in the corresponding suggested collection. For example, indicator 612D indicates that the suggested collection includes 23 photos and 1 video (e.g., 24 media items total). In some embodiments, a suggested collection interface (e.g., 612) includes a sharing affordance for transmitting one or more media items from the corresponding suggested collection. For example, sharing affordance 612E can be selected in order to share one or more media items as discussed below. In some embodiments, a suggested collection interface (e.g., 612) includes representations of one or more media items. For example, suggested collection interface 612 includes media items 612F and 612G, each representing a media item in the suggested collection of 612 (Lake Tahoe collection). In some embodiments, a suggested collection interface (e.g., 612) includes one or more selection indicators that indicate whether one or more media items are currently selected (e.g., for sharing in response to selection of a sharing affordance). In some embodiments, a selection indicator is visually associated with a media item that is currently selected, and is optionally not displayed when the same media item is not selected. For example, media items 612F and 612G each includes a selection indicator 612H, indicating that media items 612F and 612G are currently selected.

[0193] In some embodiments, the device (e.g., 600) enters into a selection mode (e.g., in response to user input) after displaying a suggested collection interface (e.g., 612). In some embodiments, the device (e.g., 600) is in selection mode (e.g., initially) upon display of a suggested collection interface (e.g., 612). In some embodiments, a suggested collection interface
 5 (e.g., 612) includes one or more of the features of 814, as described below.

[0194] FIGS. 6S-6U illustrate exemplary techniques for sharing a suggested collection of media items. In some embodiments, the device (e.g., 600) receives input (e.g., 630) representing a request to share one or more media items from a suggested collection (e.g., of 612). For example, at FIG. 6S, device 600 receives user input 630 at sharing affordance 612E. As shown
 10 in FIG. 6S, when user input 630 is received, sharing affordance 612E indicates that all media items in the collection are currently selected (e.g., sharing affordance 612E reads “SEND ALL”). In response to receiving user input 630, device 600 can prepare to share the selected media items in the suggested collection, which in this case is all media items.

[0195] FIG. 6T illustrates an exemplary representation 631 of a collection of media items
 15 inserted into an exemplary text entry field 604D for sharing. In some embodiments, preparing to share the media items includes inserting a representation of the media items into a text entry field (e.g., 604D of FIG. 6T). For example, once inserted into the text entry field 604D, the user optionally adds accompanying text (or other content) before transmitting a message that provides access to the selected media items (e.g., by inserting the media items, or a representation of the
 20 media items, into a transcript of a message conversation).

[0196] FIG. 6U illustrates an exemplary representation 631 inserted into the transcript of a message conversation after sharing. In some embodiments, in response to receiving a request to share a suggested collection of media items (e.g., 630), the device (e.g., 600) transmits a message that provides access to at least a portion of the suggested collection. For example, device 600
 25 can transmit a message that provides access to the suggested collection of media items (e.g., represented by representation 631 as shown in FIG. 6U) in response to receiving user input 630, and optionally not require additional user input to send the message, or provide an opportunity to add accompanying content. Alternatively, device 600 can transmit a message that provides access to the suggested collection of media items (e.g., represented by representation 631 as

shown in FIG. 6U) in response to user input corresponding to selection of affordance 604I of FIG. 6T.

[0197] In some embodiments, the device (e.g., 600) shares fewer than all of the media items in a suggested collection. In some embodiments, a suggested collection interface (e.g., 612) has fewer than all media items selected initially. For example, a curated set of fewer than all media items can be selected and presented upon the initial display of interface 612 (e.g., similar to as shown in FIG. 6W). In some embodiments, the device (e.g., 600) allows addition (e.g., via user input) of media items to the initial selection. This can be helpful where a suggested collection includes a large number of media items. In some embodiments, the device (e.g., 600) allows removal (e.g., via user input) of media items from the initial selection. In some embodiments, the curated set of fewer than all media items in the suggested set is selected based on characteristics of individual media items (e.g., that the media item is in focus, has good composition, or the like) and/or based on characteristics of the collection as a combination (e.g., prevent selection of duplicate or very similar media items, select media items that depict a variety of identified faces, select media items that show a variety of subject matter, or the like).

[0198] FIGS. 6V-6AG illustrate exemplary interfaces for customizing selection of media items of a suggested collection for sharing. In some embodiments, the device (e.g., 600) receives user input representing a request to toggle whether a media item is selected (e.g., to select an unselected item, or to unselect a selected item). For example, at FIG. 6V, device 600 receives user input 632 associated with (e.g., a location of) media item 612G. In some embodiments, in response to user input the device (e.g., 600) toggles selection of a media item. In some embodiments, if toggling selection causes the media item to be selected, the device displays a selection indicator associated with the item. In some embodiments, if toggling selection causes the media item to be unselected, the device ceases display of a selection indicator associated with the item. In some embodiments, if toggling selection causes the media item to be unselected, the device displays an unselected indicator associated with the item (e.g., in place of a selection indicator). As shown in FIG. 6W, in response to receiving user input 632, device 600 ceases to display selection indicator 612H, and optionally instead displays unselected indicator 612I. Thus, user input 632 causes media item 612G to no longer be selected, which is visually represented by selection indicator 612H ceasing to be displayed.

[0199] As shown in FIG. 6V, user input 632 is received at a location of selection indicator 612H. In some embodiments, user input to toggle selection (e.g., 632) is received at a location of the media item (e.g., 612G) that does not include a selection indicator, which causes the device (e.g., 600) to toggle selection of the corresponding media item. For example, the user input that toggles selection does not have to be at a location of a (e.g., displayed) selection indicator (or of a (e.g., displayed) unselected indicator) in order to toggle selection the media item. For instance, if user input 632 was instead a tap centered on a top left corner of media item 612G in FIG. 6V (e.g., not on indicator 612H), device 600 can toggle selection of media item 612G in response.

[0200] In some embodiments, a change to the selection of media items causes a displayed indication (e.g., 612E) of an amount of selected media to be updated. In some embodiments, the indication of the amount of selected media is included in a sharing affordance (e.g., 612E). For example, as shown in FIG. 6W, in response to user input 632, sharing affordance 612E has been updated (now reads “SEND 23”) to indicate that 23 media items are selected for sharing (22 photos and 1 video), which reflects that photo 612G has been unselected. Contrast this with FIG. 6V, in which sharing affordance 612E indicates (“SEND ALL”) that the amount of media items to be shared is all media items in the suggested collection (e.g., all 23 photos and 1 video indicated in title card 612A). In some embodiments, the amount indicates the type of media selected (e.g., whether there are photos and/or videos selected, such as in the statement “22 photos and 1 video”).

[0201] FIG. 6X illustrates an exemplary technique for entry into a one-up view of a suggested collection of media items. As shown in FIG. 6X, the media items in the suggested collection of media items are displayed in an exemplary grid view at interface 612. In some embodiments, a grid view includes representations, of media items, that are substantially similar or identical dimensions. For example, FIG. 6X shows media items arranged as equal-sized squares. In some embodiments, a grid view includes representations, of media items, that are arranged aligned along one or more of a vertical or horizontal axis. For example, FIG. 6X shows media items aligned along both vertical axes and horizontal axes (e.g., each square’s edges are aligned to two horizontal axes and two vertical axes). While displaying media items in a grid view as shown in FIG. 6X, the device 600 optionally provides the user with the option to inspect a media item more closely, for example to determine whether to select or unselect the media item

for sharing. In some embodiments, the device (e.g., 600) receives user input (e.g., 634) associated with a media item (e.g., in a grid view) and, in response to receiving the user input, displays the media item in the one-up view (e.g., 636 of FIG. 6Y).

[0202] FIG. 6Y illustrates an exemplary one-up view of a media item. In some
 5 embodiments, the device (e.g., 600) displays a media item in a one-up view. In some
 embodiments, displaying a media item in a one-up view includes displaying the media item
 where: it is displayed alone on the display, it is displayed substantially larger than other media
 items on the display, it is displayed so that it extends from one edge of the display to an opposite
 edge of the display in at least one dimension (e.g., between the left and right edges, and/or
 10 between the top and bottom edges), and/or it is displayed larger (e.g., zoomed in) than it was
 displayed before detecting user input that causes the media item to be displayed in the one-up
 view. For example, in response to receiving user input 634 on media item 612G in FIG. 6X,
 device 600 displays one-up view 636 as shown in FIG. 6Y. In this example, the user input
 associated with media item 612G is a “de-pinch” gesture (e.g., movement of two contacts apart
 15 from each other by more than a threshold distance). In some embodiments, the user input
 associated with media item (e.g., 612G) is a long press gesture (e.g., a contact exceeding a
 predetermined length of time). In some embodiments, the user input associated with media item
 (e.g., 612G) is a hard press gesture (e.g., a contact with a characteristic intensity that exceeds a
 threshold intensity such as a threshold intensity that is greater than a nominal contact detection
 20 intensity threshold at which a tap input can be detected). In some embodiments, the user input
 associated with media item (e.g., 612G) that causes display of the one up view is a tap gesture
 (e.g., a contact not exceeding a predetermined length of time) if the device (e.g., 600) is not
 currently in a selection mode. For example, a simple tap on a media item while not in selection
 mode opens up a one-up view. In some embodiments, one up view 636 includes one or more of
 25 the features of one up view described below with respect to shared collection interface 814.

[0203] As shown in FIG. 6Y, media item 612G is displayed in an exemplary one-up view
 636. In some embodiments, a one-up view (e.g., 636) includes an area (e.g., 636A) that includes
 the media item (e.g., 612G) displayed in the one-up view (e.g., displayed in a zoomed state larger
 than in the grid view of suggested collection interface 612 as shown in FIG. 6X). In some
 30 embodiments, a one-up view (e.g., 636) also includes an indication of selection (e.g., 636B,

currently displaying an unselected indicator 637A) that indicates whether the media item in area 636A is currently selected (or deselected). As shown in FIG. 6Y, media item 612G is currently not selected (e.g., due to user input 632 at FIG. 6V). If media item 612G were currently selected, the indication of selection 636B would, for example, include a selection indicator (e.g., a

5 checkmark, such as 637B of FIG. 6AA). In some embodiments, a one-up view includes a scrubbing region (e.g., 636C) that includes representations of a plurality of media items from the suggested collection. For example, one-up view 636 also includes scrubbing region 636C, which includes representations of additional media items (e.g., different than the media item currently in the one-up view, media item 612G), displayed smaller than the media item 612G being

10 displayed in the one-up view. In some embodiments, the plurality of media items (e.g., 636C) include an indication of whether one or more media items are currently selected. For example, the media items represented in scrubbing region 636C that are selected (e.g., as shown in FIG. 6X) each include a selection indicator (e.g., a checkmark), and the representation of the single media item that is unselected (media item 612G) does not include the selection indicator (e.g.,

15 lacks a checkmark, but includes unselected indicator 637A). One of skill would understand that other techniques for indicating whether an item is selected or unselected are possible, and are intended to be within the scope of this disclosure.

[0204] In some embodiments, a one-up view (e.g., 636) includes an indication of an amount of media items that are currently selected. In some embodiments, a one-up view includes an

20 indication of a total amount of media items in the respective collection of media items. For example, indicator 636D shown in FIG. 6Y indicates both an amount of selection (23 items are selected) and that a total amount of media items in the collection being viewed (24 items), where it states: “23 of 24 selected”.

[0205] While displaying a media item in the one-up view, the device optionally provides the

25 user with the option to view another media item from the suggested collection in the one-up view without having to return to the grid view. In some embodiments, the device receives user input (e.g., 638) while displaying a first media item in a one up view, and in response, replaces display of the first media item (e.g., 612G in FIG. 6Y) in a one up view with display of a second media item (e.g., 612F in FIG. 6AA) in a one up view. For example, at FIG. 6Z, device 600 receives

30 user input 638, representing a right swipe gesture, while media item 612G is displayed in one-up

view 636. In response to receiving user input 638, device 600 displays media item 612F in one-up view 636, as shown in FIG. 6AA. In some embodiments, the user input is associated with a scrubbing region (e.g., 636C). For example, interface 636 as shown in FIG. 6AA can be displayed in response to selection of 612F in scrubbing region 636, or in response to a swipe that
 5 scrubs the selection in region 636C to another media item.

[0206] FIG. 6AA illustrates media item 612F in one-up view 636. Media item 612F is adjacent and to the left of media item 612G (e.g., as shown in suggested collection interface 612 of FIG. 6X, and as shown in area 636C of FIG. 6Y). Thus, the single right swipe gesture 638 causes display of media item 612G in the one up view with media item 612F in the one up view.
 10 In some embodiments, the device (e.g., 600) plays a video in response to user selection received while in a one-up view of a media item. For example, as shown in FIG. 6AA, device 600 displays playback affordance 636E associated with (e.g., overlaying) media item 612F, which is a video. In response to user input representing selection of playback affordance 636E, device 600 begins playback of at least a portion of media item 612F.

[0207] As shown in FIG. 6AA, media item 612F is currently selected—thus, media item 612F includes a selection indicator 637B (a checkmark in this example) in one up view 636. In some embodiments, the device (e.g., 600) toggles whether a media item is selected in response to user input request to toggle selection of a media item that is received while in a one-up view of a media item. For example, at FIG. 6AB, device 600 receives user input 640, representing
 20 selection of selection indicator 637B, while media item 612F is selected. In response to user input 640, device 600 toggles the selection of media item 612F from being selected to being unselected. For example, in FIG. 6AC, media item 612F is no longer selected, and thus selection indicator 637B is no longer displayed, but unselected indicator 637A is displayed instead in the indication of selection 636B. Likewise, if user input 640 is received while media item 612F is
 25 not currently selected (e.g., while indicator 637B is not displayed with media item 612F, but unselected indicator 637A is displayed), then in response to user input 640, device 600 would toggle selection of media item 612F from being unselected to being selected, and optionally display selection indicator 637B with media item 612F. Also shown in FIG. 6AC, an unselected indicator 637A is also displayed (and selection indicator 637B ceases to be displayed) associated

with (e.g., at a location of) the reduced size representation of media item 612F in scrubbing region 636C.

[0208] In some embodiments, in response to toggling selection, the device updates an indication of an amount of selected media. For example, as shown in FIG. 6AC indicator 636D
 5 has been updated in response to user input 640, and now indicates that only 22 items are selected, stating: “22 of 24 selected”.

[0209] In some embodiments, the device (e.g., 600) receives user input and, in response to receiving the user input, replaces display of the one-up view with display of the grid view. For example, at FIG. 6AD, device 600 receives user input 642 corresponding to selection of done
 10 affordance 636F. As shown in FIG. 6AE, in response to receiving user input 642, device 600 ceases displaying a one-up view 636 of a suggested collection interface and displays a grid view (e.g., suggested collection interface 612).

[0210] In some embodiments, the set of media items that are currently selected is independent of how the media items are viewed. For example, FIG. 6AE illustrates that sharing
 15 affordance 612E in the grid view has again been updated to reflect an amount of media items that are currently selected. That is, because media item 612F is no longer selected, sharing affordance 612E has changed from reading “SEND 23” in FIG. 6X to now read “SEND 22” (e.g., reflecting that 22 items are currently selected, due to media items 612F and 612G being unselected of the total of 24 media items). Thus, the set of media items that were currently
 20 selected in the one-up view are still selected in the grid view (and unselected media items remain unselected). Accordingly, the one-up view can be used to undo changes made in the grid view the grid view can be used to undo changes made in the one-up view, as shown in FIGS. 6AF-6AG.

[0211] At FIG. 6AF, device 600 receives user input 644 corresponding to selection of
 25 unselected media item 612F. As shown in FIG. 6AG, in response to receiving user input 644, device 600 toggles selection of media item 612F and displays a selection indicator associated with it. Further, sharing affordance 612E has been updated and has changed from reading “SEND 22” in FIG. 6AE to now read “SEND 23”. Thus, the selection changes made in the one-up view that carried over to the grid view can be further customized.

[0212] FIGS. 6AH-6AK illustrate exemplary user interfaces for sharing a suggested collection of media items with a recipient. In this example, after customizing selection, the device 600 optionally provides the user with the option to share the selected items with the participants of the message conversation (e.g., of transcript 604A). FIG. 6AH illustrates the same set of selected media items depicted in FIG. 6AF. At FIG. 6AH, device 600 receives user input 646, corresponding to selection of sharing affordance 612E. In some embodiments, in response to receiving selection of a sharing affordance (e.g., 612E), the device (e.g., 600) shares the suggested collection (e.g., shown in suggested collection interface 612) with one or more recipients. In some embodiments, sharing a suggested collection includes transmitting data that provides access to at least a portion of the suggested collection of media items to the one or more recipients, and optionally to a cloud-based service. For example, in response to receiving user input 644, device 600 can transmit a message (e.g., 604J of FIG. 6AK, described below) to William and Gregg that includes data representing the set of selected media items (e.g., the 23 selected media items in FIG. 6AH). In some embodiments, transmitting data providing access to at least a portion of media items includes transmitting one or more media items (e.g., copies, which can be reduced in size or quality). In some embodiments, transmitting data providing access to at least a portion of media items includes sending information that provides access to one or more media items of the suggested collection through one or more remote devices (e.g., remote from device 600) (e.g., sending one or more of: a link, an address, a credential, a passcode, and/or data that instructs a remote (e.g., cloud-based) service to allow access by a recipient).

[0213] In some embodiments, in response to receiving selection of a sharing affordance, the device (e.g., 600) inserts a representation (e.g., 604H) of the suggested collection of media items (e.g., represented by suggested collection interface 612) into a text entry field (e.g., of a messaging interface). For example, in response to receiving user input 646, device 600 displays message interface 604 as shown in FIG. 6AI. In FIG. 6AI, message interface 604 now includes representation 604H in text entry field 604D that represents the suggested collection of media items of suggested collection interface 612.

[0214] In some embodiments, the device (e.g., 600) receives input of text in a text entry field that includes a representation of a suggested collection. For example, in FIG. AJ, device 600

receives input of the text “Here you go!” (e.g., via typing in keyboard region) to accompany representation 604H.

[0215] In some embodiments, the device (e.g., 600) receives user input (e.g., 647) selection of a send affordance (e.g., 604I) of a message interface (e.g., 604). In some embodiments, in response to receiving selection of the send affordance, the device (e.g., 600) transmits a message (e.g., 604J) that provides access to the suggested collection. For example, at FIG. 6AJ, device 600 receives user input 647 corresponding to selection of send affordance 604I. As shown in FIG. 6AK, in response to receiving user input 647, device 600 transmits a message 604J to the recipients William and Gregg that includes the representation 604H of the suggested collection, and inserts message 604J into transcript 604A. In this example, device 600 also transmits the accompanying text “Here you go!” in response to receiving user input 647 (e.g., which can be included as part of the same message (e.g., 604J), or as a separate message that is sent in response to the same input). Alternatively, device 600 transmits message 604J that provides access to the collection, without accompanying text, in response user input 646.

[0216] As shown in FIGS. 6AJ and 6AK, input suggestions in a sharing suggestion region can change, depending the state of a message interface (e.g., 604) or a conversation. For example the input suggestions shown in FIG. 6AJ “I”, “THIS”, and “HERE” have changed in FIG. 6AK to be replaced with “WE”, “YOU”, “LET’S”, respectively. In some embodiments, the change to input suggestions is based on text in the text entry field. In some embodiments, the change to input suggestions is based on content in the transcript (e.g., changes to the content).

[0217] In some embodiments, a representation of a suggested collection includes descriptive information (e.g., title, date, geographic location). For example, representation 604H includes text representing a geographic location associated with the suggested collection, “Lake Tahoe”. This can also be considered the title of the suggested collection, however a title can be different than a geographic location associated with the collection (e.g., “Lake Tahoe” could instead have the title “Lynne’s Birthday Celebration” as defined by (e.g., user-defined) metadata associated with the suggested collection). In some embodiments, a representation of a suggested collection includes an indication of time. For example, representation 604H includes the text “December 1 to 4”, representing the dates December 1st to December 4th. In some embodiments, a

representation of a suggested collection includes an indication of an amount of media being shared. For example, representation 604H includes the text “22 photos and 1 video”, identifying the number of photos and videos being shared. In some embodiments, a representation of a suggested collection includes an expiration time. For example, representation 604H includes the
 5 text “Link expires January 8”, which indicates that the access provided to a recipient (e.g., via a link) will expire at a particular time.

[0218] In some embodiments, a representation (e.g., 604H) of a collection includes an indication of transmission status (e.g., uploading, downloading, and/or a progress of the upload/download). In some embodiments, a representation (e.g., 604H) of a collection includes
 10 link expiration time (e.g., expires in 13 days). For example, in FIG. 6AK, 604H includes the text “Link expires January 8”. In some embodiments, a representation (e.g., 604H) includes status of receipt (e.g., delivered, read, opened, viewed, or the like)).

[0219] FIGS. 6AL-6AW illustrate other exemplary user interfaces for sharing a suggested collection of media items. As described above, a device can provide access to interfaces for
 15 sharing a suggested collection of media items from a messaging application. Specifically, the device can provide access to the suggested collection while displaying a transcript of a conversation, wherein the suggested collection can be shared into that conversation. In some embodiments, an interface for sharing a suggested collection of media items can be accessed via another application (e.g., different than a messaging application). In some embodiments, another
 20 application is an application for managing and/or viewing media items (e.g., in a media library) associated with a device (e.g., device 600). For example, such an application is also referred to as a photos application.

[0220] FIG. 6AL illustrates an exemplary home screen 648. Home screen 648 includes a plurality of affordances associated with applications. At FIG. 6AL, device 600 receives user
 25 input 650, corresponding to selection of photos application affordance 648A. In response to detecting user input 650, device 600 displays an interface associated with the photos application.

