UNITED STATES PATENT OFFICE.

JOHN D. McANULTY, OF PHILADELPHIA, PENNSYLVANIA.

IMPROVEMENT IN TOY ATTACHMENTS FOR CHILDREN'S CARRIAGES.

Specification forming part of Letters Patent No. **155,251**, dated September 22, 1874; application filed August 22, 1874.

To all whom it may concern:

Be it known that I, JOHN D. McANULTY, of the city and county of Philadelphia, Pennsylvania, have invented a new and Improved Toy, of which the following is a specification:

My invention consists of a little contrivance of apparatus whereby two dancing and one revolving figure may be operated for the amusement of children while riding in a child's carriage, the apparatus being attached to the front of the carriage and the mechanism geared with one of the wheels of the carriage by a belt.

Figure 1 is a front elevation of the apparatus; and Fig. 2 is a side elevation, together with a side elevation of a portion of a child's carriage in dotted lines, showing the mode of applying it.

Similar letters of reference indicate corresponding parts.

A is a little shelf or table, which is attached to the front portion of the carriage-body B by a bracket, C, or in any other approved manner, with a double crank-shaft, E, under it, in brackets or hangers F, on which shaft is a grooved pulley, H, by which it is turned by a

belt, I, which is to run on a pulley on one of the carriage-wheels, to be operated thereby. The crank-shaft has two connecting-rods, J, passing up through the table, for working the dancing figures which are to be connected to them. It also turns a vertical shaft, K, by the bevel-wheels L', for operating a figure to be attached to the upper end above the table, for revolving said figure.

This contrivance is very simple and cheap, and, it is believed, will afford a very pleasing toy for small children.

Having thus described my invention, I claim as new and desire to secure by Letters Patent—

A toy attachment for children's carriages, consisting of a table, A C, provided with crank-shaft E, connecting-rods J, and geared revolving shaft K, arranged to be operated by connection with the running parts of the carriage, substantially as and for the purpose described.

JOHN D. McANULTY.