[0221] FIG. 6AM illustrates an exemplary interface (e.g., 652) associated with a photos application. Interface 652 includes a plurality of representations of media items that are associated with (e.g., included in) a media library associated with device 600. Interface 652

represents an album of photos that have been designated as a “favorite”. In some embodiments, an interface associated with a photos application includes one or more affordances for accessing media collections (e.g., suggested collections for sharing). For example, at the display of interface 652, menu 654 is displayed. Menu 654 includes affordances 654A-654C (also referred to as tabs). Tab 654A is currently selected, and provides access to interfaces for browsing a media library. Tab 654B includes the text “For You”, and provides access to interfaces for accessing personalized features related to a media library of the device (e.g., including one or more suggestions for sharing collections of media with recipients). Tab 654C provides access to an interface for searching for media items.

10 [0222] At FIG. 6AN, device 600 receives user input 656, corresponding to selection of tab 654B. In some embodiments, in response to receiving input (e.g., 656), the device (e.g., 600) displays a personalized media interface (e.g., associated with the photos application) (e.g., 658). FIG. 6AO illustrates an exemplary personalized media interface 658. In some embodiments, a personalized media interface (e.g., 658) includes a sharing suggestion region (e.g., 658A). For example, personalized media interface 658 includes a sharing suggestion region 658A. In some
15 embodiments, a personalized media interface (e.g., 658) includes additional content. In some embodiments, a sharing suggestion region includes one or more suggestions (e.g., prompts) for sharing media collections with one or more suggested recipients. In some embodiments, a personalized media interface includes collections of media items received from other users (e.g., via a message conversation). For example, interface 658 can include access to (e.g., display a
20 representation of) the collection received from William (e.g., represented by 604B).

[0223] In some embodiments, a personalized media interface includes representations of one or more pre-selected collections of media items related based on a context. For example, personalized media interface 658 includes a memories region 658B, that includes representations
25 of collections that are related to a context (e.g., the location San Diego during the month of November 2017, or the location Washington D.C. during the summer of 2017). In some embodiments, the pre-selection collections can be shared (e.g., similar to a suggested collection). In some embodiments, the pre-selected collections are related to one or more of a message conversation and/or one or more recipients associated with device 600.

[0224] As described above, a sharing suggestion region 658A can include one or more suggestions (e.g., prompts) to share one or more suggested collections of media items with one or more suggested recipients. Sharing suggestion region 658A includes a prompt 660 to share a suggested collection of media items with four suggested potential recipients (e.g., represented by the four faces under the title card). In some embodiments, the prompt includes an indication of the one or more recipients. In some embodiments, an indication of a recipient includes an identified face associated with the recipient. In this example, four identified faces 660A are shown in prompt 660, each representing a suggested recipient. In some embodiments, an indication of a recipient includes a name associated with the recipient. In this example, only three of the identified faces are associated with names, and thus prompt 660 only includes three names 660B: Sue, Anna, and John. Thus, in this example, the fourth face was identified as having been depicted in at least one media item in the suggested collection of media items, however the identified face has not been matched with a known profile (e.g., a profile that includes one or more of a name or contact information associated with an identified face). In some embodiments, the identified face is not matched because a profile for the face does not exist. In some embodiments, the identified face is not matched because a profile for the recipient has not previously been associated with any identified face. For example, the device 600 includes correct contact information for the person of the identified face, but the contact information is not associated with the identified face in device 600.

[0225] In some embodiments, a suggested recipient is suggested based on an identified face associated with the recipient. As touched on above, a suggested recipient displayed at prompt 660 can be a recipient whose identified face is present in one or more media items in the suggested collection of media items. In this example, at least one media item from the suggested collection “Lake Tahoe” includes a depiction of the respective identified faces of each of Sue, Anna, and John. Further, as will be explained in detail below, a suggested recipient can be an identified face for which contact information is not currently associated (e.g., by device 600). In this way, by presenting the user with a face depicted in the photos, the user can be reminded of parties to whom they may wish to send data, even if the device is not currently able to (e.g., lacks associated contact information). Further, as shown below with respect to FIGS. 6AS-6AV, the

device can provide the user an interface for easily associating the suggested recipient with contact information.

[0226] In some embodiments, the prompt (e.g., 660) includes information associated with the suggested collection. In some embodiments, the information includes one or more of a title of the suggested collection, an indication of an event associated with the suggested collection, an indication of a geographic location associated with the suggested collection, or an indication of a time (e.g., date, date range) associated with the suggested collection. For example, prompt 660 includes an indication 660C of a geographic location “Lake Tahoe” and an indication 660D of a time range “December 1 to 4”. In some embodiments, the prompt includes one or more representations of one or more media items of the suggested collection of media items. For example, prompt 660 includes a title card 660E which depicts a media item (e.g., photo) from the Lake Tahoe collection. In other examples, the media item is a video or images played in sequence.

[0227] As can be seen in FIG. 6AO, the suggested collection represented by sharing suggestion prompt 660 is the same suggested collection of media items associated with suggested collection interface 612. Thus, in the example of prompt 660, the prompt represents a suggestion to share a previously shared collection of media items with at least one additional recipient. However, in other examples, a prompt (e.g., at interface 658) can suggest sharing one or more other collections, or suggest sharing with the recipients that were already shared with (e.g., William and Greg in FIG. 6AK).

[0228] In some embodiments, in response to user input (e.g., 656), the device (e.g., 600) displays a prompt to share a different suggested collection (e.g., than the suggested collection of 612) with a recipient (e.g., 603B, William). For example, after navigating to a sharing interface (e.g., “For You” tab) of a photos application (e.g., after displaying the message conversation in a messaging application), the device displays one or more additional suggestions for sending to the recipient that was already shared with, William. In this way, the device provides a convenient path to share additional content (e.g., related to one or more conversations or other contexts) with the recipient with whom the user of the current device is in a sharing relationship (e.g., a suggestion was previously made or the user previously transmitted access to media items).

[0229] In some embodiments, in response to user input (e.g., 656), the device (e.g., 600) displays a different suggested media collection (e.g., of 626) if a first suggested collection (e.g., of 612) was previously transmitted to the recipient. For example, the device provides a new suggestion after the first suggested collection of interface 612 was shared by the user (e.g., as shown in FIG. 6AK). That is, the device 600 can suggest further collections to share with William and Gregg.

[0230] In some embodiments, in response to user input (e.g., 656), the device (e.g., 600) displays a different suggested media collection if the first suggested collection (e.g., of 612) was not previously transmitted to the recipient. For example, the device provides a new suggestion if the first suggestion was not acted upon by the user. In some embodiments, if the first suggested collection (e.g., of 612) was not previously shared, in response to receiving user input (e.g., 656), the device displays a prompt to share the first suggested collection (e.g., 612) with the recipient. For example, if the user has not previously transmitted access to the suggested collection while in a messages application, the device provides a prompt and opportunity to transmit the suggested collection to the recipient again (e.g., at a personalized media interface 658 of a photos application).

[0231] Using the prompt 660 in sharing suggestion region 658A, a user can easily share a suggested collection of media items with one or more suggested recipients. In some embodiments, the device (e.g., 600) receives user input (e.g., 662) associated with a prompt (e.g., 660) in the sharing suggestion region (e.g., 658A). For example, at FIG. 6AP, device 600 receives user input 662 corresponding to selection of affordance 660F. In some embodiments, in response to user input (e.g., 662) associated with the prompt (e.g., 660), the device (e.g., 600) displays a suggested collection interface associated with the collection of media items associated with the prompt. For example, in response to receiving user input 662, device 600 displays suggestion page 664 (also referred to as suggested collection interface 664) as shown in FIG. 6AQ. Suggested collection interface 664 corresponds to the same suggested collection of media items as suggested collection interface 612. In this example, suggested collection interface 664 is identical to suggested collection interface 612. In some embodiments, suggested collection interface 664 includes one or more features as described with respect to suggested collection interface 612.

[0232] In some embodiments, in response to user input (e.g., 662) associated with the prompt (e.g., 660), the device (e.g., 600) transmits a message to one or more suggested recipients that provides access to the suggested collection of media items. For example, in response to user input 662, device 600 immediately shares (e.g., transmits a message) the suggested collection
5 with one or more of the suggested recipients (e.g., Sue, Anna, John).

[0233] At FIG. 6AR, device 600 receives user input 665 corresponding to selection of sharing affordance 664A. In some embodiments, in response to receiving user input corresponding to selection of an affordance associated with the prompt (e.g., affordance 660F, or 664A), the device (e.g., 600) displays a recipient confirmation interface (e.g., 666 of FIG. 6AS).

[0234] FIG. 6AS illustrates an exemplary recipient confirmation interface 666. In some embodiments, a recipient confirmation interface includes an indication of one or more faces detected in the suggested collection. For example, recipient confirmation interface 666 includes region 666A, which indicates a number of faces have been detected in the Lake Tahoe suggested collection. As described with respect to prompt 660 of FIG. 6AO, region 666A indicates that
10 four (4) faces were detected in the Lake Tahoe suggested collection. In some embodiments, a recipient confirmation interface includes one or more affordances for selecting recipients for sharing. For example, recipient confirmation interface 666 includes recipient indicators 666B-666E, each corresponding to one of the detected faces. Each of the recipient indicators 666B-666D includes an indication of a profile associated with the detected face, including a name (e.g.,
15 Sue, Anna, or John) and contact information (e.g., a phone number, such as 123-456-7890 for Sue). Notably, recipient indicator 666E is displayed, but does not include a name or contact information, as the detected face is not associated with profile information. In some embodiments, a recipient who is associated with known profile information is selected by default. For example, upon initial display of recipient confirmation user interface 666 as shown
20 in FIG. 6AS, the recipients Sue, Anna, and John are selected (e.g., as shown by the selection indicator 667A, a checkmark, in each of recipient indicators 666B-666D), yet the recipient associated with recipient indicator 666E is not selected (e.g., no selection indicator 667A is displayed in recipient indicator 666E, but an unselected indicator 667B is displayed).

[0235] In some embodiments, a recipient confirmation interface (e.g., 666) includes an affordance for adding a recipient. For example, recipient confirmation interface 666 includes affordance 666F. In this example, in response to user input corresponding to selection of 666F, device 600 provides an interface for selecting one or more additional recipient. An interface for selecting one or more additional recipient can include one or more of the features of contact selection user interface 670 of FIG. 6AU, described in more detail below.

[0236] As described briefly above, device 600 can provide a quick and easily-accessed interface for associating a suggested recipient with contact information. In some embodiments, the device (e.g., 600) receives user input associated with a suggested recipient (e.g., not associated with contact information). For example, at FIG. 6AT, device 600 receives user input 668 corresponding to selection of recipient indicator 666E, which is not associated with contact information.

[0237] In some embodiments, in response to receiving user input associated with a suggested recipient, the device (e.g., 600) provides (e.g., displays) an interface for associating the suggested recipient with contact information. For example, FIG. 6AU illustrates an exemplary contact selection user interface 670 displayed in response to receiving user input 668. In some embodiments, a contact selection user interface (e.g., 670) includes one or more representations of one or more contacts (e.g., 670A). For example, contact selection user interface 670 includes a plurality of representations each associated with a contact (e.g., Andrew, Billy), including representation 670A, associated with the contact named “Mary”. In some embodiments, a contact represented in a contact selection user interface (e.g., 670) is associated with contact information. In some embodiments, contact information includes one or more of a phone number, an e-mail address, a link, a network address, or other data for addressing or directing data to a recipient (e.g., a device, a user account).

[0238] At FIG. 6AU, device 600 receives user input 672 corresponding to selection of a representation of a contact. In some embodiments, in response to detecting a user input corresponding to selection of a representation of a contact, the device (e.g., 600) associates contact information associated with the selected contact (e.g., 670A) with the suggested recipient (e.g., 666E). For example, in response to receiving user input 672, device 600 associates the

detected face associated with recipient indicator 666E with contact information associated with the contact named Mary of representation 670A.

[0239] FIG. 6AV illustrates recipient confirmation interface 666. In some embodiments, the device (e.g., 600) displays the recipient confirmation interface (e.g., 666 in FIG. 6AV)

5 subsequent to (e.g., in response to) user input (e.g., 672) corresponding to selection of a contact (e.g., 670A). For example, in response to receiving selection of Mary, device 600 ceases displaying contact selection interface 670, and returns to display of recipient confirmation interface 666 as shown in FIG. 6AV. In FIG. 6AV, recipient indicator 666E now includes the name of the selected contact, Mary, and a phone number associated with the selected contact. In
10 this example, the detected face that was previously not associated with contact information is now associated with Mary's contact information. In some embodiments, the association between the contact and the detected face is persistent. For example, if the same face is detected in another collection, Mary's name would be displayed alongside a recipient indicator in a recipient confirmation interface, without the need for selection of Mary again at a contact selection user
15 interface. In some embodiments, in response to user input (e.g., 672) corresponding to selection of a contact (e.g., 670A), the device automatically selects the suggested recipient (e.g., 666E). For example, in response to user input 672 selecting Mary, device 600 selects the suggested recipient Mary, and displays a selection indicator 667A associated with recipient indicator 666E in FIG. 6AV.

20 **[0240]** In some embodiments, the device (e.g., 600) receives user input associated with a suggested recipient, and in response to receiving such input, toggles selection of the suggested recipient. For example, at FIG. 6AV, the user can select Mary's indicator (e.g., 666E) to toggle selection (change from selected to unselected, or change from unselected to selected). In some
25 embodiments, the device (e.g., 600) does not share the suggested collection of media with an unselected suggested recipient in response to user input (e.g., 674, described below) that causes the suggested collection of media to be shared with selected suggested recipients.

[0241] In some embodiments, a recipient confirmation interface (e.g., 666) includes one or more affordances for sharing the corresponding suggested collection of media items. For example, as shown in FIG. 6AW, recipient confirmation interface 666 includes sharing

affordances 666G and 666H. In some embodiments, in response to receiving user input corresponding to selection of a sharing affordance, the device (e.g., 600) transmits data that provides access to one or more media items of the suggested collection of media items. In some embodiments, providing access comprises providing access through a particular cloud-based service, and optionally transmitting a message to the recipient indicating that such access has been provided, including data usable to access the media through the cloud-based service. For example, providing access through the particular cloud-based service can be done when a recipient has an account with the cloud-based service. In such case, access can be provided to the recipient's account (e.g., to media items hosted by the cloud-based service, but shared by the user of device 600), while preventing access to other accounts on the cloud-based service (or non-users of the cloud-based service). In some embodiments, providing access comprises sharing a direct link that provides access to one or more suggested collection of media items. For example, providing a direct link can include sending a publically-accessible but non-guessable web address to a recipient. In some embodiments, sending a direct link does not prevent access by parties (e.g., devices) other than the recipient. For example, the recipient can forward the direct link to other non-intended recipients, who could use the link to view the shared collection. However, the option of sending a direct link provides an alternative option for sharing media items, particularly with recipients not associated with the particular cloud-based service. For example, in response to selection of affordance 666H, device 600 transmits a direct link to the selected recipients.

[0242] At FIG. 6AW, device 600 receives user input 674 corresponding to selection of affordance 666G. In response to receiving user input 674, device 600 transmits data that provides access to one or more media items of the suggested collection of media items through a particular cloud-based service (e.g., as described above). In some embodiments, in response to receiving user input (e.g., 674) corresponding to selection of a sharing affordance, device 600 displays a transcript of a messages conversation with the selected recipients that includes a representation of the shared suggested collection. In this example, such a message conversation would include Sue, Anna, John, and Mary, and include a representation that includes one or more features as that described with respect to the representation 604H shown in FIG. 6AK.

[0243] FIGS. 6AX-6AAB illustrates exemplary interfaces for ceasing to share a collection of media items. FIG. 6AX illustrates personalized media interface 658. At FIG. 6AX, device 600 receives user input 676 corresponding to selection of affordance 658C. For example, affordance 658C can be an avatar (e.g., face) associated with a user of device 600. In some embodiments, in response to receiving user input (e.g., 676) associated with a personalized media interface (e.g., 658), the device (e.g., 600) displays a sharing management interface (e.g., 678).

[0244] FIG. 6AY illustrates an exemplary sharing management interface 678. In some embodiments, a sharing management interface includes one or more options for managing one or more collection of media items that have been shared with one or more recipients. For example, sharing management interface 678 includes shared moments region 678A, which includes affordances 678B-678D, each associated with a collection of media items that has been shared. Affordance 678B corresponds to the “Lake Tahoe” collection of media items that was shared with William and Gregg, as shown in FIG. 6AK.

[0245] In some embodiments, the device receives user input (e.g., 679) associated with (e.g., corresponding to selection of an affordance associated with) a collection of media items that has been shared. For example, at FIG. 6AZ, device 600 receives user input 679 corresponding to selection of affordance 678B.

[0246] In some embodiments, in response to receiving user input (e.g., 679) associated with a collection of media items that have been shared, the device (e.g., 600) displays a shared collection management interface (e.g., 678). For example, in response to receiving user input 679, device 600 displays exemplary shared collection management interface 680, as shown in FIG. 6AAA. In some embodiments, a shared collection management interface (e.g., 680) includes information related to the shared collection, including one or more of the following (as shown in FIG. 6AAA): a geographic location (e.g., Lake Tahoe), a time (e.g., December 1 to 4), an amount of media items shared (e.g., 22 photos and 1 video), an expiration time (e.g., January 8), and recipient information (e.g., the collection was shared with William and Gregg).

[0247] The device optionally provides the user with the option to cease sharing a previously shared collection of media items that can still be accessed by one or more recipients (e.g., access to a shared collection has not expired). In some embodiments, an interface (e.g., 680) associated

with a personalized media interface (e.g., 658) includes an option (e.g., 680A) to cease sharing the collection of media items. For example, shared collection management interface 680 includes affordance 680A for ceasing to share the associated shared collection from Lake Tahoe.

[0248] At FIG. 6AAB, device 600 receives user input 682 corresponding to selection of affordance 680A, representing a request to stop (also referred to as cease) sharing the associated collection of media items. In some embodiments, in response to receiving user input representing a request to stop sharing a collection of media items, the device (e.g., 600) ceases providing access to one or more of the recipients of the shared collection. For example, if the device 600 previously provided access via predetermined cloud-based service to a user account, such access (e.g., permission to access the media items) can be revoked by transmitting a message to the cloud-based service (e.g., a server). For example, if device 600 previously provided a direct link for accessing the media items, the device can cause such link to be deactivated. For instance, if the media items are hosted on a server and accessed via the link, the device 600 can transmit a message that causes the server to cease to provide access to the media items when a device requests a connection via the address in the link (e.g., deactivates the link).

[0249] FIG. 6AAC illustrates an exemplary representation of an expired shared collection of media items. For example, FIG. 6AAC depicts message interface 604, which includes transcript 604A and representation 604H, representing the Lake Tahoe collection of media items shared by Lynne, the user of device 600. In some embodiments, a shared collection of media items expires in response to an expiration time passing. For example, in FIG. 6AK, the representation 604H included an expiration time of January 8. Accordingly, on January 9 after the expiration date, the representation 604H can appear in the transcript as shown in FIG. 6AAC. In some embodiments, a shared collection of media items expires in response to user input (e.g., 682) request to cease sharing. For example, in response to receiving user input 682, as described above, the shared collection can cease to be shared, thus causing representation 604H to appear in the transcript as shown in FIG 6AAC.

[0250] FIGS. 7A-7J is a flow diagram illustrating a method for sharing a suggested collection of media items using an electronic device in accordance with some embodiments. Method 700 is performed at a device (e.g., 100, 300, 500, 600) with a display and one or more

input devices (e.g., a touch sensitive display, a touch sensitive surface, a mouse). Some operations in method 700 are, optionally, combined, the orders of some operations are, optionally, changed, and some operations are, optionally, omitted.

[0251] As described below, method 700 provides an intuitive way for sharing a suggested collection of media items. The method reduces the cognitive burden on a user for sharing a collection of media items, thereby creating a more efficient human-machine interface. For battery-operated computing devices, enabling a user to share a collection of media items faster and more efficiently conserves power and increases the time between battery charges.

[0252] The electronic device (e.g., 600) receives (702), via the one or more input devices (e.g., one or more of a touch sensitive display, a touch sensitive surface, a mouse, or the like), a first input (e.g., 608, 614, 616, 620, or 656).

[0253] In response to receiving the first input, the electronic device (e.g., 600) displays (704), on the display (e.g., 602), a suggested collection of media items (e.g., represented by 612) for sharing with a recipient (e.g., 603B, 603C), wherein the suggested collection is relevant to a message conversation (e.g., transcript 604A of message interface 604 in FIG. 6A-6D) with the recipient. In some embodiments, the suggested collection (e.g., represented by 612) of media items includes one or more media items (e.g., one or more photos, one or more videos, or one or more of both). In some embodiments, the suggested collection includes a media item (e.g., 612G) depicting the recipient (e.g., 603B), and/or that was taken at an event known to have been attended by the recipient. For example, the event can be media captured at the geographic location “Lake Tahoe” between the dates December 1 to December 4, as shown in FIG. 6N. In some embodiments, the suggested collection includes a subset of media items (e.g., photos or videos) that meet selection criteria (e.g., media items taken within a particular time frame at a particular location or a collection of locations). In some embodiments, the suggested collection includes all media items that meet the selection criteria. For example, the collection represented by suggested collection interface 612 includes all media items captured by the user that meet the selection criteria of: captured at the geographic location “Lake Tahoe” between December 1 and December 4.

[0254] Displaying a suggested collection of media items for sharing with a recipient that is relevant to a message conversation with that recipient allows the user to quickly identify media that the user is likely to want to share with the recipient. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0255] Subsequent to displaying the suggested collection of media items, the electronic device (e.g., 600) receives (706), via the one or more input devices, a second input (e.g., 630 of FIG. 6S, 646 of FIG. 6AH, or 647 of FIG. 6AJ) representing a request to transmit at least a portion of the suggested collection of media items to the recipient.

[0256] In response to receiving the second input, the electronic device (e.g., 600) transmits (708) a message (e.g., 631 of FIG. 6U, or 604J of FIG. 6AK) to the recipient as part of the message conversation (e.g., represented by transcript 604A of FIGS. 6U or 6AK) that provides access to the at least a portion of the suggested collection of media items (e.g., represented by 612). For example, the electronic device inserts an affordance 604H representing the shared collection into a transcript of the conversation, as shown in FIG. 6AK.

[0257] In some embodiments, further in response to receiving the first input, and while displaying at least a portion of the suggested collection of media items, the electronic device (e.g., 600) displays (710), on the display, an indication of selected media (e.g., 612E of FIG. 6R, or indicators 612H of FIG. 6R) that identifies an initial set of selected media items from the suggested collection that were automatically selected (e.g., without input to select) for sharing. For example, in FIG. 6R, device 600 displays selection indicators 612H on media items (e.g., that make up an initial set of selected media items). Also, for example, in FIG. 6R, sharing affordance 612E includes an indication of the selected media items (e.g., identifying an amount of items in the first collection that are selected), and states “SEND ALL” (e.g., all media items are selected). In some embodiments, the initial set of selected media items includes fewer than all media items in the suggested collection of media items (e.g., as shown in FIG. 6W). For

example, in FIG. 6W, fewer than all media items are selected. In FIG. 6W, media item 612G is not selected. Also in FIG. 6W, sharing affordance 612E includes an indication of the selected media items (e.g., an amount of items in the first collection that are selected), and states “SEND 23” (e.g., 23 media items are selected).

5 [0258] Displaying an indication of selected media that identifies an initial set of selected media items allows the user to quickly view a pre-selected set of media from a relevant collection of media items, reducing the number of inputs required to select and transmit media items to the recipient. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device
10 interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0259] In some embodiments, while displaying the indication of selected media that
15 identifies the initial set of selected media items, the electronic device (e.g., 600) receives (712), via the one or more input devices, the second input (e.g., 630, or selection of 604I (e.g., 647)) representing the request to transmit at least a portion of the suggested collection of media items to the recipient. In response to receiving the second input, the electronic device (e.g., 600) transmits (714) a message (e.g., 631 as shown in FIG. 6U, 604J as shown in FIG. 6AK) to the
20 recipient (e.g., 603B, 603C) as part of the message conversation and providing access to the initial set of selected media items. In some embodiments, the electronic device provides access to selected media items (e.g., fewer than all) if less than all are selected.

[0260] Transmitting a message to the recipient as part of the message conversation that provides access to the initial set of selected media items allows the user to quickly send a pre-
25 selected set of media from a relevant collection of media items, reducing the number of inputs required to select and transmit media items to the recipient. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device)

which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0261] In some embodiments, the indication of selected media is a first affordance (e.g., 612E) and the second input (e.g., 630, 646) corresponds to selection (716) of the first affordance, and the first affordance includes an indication of an amount of media items included in the initial set of selected media items. In some embodiments, an amount of media items corresponds to a total number of selected media items. For example, affordance 612E includes the exemplary amount “ALL” in FIG. 6S (e.g., all media items are currently selected). For example, affordance 612E includes the exemplary amount “22” in FIG. 6AH (e.g., 22 media items are currently selected).

[0262] In some embodiments, the initial set of selected media items includes (718) fewer than all media items in the suggested collection of media items. For example, suggested collection interface 612 of FIG. 6AH depicts fewer than all media items in a suggested collection of media items selected.

[0263] In some embodiments, the electronic device (e.g., 600) receives (722), via the one or more input devices, input (e.g., 632 of FIG. 6V, 640 of FIG. 6AB, 642 of FIG. 6AD, 644 of FIG. 6AF), representing a change (e.g., additional selection, or removing selection) to the initial set of selected media items from the suggested collection to form a user-selected set of selected media items from the suggested collection, wherein the initial set of selected media items differs from the user-selected set of selected media items with respect to the selection of at least one media item of the first collection. The electronic device (e.g., 600) updates (724) the indication (e.g., updates 612E as shown in FIG. 6W, updates 636D as shown in of FIG. 6AC, updates 612E as shown in FIG. 6AG, or replaces 612H with 612I as shown in FIG. 6W) of selected media based on the user-selected set of selected media items. For example, the electronic device changes a send affordance 612E from “SEND ALL” to “SEND 23” to identify the number of items in the user selection, and/or updates selection indicators associated with the media items. While displaying the indication of selected media that is updated based on the user-selected set of selected media items, electronic device (e.g., 600) receives (726), via the one or more input devices, the second input (e.g., 630 of FIG. 6S, 646 of FIG. 6AH, or 647 of FIG. 6AJ). For

example, the second input represents request to provide access to (e.g., transmit) at least a portion of the suggested collection of media items to the recipient. In response to receiving the second input, the electronic device (e.g., 600) transmits (728) a message (e.g., 631 of FIG. 6U, or 604J of FIG. 6AK) to the recipient as part of the message conversation that provides access to the user-selected set of selected media items.

[0264] Receiving input representing a change to the initial set of selected media items from the suggested collection to form a user-selected set of selected media items from the suggested collection, and transmitting a message to the recipient as part of the message conversation that provides access to the user-selected set of selected media items allows the user to quickly modify a pre-selected set of media from a relevant collection of media items, reducing the number of inputs required to select and transmit media items to the recipient. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0265] In some embodiments, the indication (e.g., 612E) of selected media comprises (730) an indication of an amount of media items from the suggested collection that are currently selected, and updating the indication of selected media comprises updating the indication to include display of the amount of media items in the user-selected set of selected media items (e.g., 612E as shown in FIGS. 6V-6W), and the indication of selected media is a second affordance (e.g., 612E of FIG. 6AH) and the second input (e.g., 646 of FIG. 6AH) corresponds to selection of the second affordance.

[0266] Updating the indication to include display of the amount of media items in the user-selected set of selected media items provides the user with visual feedback about the amount of media items that are selected. Providing improved visual feedback to the user enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the

device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0267] In some embodiments, while displaying the suggested collection of media items, and while in a media item selection mode, the electronic device (e.g., 600) receives (734), via the one or more input devices, a third input (e.g., 632 or 634) associated with a first media item (e.g., 612G) of the suggested collection of media items (e.g., represented by interface 612). In accordance with a determination (736) that the third input associated with the first media item is a first gesture (e.g., user input 632) (e.g., a tap on single media), the electronic device: toggles (738) whether the first media item is selected without displaying the first media item in a one-up view (e.g., as shown in FIG. 6W); in accordance with the toggling causing the first media item to be selected, displays (740), on the display, a selection indicator (e.g., 612H of FIG. 6V) associated with the first media item (e.g., 612G of FIG. 6V); and in accordance with the toggling causing the first media item to be unselected (e.g., 612G of FIG. 6W), ceases to display (742), on the display, the selection indicator (e.g., as shown in FIG. 6W, 612G is no longer displayed) associated with the first media item. In accordance with a determination that the third input associated with the first media item is a second gesture (e.g., user input 634) (e.g., a deep press gesture, a press and hold gesture, a de-pinch gesture), different than the first gesture, the electronic device (e.g., 600): displays (744), on the display, the first media item in the one-up view (e.g., 612G in one up view 636 as shown in FIG. 6Y) without toggling whether the first media item is selected (e.g., 612G remains unselected as shown in FIG. 6Y). In some embodiments, in response to receiving a subsequent user input (e.g., corresponding to the first gesture, such as a tap) (e.g., similar to user input 640 of FIG. 6AB) received at a location associated with the first media item displayed while in a one-up view, the electronic device toggles selection of the first media item. In some embodiments, in response to receiving a subsequent user input (e.g., corresponding to a gesture, such as a pinch gesture as illustrated by user input 845 shown in FIG. 8AG) received at a location associated with the first media item displayed while in a one-up view, the electronic device exits the one-up view, and optionally displays a grid view.

[0268] Entering or forgoing entering into a media item selection mode, depending on whether a input that causes a one-up view to be displayed is a second gesture or a first gesture,

respectively, provides with user with more control of the device by allowing gesture-dependent, different outcomes from a input. Providing additional control of the device without cluttering the UI with additional displayed controls enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and
 5 reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0269] In some embodiments, the first gesture (e.g., user input 632) is a tap gesture, and the second gesture (e.g., user input 634) is selected from the group consisting of: a de-pinch gesture
 10 (e.g., movement of two contacts apart from each other by more than a threshold distance), a long press gesture (e.g., a contact exceeding a predetermined length of time), and a hard press gesture (e.g., a contact with a characteristic intensity that exceeds a threshold intensity such as a threshold intensity that is greater than a nominal contact detection intensity threshold at which a tap input can be detected).

[0270] In some embodiments, while displaying the first media item in the one-up view, and while in the media item selection mode (746) the electronic device (e.g., 600): receives (748), via the one or more input devices, a fourth input (e.g., 640) associated with the first media item displayed in the one-up view (e.g., 612F as shown in FIG. 6Y, 612F as shown in FIG. 6AA). In response to receiving the fourth input (750), the electronic device: toggles whether the first
 20 media item is selected (e.g., changing from unselected to selected, or from selected to unselected); in accordance with the toggling causing the first media item to be selected, displays, on the display, a selection indicator (e.g., 637B as shown in FIG. 6AA) associated with the first media item; and in accordance with the toggling causing the first media item to be unselected, ceases to display, on the display, the selection indicator (e.g., as shown in FIG. 6AC, 637B is no
 25 longer displayed) associated with the first media item.

[0271] In some embodiments, the suggested collection of media items is determined to be relevant (720) to the message conversation with the recipient based on an identified face associated with the recipient (e.g., face displayed for recipient 603B of FIG. 6A), and wherein one or more media items in the suggested collection of media items for sharing with the recipient

are selected based on the identified face associated with the recipient being identified in at least a portion of the one or more media items in the suggested collection of media items. For example, the collection represented by suggested collection interface 612 is suggested based on media item 612G (e.g., as shown in FIG. 6N) including a depiction of recipient 603B's identified face.

5 In some embodiments, the electronic device selects the media items. In some embodiments, a cloud-based service selects the media items (e.g., which are accessible by, or are communicated to, the electronic device).

[0272] Selecting media items based on an identified face associated with the recipient allows the user to quickly identify media that the user is likely to want to share with the recipient.

10 Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

15 **[0273]** In some embodiments, the suggested collection of media items is determined to be relevant (732) to the message conversation with the recipient based on an event known to have been attended by the recipient, and one or more media items in the suggested collection of media items for sharing with the recipient are selected based on an indication that the one more media items in the suggested collection are associated with (e.g., depict, or were taken at the time and
20 place of, or include metadata identifying) the event known to have been attended by the recipient. For example, the suggested collection represented by suggested collection interface 612 (e.g., as shown in FIG. 6F) includes media captured at an event defined by the geographic location Lake Tahoe and the time period December 1 to December 4 (e.g., as identified by 612B and 612C of FIG. 6F) known to have been attended by recipient 603B named William. In some
25 embodiments, the suggested collection is suggested because the event is mentioned in the transcript of the conversation (e.g., 604A). For example, at FIG. 6F, the transcript 604A includes mention of the event defined by the geographic location Lake Tahoe and time period December 1 to December 4 in the text "Hi! Could you send me the photos from Lake Tahoe last weekend" (e.g., in this example, the last weekend corresponds to December 1 to December 4. In some
30 embodiments, an event is determined by a time period and/or a geographic location associated

with media items, and automatically determined based on metadata. In some embodiments, an event is determined based on a user-defined metadata. In some embodiments, event is known to have been attended by the recipient based on a proximity of a device associated with the recipient (e.g., to device 600) (e.g., during the event). In some embodiments, event is known to have been attended by the recipient based on user input identifying the recipient has having attended the event.

[0274] Selecting media items based on the event known to have been attended by the recipient allows the user to quickly identify media that the user is likely to want to share with the recipient. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0275] In some embodiments, receiving the first input comprises receiving (752) the first input while displaying, on the display, a transcript (e.g., 604A) of the message conversation with the recipient. For example, device 600 receives user input 608 in FIG. 6E while displaying a transcript of the conversation. For example, device 600 receives user input 614 in FIG. 6G while displaying a transcript of the conversation. For example, device 600 receives user input 616 in FIG. 6H while displaying a transcript of the conversation. For example, a transcript is a representation of at least a portion of messages exchanged between two users, such as a user (e.g., user account) of the first device and the recipient (e.g., the recipient's user account or device).

[0276] Receiving a input (that causes display of a suggested collection of media items for sharing with a recipient) while displaying a transcript of the message conversation with the recipient allows the user to quickly view and share relevant media with the recipient by reducing the number of inputs needed to access the relevant media. Reducing the number of inputs needed to perform an operation enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user

mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0277] In some embodiments, the suggested collection of media items is determined (754) to
 5 be relevant to the message conversation with the recipient based on the identity of one or more participants (e.g., 603B and/or 603C) in the message conversation. For example, a participant can be a user associated with a user account (e.g., of cloud-based service, of a social media service), or a contact (e.g., from an address book) associated with the electronic device or a user (e.g., account) of the electronic device (e.g., 600). In some embodiments, the collection of media
 10 items is a collection of media items in which one or more of the participants (or more than a threshold number of the participants) in the conversation appear in media items in the suggested collection. For example, the collection of media items includes photos and/or videos of a camping trip that some or all of the participants in the conversation attended and thus the collection of media items is suggested for sharing with the participants in the conversation
 15 because the participants in the conversation attended the camping trip.

[0278] Suggesting a collection of media items that are determined to be relevant to participants of a message conversation with the recipient allows the user to quickly identify media that the user is likely to want to share with the recipient. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the
 20 operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0279] In some embodiments, the suggested collection of media items (e.g., represented by
 25 interface 612) is determined (756) to be relevant to the message conversation with the recipient (e.g., 603B) based on content (e.g., text, or media items (images, videos)) of the transcript (e.g., 604A of FIG. 6D) of the message conversation. For example, the suggested collection corresponding to interface 612 of FIG. 6F is relevant to the text “Hi! Could you send me the photos from Lake Tahoe last weekend?” represented by message 604C of FIG. 6G. For

example, the suggested collection corresponding to interface 612 of FIG. 6F is relevant to the received shared collection corresponding to representation 604B (e.g., which is also associated with the location “Lake Tahoe” and the dates December 1 to December 4, because it represents the media items captured by William during the same trip that the user of device 600 attended) in transcript 604A as shown in FIG. 6D.

[0280] Suggesting a collection of media items that are determined to be relevant to content of the transcript of a message conversation with the recipient allows the user to quickly identify media that the user is likely to want to share with the recipient. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0281] In some embodiments, the suggested collection of media items (e.g., represented by interface 612) is determined (758) to be relevant to the message conversation with the recipient (e.g., 603B) based on text (e.g., 604C) of messages included in the transcript (e.g., 604A of FIG. 6G) of the message conversation. For example, the suggested collection corresponding to interface 612 of FIG. 6F is relevant to the text “Hi! Could you send me the photos from Lake Tahoe last weekend?” represented by message 604C of FIG. 6G.

[0282] In some embodiments, the suggested collection of media items (e.g., represented by interface 612) is determined (760) to be relevant to the message conversation with the recipient (e.g., 603B) based on a reference to a time (e.g., “last weekend” in message 604C) mentioned (e.g. included) in the transcript (e.g., 604A of FIG. 6G) of the message conversation. In some embodiments, the reference to a time is a textual reference to a particular time, date or date range, or relative description of time (e.g., last week, last month). For example, the suggested collection corresponding to interface 612 of FIG. 6F is relevant to the mention of “last weekend” in the text “Hi! Could you send me the photos from Lake Tahoe last weekend?” represented by message 604C of FIG. 6G.

[0283] In some embodiments, the suggested collection of media items (e.g., represented by interface 612) is determined (762) to be relevant to the message conversation with the recipient (e.g., 603B) based on a geographic location (e.g., “Lake Tahoe” in message 604C) mentioned (e.g. included) in the transcript (e.g., 604A of FIG. 6G) of the message conversation. For
 5 example, the suggested collection corresponding to interface 612 of FIG. 6F is relevant to the mention of “Lake Tahoe” in the text “Hi! Could you send me the photos from Lake Tahoe last weekend?” represented by message 604C of FIG. 6G.

[0284] In some embodiments, the suggested collection of media items (e.g., represented by interface 612) is determined (764) to be relevant to the message conversation with the recipient
 10 (e.g., 603B) based on a collection of media items that was received from the recipient and that is represented in the transcript of the message conversation (e.g., representation 604B). In some embodiments, In some embodiments, the electronic device received the media items in the collection of media items from the recipient that are represented in the transcript. In some
 15 embodiments, the electronic device received a link or other data for accessing the media items, in the collection of media items from the recipient that are represented in the transcript, from a remote device (e.g., a server) .

[0285] In some embodiments, prior to displaying (e.g., FIG. 6B) a sharing affordance (e.g., 606C of FIG. 6C) that corresponds to the suggested collection of media items, the electronic device (e.g., 600) displays (766), on the display, the transcript (e.g., 604A of FIG. 6B) of the
 20 message conversation concurrently with a keyboard region (e.g., 604E) that includes a suggestion region (e.g., 606) that is populated with input suggestions (e.g., 606A and 606B). For example, input suggestions can include one or more of: autocorrect suggestions, autocomplete suggestions, or the like. While displaying the transcript of the message conversation concurrently with the keyboard region (e.g., as shown in FIG. 6B), the electronic device (e.g.,
 25 600) replaces (768) display of an input suggestion (e.g., 606B of FIG. 6B) in the keyboard region with the sharing affordance (e.g., 606C of FIG. 6C), wherein the sharing affordance is displayed concurrently with the transcript of the message conversation, wherein receiving the first input (e.g., 608 of FIG. 6E) comprises receiving input corresponding to selection of the sharing affordance. In some embodiments, the sharing affordance is displayed concurrently with the
 30 keyboard region. In some embodiments, the sharing affordance is displayed in response to

receiving a message from the recipient. For example, the sharing affordance 606C can be displayed in response to receiving an indication that the recipient (e.g., 603B) has shared one or more media items (e.g., upon receiving representation 604B of FIG. 6D), providing the user of the first device streamlined access to an interface for sharing back media items with the recipient.

5 [0286] Displaying an affordance while displaying the transcript allows the user to quickly access media that the user is likely to want to share with the recipient. Reducing the number of inputs needed to perform an operation enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power
10 usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0287] In some embodiments, prior to displaying the sharing affordance that corresponds to the suggested collection of media items, and while displaying the transcript (e.g., 604A of FIG. 6D) of the message conversation with the recipient (770): the electronic device (e.g., 600)
15 receives (772), via the one or more input devices, input (e.g., 607 of FIG. 6D) associated with a text entry field (e.g., 604D) displayed concurrently with the transcript of the message conversation. For example, the electronic device receives a tap on the text entry field 604D, or receives character input (e.g., 607). In response to receiving the input associated with the text entry field, the electronic device (e.g., 600) displays (774), on the display, the sharing affordance
20 (e.g., 606C) concurrently with the transcript of the message conversation.

[0288] In some embodiments, receiving the first input comprises receiving (776) input (e.g., 614) corresponding to selection of a portion (e.g., 604F of FIG. 6G) of a message (e.g., 604C) in the transcript (e.g., 604A) of the message conversation. In some embodiments, a portion (e.g., 604F) of a message is determined to be relevant to a shareable collection of media items (e.g.,
25 the collection represented by interface 612). In some embodiments, the electronic device makes the portion of the message selectable. For example, the device displays a message by the recipient in the transcript that reads “Hi! Could you send me the photos from Lake Tahoe last weekend?” with a portion that is selected. For example, in FIG. 6G “photos from Lake Tahoe” is selectable and displayed with a visual indication that it is selectable (e.g., underlined). In

response to user selection of the selectable text (e.g., user input 614), the device displays a suggested collection of media items (e.g., suggested collection interface 612 as shown in FIG. 6F or 6N, or in a one-up view 636).

[0289] Receiving input corresponding to selection of a portion of a message in the transcript
 5 allows the user to quickly access media that the user is likely to want to share with the recipient that is related to the selected portion, reducing the number of inputs needed to do so. Reducing the number of inputs needed to perform an operation enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally,
 10 reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0290] In some embodiments, prior to receiving the first input (e.g., 620 of FIG. 6J), and while displaying the transcript (e.g., 604A) of the message conversation with the recipient (e.g., 603B), the electronic device (e.g., 600) displays (780) a plurality of affordances (e.g., 610A of
 15 FIG. 6I) including an affordance (e.g., 610B) associated with a first (e.g., photos application) application and an affordance (e.g., 610C) associated with a second application (e.g., music application), different than the first application. The electronic device (e.g., 600) receives (782), via the one or more input devices, input corresponding to selection of the affordance (e.g., 610B) associated with the first application. In response to receiving the input corresponding to
 20 selection of the affordance associated with the first application, and while continuing to display the transcript of the message conversation with the recipient, the electronic device (e.g., 600) displays (784), on the display, an interface (e.g., 610 of FIG. 6J) associated with the first application. While displaying the interface associated with the first application, the electronic device (e.g., 600) displays (786), on the display, the suggested collection of media items (e.g.,
 25 612 of FIG. 6F or FIG. 6N, or in a one-up view 636) for sharing with the recipient. In some embodiments, the electronic device displays the suggested collection of media items (e.g., 612 of FIG. 6F or FIG. 6N) for sharing with the recipient in response to user input received while displaying the interface associated with the first application (e.g., 610). For example, at the display of page 618 at interface 610, as shown in FIG. 6J, the device receives a swipe gesture
 30 input (e.g., 620), and in response displays page 612, as shown in FIG. 6L.

[0291] In some embodiments, the input corresponding to selection of the affordance (e.g., 610B) associated with the photos application is the first input and the display of the photos application user interface (e.g., 610) includes display of the suggested collection of media items (e.g., 612) for sharing with the recipient (e.g., 603B). For example, the electronic device can
 5 display interfaces 610 and 612 as shown in FIG. 6F in response to user input 616, and optionally not require a swipe over from interface 618. In some embodiments, the first input (e.g., 620) is received while the photos application user interface (e.g., 610 of FIG. 6J) is displayed (e.g., a swipe over from “Recent Photos” interface 618 to interface 612 as shown in FIG. 6J). In some
 10 embodiments, in response to an additional input (e.g., 622 of FIG. 6L) (e.g., swipe up on the drawer handle) received while the photos application user interface is displayed, the device expands the size of the displayed photos application user interface (e.g., to make larger, to take up all of the display, to replace the transcript). In some embodiments, the displayed suggested collection of media items (e.g., as shown in interface 612) is scrollable. For example, user input representing a request to scroll (e.g., upward or downward swipe on 612) causes additional
 15 media items in the collection to be displayed.

[0292] In some embodiments, the transcript (e.g., 604A) of the message conversation with the recipient is displayed (778) concurrently with the suggested collection of media items (e.g., represented by interface 612) for sharing with the recipient. For example, transcript 604A is displayed concurrently with suggested collection interface 612 in FIG. 6F.

[0293] In some embodiments, transmitting the message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items comprises inserting (7102) a representation (e.g., 631 of FIG. 6U, or 604H of FIG. 6AK) of the suggested collection of media items into the transcript (e.g., 604A). In some
 20 embodiments, the representation includes an indication of transmission (e.g., upload or download) status (e.g., 2 of 23 uploading, 10 of 23 downloading, uploading, downloading, or the like). In some embodiments, the representation includes an expiration time (e.g., expiration of a link or access) (e.g., expires in 13 days, or the like). In some embodiments, the representation includes a status of receipt (e.g., delivered, read, opened, viewed, or the like). In some
 25 embodiments, the electronic device receives text to accompany the representation that is inserted with the representation into the transcript. For example, at FIG. 6AK, the device 600 inserted the
 30

accompanying text “Here you go!” along with representation 604H as part of message 604J. In some embodiments, the device inserts the representation of the collection into a text entry field (e.g., before transmitting to third party), and then receives accompanying text before transmitting and inserting the representation and the accompanying text into the transcript. For example, at

5 FIG. 6J, device 600 receives the accompanying text (e.g., via user input at the keyboard) in text entry field, before inserting (e.g., in response to user input 647) the text and the representation in the transcript 604A (e.g., as shown in FIG. 6AK).

[0294] In some embodiments, transmitting the message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of

10 media items comprises (794): in accordance with a determination that the recipient (e.g., 603B) is eligible to receive messages through a predetermined cloud-based service (e.g., a recipient is associated with a device that can receive messages through a specific cloud-based service for sending and/or receiving electronic messages (e.g., via the internet)), the electronic device (e.g., 600) provides (796) access to the at least a portion of the suggested collection of media items

15 through the predetermined cloud-based service, wherein the access provided through the predetermined cloud service restricts access by users other than the recipient; and in accordance with a determination that the recipient is not eligible to receive messages through the predetermined cloud-based service, the electronic device provides (798) access to the at least a portion of the suggested collection of media items by sending a link (e.g., publically-accessible,

20 non-guessable URL) to the recipient, wherein the access provided by sending a link does not restrict access by users other than the recipient. In some embodiments, providing access through the cloud-based service provides access to the recipient only, and the recipient is not permitted or able to forward access to another party (e.g., another user of the cloud-based service). For example, the access provided is limited to an account associated with the recipient.

25 [0295] Providing restricted access to a collection of media through a predetermined service, dependent on whether the recipient is eligible to receive messages through the service, increases the security of sharing media items by the user without requiring additional input. Reducing the number of inputs needed to perform an operation enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs

30 and reducing user mistakes when operating/interacting with the device) which, additionally,

reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0296] In some embodiments, transmitting the message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items comprises transmitting (7100), to the recipient, the media items in the at least a portion of the suggested collection of media items.

[0297] In some embodiments, subsequent to transmitting the message (e.g., 604J of FIG. 6AK) to the recipient (e.g., 603B) as part of the message conversation that provides access to the at least a portion of the suggested collection of media items (788) (e.g., represented by interface 612): the electronic device (e.g., 600) receives (790), via the one or more input devices, input (e.g., 682 of FIG. 6AAB) representing revocation of the recipient's access to the at least a portion of the suggested collection of media items. In response to receiving the input representing revocation of the recipient's access, the electronic device transmits (792) data (e.g., to a server, such as a server of a cloud-based service for sending and/or receiving messages) that causes termination of the access to the at least a portion of the suggested collection of media items that was provided in the message (e.g., 604J of FIG. 6AK) to the recipient (e.g., 603B). For example, device 600 sends instructions to a server of a cloud-based messaging service in order to revoke the user's access, or that de-activates a hyperlink.

[0298] Causing termination of recipient's access rights increases the security of sharing media items by the user without requiring an excessive number of inputs to ensure control of media items. Reducing the number of inputs needed to perform an operation enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0299] In some embodiments, subsequent to transmitting the message to the recipient as part of the message conversation that provides access to the at least a portion of the suggested collection of media items (7104): the electronic device (e.g., 600) receives (7106), via the one or more input devices, a fifth input (e.g., 656 of FIG. 6AN). For example, the fifth input is

associated with a photos application, such as selection of the “For You” tab 654B in the interface 652 shown in FIG. 6AN. In response to receiving the fifth input, the electronic device (e.g., 600) displays (7108), on the display, a prompt (e.g., 660 of FIG. 6AO) to share the suggested collection (e.g., represented by interface 612) with a (e.g., one or more) suggested recipient (e.g., recipients 660A of FIG. 6AO, recipients associated with 666B-666D of FIG. 6AS) different than the recipient (e.g., 603B). For example, selecting the “For You” tab causes a sharing suggestions interface to be displayed, which includes the suggested collection of media items and one or more additional recipients (e.g., users, user accounts, contacts) with whom to share the suggested collection with.

10 [0300] Displaying a prompt to share the suggested collection with a suggested recipient different than the recipient allows the user to quickly identify an additional recipient with whom the user is likely to want to share media. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper
15 inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0301] In some embodiments, in response to the fifth input, the device displays a prompt to share a different suggested collection (than the suggested collection displayed in response to the
20 first input) with the recipient (e.g., 603B). For example, after navigating to a sharing interface (e.g., “For You” tab) of a photos application (e.g., after displaying the message conversation in a messaging application), the device displays one or more additional suggestions for sending to the recipient (e.g., 603B). Thus, the device provides a convenient path to share additional content (e.g., related to conversations or other relationship) with the recipient with whom the user of the
25 current device is in a sharing relationship (e.g., a suggestion was previously made or the user previously transmitted access to media items). In some embodiments, the device displays a different suggested media collection if the suggested collection was previously transmitted to the recipient. For example, the device provides a new suggestion after the first suggestion (e.g., of suggested collection interface 612) was acted upon by the user (e.g., sent to recipient 603B). In
30 some embodiments, the device displays a different suggested media collection if the suggested

collection was not previously transmitted to the recipient (e.g., 603B). For example, the device provides a new suggestion if the first suggestion was not acted upon by the user. In some embodiments, if the first suggestion was previously not acted upon by the user, in response to receiving the fifth input, the device displays a prompt to share the suggested collection with the recipient. For example, if the user has not previously transmitted access to the suggested collection while in a messages application, the device provides a prompt and opportunity to transmit the suggested collection to the recipient again (e.g., at a sharing interface of a photos application).

[0302] In some embodiments, the suggested recipient is suggested based on one or more of (7110): an identified face (e.g., shown in 660A of FIG. 6AO) associated with the suggested recipient (e.g., Sue, Anna, or John mentioned in FIG. 6AO) being identified in at least a portion of the media items of the suggested collection; and an event known to have been attended by the suggested recipient (e.g., wherein the suggested collection includes media taken at the event), wherein suggested collection is associated with (e.g., depicts, includes media taken at the time and place of, is tagged with metadata of) the event known to have been attended by the suggested recipient.

[0303] In some embodiments, while displaying an interface (e.g., 666 of FIG. 6AS) associated with the prompt (e.g., 660) to share the suggested collection with the suggested recipient: the electronic device (e.g., 600) displays (7112), on the display, an indication (e.g., 666E) of the suggested recipient that includes a depiction of an identified face associated with the suggested recipient.

[0304] In some embodiments, the suggested recipient (e.g., associated with 666E of FIG. 6AS) is not associated with (7114) contact information associated with the device, and the identified face associated with the suggested recipient is depicted in at least a portion of the media items of the suggested collection. While displaying the indication of the suggested recipient that includes the depiction of the identified face associated with the suggested recipient, the electronic device (e.g., 600) receives (7116), via the one or more input devices, a sixth input (e.g., 668 of FIG. 6AT) representing selection of the suggested recipient. In response to receiving the sixth input, the electronic device displays (7118), on the display, a prompt (e.g.,

670 of FIG. 6AU) to match the suggested recipient (e.g., represented by 666E of FIG. 6AT) with contact information associated with the device. The electronic device receives (7120), via the one or more input devices, a seventh input (e.g., 672 of FIG. 6AU) representing selection of an item of contact information (e.g., 670A) from the contact information associated with the device.

5 In response to receiving the seventh input, the electronic device associates (7122) the suggested recipient with the item of contact information. In some embodiments, the electronic device updates the indication of the suggested recipient based on the item of contact information (e.g., to include a contact name as shown in FIG. 6AV). Subsequent to associating the suggested recipient with the item of contact information, the electronic device transmits (7124), using the
10 item of contact information, a message (e.g., such as 604J of FIG. 6AK) to the suggested and providing access to at least a portion of the suggested collection of media items in response to selection (e.g., user input 674 or 665) of an affordance (e.g., 664A of FIG. 6AR, or 666G or 666H of FIG. 6AW) included in an interface (e.g., 664 or 666) associated with (e.g., accessed via) the prompt.

15 **[0305]** Note that details of the processes described above with respect to method 700 (e.g., FIGS. 7A-7J) are also applicable in an analogous manner to the methods described below. For example, method 900 optionally includes one or more of the characteristics of the various methods described above with reference to method 700. For brevity, these details are not repeated below.

20 **[0306]** FIGS. 8A-8AQ illustrate exemplary user interfaces for sharing a suggested collection of media items that is related to a received collection of media items, in accordance with some embodiments. The user interfaces in these figures are used to illustrate the processes described below, including the processes in FIGS. 9A-9G.

[0307] FIGS. 8A-8AL illustrate exemplary user interface for viewing and managing a
25 received a shared collection of media items. FIG. 8A illustrates an exemplary message user interface 804, displayed on display 602 of electronic device 600 (described above). In some embodiments, message interface 804 includes one or more features of message interface 604. The message interface 804 includes a transcript 804A of a message conversation between the parties shown in parties region 804B. In this example, the conversation is between users named

Lynne (e.g., user 805A), William (e.g., user 805B), and Gregg (e.g., user 805C). In this example, Lynne is the user of device 600 (e.g., an account associated with Lynne is logged in), who is communicating with William and Gregg (e.g., each using their own devices remote from device 600).

5 **[0308]** In some embodiments, the device (e.g., 600) receives an indication that a collection of media items has been shared with the device. For example, device 600 can receive a message that includes information for accessing the shared collection (e.g., the media items themselves, a link, or other data for accessing the shared collection). In some embodiments, the device (e.g., 600) displays a representation (e.g., 804C) of the received shared collection. In some
10 embodiments, the device displays the representation of the received shared media collection in a transcript (e.g., 804A) of a message conversation. For example, message interface 804 also includes an exemplary representation 804C of a received shared collection of media items that has been shared with Lynne by William. For example, William has provided access (e.g., as described above) to the shared collection of media items to Lynne (e.g., provided access via a
15 cloud-based service to a device or account associated with Lynne). Techniques for providing access to a collection of media items are discussed above, and hereby incorporated.

[0309] In some embodiments, the representation (e.g., 804CD) of the received shared collection includes an indication of transfer status. For example, an indication of transfer status can include an indication that the received shared collection is currently being uploaded or
20 downloaded. As shown in FIG. 8A, representation 804C includes an indication of upload status, included in the text “William is uploading 2 of 30”, which indicates that the sender/sharer (William) is uploading the media items in the shared collection, as well as the progress of such upload (2 out of 30 media items have been uploaded already). As shown in FIG. 8D, described in more detail below, representation 804C includes an indication of download status, including
25 the text “Downloading 2 of 30”, indicating that device 600 is currently downloading the media items of the shared collection, as well as the progress of such download.

[0310] FIGS. 8B-8C illustrate an exemplary technique for previewing a received shared collection of media items (e.g., that has not been fully transferred (e.g., downloaded or uploaded)). In some embodiments, the device (e.g., 600) displays a preview (e.g., 808) of one or

more media items in the received shared collection of media items in response to user input (e.g., 806) received while the collection of media items is currently being transferred. For example, at FIG. 8B, device 600 receives user input 806 corresponding to selection of representation 804A. As can be seen in FIG. 8B, William (the sender/sharer) is still uploading the shared collection of media items. In response to receiving user input 806, device 600 displays preview interface 808, as shown in FIG. 8C.

[0311] FIG. 8C illustrates an exemplary preview interface 808. In some embodiments, a preview interface (e.g., 808) includes an indication of transfer status (e.g., 808A). For example, preview interface 808 includes an indication 808A that William is currently uploading 30 photos.

In some embodiments, a preview interface includes an indication (e.g., 808B) of the identity of the sender/sharer (e.g., includes his name and an avatar with his face). For example, preview interface 808 includes an indication 808B that William is the sender/sharer. In some embodiments, a preview interface includes representations (e.g., 808C) of one or more media items in the shared collection. In some embodiments, the representations in the preview interface are presented different in at least one respect than if the media items had completed being downloaded (e.g., by device 600). For example, as shown in FIG. 8C, the media items 808C are displayed dimmed (e.g., with a gray hue, also referred to as “grayed out”) to indicate that the media items are still being transferred. In other examples, the media items can be reduced quality representations of the actual media items. In other examples, the media items can be displayed, but be non-selectable (e.g., such that when input attempting to select or view a displayed representation of a media item is received, the device does not perform an action such as toggle selection of the media item or display a one-up view of the media item). Accordingly, previewing a collection while still transferring allows the user to view some of the media items in the collection.

[0312] FIGS. 8D-8I illustrate various interfaces for downloading and accessing a received shared collection of media items. FIG. 8D illustrates an exemplary representation 804C of a received shared collection of media items while it is being downloaded (e.g., by device 600). In some embodiments, the device (e.g., 600) initiates a download of media items of a received shared collection of media items in response to user input (e.g., selection of representation 804C). For example, in response to user input 806 of FIG. 8B representing a tap on

representation 804C (e.g., before or after William has finished uploading the collection), device 600 initiates download of the shared collection and displays representation 804C with a download status as shown in FIG. 8D.

[0313] While a received shared collection is downloading, a representation (e.g., 804C) of the shared collection might cease to be displayed (e.g., due to user action, or due to new messages inserted into a transcript that includes the representation). Accordingly, device 600 can display a notification (e.g., a pop-up window or banner) to provide a user with easy access to the collection upon completion of the download. Thus, the user can continue using device 600 and does not need to continually monitor the download, or perform an extraneous number of inputs to find the original (e.g., selected) representation of the shared collection. FIGS. 8E-8H are illustrative.

[0314] FIG. 8E illustrates message interface 804, where a new message has been received from William (e.g., user 805B) and added to the transcript 804A. As shown in FIG. 8E, the new message “Hi! Could you send me the photos from Lake Tahoe last weekend?” has been received from William (e.g., a device used by William) by device 600 and displayed in the transcript 804A, pushing representation up in the transcript.

[0315] At FIG. 8F, device 600 receives another new message in transcript 804A, this time from Gregg (e.g., a device used by Gregg) that reads “Definitely. Can’t right now, but will send later.” As can be seen in FIG. 8F, the new message from Gregg caused representation 804C to cease to be displayed. In this example, the newer messages in the transcript 804A caused older content (including representation 804C) to be pushed off the display in favor of displaying new content in the transcript (e.g., chronologically by time of message transmission). In some embodiments, the transcript is scrollable. For example, device 600 can receive user input representing a request to scroll the content of the transcript (e.g., scroll it up), and cause representation 804C to be displayed again.

[0316] At FIG. 8G, device 600 has completed downloading the received shared collection of representation 804C. In some embodiments, in response to detecting completion of the download of a received shared collection of media items, the device (e.g., 600) displays an affordance (e.g., 809) for accessing the downloaded collection. For example, in FIG. 8G, device

600 displays notification 809, an exemplary affordance. In some embodiments, the affordance (e.g., 809) for accessing the downloaded collection is displayed in accordance with a determination that a representation (e.g., 804C) of the downloaded collection is not currently displayed on the display (e.g., 602 of device 600). For example, in FIG. 8G, device 600

5 determines that representation 804C is no longer displayed, and thus displays notification 809.

In some embodiments, if representation 804C is displayed when the download completed, device 600 forgoes displaying notification 809 in response to completion.

[0317] In some embodiments, the device (e.g., 600) receives user input (e.g., 810) associated with the affordance (e.g., 809) and, in response, displays one or more representations of media
10 items in the received shared collection of media items. For example, at FIG. 8H, device 600 receives user input 810 corresponding to selection of notification 809 and, in response, displays shared collection interface 814 (e.g., in a one-up view as shown in FIG. 8J, described in more detail below) or shared collection interface 814 (e.g., in a grid view as shown in FIG. 8V, described in more detail below).

15 [0318] FIG. 8I illustrates an exemplary representation 804C for a collection of media items (e.g., that has completed downloading). For example, device 600 displays representation 804C as shown in FIG. 8I upon completion of the download initiated by user input selecting representation 804C before the collection had been downloaded (e.g., user input 806 of FIG. 8B). At FIG. 8I, device 600 receives user input 812 corresponding to selection of representation 804C
20 and, in response, displays shared collection interface 814 (e.g., in a one-up view as shown in FIG. 8J, described in more detail below) or shared collection interface 814 (e.g., in a grid view as shown in FIG. 8V, described in more detail below).

[0319] In response to receiving a shared collection (e.g., 804C), the device 600 optionally provides the user with the option to quickly and easily share back media with the other
25 participants in the conversation. In some embodiments, the device (e.g., 600) displays one or more prompts (e.g., 811A, 813) to share back media in response to receiving an indication that another user (e.g., 805B) has shared media with a user of the device (e.g., 805A). In some embodiments, a prompt (e.g., 811A, 813) is displayed at message interface (e.g., 804) concurrently with a transcript of a message conversation (e.g., 804A). For example, FIG. 8I

illustrates a prompt 811A, which is a input suggestion affordance in an input suggestion region 811. Prompt 811A includes the text “Share Back”, prompting the user to reciprocate sharing media. Input suggestion affordance 811A includes one or more of the features of input suggestion affordance 606C, described above. FIG. 8I also illustrates prompt 813, displayed
5 next to representation 804C. In some embodiments, the device (e.g., 600) displays a prompt (e.g., 813) associated with (e.g., near, adjacent) a displayed representation (e.g., 804C) of a received shared collection. For example, prompt 813 can be persistently displayed alongside 804C, so that the user always has a quick entry point to access interfaces for sharing back media that is specifically relevant to the received shared collection represented by 804C. Thus, even if
10 804C ceases to be displayed, the device allows the user to scroll the transcript and select prompt 813. Also, if input suggestion region updates and the device ceases displaying 811A (e.g., replaces it with other suggestions), the user can use prompt 813.

[0320] In some embodiments, user input corresponding to selection of a prompt (e.g., 811A, 813) to share back media causes display of a suggested collection interface (e.g., that includes
15 one or more features as described above with respect to interfaces 612 and/or 634). In some embodiments, user input corresponding to selection of a prompt (e.g., 811A, 813) to share back media causes display of another prompt interface (e.g., 854, described below).

[0321] FIGS. 8J-8AL illustrate exemplary interfaces for viewing and managing media items in a received shared collection of media items.

[0322] FIG. 8J illustrates an exemplary shared collection interface 814, representing the received shared collection shared by William (e.g., represented by 804C in FIG. 8I). For example, shared collection interface 814 can be displayed in response to user input 810 or 812. In some embodiments, a shared collection interface (e.g., 814) includes representations of one or more media items in a shared collection of media items. For example, FIG. 8J represents a one-
25 up view of a media item 816A from the received shared collection of media items of representation 804C.

[0323] A shared collection interface such as 814 can be used to view media items. For example, still referring to FIG. 8J, shared collection interface 814 includes one-up region 814A for viewing a media item in a one-up style view (e.g., as described above). Shared collection

interface 814 also includes scrubbing region 814B, which includes reduced-size representations (e.g., relative to their actual dimensions and/or relative to the media item displayed in one-up view) of other media items in the received shared collection. In some embodiments, user input corresponding to selection of a media item in the scrubbing region (e.g., 814B) causes the device
 5 (e.g., 600) to display the corresponding media item in the one up region (e.g., 814A). In some embodiments, user input corresponding to a directional swipe gesture (e.g., left swipe, or right swipe) in the scrubbing region (e.g., 814B) causes the device (e.g., 600) to perform a scrubbing action through the collection of media items, and display a different media item based on when the scrubbing action ends. For example, after completion of the scrubbing action, device 600
 10 displays the media item that is centered in the scrubbing region, or that is adjacent to an indicator (e.g., the dot shown under region 814B), in the one-up region 814A.

[0324] The device that receives a shared collection of media items optionally provides the user with the option to save one or more of the media items into a media library associated with the user. This can be beneficial because, as described above, access to received shared media
 15 can expire. In some embodiments, the receiving party (e.g., of a shared collection) can add one or more media items, from the shared collection, to a media library. In some embodiments, the receiving party can access the media items in the media library after access provided by the sharer has expired (e.g., after expiration time, or after access is revoked). For example, the access provided by the sharer to the shared media can be hosted by a third-party cloud service,
 20 which facilitates the sharing from the sharing party to the receiving party. This can provide the benefit of simplifying the process for sharing. For instance, the sharer does not need to worry about creating and maintaining a dedicated connection to the receiving party (e.g., via proximity dependent technology such as Wi-Fi or Bluetooth, or via non-proximity dependent technology such as file transfer protocol (FTP) or a virtual private network (VPN) (or the like) between two
 25 devices). Further, the sharer also does not need to worry about facilitating third-party hosting, such as dealing with manually configuring or hosting an environment for sharing (e.g., a website). However, the hosting can be temporary, thus limiting the time for accessing the shared collection.

[0325] In view of the above, interfaces for saving media items are discussed below. In some
 30 embodiments, a shared collection interface provides the ability to save media items from a

received shared collection. In some embodiments, a shared collection interface (e.g., 814) includes an affordance for saving one or more media items to a media library associated with the user of the device (e.g., 600). For example, still referring to FIG 8J, shared collection interface 814 includes affordance 814C. In this example, affordance 814C includes the text “Add All to
 5 Library”. Affordance 814C can be used to quickly and easily add (e.g., save) all of the media items in the received shared collection to a media library. Thus, the user of device 600 does not need to perform extraneous inputs to select media items individually in order to eventually add them to their media library. Moreover, the user can decide to save all media items in the received collection with or without having viewed them all (e.g., all media can be saved at the
 10 display of the first media item 816A as shown in FIG 8J, without swiping over to other media items). In some embodiments, a shared collection interface (e.g., 814) includes an indication of the amount of media in the collection of media items. For example, shared collection interface 814 includes indicator 814D, which indicates that the shared collection being viewed includes a total of 30 media items (e.g., photos).

15 [0326] At FIG. 8K, device 600 receives user input 818 corresponding to selection of affordance 814C. In some embodiments, in response to receiving a request to save media items (e.g., user input 818), the device (e.g., 600) causes one or more media items from the corresponding collection to be added to a media library (e.g., associated with the device, or a user account associated with the device). For example, in response to receiving user input 818,
 20 device 600 causes all of the media items (e.g., 30 photos) to be added to a media library associated with device 600. In some embodiments, adding media to a media library comprises saving the media items to local storage (e.g., on device 600). In some embodiments, adding media to a media library comprises saving the media items to remote storage (e.g., a cloud-based media library maintained on a cloud-based service provider’s server). An example of a cloud-
 25 based service includes “iCloud” provided by Apple Inc. of Cupertino, California.

[0327] FIG. 8L illustrates an exemplary save confirmation indicator 820. In some embodiments, the device (e.g., 600) displays a save confirmation indicator in response to a request to save one or more media items to a media library (e.g., associated with the device). For example, device 600 displays save confirmation indicator 820 in response to receiving user input
 30 818 corresponding to selection of the “Add All to Library” affordance 814C in FIG. 8K. In

some embodiments, a save confirmation indicator includes an indication of the amount of media saved. For example, save confirmation indicator 820 indicates that 30 media items (e.g., photos) were added to the media library in the text: “30 photos added to your library”.

5 [0328] FIG. 8M illustrates shared collection interface 814 after successfully adding media items to a library. In some embodiments, subsequent to adding media to the library, an affordance for adding media to a library ceases to be displayed. For example, 814C is no longer displayed at interface 814. In some embodiments, subsequent to adding media to the library, an affordance for viewing media in a media library is displayed. For example, affordance 814F is now displayed, and reads “View in Library”. Affordance 814F includes one or more of the
10 features described with respect to affordance 814L, described in more detail below with respect to FIGS. 8AJ-8AL.

[0329] The device optionally provides the user with the option to add fewer than all of the media items in a received shared collection to a media library. FIGS. 8N-8AI illustrate various interfaces for selecting and saving fewer than all media items in a received shared collection.

15 [0330] FIG. 8N illustrates shared collection interface 814 (e.g., the same shown in FIG. 8J). In FIG. 8N, shared collection interface 814 includes select affordance 814E. In some embodiments, in response to receiving user input (e.g., 822) representing a request to enter into a selection mode, the device (e.g., 600) enters into a selection mode. In this example, select affordance 814E can be used to enter into a selection mode, in which the device allows the user
20 to customize the selection of media items to be saved to their media library (e.g., to select fewer than all media items).

[0331] At FIG. 8N, device 600 receives user input 822 corresponding to selection of select affordance 814E. In response to receiving user input 822, device 600 enters into a selection mode.

25 [0332] FIG. 8O illustrates an exemplary sharing user interface 814 while in an exemplary selection mode. For example, device 600 displays sharing user interface 814, as shown in FIG. 8O, in response to receiving user input 822. In some embodiments, entering a sharing mode comprises displaying (e.g., on display 602 of device 600) one or more selection indicators

associated with one or more media items of a collection of media items. For example, in FIG. 8O, sharing user interface 814 includes a selection indicator 824A associated with media item 816A, and a selection indicator 824A associated with media item 816B (e.g., in the scrubbing region).

- 5 **[0333]** In some embodiments, while in a selection mode, the device (e.g., 600) disables one or more affordance for saving media items. For example, in FIG. 8O, device 600 changes the appearance of affordance 814C (e.g., it appears grayed out) and make it non-selectable. For instance, because the device entered selection mode (e.g., for customizing selection), deactivating affordance 814C for adding all media items to library prevents unintentional
- 10 selection (e.g., accidental saving of all media instead of the custom selection) by the user. In some embodiments, in response to entering into a selection mode, the device (e.g., 600) displays an affordance for saving a selection of media items. For example, in FIG. 8O, device 600 displays done affordance 814G (e.g., replacing affordance 814E) that, when selected, causes the currently selected media items to be added to the media library associated with the device.
- 15 **[0334]** In some embodiments, while in a selection mode, the device (e.g., 600) displays an indication of an amount of media items that are currently selected. For example, in FIG. 8O, shared collection interface 814 includes indicator 814D, which has been updated to indicate that the amount (e.g., number) of media items in the shared collection that are currently selected (e.g., “30 photos selected”).
- 20 **[0335]** In some embodiments, in response to entering a selection mode, an initial set of media items are currently selected. In some embodiments, the initial set of media items includes all media items in the collection of media items. For example, in FIG. 8O, all 30 media items of the collection are selected by default (e.g., upon entering the selection mode initially (for the first time)). In some embodiments, the initial set of media items includes fewer than all media items
- 25 in the collection. For example, upon entering selection mode (as shown in FIG. 8O), one or more media items are not selected (e.g., a selection indicator is not displayed associated with them) by default. For example, fewer than all media items are selected, similar to as shown in FIG. 8S. In some embodiments, one or more media items (e.g., fewer than all) are selected based on selection criteria. For example, selection criteria are discussed above, and for brevity is

not repeated here. In some embodiments, the initial set of media items is an empty set (e.g., includes no media items). For example, upon entering selection mode, no media items are selected by default, but the user can add to the empty set by selecting one or more media items.

[0336] As described above with respect to one-up view 636 (e.g., FIGS. 6Y-6AD), device
 5 600 can navigate between media items displayed in a one-up view (e.g., in region 814A), and select and/or deselect media items while in a selection mode. In some embodiments, the device (e.g., device 600) replaces display of a first media item in a one up-view (e.g., 816A) with display of a second media item in a one-up view (e.g., 816B) in response to user input (e.g., 826) received while displaying the first media item in a one-up view. For example, at FIG. 8P, device
 10 600 receives user input 826 representing a left swipe gesture in the one-up view region 814A while media item 816A is displayed in region 814A.

[0337] FIG. 8Q shows an exemplary second media item from a collection displayed in a one-up view. For example, in response to receiving user input 826 representing a left swipe gesture in the one-up view region 814A while media item 816A is displayed in region 814A, device 600
 15 replaces display of media item 816A in region 814A with media item 816B. Thus, the user can navigate between media items displayed in a one-up view to inspect particular media items in detail in order to determine whether to include such media items in a selection.

[0338] In some embodiments, navigating between media items in a one-up view can be performed while not in a selection mode. For example, if user input 826 is received while not in
 20 a selection mode (e.g., at interface 814 as shown in FIGS. 8J or 8M), device 600 replaces display of media item 816A with media item 816B in region 814A.

[0339] FIGS. 8R-8U illustrate the selection and saving of a customized selection of an exemplary set of media items from a received shared collection of media items. In some embodiments, the device (e.g., 600) receives user input (e.g., at a location associated with a
 25 media item) representing a request to toggle selection of a media item (e.g., while in a selection mode). In some embodiments, the user input representing a request to toggle selection of a media corresponds to selection of a selection indicator. For example, at FIG. 8R, device 600 receives user input 828 corresponding to selection of selection indicator 824A associated with media item 816B.

[0340] FIG. 8S illustrates an exemplary media item in a one-up view that is not currently selected. For example, device 600 displays sharing interface 814 as shown in FIG. 8S in response to receiving user input 828. Because user input 828 was received while media item 816B was selected, user input 828 causes it to become unselected and thus selection identifier 824A ceases to be displayed, as shown in FIG. 8S. In some embodiments, the device (e.g., 600) displays an unselected indicator (e.g., 824B) associated with a media item that is currently unselected (e.g., while the device is in a selection mode). For example, in FIG. 8S, unselected indicator 824B is displayed. Displaying an unselected indicator (e.g., an unfilled region for a selection indicator) associated with a media item can, for example, affirmatively indicate to a user that the device is in the selection mode, and/or that the corresponding media item is unselected.

[0341] In some embodiments, a user input representing a request to toggle selection of a media item corresponds to input at a location of a media item. For example, a user touch anywhere on media item 816B (e.g., not just on a selection indicator or unselected indicator) causes device 600 to select it or unselect it, depending on the current selection state.

[0342] In some embodiments, the user input representing a request to toggle selection of a media is selection of an unselected indicator (e.g., 824C). For example, at FIG. 8S, interface 814 includes unselected indicator 824B (e.g., an empty circle). In some embodiments, the selection is received while the unselected indicator is displayed. For instance, if user input 828 of FIG. 8R is received instead while media item 816B is not currently selected (e.g., as shown in FIG. 8S, described below), device 600 causes media item 816B to be selected and displays selection indicator 824A (e.g., as shown in FIG. 8R).

[0343] In some embodiments, subsequent to (e.g., in response to) a change in the currently selected media items, the device (e.g., 600) updates a displayed indication of an amount of media items that are currently selected. For example, in FIG. 8S, shared collection interface 814 includes indicator 814D, which has been updated to indicate that the amount (e.g., number) of media items in the shared collection that are currently selected (e.g., “29 photos selected”).

[0344] After customizing the selection of media items, the device optionally provides the user with the option to add the selected items to a media library (e.g., as discussed previously).

At FIG. 8T, after receiving user input 828 to unselect media item 816B, device 600 receives user input 830 on done affordance 814G. In some embodiments, in response to user input (e.g., 830), the device (e.g., 600) causes one or more media items in a user-selected set of media items to be added to a media library. For example, in response to receiving user input 830, device 600

5 causes the 29 selected media items indicated in FIG. 8T, representing a user-selected set of media items from the received shared collection, to be added to a media library (e.g., associated with the device or, the associated with a user (e.g., account) associated with the device). In this example, all media items except media item 816B are added to a media library in response to user input 830.

10 **[0345]** FIG. 8U illustrates an exemplary save confirmation indicator 832. In some embodiments, the device (e.g., 600) displays a save confirmation indicator (e.g., 832) in response to user input (e.g., 830) representing a request to add one or more media items from a collection a media library. Save confirmation indicator 832 indicates that the operation of adding the one or more media items was successful. In some embodiments, a save confirmation indicator (e.g.,

15 832) includes an indication of an amount of media items that were added to the media library. For example, save confirmation indicator 832 indicates that 29 media items (e.g., photos) were saved to the user's (e.g., of device 600) media library, stating: "29 photos added to your library". In some embodiments, the device (e.g., 600) displays an indication if one or more media items were not successfully added to the media library.

20 **[0346]** FIG. 8U also illustrates an exemplary shared collection interface (e.g., 814) after saving one or more media items. For example, shared collection interface 814 as shown in FIG. 8U is displayed in response to user input 830. In some embodiments, subsequent to adding one or more media items to a library, the device (e.g., 600) exits a selection mode. For example, as shown in FIG. 8U, shared collection interface 814 is no longer in selection mode. For instance,

25 select affordance 814E is displayed again, and no selection indicators (e.g., 824A) or unselected indicators (e.g., 824B) are displayed anymore (e.g., as they are in FIG. 8T).

[0347] FIGS. 8V-8AI illustrate various interfaces for viewing a collection of media items in a grid view, for moving between a grid view and a one-up view, or for selecting media items while in either view.

[0348] FIG. 8V illustrates shared collection interface 814 arranged in a grid view (e.g., as described above with respect to FIG. 6X above). In some embodiments, the device (e.g., 600) displays a shared collection interface (e.g., 814) in a grid view (e.g., FIG. 8V) in response to user input. For example, shared collection interface 814 can be displayed in response to user input selection of a notification that download has completed (e.g., 810) or user input selection of a representation of the collection in a message transcript (e.g., 812). Restated, device 600 can initially display the shared collection in either a grid view or in a one-up view. In some embodiments, whether a collection is displayed in a grid or one-up view in response to user input corresponding to selection of a representation of the collection is user-configurable.

[0349] In some embodiments, a shared collection interface (e.g., 814) in grid view includes one or more features of suggested collection interface 612 as described with respect to FIG. 6N above. For example, a shared collection interface (e.g., 814) includes an indication of the amount of media items. For example, still referring to FIG. 8V, indicator 814I of interface 814 indicates that the suggested collection includes 30 photos. In some embodiments, a shared collection interface (e.g., 814) includes a save affordance for causing one or more media items from the corresponding collection of media items to be saved (e.g., added to a media library). For example, save affordance 814J of interface 814 can be selected in order to add one or more media items to a media library, as discussed above. In some embodiments, a shared collection interface (e.g., 814) includes representations of one or more media items in the corresponding collection of media items. For example, shared collection interface 814 includes representations of media items 816A and 816B, each representing a media item in the received shared collection represented by shared collection interface 814 (Lake Tahoe collection from William, FIG. 8A). In some embodiments, a displayed collection of media items (e.g., as shown in interface 814) is scrollable (e.g., to reveal additional content or elements as described herein with respect to interface 814). For example, user input representing a request to scroll (e.g., upward or downward swipe on 814) causes additional media items in the collection to be displayed.

[0350] In some embodiments, the device (e.g., 600) transitions a displayed shared collection interface (e.g., 814) from a grid view to a one-up view. In some embodiments, the device (e.g., 600) transitions a displayed shared collection interface (e.g., 814) from a one-up view to a grid view. In some embodiments, the transition is performed in response to user input. For example,

device 600 can receive user input (e.g., a tap, a gesture, a key press) at FIG. 8J or 8U while in one up view, and transition to the grid view shown in FIG. 8V. For example, the user input that causes transition to the grid view can be a “pinch” gesture (e.g., movement of two contacts toward each other by more than a threshold distance) (e.g., in region 814A of the one-up view).

5 In some embodiments, the device (e.g., 600) transitions a displayed shared collection interface (e.g., 814) from a grid view to a one-up view. For example, device 600 can receive user input (e.g., a tap, a gesture, a key press) while in a grid view, and transition to the one-up view, as shown in FIGS. 8Z-8AA and 8AD-8AE. In some embodiments, the user input that causes transition to the one-up view can be a de-pinch gesture (e.g., as shown in FIGS. 8Z-8AA and
10 8AD-8AE). In some embodiments, the user input that causes transition to the one-up view can be a long press gesture (e.g., a contact exceeding a predetermined length of time). In some embodiments, the user input that causes transition to the one-up view can be a hard press gesture (e.g., a contact with a characteristic intensity that exceeds a threshold intensity such as a threshold intensity that is greater than a nominal contact detection intensity threshold at which a
15 tap input can be detected). In some embodiments, the user input that causes transition to the one-up view can be is a tap gesture (e.g., a contact not exceeding a predetermined length of time) (e.g., if not in a selection mode).

[0351] While displaying media items in a grid view, the device optionally provides the user with the option to select and add one or more of the media items in the received collection into a
20 media library. In some embodiments, while in a grid view, the device (e.g., 600) receives user input (e.g., 834) representing a request to enter into a selection mode and, in response, enters into a selection mode. For example, at FIG. 8V, device 600 receives user input 834 corresponding to selection of select affordance 814E. In response, device 600 displays shared collection interface 814 in a selection mode, as shown in FIG. 8W.

25 [0352] FIG. 8W illustrates exemplary shared collection interface 814 in a grid view while in a selection mode. For example, device 600 displays sharing user interface 814, as shown in FIG. 8W, in response to receiving user input 834. In some embodiments, entering a sharing mode comprises displaying (e.g., on display 602 of device 600) one or more selection indicators associated with one or more media items of a collection of media items. In some embodiments,
30 a shared collection interface (e.g., 814) while in a selection mode includes one or more selection

indicators that indicate whether one or more media items are currently selected. In some embodiments, a selection indicator is visually associated with a media item that is currently selected, and is optionally not displayed when the same media item is not selected. In some embodiments, a shared collection interface (e.g., 814) while in a selection mode includes one or more unselected indicators that indicate whether one or more media items are not currently selected. In some embodiments, an unselected indicator is visually associated with a media item that is not currently selected, and is optionally not displayed when the same media item is selected.

[0353] For example, in FIG. 8W, sharing user interface 814 includes a selection indicator 824A associated with media item 816A, and a selection indicator 824A associated with media item 816B. Thus, both media items 816A and 816B are currently selected.

[0354] In some embodiments, in response to entering into a selection mode, the device (e.g., 600) displays an affordance for saving a selection of media items. For example, in FIG. 8W, device 600 displays done affordance 814G (e.g., replacing affordance 814E) that, when selected, causes the currently selected media items to be added to the media library associated with the device.

[0355] In some embodiments, while in a selection mode, the device (e.g., 600) displays an indication of an amount of media items that are currently selected. For example, in FIG. 8W, shared collection interface 814 includes indicator 814D, which has been updated to indicate that the amount (e.g., number) of media items in the shared collection that are currently selected (e.g., “30 photos selected”).

[0356] In some embodiments, in response to entering a selection mode, an initial set of media items are currently selected. In some embodiments, the initial set of media items includes all media items in the collection of media items. For example, in FIG. 8W, all 30 media items of the collection are selected by default upon entering selection mode (e.g., upon entering the selection mode initially (for the first time)). In some embodiments, the initial set of media items includes fewer than all media items in the collection. For example, upon entering selection mode (as shown in FIG. 8W), one or more media items are not selected (e.g., do not include a selection indicator associated with them) by default. In some embodiments, the initial set of media items

is an empty set (e.g., includes no media items). For example, upon entering selection mode, no media items are selected by default, but the user can add to the empty set by selecting one or more media items.

[0357] As described previously, while in a selection mode, the user can customize selection of media items. In some embodiments, while displaying a shared collection interface (e.g., 814) in a grid view, and while in a selection mode, the device (e.g., 600) receives user input representing a request to toggle selection of a media item. For example, at FIG. 8X, device 600 receives user input 836 while shared collection interface 814 is in a grid view, representing a request to toggle selection of media item 816B, which is currently selected. At FIG. 8Y, in response to receiving the user input 836, device 600 has toggled selection of media item 816B, which is now not currently selected (e.g., selection indicator 824A is no longer displayed associated with media item 814B, and unselected indicator 824B is now displayed associated with media item 814B).

[0358] In some embodiments, the device (e.g., 600) updates an indication of an amount of currently selected media items in response to toggling selection of a media item. For example, FIG. 8Y illustrates that indicator 814D has been updated to indicate that the amount of media items selected has changed to 29 items (from 30 items in FIG. 8X). In some embodiments, the indication of an amount of currently selected media items is an affordance (e.g., for saving the media items). For example, FIG. 8Y illustrates that save affordance 814J has been updated to indicate that the amount of media items selected is 29 items (e.g., out of the 30 total items in the collection indicated by indicator 814I), and now states: “Add 29 to Library”.

[0359] FIGS. 8Z-8AC illustrate exemplary techniques for transitioning between grid view and one-up view, while staying in a selection mode. As described above, a shared collection interface (e.g., 814) can transition between grid view and one-up view in response to user input. For example, while in selection mode in a grid view, the device optionally provides the user with the option to transition to a one-up view while staying in selection mode. In some embodiments, the device (e.g., 600) receives user input representing a request to transition to a one-up view. In some embodiments, the user input is associated with a location of a media item. For example, at

FIG. 8Z, device 600 receives user input 838 at a location associated with media item 816B. In this example, user input 838 is a de-pinch gesture centered on media item 816B.

[0360] In some embodiments, in response to receiving user input representing the request to transition to a one-up view that is associated with a location of a media item, the device (e.g., 600) displays the media item in a one-up view. For example, at FIG. 8AA, device 600 displays media item 816B in a one-up view in response to receiving user input 838. Further, because user input 838 was a de-pinch gesture associated with (e.g., centered on) the location of media item 816B, the one-up view is a one-up view of media item 816B.

[0361] In some embodiments, if a request to transition between a grid view and a one-up view is received while the device (e.g., 600) is currently in a selection mode, the device stays in the selection mode after transitioning between the grid view and the one-up view. For example, in FIG. 8AA, shared collection interface 814 stayed in selection mode (e.g., selection indicators and an unselected indicator are displayed, a done affordance is displayed) after transitioning to the one-up view.

[0362] While in selection mode, a user might wish to view a particular media item in a one-up view, without toggling selection of that media item. In some embodiments, in response to receiving a user input associated with a media item that causes a transition between a one-up view and a grid view while in a selection mode, the device (e.g., 600) enters a one-up view without toggling selection of the media item. For example, in response to receiving user input 838 at FIG. 8Z on media item 816B (which is unselected), the device transitions to one-up view as shown in FIG. 8AA but media item 816B remains unselected.

[0363] In some embodiments, the device (e.g., 600) toggle selections if a user input associated with a location of a media item is a first gesture (e.g., 836), and transitions to a one-up view without toggling selection if the user input (e.g., 838) is a second gesture different than the first gesture. For example, in response to a tap gesture represented by user input 836 (FIG. 8X), device 600 toggles selection of media item 816B. However, in response to a de-pinch gesture represented by user input 838 (FIG. 8Z) at the location of media item 816B, device 600 transitions to a one-up view of media item 816B without toggling selection. In this way, the user can inspect a media item of interest in a one-up view without causing it to be selected. While in

the one-up view, the user can then toggle selection of that media item (e.g., or other media items), as illustrated in FIGS. 8AB-8AC described below.

[0364] In some embodiments, the set of media items that are currently selected remain unchanged in response to transitioning between a grid view and a one-up view (e.g., transitioning either from grid view, or to grid view). For example, as shown in FIG. 8Z, the total number of media items currently selected is 29 items, and the only media item unselected is media item 816B. As shown in FIG. 8AA, after transitioning to the one-up view, the set of currently selected media items is still 29 items and the unselected media item is still 816B. Accordingly, the device can move between different views of the media items in a collection without unintentionally changing the currently selected set of media items.

[0365] FIGS. 8AB-8AC illustrate an exemplary technique for toggling selection of a media item while in a one-up view. After entering one-up view, as shown in FIG. 8AA, the device optionally provides the user with the option to make a change to the set of currently selected media items. At FIG. 8AB, device 600 receives user input 840, representing a request to toggle selection of media item 816B (currently unselected) in the one-up view. At FIG. 8AC, in response to receiving user input 840, device 600 toggles selection of media item 816B (to be selected).

[0366] FIGS. 8AD-8AG illustrate an exemplary technique for simultaneously transitioning between views of a shared collection interface and entering a selection mode. In some embodiments, the device (e.g., 600) receives user input (e.g., 842) representing a request to transition between a grid view and a one-up view while not in a selection mode, and in response, transitions between the grid view and one-up view and enters into a selection mode. For example, FIG. 8AD illustrates shared collection interface 814 while not in a selection mode (e.g., also as shown in FIG. 8V). At FIG. 8AD, device 600 receives user input 842 representing a de-pinch gesture (e.g., as described above), and in response, displays shared collection interface 814 in a one-up view as shown in FIG. 8AE.

[0367] FIG. 8AE illustrates shared collection interface 814 in a one-up view while in a selection mode. For example, in response to receiving de-pinch gesture user input 842, device 600 displays shared collection interface 814 in a one-up view and enters a selection mode. In

some embodiments, the user input, representing a request to transition between a grid view and a one-up view while not in a selection mode, is associated with a location associated with a media item. For example, user input 842 is a de-pinch gesture centered on the location of media item 816B and thus enters one-up view of that media item. In some embodiments, in response to the user input representing a request to transition between a grid view and a one-up view while not in a selection mode, the device enters a one-up view without entering into a selection mode if the user input is a first gesture, and the device enters into a one-up view and enters into a selection mode if the user input is a second gesture different than the first gesture. In some embodiments, a gesture is one of: a tap gesture, a pinch gesture, a de-pinch gesture, a deep press, or a press and hold. For instance, a first gesture can be a tap gesture and a second gesture can be a de-pinch gesture. For example, as shown in FIG. 8AD, because user input 842 is a de-pinch gesture (e.g., an exemplary second gesture), device 600 transitions to the display of a one-up view and enters a selection mode (as shown in FIG. 8AE). If user input 842 was a tap gesture (e.g., an exemplary first gesture) received while not in a selection mode, then device 600 would transition to the display of a one-up view without entering into selection mode. For example, in response to the tap gesture, device 600 would display shared collection interface 814 as shown in FIG. 8J, but with media item 816B displayed in region 814A.

[0368] After entering into one-up view and selection mode in response to the same user input (e.g., as shown in FIG. 8AE), the user can toggle selection of media items as described previously. For example, at FIG. 8AF, device 600 receives user input 844 associated with a location of media item 816B (e.g., selection of selection indicator 824A for media item 816B). As shown in FIG. 8AG, in response to receiving user input 844, the device 600 toggles selection of media item 816B to be unselected (e.g., unselected indicator 824B is now displayed, and selection indicator 824A is no longer displayed; indicator 814D is updated from “30” to “29” to indicate that one item has been unselected).

[0369] FIGS. 8AG-8AH illustrates an exemplary technique for transitioning between a one-up view and a grid view. For example, while in a one-up view, the device optionally provides the user with the option to change to a grid view. In some embodiments, in response to receiving user input (e.g., 845) while displaying a one-up view of a collection of media items, the device (e.g., 600) transitions the one-up view to a grid view. For example, at FIG. 8AG, the device

receives user input 845, representing a pinch gesture (e.g., two contacts brought closer together), and in response, displays interface 814 in a grid view as shown in FIG. 8AH.

[0370] FIG. 8AH illustrates an exemplary grid view. At FIG. 8H, the device 600 receives user input 846 corresponding to selection (e.g., a tap) of save affordance 814J. In response to receiving user input 846, device 600 causes the selected media items to be added to a media library associated with the device, as discussed previously. In some embodiments, the device (e.g., 600) displays a confirmation that the media items were successfully added. For example, at FIG. 8AI, subsequent to receiving user input 846 (e.g., in response to or subsequent to the media items having been successfully added to the library), device 600 displays a confirmation indicator 848.

[0371] FIGS. 8AJ-8AL illustrate exemplary interfaces for viewing media items that have been added to a media library. FIG. 8AJ illustrates an exemplary shared collection interface after one or more media items have been added to a media library. In some embodiments, after adding one or more media items to a media library, the device (e.g., 600) displays an affordance for viewing the media items in the library (e.g., a browsing interface of a photos application). For example, as shown in FIG. 8AJ, save affordance 814J has been replaced by affordance 814L, which reads “View in Library”. At FIG. 8AK, the device (e.g., 600) receives user input 850 corresponding to selection of affordance 814L. In response to receiving user input 850, device 600 displays library interface 852 of FIG. 8AL.

[0372] In some embodiments, after adding the media items to the library, the device (e.g., 600) exits selection mode. For example, turning briefly back to FIG. 8AJ, interface 814 is no longer in selection mode (e.g., no selection indicators or unselected indicators are displayed). For example, because the device already caused addition of the requested selection of media items to a media library, the selection mode is no longer needed.

[0373] FIG. 8AL illustrates an exemplary library interface 852. In some embodiments, the device (e.g., 600) displays a library interface (e.g., 852) in response to user input (e.g., 850). In this example, library interface 852 depicts media items that are included in the media library associated with device 600. Notably, library interface 852 includes a region 852A that includes representations of one or more media items in the media library associated with device 600. As

can be seen, region 852A includes media items from the received shared collection of media items received from William, and saved at FIG. 8AH (e.g., in response to user input 846). For example, representations of media item 816A and 816B are included. In some embodiments, a library interface includes representations of media items that were added from the received
 5 shared collection and representations of media items that were already in the library before adding from the received shared collection. In this example, representations of media items from the user's library that were not added from the collection shared by William are also included (e.g., media items 854F and 854G, described below with respect to FIG. 8AM).

[0374] In some embodiments, the library interface is associated with a photos application.

10 For example, displaying library interface 852 can include opening or launching a photos application.

[0375] After receiving a shared collection, the device optionally provides the user with the option to view a personalized media interface (e.g., as described above with respect to interface 658 of FIGS. 6AO-6AAB). In some embodiments, the device receives user input representing a
 15 request to view a personalized media interface, and in response, displays a personalized media interface. For example, in response to user selection of affordance 852B of FIG. 8AL, device 600 displays personalized media interface (e.g., similar to 658).

[0376] FIGS. 8AM-8AQ illustrate exemplary interfaces for sharing back one or more media items. The device optionally provides the user with the option to share back one or more media
 20 items (e.g., a collection) after receiving a shared collection from another user (e.g., a user account, or a device associated with a user). In some embodiments, the device (e.g., 600) outputs (e.g., displays) a sharing prompt (e.g., 854) to share media items with another user (e.g., a user other than the user of device 600). FIG. 8AM illustrates an exemplary prompt 854 for sharing back a collection of one or more media items with a sender who shared a collection. In
 25 this example, William (recipient user 803B) shared the media collection represented by 804C in the transcript 804A with the user of device 600 (user 803A). Based on receiving an indication of the collection shared by William, device 600 displays a sharing prompt 854 that suggests one or more media items (e.g., suggested media items) to share back with William. Thus, a sharing

prompt provides quick and easy access to a sharing suggestion (e.g., a suggested collection) in order to reciprocate the sharing of media.

[0377] In some embodiments, a prompt to share media items includes one or more of the features of sharing prompt 854. In some embodiments, a prompt (e.g., 854) includes an indication of a context. In some embodiments, the context is a context that is related to both the received shared collection and the suggested collection. For example, prompt 854 includes region 854A, which includes text that indicates that the sharer (William) has shared media items related to the location Lake Tahoe and the time period December 1 to 4, and that there are suggested media items (e.g., 854F and 854G) related to that context that are available to share:

10 “William shared his photos from Lake Tahoe December 1 to 4. Would you like to share yours?”

In some embodiments, a prompt (e.g., 854) includes representations of one or more suggested media items. For example, prompt 854 includes representations of media items 854F and 854G from the suggested collection. In some embodiments, a prompt (e.g., 854) includes one or more of the features of interfaces 612 and/or 814, as described herein throughout. For example,

15 prompt 854 includes a title card 854B (e.g., that includes an indication of a geographic location associated with the suggested collection (Lake Tahoe), an indication of a time period associated with the suggested collection (“Dec. 1 to 4” (e.g., December 1 to 4)), and a representative image (e.g., from the suggested collection)).

[0378] In some embodiments, the prompt includes an affordance for sharing the suggested collection with a recipient (e.g., the user who shared the received collection that causes the prompt to be displayed). For example, prompt 854 includes sharing affordance 854C. In some embodiments, the affordance for sharing (e.g., 854C) includes one or more of the features as described above with respect to any of affordances 604I, 612E, 664A, 666G, or 666H. For example, if the user changes selection of the media items for sharing, affordance 854C can be

25 updated to reflect the number of selected media items (e.g., “Share 22” if 22 media items are selected).

[0379] In some embodiments, a prompt (e.g., 854) includes an affordance (e.g., 854D) for entering a selection mode. For example, prompt 854 includes select affordance 854D for entering a selection mode. Select affordance 854D includes one or more of the features as

described above with respect to affordance 814E. For example, in response to user selection of select affordance 854D, device 600 enters selection mode (e.g., allowing user-customization of the media items that are selected for sharing). In some embodiments, a prompt (e.g., 854) is displayed (e.g., initially) in selection mode. For example, device 600 can display prompt 854 in selection mode without first requiring user input (e.g., of select affordance 854D). In some
 5 embodiments, fewer than all media items of the suggested collection are selected for sharing. For example, the suggested collection of FIG. 8AM includes 23 photos and 1 video (e.g., as indicated by indicator 854E), and fewer than 24 media items can be initially (e.g., automatically) selected for sharing (e.g., only 20 media items). In some embodiments, media items are selected
 10 (e.g., automatically) based on selection criteria (e.g., as described above).

[0380] The discussion above (e.g., with respect to FIG. 6) regarding a suggested collection being suggested based on it being determined to be relevant to content in a transcript (e.g., a received shared collection) is equally applicable to a prompt (e.g., 811A, 813, or 854) to share media items after receiving a shared collection, and is incorporated herein. In some
 15 embodiments, the suggested media items are related to the received collection of media items based on a context. For example, the suggested media items are related by a context (e.g., a time or time range, a geographic location or set of geographic locations, identified faces depicted in the media items, or other metadata). In some embodiments, the context is determined based on the received collection of media items. For example, the context is a time range and/or at a
 20 geographic location, or corresponds to an identified event associated with the received shared collection. In the example of FIG. 8AM, the suggested collection relates to the context of an event defined by geographic location and time—the location Lake Tahoe and the time range December 1 to December 4. Notably, the received shared collection from William represented by 804C also corresponds to the geographic location Lake Tahoe and the time range December 1
 25 to December 4 (e.g., as shown by 804C in FIG. 8A). Thus, for example, device 600 displays a sharing prompt 854 that suggests sharing the Lake Tahoe collection because it relates to a context (e.g., geographic location) that is also related to the received shared collection from William.

[0381] In some embodiments, the suggested media items are not included in the received
 30 shared collection. For example, device 600 suggests media items (e.g., the collection represented

by interface 854) to share back with William that were not received in the collection shared by William (e.g., in the shared collection represented by 804C). In this way, device 600 prevents sharing or display of duplicate media items (e.g., already shared between, and thus already possessed by, two users). In some embodiments, the device (e.g., 600) identifies the one or more media items that share the context is performed by the device. In some embodiments, the identifying is performed by a remote device (e.g., a server).

[0382] In some embodiments, the prompt (e.g., 854) is displayed in response to further user action after receiving an indication of a shared collection from another user (e.g., 804C of FIG.

8A). For example, prompt 854 can be displayed after the user of device 600 accesses a

personalized media interface (e.g., selects affordance 852B in FIG. 8AL, the tab labeled “For You”). For further example, the prompt can be displayed after the user views an interface

associated with the received shared collection and adds media to a media library (e.g., displayed subsequent, or in response, to user input: 808 of FIG. 8K, 830 of FIG. 8T, or 846 of FIG. 8AH).

For instance, at FIG. 8AK, after adding media items from the collection received from William

to the media library, the device 600 receives user input representing a request to close (e.g., cease displaying) interface 814, and in response displays prompt 854. Thus, after the user is finished viewing and/or saving media items from the received shared collection, the device displays a prompt (e.g., 854).

[0383] In some embodiments, the prompt is displayed in response to receiving the indication that a first user (e.g., 803B) has shared a first collection with a second user (e.g., of device 600).

For example, as described above, in response to receiving an indication that William (e.g., user 803B) has shared the Lake Tahoe collection associated with representation 804C in FIG. 8I,

device 600 displays one or more of the following exemplary prompts: sharing affordance 811A (e.g., includes the text “Share Back”) or sharing affordance 813. In some embodiments, the

prompt (e.g., 811A and/or 813) is displayed concurrently with a transcript (e.g., 804A) of a message conversation with the recipient (e.g., user 803B). In some embodiments, a prompt is an affordance (e.g., 811A or 813 of FIG. 8I).

[0384] At FIG. 8AN, device 600 receives user input 856 corresponding to selection of affordance 854C, representing a request to share a suggested collection of media items. In some

embodiments, in response to receiving a request to share a suggested collection of media items (e.g., 856), the device (e.g., 600) prepares to share one or more media items (e.g., selected media items) from the suggested collection.

[0385] FIG. 8AO depicts exemplary message interface 804. FIG. 8AO illustrates an
 5 exemplary representation 804D of a suggested media collection that is being shared back. In some embodiments, preparing to share the suggested collection includes inserting a representation of the media items into a text entry field (e.g., text entry field 804F of FIG. 8AO). For example, device 600 inserts representation 804D into a text entry field 804F in FIG. 8AO, allowing the user to optionally add accompanying text (or other content) before sharing (e.g., via
 10 selection of an affordance, such as 804E). At FIG. 8AP, device receives user input 858 corresponding to selection of affordance 804E, and in response, shares the suggested collection (e.g., the selected media items) with the other user (e.g., 803B, William).

[0386] FIG. 8AQ illustrates an exemplary representation of a suggested collection that has been shared back. In some embodiments, sharing includes transmitting a message that provides
 15 access to media items of the media collection. In some embodiments, sharing includes one or more of inserting the media items, or a representation of the media items, into a transcript of a message conversation. For example, as shown in FIG. 8AQ, device 600 has caused representation 804D to be inserted into the transcript in response to user input 858.

[0387] In some embodiments, in response to receiving a request to share a suggested
 20 collection of media items (e.g., 856), the device (e.g., 600) immediately transmits a message that provides access to media items of the suggested collection (e.g., the selected media items). For example, device 600 can display message interface 804 as shown in FIG. 8AQ in response to user input 856 at prompt 854, and optionally not require user input 858, or provide an opportunity to add accompanying content.

25 [0388] In some embodiments, a representation of a collection of media items is associated with a displayed indication of receipt. For example in FIG. 8AQ, representation 804D is associated with receipt indicator 804G, which indicates that the shared suggested collection (e.g., the message that includes the representation) as been delivered to one or more recipients (e.g., users 803B and 803C). In some embodiments, a receipt indicator includes information regarding

a recipient's activity accessing and/or viewing the shared collection. For example, instead of (or in addition to) stating "Delivered", indicator 804G can include text such as: "Read", "Read at [a particular time]", "Viewed", "Viewed [n] times", "Opened", "Not Viewed", or the like.

[0389] FIGS. 9A-9G is a flow diagram illustrating a method for 900 using an electronic device in accordance with some embodiments. Method 700 is performed at a device (e.g., 100, 300, 500, 600) with a display and one or more input devices. Some operations in method 900 are, optionally, combined, the orders of some operations are, optionally, changed, and some operations are, optionally, omitted.

[0390] As described below, method 900 provides an intuitive way for sharing a suggested collection of media items that is related to a received collection of media items. The method reduces the cognitive burden on a user for sharing a suggested collection of media items that is related to a received collection of media items, thereby creating a more efficient human-machine interface. For battery-operated computing devices, enabling a user to share a suggested collection of media items that is related to a received collection of media items faster and more efficiently conserves power and increases the time between battery charges.

[0391] The electronic device (e.g., 600) receives (902) an indication, from an external device (e.g., 100, 300, 500), that a first user (e.g., a device or account associated with a first user) has shared (e.g., provided access to (e.g., via a link and/or corresponding permission), or has sent the actual media items) a first collection of media items with a second user (e.g., a device (e.g., 600) or account associated with the second user). For example, in FIG. 8A, device 600 receives an indication that user 805B ("William") has shared the collection of media items represented by representation 804C as shown in FIG. 8A.

[0392] Subsequent to (e.g., in response to) receiving the indication that the first user has shared the first collection of media items with the second user, the electronic device (e.g., 600) outputs (904) (e.g., displays, on the display) a prompt (e.g., 811A of FIG. 8I, 813 of FIG. 8I, or 854 of FIG. 8M) to share, with the first user (e.g., 805B) (e.g., share with a device or an account associated with the first user), one or more suggested media items (e.g., 854F, 854G of FIG. 8AM) associated with (e.g., included a local and/or remotely stored media library of, or stored locally on a device of) the second user (e.g., 805A) (e.g., or a device or account associated with

the second user) that are related to the first collection of media items based on a context, wherein: the context is determined (906) based on the first collection of media items (e.g., context is a time range and/or at a geographic location, or corresponds to an identified event), and the one or more suggested media items are not included (908) in the first collection (e.g., the one or more media items were included in the second user's media library before receiving the indication of the shared first collection).

[0393] Displaying a prompt to share, with the first user, one or more suggested media items associated with the second user that are related to a first collection of media items (shared by the first user) based on a context allows the second user to quickly identify media items that are the user is likely to want to share with the first user. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0394] In some embodiments, the prompt (e.g., 854) is output in response to user input (e.g., selection of 811A or 813 of FIG. 8I, or user input 846 of FIG. 8AH, or selection of 852B of FIG. 8AL). In some embodiments, the prompt is output in response to one or more media items in the first collection being added to a media library associated with the electronic device (e.g., subsequent to displaying interface 814 as shown in FIG. 8AI).

[0395] In some embodiments, identifying the one or more media items that share the context is performed by the electronic device (e.g., 600). In some embodiments, identifying the one or more media items that share the context is performed by one or more remote devices (e.g., a server).

[0396] In some embodiments, while displaying a representation (e.g., 854F or 854G of FIG. 8AM, or 804D of FIG. 8AO) of the one or more suggested media items associated with the second user, the electronic device (e.g., 600) displays (910), on the display, a first affordance (e.g., 854C of FIG. 8AM, or 804E of FIG. 8AO).

[0397] The electronic device (e.g., 600) receives (912), via the one or more input devices, a first input (e.g., 856 of FIG. 8AN, or 858 of FIG. 8AP) representing selection of the first affordance (e.g., 854C of FIG. 8AM, or 804E of FIG. 8AO).

[0398] In response to receiving the first input (e.g., 856 of FIG. 8AN, or 858 of FIG. 8AP), the electronic device (e.g., 600) transmits (914) a message (e.g., the message including representation 804D of FIG. 8AQ) to the first user (e.g., 805B) (e.g., as part of a message conversation with the second user) and provides access to the at least a portion of the one or more suggested media items (e.g., transmits the media items themselves, or provides a link or other data and/or permissions for accessing the media items).

[0399] In some embodiments, subsequent to receiving the indication (e.g., 804C of FIG. 8A) that the first user (e.g., 805B) has shared the first collection of media items with the second user (e.g., 805A), and prior to outputting the prompt to share, the electronic device (e.g., 600) receives (916), via the one or more input devices, a second input (e.g., 818 of FIG. 8K, 830 of FIG. 8T, or 846 of FIG. 8AH) representing a request to add one or more media items in the first collection of media items to a media library associated with the second user (e.g., a media library stored locally on a device (e.g., 600) associated with the second user, and/or a media library stored remotely (e.g., cloud-based media storage) associated with the second user). In response to receiving the second input, the electronic device (e.g., 600) causes (918) the one or more media items in the first collection of media items to be added to the media library associated with the second user (e.g., as indicated by 820 of FIG. 8L, 832 of FIG. 8U, or 848 of FIG. 8AI). Subsequent to causing the one or more media items in the first collection to be added to the media library associated with the second user, the electronic device (e.g., 600) displays (920) the prompt (e.g., 854 of FIG. 8AM) to share the one or more suggested media items associated with the second user, wherein: the one or more suggested media items associated with the second user are selected (922) from the media library associated with the second user, and the one or more suggested media items associated with the second user exclude (924) the one or more media items from the first collection that have been added to the media library associated with the second user. For example, after adding the media items from the collection received from William, which are depicted at interface 814 of FIG. 8AJ, to a media library associated with the electronic device, the electronic device displays a prompt 854 of FIG. 8AM that suggests sharing

media items from the media library—however the suggested media items do not include the media items from William (e.g., the media items (e.g., 854F and 854G) represented in prompt FIG. 8AM do not include the media items from William’s collection, represented in FIG. 8AJ). In this way, the electronic device avoids suggesting media items to share with a recipient that
 5 were received from the recipient.

[0400] Selecting suggested media items from a media library of the user that includes media added from the first collection, and excluding from the suggestion the media items from the first collection allows the user to quickly identify and send media items that have not already been received from the first user without requiring an excessive number of inputs or placing a high
 10 cognitive burden on the user. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more
 15 quickly and efficiently.

[0401] In some embodiments, the context is determined (926) based on an identified face being identified in: one or more media items in the first collection of media items, and one or more media items in the one or more suggested media items. In some embodiments, the one or more media items in the first collection of media items, and the one or more media items in the
 20 one or more suggested media items are different media items. For example, the exemplary first collection received from William (e.g., 805B), represented in interface 814J of FIG. 8AJ, includes a media item 814K that includes a depiction of an identified face (e.g., of William) of a snowboarder, and the exemplary one or more suggested media items represented in interface 854 of FIG. 8AM include a depiction of the same identified face in media item 854F that depicts the
 25 same person snowboarding. Thus, the one or more suggested media items and the first collection are determined to be related based on a context determined based on the face in both media items 814K and 854F.

[0402] Using a determined context based on an identified face being depicted in the first collection and in the one or more suggested media items allows the user to quickly identify

media that the second user is likely to want to share with the first user, in particular that depicts a face common to both sets of media. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0403] In some embodiments, the context is determined (928) based on an event associated with the first collection of media items and the one or more suggested media items. For example, the exemplary first collection received from William (e.g., 805B), represented in interface 814 of FIG. 8AJ, includes media items associated with an event “Lake Tahoe” that occurred December 1 to December 4, and the exemplary one or more suggested media items represented in interface 854 of FIG. 8AM also include one or more media items associated with an event named “Lake Tahoe” that occurred December 1 to December 4.

[0404] Using a determined context based on an event associated with the first collection and the one or more suggested media items allows the user to quickly identify media that the second user is likely to want to share with the first user. Performing an optimized operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0405] In some embodiments, the event corresponds to a range of time, and wherein the first collection and the one or more suggested media items respectively include (930) one or more media items captured during the range of time. In some embodiments, a range of time is a range that begins at a first particular time of day and/or on a first particular date, and ends at a second particular time of day and/or on a second particular date. In some embodiments, media item includes or is associated with metadata indicating that the media item was captured at a particular time within the range of time. For example, the exemplary first collection received

from William (e.g., 805B), represented in interface 814 of FIG. 8AJ, includes media items associated with an event “Lake Tahoe” that occurred during the range of time December 1 to December 4, and the exemplary one or more suggested media items represented in interface 854 of FIG. 8AM also include one or more media items associated with an event named “Lake
 5 Tahoe” that occurred during the range of time December 1 to December 4.

[0406] In some embodiments, the event corresponds to a geographic location, and the first collection and the one or more suggested media items respectively include (932) one or more media items captured at the geographic location. In some embodiments, media item includes or is associated with metadata indicating that the media item was captured at or near (e.g., in
 10 another geographic location) the geographic location. In some embodiments, the event corresponds to a plurality of geographic locations (e.g., media items taken during a road trip at multiple locations). For example, the exemplary first collection received from William (805B), represented in interface 814 of FIG. 8AJ, includes media items associated with an event “Lake Tahoe” that occurred at the geographic location Lake Tahoe, and the exemplary one or more
 15 suggested media items represented in interface 854 of FIG. 8AM also include one or more media items associated with an event named “Lake Tahoe” that occurred at the geographic location Lake Tahoe.

[0407] In some embodiments, subsequent to receiving the indication that the first user has shared the first collection of media items with the second user, the electronic device (e.g., 600)
 20 displays (934), on the display, a second affordance (e.g., 804C of FIG. 8A, 8D or 8I; 814J of FIG. 8AJ) associated with the first collection of media items. In some embodiments, the affordance associated with the first collection is displayed concurrently with a transfer (e.g., download/upload) progress indicator (e.g., “Downloading”, “Uploading”, “Lori is uploading 23
 25 photos”; “Downloading 23 photos”, or the like). For example, as shown in FIG. 8A, affordance 804C includes an indication that the corresponding media items are being uploaded (e.g., by the sender device, associated with William), and the state of the upload (e.g., 2 of 30). For example, as shown in FIG. 8D, affordance 804C includes an indication that the corresponding media items are being downloaded (e.g., by the recipient device, associated with Lynne), and the state of the
 30 download (e.g., 2 of 30). In some embodiments, in response to user input (e.g., 806 of FIG. 8B) selection of the affordance while transferring is in progress (e.g., downloading and/or uploading)

displays a preview of one or more media items of the first collection. In some embodiments, the preview includes representations of one or more media item that are: reduced in size and/or quality, displayed greyed out, and/or not selectable. For example, in response to user input 806, the electronic device displays interface 808 as shown in FIG. 8C.

5 [0408] In some embodiments, the electronic device (e.g., 600) receives (936), via the one or more input devices, a third input (e.g., 810 of FIG. 8H, or 812 of FIG. 8I) representing selection of the second affordance (e.g., 804C) associated with the first collection of media items. In response to receiving the third input representing selection of the second affordance, the electronic device displays (938), on the display, an interface (e.g., 814 as shown in FIG. 8J, 8O,
10 8V, or 8W) for viewing the first collection that includes a depiction (e.g., 816A, 816B) of at least a portion of the first collection of media items. For example, the interface includes is a one-up view of a media item or a grid view of a plurality of photos from the first collection.

[0409] In some embodiments, while displaying the interface for viewing the first collection, the electronic device (e.g., 600) displays (940) a third affordance (e.g., 814C of FIG. 8J, 814G of
15 FIG. 8T, 814J of FIGS. 8V or 8AH). In some embodiments, the electronic device (e.g., 600) receives (942), via the one or more input devices, a fourth input (e.g., 818 of FIG. 8K, 830 of FIG. 8T, 846 of FIG. 8AH) representing selection of the third affordance. In response to receiving the fourth input representing selection of the third affordance, the electronic device (e.g., 600) causes (944) one or more media items in the first collection to be added to a media
20 library associated with the second user. For example, the electronic device adds (e.g., selected) media items to a media library on local storage, or transmits command to a cloud-based service to add media items to a remote media library (e.g., on a cloud-based service).

[0410] In some embodiments, prior to receiving the fourth input representing selection of the third affordance, and while displaying the interface for viewing the first collection, the electronic
25 device (e.g., 600) receives (946), via the one or more input devices, a fifth input (e.g., 822 of FIG. 8N, 834 of FIG. 8V, or 842 of FIG. 8AD). In response to receiving the fifth input, the electronic device (e.g., 600) enters (948) into a media item selection mode (e.g., as shown in FIGS. 8O, 8W, or 8AE). While in the media item selection mode (950): while displaying a representation of a first media item (e.g., 816B of FIG. 8R, 816B of FIG. 8X) of the first

collection of media items, the electronic device (e.g., 600) receives (952), via the one or more input devices, a sixth input (e.g., 828 of FIG. 8R, 836 of FIG. 8X) associated with a location of the displayed representation of the first media item. In response to receiving the sixth input (954), the electronic device (e.g., 600): toggles whether the first media item is selected (e.g., as shown in FIGS. 8S or 8Y); in accordance with the toggling causing the first media item to be selected, the electronic device (e.g., 600) displays, on the display, a selection indicator (e.g., 824A of FIGS. 8R or 8W) associated with the displayed representation of the first media item; and in accordance with the toggling causing the first media item to be unselected, the electronic device (e.g., 600) ceases to display, on the display, the selection indicator associated with the representation of the first media item (e.g., as shown in FIGS. 8S or 8Y).

[0411] In some embodiments, in accordance with a determination (956) that the sixth input is a first gesture (e.g., a tap on a media item) (e.g., user input 828 of FIG. 8R, or user input 836 of FIG. 8X), the electronic device (e.g., 600): toggles whether the first media item is selected (e.g., as shown in FIGS. 8S or 8Y); in accordance with the toggling causing the first media item to be selected, displays, on the display, the selection indicator (e.g., 824A of FIGS. 8R or 8W) associated with the displayed representation of the first media item; and in accordance with the toggling causing the first media item to be unselected, ceases to display, on the display, the selection indicator associated with the representation of the first media item. In some embodiments, in accordance with the toggling causing the first media item to be unselected, the electronic device displays an unselected indicator (e.g., 824B of FIG. 8S or 8Y). In accordance with a determination that the sixth input is a second gesture (e.g., user input 838 of FIG. 8Z) (e.g., a deep press gesture, a press and hold gesture, or a de-pinch gesture centered on the media item), different than the first gesture, the electronic device: displays (958), on the display, a one-up view (e.g., 814 as shown in FIG. 8AA) of the first media item (e.g., 816B) without toggling whether the first media item is selected. For example, at FIGS. 8X-8Y, in response to user input 836 (e.g., a tap on media item 816B), the device toggles selection of media item 816B without entering a one-up view. At FIGS. 8Z-8AA, in response to user input 838 (e.g., a de-pinch centered on media item 816B), the device enters a one-up view without toggling selection of media item 816B. In some embodiments, a subsequent user input (e.g., that is the first gesture,

such as a tap) (e.g., user input 840 of FIG. 8AB) received on the media item displayed while in a one-up view toggles selection of the media item (e.g., as shown in FIGS. 8AB-8AC).

[0412] Toggling, or forgoing toggling and entering a one-up view of media item, depending on whether an input is a first gesture or a second gesture, respectively, provides with user with
 5 more control of the device by allowing gesture-dependent, different outcomes from a input. Providing additional control of the device without cluttering the UI with additional displayed controls enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves
 10 battery life of the device by enabling the user to use the device more quickly and efficiently.

[0413] In some embodiments, displaying the representation (e.g., 816B of FIG. 8AA) of the first media item (e.g., 816B) of the first collection of media items comprises displaying (960), on the display, a one-up view of the first media item (e.g., as shown in FIGS. 8Q, 8AA, or 8AG), wherein the sixth input (e.g., 828 of FIG. 8R, 840 of FIG. 8AB, or 844 of FIG. 8AF) is received
 15 while displaying the one-up view of the first media item.

[0414] In some embodiments, while in the media item selection mode, the electronic device (e.g., 600) receives (962), via the one or more input devices, input (e.g., 828 of FIG. 8R, 836 of FIG. 8X, 840 of FIG. 8AB, or 844 of FIG. 8AF) that defines a user-selected set of media items in the first collection of media items (e.g., selection and/or de-selection of one or more media
 20 items), wherein the user-selected set of media items in the first collection includes fewer than all media items in the first collection (e.g., 29 out of 30 as indicated in FIG. 8AH). Subsequent to receiving the input that defines the user-selected set of media items in the first collection, the electronic device receives (964), via the one or more input devices, the fourth input (e.g., 830 of FIG. 8T, or 846 of FIG. 8AH) representing selection of the third affordance (e.g., 814G, or
 25 814J). In response to receiving the fourth input representing selection of the third affordance, the electronic device causes (966) the user-selected set of media items in the first collection to be added to a media library associated with the second user (e.g., saves the photos to a locally stored media library and/or causes a cloud-based service to save photos to a remotely stored media library) without causing media items in the first collection that are not included in the user-

selected set of media items to be added to the media library associated with the second user. For example, in response to receiving user input 846 of FIG. 8AH, the electronic device causes the addition of the 29 selected media items to a media library, without causing the addition of the 1 unselected media item (media item 816B) to the media library.

5 [0415] In some embodiments, the interface (e.g., 814 as shown in FIG. 8AD) for viewing the first collection includes (968) a plurality of representations of media items (e.g., 816A and 816B, as shown in FIG. 8AD) arranged in a grid (e.g., arranged aligned along one or more of a vertical axis or horizontal axis), the plurality of representations includes the representation of the first media item (e.g., 816B), and in response to receiving the fifth input (970): in accordance with a
10 determination that the fifth input is a third gesture (e.g., a tap on a media item), the electronic device (e.g., 600): displays (972), on the display, a one-up view of the first media item without entering into the media item selection mode (e.g., such as a one-up view shown in FIG. 8J, but with media item 816B displayed in region 814A). In accordance with a determination (974) that the fifth input is a fourth gesture (e.g., user input 842 of FIG. 8AD) (e.g., a deep press gesture, a
15 press and hold gesture, or a de-pinch gesture centered on a media item), different than the third gesture (e.g., a tap gesture), the electronic device: displays (976), on the display, a one-up view of the first media item (e.g., as shown in FIG. 8AE); and enters (978) into the media item selection mode (e.g., a shown in FIG. 8AE). In some embodiments, the fifth input is received while displaying the first media item in the one-up view and while in the media item selection
20 mode. For example, while displaying a one-up view as shown in FIG. 8N, the electronic can enter a selection mode in response to selection of affordance 814F (e.g., user input 822).

[0416] Entering or forgoing entering into a media item selection mode, depending on whether an input that causes a one-up view to be displayed is a fourth gesture or a third gesture, respectively, provides with user with more control of the device by allowing gesture-dependent,
25 different outcomes from an input. Providing additional control of the device without cluttering the UI with additional displayed controls enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more
30 quickly and efficiently.

[0417] In some embodiments, the first collection of media items includes a first set of media items that are included in a media library associated with the second user, the first collection of media items includes a second set of media items that are not included in the media library associated with the second user, and displaying the interface for viewing the first collection that includes a depiction of at least a portion of the first collection of media items (e.g., a single media item in a one-up view, or a title card and a plurality of photos from the first collection) comprises: displaying (980) representations of the first set of media items that are not included in the media library associated with the second user without displaying representations of the second set of media items that are included in the media library associated with the second user.

For example, the electronic device (e.g., 600) does not display (e.g., at interface 814) representations of media items in the first collection that were already included in the second user's (e.g., 805A) media library before the first user (e.g., 805B) shared the first collection. For example, this can avoid adding duplicate media items to a library and makes more efficient use of display space, by not displaying media items that are not new to the user.

[0418] Forgoing displaying representations of the second set of media items that are included in the media library associated with the second user allows the user to view only media items that are not already included in their media library, avoiding display and review of duplicate media items. Performing an operation when a set of conditions has been met without requiring further input enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0419] In some embodiments, the electronic device (e.g., 600) receives (982), via the one or more input devices, a seventh input (e.g., 806 of FIG. 8B) representing selection of the second affordance (e.g., 804C). In response to receiving the seventh input representing selection of the second affordance, and in accordance with a determination that the first collection of media items has not been downloaded (e.g., downloaded data representing at least a portion of the collection of media items) (e.g., user has not previously selected 804C, or otherwise viewed the shared collection), the electronic device initiates (984) a download of the first collection of media items (e.g., the media items represented by affordance 804C, and shown in interface 814).

Subsequent to initiating the download of the first collection of media items, the electronic device detects (986) completion of the download of the first collection of media items. In response to detecting (988) completion of the download of the first collection of media items: in accordance with a determination that the second affordance is not currently being displayed (e.g., affordance 5 804C is no longer displayed in the transcript as shown in FIG. 8F, such as if the transcript as grown or if the device is no longer displaying the transcript and/or a message application as shown in FIG. 6AL), the electronic device displays (990), on the display, a fourth affordance (e.g., 809 of FIG. 8G) associated with the first collection of media items; in accordance with a determination that the second affordance is currently being displayed, the electronic device 10 forgoes (992) displaying the fourth affordance. The electronic device receives (994), via the one or more input devices, an eighth input (e.g., 810 of FIG. 8H) representing selection of the fourth affordance associated with the first collection of media items. In response to the receiving the eighth input, the electronic device displays (996), on the display, an interface (e.g., 814 as shown in FIG. 8J, 8O, 8V, or 8W) for viewing the first collection that includes a depiction of at least a 15 portion of the first collection of media items.

[0420] Displaying a third affordance, which causes an interface for viewing the first collection, to be displayed upon completion of a download while content that does not include a first affordance for doing the same is no longer displayed allows the user to quickly access a first collection without requiring excessive input to seek out the first affordance for selection. 20 Reducing the number of inputs needed to perform an operation enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which, additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

25 **[0421]** In some embodiments, the indication that the first user has shared the first collection of media items with the second user includes a link for accessing the first collection of media items, and wherein displaying the second affordance (e.g., 804C of FIG. 8A) associated with the first collection of media items comprises concurrently displaying, on the display: the second affordance associated with the first collection of media items; and an expiration time that 30 indicates when the link for accessing the first collection of media items expires. For example,

representation 804C in FIG. 8A indicates an expiration time of January 8 in the included text “Link expires January 8”.

[0422] In some embodiments, subsequent to the expiration of the link for accessing the first collection of media items, receiving, via the one or more input devices, a ninth input (e.g., such as 812 of FIG. 8I) representing selection of the second affordance (e.g., 804C of FIG. 8I) associated with the first collection of media items. In response to receiving the ninth input representing selection of the second affordance: in accordance with a determination that the at least a portion of the first collection of media items have previously been downloaded, the electronic device (e.g., 600) displays, on the display, an interface for viewing the first collection that includes a depiction of the at least a portion of the first collection of media items (e.g., 814 as shown in FIG. 8AJ). For example, in response to selection of a representation such as 804C of FIG. 8I after access has expired, if one or more media items from the first collection had been downloaded (e.g., before expiration), the electronic device displays shared collection interface such as 814 as shown in FIG. 8AJ, or 854 as shown in FIG. 8AL. The shared interface can be displayed in a one-up view or a grid view. In accordance with a determination that the at least a portion of the first collection of media items have not previously been downloaded, the electronic device forgoes displaying, on the display, the interface for viewing the first collection that includes the depiction of the at least a portion of the first collection of media items. For example, selection of 804C after access has expired might cause display of an error message or have no effect (e.g., not cause display of an interface in response). In some embodiments, the electronic device displays (e.g., associated with the second affordance) an indication that the link has expired (e.g., as shown in representation 604H of FIG. 6AAC).

[0423] Displaying the user interface for viewing the first collection in response despite selection of an expired link, in accordance with at least a portion of the first collection having been downloaded, provides the user with quick access to the downloaded media without requiring excessive input to seek out the downloaded media items in a library interface. Reducing the number of inputs needed to perform an operation enhances the operability of the device and makes the user-device interface more efficient (e.g., by helping the user to provide proper inputs and reducing user mistakes when operating/interacting with the device) which,

additionally, reduces power usage and improves battery life of the device by enabling the user to use the device more quickly and efficiently.

[0424] Note that details of the processes described above with respect to method 900 (e.g., FIGS. 9A-9G) are also applicable in an analogous manner to the methods described

5 below/above. For example, method 900 optionally includes one or more of the characteristics of the various methods described above with reference to method 700. For brevity, these details are not repeated below.

[0425] The foregoing description, for purpose of explanation, has been described with

reference to specific embodiments. However, the illustrative discussions above are not intended
10 to be exhaustive or to limit the invention to the precise forms disclosed. Many modifications and variations are possible in view of the above teachings. The embodiments were chosen and described in order to best explain the principles of the techniques and their practical applications. Others skilled in the art are thereby enabled to best utilize the techniques and various embodiments with various modifications as are suited to the particular use contemplated.

15 **[0426]** Although the disclosure and examples have been fully described with reference to the accompanying drawings, it is to be noted that various changes and modifications will become apparent to those skilled in the art. Such changes and modifications are to be understood as being included within the scope of the disclosure and examples as defined by the claims.

[0427] As described above, one aspect of the present technology is the gathering and use of

20 data available from various sources to improve the delivery to users of sharing suggestions or any other content that may be of interest to them. The present disclosure contemplates that in some instances, this gathered data may include personal information data that uniquely identifies or can be used to contact or locate a specific person. Such personal information data can include demographic data, location-based data, telephone numbers, email addresses, twitter IDs, home
25 addresses, data or records relating to a user's health or level of fitness (e.g., vital signs measurements, medication information, exercise information), date of birth, or any other identifying or personal information.

[0428] The present disclosure recognizes that the use of such personal information data, in the present technology, can be used to the benefit of users. For example, the personal information data can be used to deliver targeted and relevant sharing suggestions that are of greater interest to the user. Accordingly, use of such personal information data enables users to review a sharing
 5 suggestion yet control whether to share the content with others. Further, other uses for personal information data that benefit the user are also contemplated by the present disclosure. For instance, health and fitness data may be used to provide insights into a user's general wellness, or may be used as positive feedback to individuals using technology to pursue wellness goals.

[0429] The present disclosure contemplates that the entities responsible for the collection,
 10 analysis, disclosure, transfer, storage, or other use of such personal information data will comply with well-established privacy policies and/or privacy practices. In particular, such entities should implement and consistently use privacy policies and practices that are generally recognized as meeting or exceeding industry or governmental requirements for maintaining personal information data private and secure. Such policies should be easily accessible by users, and
 15 should be updated as the collection and/or use of data changes. Personal information from users should be collected for legitimate and reasonable uses of the entity and not shared or sold outside of those legitimate uses. Further, such collection/sharing should occur after receiving the informed consent of the users. Additionally, such entities should consider taking any needed steps for safeguarding and securing access to such personal information data and ensuring that
 20 others with access to the personal information data adhere to their privacy policies and procedures. Further, such entities can subject themselves to evaluation by third parties to certify their adherence to widely accepted privacy policies and practices. In addition, policies and practices should be adapted for the particular types of personal information data being collected and/or accessed and adapted to applicable laws and standards, including jurisdiction-specific
 25 considerations. For instance, in the US, collection of or access to certain health data may be governed by federal and/or state laws, such as the Health Insurance Portability and Accountability Act (HIPAA); whereas health data in other countries may be subject to other regulations and policies and should be handled accordingly. Hence different privacy practices should be maintained for different personal data types in each country.

[0430] Despite the foregoing, the present disclosure also contemplates embodiments in which users selectively block the use of, or access to, personal information data. That is, the present disclosure contemplates that hardware and/or software elements can be provided to prevent or block access to such personal information data. For example, in the case of providing sharing suggestions, the present technology can be configured to allow users to select to "opt in" or "opt out" of participation in the collection of personal information data during registration for services or anytime thereafter. In another example, users can select not to provide, or limit, data for determining sharing suggestions relevant to the user's activity or device. In addition to providing "opt in" and "opt out" options, the present disclosure contemplates providing notifications relating to the access or use of personal information. For instance, a user may be notified upon downloading an app that their personal information data will be accessed and then reminded again just before personal information data is accessed by the app.

[0431] Moreover, it is the intent of the present disclosure that personal information data should be managed and handled in a way to minimize risks of unintentional or unauthorized access or use. Risk can be minimized by limiting the collection of data and deleting data once it is no longer needed. In addition, and when applicable, including in certain health related applications, data de-identification can be used to protect a user's privacy. De-identification may be facilitated, when appropriate, by removing specific identifiers (e.g., date of birth, etc.), controlling the amount or specificity of data stored (e.g., collecting location data a city level rather than at an address level), controlling how data is stored (e.g., aggregating data across users), and/or other methods.

[0432] Therefore, although the present disclosure broadly covers use of personal information data to implement one or more various disclosed embodiments, the present disclosure also contemplates that the various embodiments can also be implemented without the need for accessing such personal information data. That is, the various embodiments of the present technology are not rendered inoperable due to the lack of all or a portion of such personal information data. For example, content can be selected and suggested to users by inferring preferences or relevance based on non-personal information data or a bare minimum amount of personal information, such as the content being requested by the device associated with a user,

other non-personal information available to the sharing suggestion services, or publicly available information.

[0433] The foregoing description, for purpose of explanation, has been described with
5 reference to specific embodiments. However, the illustrative discussions above are not intended
to be exhaustive or to limit the invention to the precise forms disclosed. Many modifications and
variations are possible in view of the above teachings. The embodiments were chosen and
described in order to best explain the principles of the invention and its practical applications, to
thereby enable others skilled in the art to best utilize the invention and various embodiments with
10 various modifications as are suited to the particular use contemplated. The scope of present
invention is defined by the claims.

P a t e n t k r a v

1. Computerimplementeret fremgangsmåde, som omfatter:

i en indretning med et display og en eller flere inputindretninger:

5 at modtage (702), via den ene eller flere inputindretninger, et første input;

 som reaktion på modtagelse af det første input, at vise (704), på displayet, en foreslået samling af medieelementer til deling med en modtager, hvor den foreslåede samling er relevant for en beskedkonversation med modtageren baseret på en samling af medieelementer, som blev modtaget fra modtageren, og som er repræsenteret i transskriptionen af beskedkonversationen;

10

 efter visning af den foreslåede samling af medieelementer, at modtage (706), via den ene eller flere inputindretninger, et andet input, som repræsenterer en anmodning om at overføre mindst en del af den foreslåede samling af medieelementer til modtageren; og

15

 som reaktion på modtagelse af det andet input, at overføre (708) en besked til modtageren som del af beskedkonversationen, som tilvejebringer adgang til den mindst ene del af den foreslåede samling af medieelementer.

20

2. Fremgangsmåde ifølge krav 1, endvidere omfattende:

 endvidere som reaktion på modtagelse af det første input, og under visning af mindst en del af den foreslåede samling af medieelementer, at vise, på displayet, en indikation af valgte medier, som identificerer et initialt sæt af valgte medieelementer fra den foreslåede samling, som blev automatisk valgt til deling.

25

3. Fremgangsmåde ifølge krav 2, endvidere omfattende:

30 under visning af indikationen af valgte medier, som identificerer det initiale sæt af valgte medieelementer, at modtage, via den ene eller flere input-

indretninger, det andet input, som repræsenterer anmodningen om at overføre mindst en del af den foreslåede samling af medieelementer til modtageren; og

5 som reaktion på modtagelse af det andet input, at overføre en besked til modtageren som del af beskedkonversationen og tilvejebringe adgang til det initiale sæt af valgte medieelementer.

10 4. Fremgangsmåde ifølge et hvilket som helst af kravene 2-3, hvor indikationen af valgte medier er en første affordance, og det andet input svarer til udvælgelse af den første affordance, og hvor den første affordance indbefatter en indikation af en mængde af medieelementer inkluderet i det initiale sæt af valgte medieelementer.

15 5. Fremgangsmåde ifølge et hvilket som helst af kravene 2-4, hvor det initiale sæt af valgte medieelementer indbefatter færre end alle medieelementer i den foreslåede samling af medieelementer.

20 6. Fremgangsmåde ifølge et hvilket som helst af kravene 2-5, endvidere omfattende:
at modtage, via den ene eller flere inputindretninger, et input, som repræsenterer en ændring af det initiale sæt af valgte medieelementer fra den foreslåede samling for at danne et bruger-valgt sæt af valgte medieelementer fra den foreslåede samling, hvor det initiale sæt af valgte medieelementer adskiller sig fra det bruger-valgte sæt af valgte medieelementer i forhold til udvælgelsen af mindst et medieelement af den første samling;
25 at opdatere indikationen af valgte medier baseret på det bruger-valgte sæt af valgte medieelementer;
under visning af indikationen af valgte medier, som er opdateret baseret på det bruger-valgte sæt af valgte medieelementer, at modtage, via den ene eller flere inputindretninger, det andet input, som repræsenterer anmodningen
30 om at overføre mindst en del af den foreslåede samling af medieelementer til modtageren; og

som reaktion på modtagelse af det andet input, at overføre en besked til modtageren som del af beskedkonversationen, som tilvejebringer adgang til det bruger-valgte sæt af valgte medieelementer.

- 5 7. Fremgangsmåde ifølge krav 6, hvor indikationen af valgte medier omfatter en indikation af en mængde af medieelementer fra den foreslåede samling, som i øjeblikket er valgt,
- 10 hvor opdatering af indikationen af valgte medier omfatter opdatering af indikationen for at inkludere visning af mængden af medieelementer i det bruger-valgte sæt af valgte medieelementer, og
- hvor indikationen af valgte medier er en anden affordance, og det andet input svarer til udvælgelse af den anden affordance.

- 15 8. Fremgangsmåde ifølge et hvilket som helst af kravene 1-6, endvidere omfattende:
- under visning af den foreslåede samling af medieelementer og i en medieelement-udvælgelsesmodus, at modtage, via den ene eller flere inputindretninger, et tredje input associeret med et første medieelement af den foreslåede samling af medieelementer;
- 20 i overensstemmelse med en bestemmelse af, at det tredje input, som er associeret med det første medieelement, er en første gesture:
- at skifte mellem, om det første medieelement er valgt uden at vise det første medieelement i en one-up visning;
- i overensstemmelse med skiftet, som medfører, at det første medieelement vælges, at vise, på displayet, en udvælgelsesindikator, som er
- 25 associeret med det første medieelement; og
- i overensstemmelse med skiftet, som medfører, at det første medieelement ikke vælges, at ophøre med at vise, på displayet, udvælgelsesindikatoren, som er associeret med det første medieelement; og
- 30 i overensstemmelse med en bestemmelse af, at det tredje input, som er associeret med det første medieelement, er en anden gesture, som er forskellig fra den første gesture:

at vise, på displayet, det første medieelement i one-up visningen uden at skifte mellem, om det første medieelement er valgt.

5 9. Fremgangsmåde ifølge krav 8, hvor den første gesture er en tap gesture, og hvor den anden gesture er valgt fra gruppen bestående af: en de-pinch gesture, en gesture med et langt tryk og en gesture med et hårdt tryk.

10 10. Fremgangsmåde ifølge et hvilket som helst af kravene 8-9, hvilken fremgangsmåde endvidere omfatter:
under visning af det første medieelement i one-up visningen og i medieelement-udvælgelsesmodusen:

at modtage, via den ene eller flere inputindretninger, et fjerde input associeret med det første medieelement vist i one-up visningen; og

som reaktion på modtagelse af det fjerde input:

15 at skifte mellem, om det første medieelement er valgt;

i overensstemmelse med skiftet, som medfører, at det første medieelement vælges, at vise, på displayet, en udvælgelsesindikator, som er associeret med det første medieelement; og

20 i overensstemmelse med skiftet, som medfører, at det første medieelement ikke vælges, at ophøre med at vise, på displayet, udvælgelsesindikatoren, som er associeret med det første medieelement.

25 11. Fremgangsmåde ifølge et hvilket som helst af kravene 1-10, hvor det er bestemt, at den foreslåede samling af medieelementer er relevant for beskeds-konversationen med modtageren baseret på et identificeret ansigt associeret med modtageren, og

30 hvor et eller flere medieelementer i den foreslåede samling af medieelementer til deling med modtageren er valgt baseret på det identificerede ansigt associeret med modtageren, som er identificeret i mindst en del af det ene eller flere medieelementer i den foreslåede samling af medieelementer.

12. Fremgangsmåde ifølge et hvilket som helst af kravene 1-11, hvor det er bestemt, at den foreslåede samling af medieelementer er relevant for beskedkonversationen med modtageren baseret på en begivenhed, som modtageren vides at have deltaget i, og
- 5 hvor et eller flere medieelementer i den foreslåede samling af medieelementer til deling med modtageren er valgt baseret på en indikation af, at det ene eller flere medieelementer i den foreslåede samling er associeret med begivenheden, som modtageren vides at have deltaget i.
- 10 13. Fremgangsmåde ifølge et hvilket som helst af kravene 1-12, hvor modtagelse af det første input omfatter modtagelse af det første input under visning, på displayet, af en transskription af beskedkonversationen med modtageren.
- 15 14. Fremgangsmåde ifølge krav 13, hvor det er bestemt, at den foreslåede samling af medieelementer er relevant for beskedkonversationen med modtageren baseret på identiteten af en eller flere deltagere i beskedkonversationen.
- 20 15. Fremgangsmåde ifølge et hvilket som helst af kravene 13-14, hvor det er bestemt, at den foreslåede samling af medieelementer er relevant for beskedkonversationen med modtageren baseret på indhold af transskriptionen af beskedkonversationen.
- 25 16. Fremgangsmåde ifølge krav 15, hvor det er bestemt, at den foreslåede samling af medieelementer er relevant for beskedkonversationen med modtageren baseret på tekst i beskeder inkluderet i transskriptionen af beskedkonversationen.

17. Fremgangsmåde ifølge et hvilket som helst af kravene 15-16, hvor det er bestemt, at den foreslåede samling af medieelementer er relevant for beskedkonversationen med modtageren baseret på en reference til en tid nævnt i transskriptionen af beskedkonversationen.

5

18. Fremgangsmåde ifølge et hvilket som helst af kravene 15-17, hvor det er bestemt, at den foreslåede samling af medieelementer er relevant for beskedkonversationen med modtageren baseret på en geografisk lokation nævnt i transskriptionen af beskedkonversationen.

10

19. Fremgangsmåde ifølge et hvilket som helst af kravene 13-18, endvidere omfattende:

før visning af en deling-affordance, som svarer til den foreslåede samling af medieelementer, at vise, på displayet, transskriptionen af beskedkonversationen samtidigt med et tastaturområde, som indbefatter et forslagsområde, som har input-forslag;

15

under visning af transskriptionen af beskedkonversationen samtidigt med tastaturområdet, at erstatte visning af et input-forslag i tastaturområdet med deling-affordancen, hvor deling-affordancen er vist samtidigt med transskriptionen af beskedkonversationen; og

20

hvor modtagelse af det første input omfatter modtagelse af et input svarende til udvælgelse af deling-affordancen.

20. Fremgangsmåde ifølge krav 19, endvidere omfattende, før visning af deling-affordancen, som svarer til den foreslåede samling af medieelementer, og under visning af transskriptionen af beskedkonversationen med modtageren:

25

at modtage, via den ene eller flere inputindretninger, et input associeret med et tekstindlæsningsfelt, der vises samtidigt med transskriptionen af beskedkonversationen; og

30

som reaktion på modtagelse af inputtet associeret med tekstindlæsningsfeltet, at vise, på displayet, deling-affordancen samtidigt med transskriptionen af beskedkonversationen.

5 21. Fremgangsmåde ifølge et hvilket som helst af kravene 13-20, hvor modtagelse af det første input omfatter modtagelse af et input svarende til en udvælgelse af en del af en besked i transskriptionen af beskedkonversationen.

10 22. Fremgangsmåde ifølge et hvilket som helst af kravene 13-21, endvidere omfattende:
 før modtagelse af det første input og under visning af transskriptionen af beskedkonversationen med modtageren, at vise en flerhed af affordancer indbefattende en affordance, som er associeret med en første applikation, og en affordance, som er associeret med en anden applikation, som er forskellig fra
 15 den første applikation;
 at modtage, via den ene eller flere inputindretninger, et input svarende til udvælgelse af affordancen, som er associeret med den første applikation;
 som reaktion på modtagelse af inputtet svarende til udvælgelse af affordancen, som er associeret med den første applikation, og under fortsat visning af transskriptionen af beskedkonversationen med modtageren, at vise,
 20 på displayet, en grænseflade, som er associeret med den første applikation;
 under visning af grænsefladen, som er associeret med den første applikation, at vise, på displayet, den foreslåede samling af medieelementer til deling med modtageren.

25 23. Fremgangsmåde ifølge et hvilket som helst af kravene 13-22, hvor transskriptionen af beskedkonversationen med modtageren vises samtidigt med den foreslåede samling af medieelementer til deling med modtageren.

30 24. Fremgangsmåde ifølge et hvilket som helst af kravene 13-23, hvor overførsel af beskeden til modtageren som del af beskedkonversationen, der til-

vejebringer adgang til den mindst ene del af den foreslåede samling af medieelementer, omfatter indsætning af en repræsentation af den foreslåede samling af medieelementer i transskriptionen.

- 5 25. Fremgangsmåde ifølge et hvilket som helst af kravene 1-24, hvor overførsel af beskeden til modtageren som del af beskedkonversationen, som tilvejebringer adgang til den mindst ene del af den foreslåede samling af medieelementer, omfatter:

10 i overensstemmelse med en bestemmelse af, at modtageren er berettiget til at modtage beskeder gennem en forudbestemt cloud-baseret service, at tilvejebringe adgang til den mindst ene del af den foreslåede samling af medieelementer gennem den forudbestemte cloud-baserede service, hvor adgangen, som er tilvejebragt gennem den forudbestemte cloud-service, begrænser adgang for brugere andre end modtageren; og

15 i overensstemmelse med en bestemmelse af, at modtageren ikke er berettiget til at modtage beskeder gennem den forudbestemte cloud-baserede service, at tilvejebringe adgang til den mindst ene del af den foreslåede samling af medieelementer ved at sende et link til modtageren, hvor adgangen, som er tilvejebragt ved at sende et link, ikke begrænser adgang for brugere andre end modtageren.

- 25 26. Fremgangsmåde ifølge et hvilket som helst af kravene 1-24, hvor overførsel af beskeden til modtageren som del af beskedkonversationen, som tilvejebringer adgang til den mindst ene del af den foreslåede samling af medieelementer, omfatter:

at overføre, til modtageren, medieelementerne i den mindst ene del af den foreslåede samling af medieelementer.

- 30 27. Fremgangsmåde ifølge et hvilket som helst af kravene 1-26, endvidere omfattende, efter overførsel af beskeden til modtageren som del af beskedkonversationen, som tilvejebringer adgang til den mindst ene del af den foreslåede samling af medieelementer:

at modtage, via den ene eller flere inputindretninger, et input, der repræsenterer tilbagekaldelse af modtagerens adgang til den mindst ene del af den foreslåede samling af medieelementer; og

5 som reaktion på modtagelse af inputtet, der repræsenterer tilbagekaldelse af modtagerens adgang, at overføre data, som bevirker ophør af adgangen til den mindst ene del af den foreslåede samling af medieelementer, som var tilvejebragt i beskeden til modtageren.

10 28. Fremgangsmåde ifølge et hvilket som helst af kravene 1-27, endvidere omfattende, efter overførsel af beskeden til modtageren som del af beskedkonversationen, som tilvejebringer adgang til den mindst ene del af den foreslåede samling af medieelementer:

15 at modtage, via den ene eller flere inputindretninger, et femte input; og som reaktion på modtagelse af det femte input, at vise, på displayet, en prompt om at dele den foreslåede samling med en foreslået modtager, som er en anden end modtageren.

29. Fremgangsmåde ifølge krav 28, hvor den foreslåede modtager er foreslået baseret på et eller flere af:

20 et identificeret ansigt, som er associeret med den foreslåede modtager, som er identificeret i mindst en del af medieelementerne af den foreslåede samling; og

25 en begivenhed, som den foreslåede modtager vides at have deltaget i, hvor den foreslåede samling er associeret med begivenheden, som den foreslåede modtager vides at have deltaget i.

30. Fremgangsmåde ifølge krav 28, endvidere omfattende, under visning af en grænseflade, som er associeret med prompten om at dele den foreslåede samling med den foreslåede modtager:

30 at vise, på displayet, en indikation af den foreslåede modtager, som indbefatter en afbildning af et identificeret ansigt associeret med den foreslåede modtager.

31. Fremgangsmåde ifølge krav 30, hvor den foreslåede modtager ikke er associeret med kontaktinformation associeret med indretningen, og hvor det identificerede ansigt, som er associeret med den foreslåede modtager, er af-

5 billedet i mindst en del af medieelementerne af den foreslåede samling, hvilken fremgangsmåde endvidere omfatter:

under visning af indikationen af den foreslåede modtager, som indbefatter af-

bildning af det identificerede ansigt, som er associeret med den foreslåede modtager, at modtage, via den ene eller flere inputindretninger, et sjette in-

10 put, som repræsenterer udvælgelse af den foreslåede modtager;

som reaktion på modtagelse af det sjette input, at vise, på displayet, en prompt om at matche den foreslåede modtager med kontaktinformation asso-

cieret med indretningen;

at modtage, via den ene eller flere inputindretninger, et syvende input, som

15 repræsenterer udvælgelse af et element af kontaktinformation fra kontaktin-

formationen associeret med indretningen; og

som reaktion på modtagelse af det syvende input, at associere den foreslå-

ede modtager med elementet af kontaktinformation; og

efter associering af den foreslåede modtager med elementet af kontaktinfor-

20 mation, at overføre, ved anvendelse af elementet af kontaktinformation, en besked til den foreslåede og tilvejebringe adgang til mindst en del af den fo-

reslåede samling af medieelementer som reaktion på udvælgelse af en affor-

dance inkluderet i en grænseflade associeret med prompten.

32. Computerlæsbart lagringsmedium, som lagrer et eller flere programmer, som er konfigureret til at blive eksekveret af en eller flere processorer af en elektronisk indretning med et display og en berøringsfølsom overflade, hvor det ene eller flere programmer indbefatter instruktioner til udførelse af frem-

gangsmåden ifølge et hvilket som helst af kravene 1-31.

33. Elektronisk indretning, som omfatter:

et display;

en eller flere inputindretninger;

en eller flere processorer; og

en hukommelse, som lagrer et eller flere programmer, der er konfigureret til at blive eksekveret af den ene eller flere processorer, hvor det ene eller flere programmer indbefatter instruktioner til udførelse af fremgangsmåden ifølge et hvilket som helst af kravene 1-31.

SEARCH REPORT - PATENT		Application No. PA 2018 70385
1. ☐ Certain claims were found unsearchable (See Box No. I). 2. ☐ Unity of invention is lacking prior to search (See Box No. II).		
A. CLASSIFICATION OF SUBJECT MATTER G 06 Q 10/10 (2012.01) According to International Patent Classification (IPC) or to both national classification and IPC		
B. FIELDS SEARCHED		
PCT-minimum documentation searched (classification system followed by classification symbols) IPC & CPC: G06Q & H04L		
Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched		
Electronic database consulted during the search (name of database and, where practicable, search terms used) EPODOC		
C. DOCUMENTS CONSIDERED TO BE RELEVANT		
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant for claim No.
Y	<u>US 2007/0271340</u> A1 (GOODMAN et al.) 2007-11-22 Abstract, paragraphs [0017], [0019], [0113], and [0130], and fig. 6	1-38
Y	<u>US 2017/0063753</u> A1 (PROBASCO et al.) 2017-03-02 Paragraph [0025] and fig. 1: object identifier control 106	1-38
A	<u>US 2014/0025737</u> A1 (KRUGLICK) 2014-01-23 Paragraph [0028]	11-19
A	<u>GB 2550639</u> A (GOOGLE INC.) 2017-11-29 Page 2, lines 11 – 27; page 22, lines 19-17	11-21
A	<u>US 9904906</u> B2 (KIM et al.) 2018-02-27 Col. 5, lines 41 – 64	11-19
A	<u>US 2009/0113315</u> A1 (FISHER et al.) 2009-04-30 Paragraph [00729] and fig. 7	22
☒ Further documents are listed in the continuation of Box C.		
* Special categories of cited documents: "A" Document defining the general state of the art which is not considered to be of particular relevance. "D" Document cited in the application. "E" Earlier application or patent but published on or after the filing date. "L" Document which may throw doubt on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified). "O" Document referring to an oral disclosure, use, exhibition or other means.	"P" Document published prior to the filing date but later than the priority date claimed. "T" Document not in conflict with the application but cited to understand the principle or theory underlying the invention. "X" Document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone. "Y" Document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art. "&" Document member of the same patent family.

SEARCH REPORT - PATENT		Application No. PA 2018 70385
C (Continuation). DOCUMENTS CONSIDERED TO BE RELEVANT		
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant for claim No.
A	<u>US 2015/0256491</u> A1 (EATOUGH et al.) 2015-09-10 Paragraph [0030]	29-31

SEARCH REPORT - PATENT	Application No. PA 2018 70385
Box No. I Observations where certain claims were found unsearchable	
This search report has not been established in respect of certain claims for the following reasons: 1. ☐ Claims Nos.: because they relate to subject matter not required to be searched, namely: 2. ☐ Claims Nos.: because they relate to parts of the patent application that do not comply with the prescribed requirements to such an extent that no meaningful search can be carried out, specifically: 3. ☐ Claims Nos.: because of other matters.	
Box No. II Observations where unity of invention is lacking prior to the search	
The Danish Patent and Trademark Office found multiple inventions in this patent application, as follows:
