ABSTRACT

Techniques for messaging agent coordination are described. In one embodiment, an apparatus may comprise a commerce intermediary server operative to receive a commerce interface control selection in a user-to-user message thread interface on a client device, the user-to-user message thread associated with a user-to-user message thread for a plurality of users with a messaging system; display a commerce interface in association with the user-to-user message thread interface, the commerce interface comprising a plurality of commerce configuration options; receive a commerce option share control selection in association with the commerce interface; and share the plurality of commerce configuration options with the user-to-user message thread. Other embodiments are described and claimed.

RELATED APPLICATIONS

[0001] This application claims the benefit of priority under 35 U.S.C. §119(e) to U.S. Provisional Patent Application No. 62/321,082, titled “Techniques for Messaging Agent Interactions,” attorney docket number 1360F0137Z, filed on Apr. 11, 2016, which is hereby incorporated by reference in its entirety.

[0002] This application is related to the United States patent application titled “Techniques for a Messaging Agent Platform,” attorney docket number 1360F0137.1, filed on Dec. 29, 2016, which is hereby incorporated by reference in its entirety.

[0003] This application is related to the United States patent application titled “Techniques for Messaging Agent Customization,” attorney docket number 1360F0137.2, filed on Dec. 29, 2016, which is hereby incorporated by reference in its entirety.

[0004] This application is related to the United States patent application titled “Techniques for Messaging Agent Messaging Interactions,” attorney docket number 1360F0137.3, filed on Dec. 29, 2016, which is hereby incorporated by reference in its entirety.

BACKGROUND

[0005] Users may interact with each other in a messaging system, sending messages back and forth to each other in a text-based conversation between two or more users. A user may have a user account associated with them in the messaging system, the user account providing an online identity for the user, a destination for messages directed to the user, and generally coordinating the user’s access to and use of the messaging system. A user may access the messaging system from a variety of endpoints, including mobile devices (e.g., cellphones), desktop computers, web browsers, specialized messaging clients, etc.

SUMMARY

[0006] The following presents a simplified summary in order to provide a basic understanding of some novel embodiments described herein. This summary is not an extensive overview, and it is not intended to identify key/critical elements or to delineate the scope thereof. Some concepts are presented in a simplified form as a prelude to the more detailed description that is presented later.

[0007] Various embodiments are generally directed to techniques for messaging agent interactions. Some embodiments are particularly directed to techniques for messaging agent interactions for commerce interactions within a messaging client. In one embodiment, for example, an apparatus may comprise a commerce intermediary server device. In another embodiment, for example, an apparatus may comprise a client device. Other embodiments are described and claimed.

[0008] To the accomplishment of the foregoing and related ends, certain illustrative aspects are described herein in connection with the following description and the annexed drawings. These aspects are indicative of the various ways in which the principles disclosed herein can be practiced and all aspects and equivalents thereof are intended to be within the scope of the claimed subject matter. Other advantages

and novel features will become apparent from the following detailed description when considered in conjunction with the drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

[0009] FIG. 1 illustrates an embodiment of a consumer-to-business messaging system.

[0010] FIG. 2 illustrates an embodiment of a social graph.

[0011] FIG. 3A illustrates an embodiment of a user interface for a business web page.

[0012] FIG. 3B illustrates an embodiment of a user interface for a message thread displaying a get-started message.

[0013] FIG. 3C illustrates an embodiment of a user interface for a message thread displaying a user message and responding bot message.

[0014] FIG. 3D illustrates an embodiment of a user interface for a message thread displaying a user message and a responding bot message.

[0015] FIG. 3E illustrates an embodiment of a user interface for a message thread displaying a carousel.

[0016] FIG. 3F illustrates an embodiment of a user interface for a message thread displaying a scrolled carousel.

[0017] FIG. 3G illustrates an embodiment of a user interface for a message thread displaying an order template.

[0018] FIG. 3H illustrates an embodiment of a user interface for a message thread displaying an order receipt message.

[0019] FIG. 4A illustrates an embodiment of a user interface for search.

[0020] FIG. 4B illustrates an embodiment of a user interface for search results.

[0021] FIG. 5 illustrates an embodiment of the consumer-to-business messaging system engaging in messaging operations.

[0022] FIG. 6A illustrates an embodiment of a first logic flow for the system of FIG. 1.

[0023] FIG. 6B illustrates an embodiment of a second logic flow for the system of FIG. 1.

[0024] FIG. 6C illustrates an embodiment of a third logic flow for the system of FIG. 1.

[0025] FIG. 6D illustrates an embodiment of a fourth logic flow for the system of FIG. 1.

[0026] FIG. 7 illustrates an embodiment of a centralized system for the system of FIG. 1.

[0027] FIG. 8 illustrates an embodiment of a distributed system for the system of FIG. 1.

[0028] FIG. 9 illustrates an embodiment of a computing architecture.

[0029] FIG. 10 illustrates an embodiment of a communications architecture.

[0030] FIG. 11 illustrates an embodiment of a radio device architecture.

DETAILED DESCRIPTION

[0031] Users may engage with a business via a page in a social-networking service using messaging communication, as they may be familiar with from chatting with friends. Users may discover, engage with, and purchase products and services from these businesses in the same messaging application they use for communicating with friends, colleagues, and other acquaintances. Some of these messages may be

automatically responded to, while others may be responded to fully or partially manually by administrators of business pages.

[0032] Users may be accustomed to interacting with a business via a web page. Even where this web page contains interactive or dynamic elements, the interaction is still received in the presentation style of a web page. Business pages, similar to web pages, may be accessible via a messaging system. However, where a web page may empower chatting via a pop-up dialog box, a messaging system may display a conversational interaction with a business to a messaging-specific interface. This may serve to ground the interaction in the presentation style of messaging, thereby humanizing and personalizing the experience. Further, just as with messaging with another person, the messaging client may maintain a history of a conversation, allow navigation away from the conversation and returning, and a mirroring of the conversation across multiple user devices. In contrast, a pop-up messaging dialog on a web page is temporary, stuck to a browser window that cannot be closed until the conversation is completed, and rooted in a single user device. This conversation with a business page may be represented by a messaging bot, the messaging bot a virtual representation of the business page in a messaging environment. The messaging bot may function as an avatar for the business and unify the experience of messaging with a business within a single messaging representation.

[0033] A messaging client may execute in a variety of environments. A first implementation may execute on the iOS™ platform, a second implementation on the Android™ platform, and a third may be embedded within a web page for a messaging service and/or social-networking service, without limitation. The same messaging bot may be accessed through a messaging client on any of these platforms, connected to the messaging clients on each of the platforms through a unified messaging system. As such, the development of a messaging bot may be simplified, with the messaging system adapting the messaging experience to each platform. And the user's experience may be unified, such that they experience the same messaging bot whichever device they use to access the messaging system. And because the messaging system may replicate messaging state between devices, they may begin a conversation on one device and then continue it on another. For instance, a user may initiate a conversation about a product from a smartphone device when viewing a product in a physical store, then pick up the conversation from home on their personal computer or tablet device.

[0034] By extending their presence to an existing messaging system and messaging client, a business may gain a new and rich channel for connecting with their customers. Messaging can provide the interactivity of a phone conversation, but with an asynchronous engagement and thereby accommodation of a user's personal schedule. A messaging system can provide reliable delivery, delivery receipts for both the business and user, rich interfaces, complex media communication, and duplication across multiple devices. And this functionality can be discovered by the users of the messaging system without them having to install a custom application for the business. For example, an airline can empower checking in, receiving a boarding pass, getting notified of flight delays, and making changes all through an existing infrastructure without having to deploy a custom application or convince users to install the application.

[0035] In particular, many of the situations that might prompt a user to want to access a business through a mobile device—for example, an emergency need to reschedule a flight while on a trip—may be precisely those situations in which it would be inconvenient to discover a business-specific application, download it, configure it, connect it to their account, and then carry out their desired task. Instead, a user may access the business through an application they already have on their device and use for personal communication and communication with other businesses. Further, the messaging system may be able to verify the identity of a user to the business, such as by having already verified a user's phone number and being able to attest that the phone number is associated with the user using the messaging client.

[0036] Businesses may be empowered, therefore, to reach out to customers using this additional channel. Existing customers may be matched based on their identifying information, such as their name, address, or phone number. The business may be empowered to send an introductory message to identified existing customers to invite them to use the messaging system as a communication channel with the business. However, the messaging system may protect the privacy of the customers by only providing access to any account information if the user themselves engages with the business through actively messaging with the business, such as in response to an introductory message from the business. Users may therefore feel safe that the presence of businesses on the messaging system they use will only open them to contact on this new channel if they desire it. The acquisition of new customers may be promoted by encouraging the discovery of businesses within a messaging client, though the actual messaging of new customers may be prevented until the user themselves reaches out to the business.

[0037] Similarly, the privacy of users may be protected by limiting the scope of how sponsored messages may be sent by businesses to users. Rather than allowing the broad spamming of advertisements via a messaging channel, businesses may be empowered to use sponsored messages to attempt to reengage users that have already expressed their interest in engaging with a business via a messaging system. An Internet retailer attempting to broadly message users details about their products may drive users away from a messaging system, and, as such, the messaging system may employ techniques to avoid indiscriminate or impersonal promotion and instead guide businesses to use highly-discriminating and personally-targeted promotion. The messaging system may analyze both the targets of sponsored messages and the contents of sponsored messages in an attempt to reduce indiscriminate promotion.

[0038] The messaging system may restrict businesses to only sending sponsored messages to users or threads (e.g., threads between users) that have previously engaged in messaging with that business. This may encourage businesses to take on the task of encouraging users to engage with them—to make their messaging channel a valuable tool for interaction—before they are granted the privilege of pushing promotional information to the user. The messaging system may restrict the contents of sponsored messages to being responsive to the specific interactions between a business and its customers. If a user had asked about a product, but it was out of stock, it may be appropriate for a business to inquire whether the user was still interested in it, even if the user didn't specifically ask to be notified: this is

personal, and still may be prevented by a user by blocking the business in the messaging client. Similarly, if a user-to-user thread asked a restaurant reservation messaging bot about the availability of a restaurant, it may be appropriate for a business to notify the thread that they'll need to make a reservation soon if they want one, as the restaurant is filling up. However, a business may be prevented from broadly spamming users every evening about whether they are interested in making a reservation, even if they would compensate the messaging system for the privilege of doing so.

[0039] Spam protection may be provided on both an individual and community-wide level. A business may be prevented from contacting individual users without at least the implied consent of those users, such as may be received by the user messaging with the business or specifically requesting that the business contact them through the messaging system. The user may be empowered to withdraw this consent, such as through the display of a prominent block button in each message thread with a business that completely prevents the business from messaging them again. This feedback may then be captured to protect the community as a whole. A business with a large amount of negative user feedback, such as through being blocked, may be rate limited or removed from the messaging system completely. This may be manually or automatically applied in various embodiments.

[0040] In some embodiments, a user may be provided with multiple block buttons. A full-block button may completely block all messages from the business to the user, completely shutting the business out from contacting the user. A sponsored-message block button may only prevent the sending of sponsored messages—messages outside the active communication between a user and a business in response to a user request that a business may pay the messaging system to be able to send. A business may therefore be temporarily authorized to message a user in response to a user request. For instance, the business may be provided a limited-time access token that allows them to, for free, send messages to the user for a limited period of time in response to the user messaging the business. However, the business may be prevented from sending messages, including sponsored messages, outside the limited period of time. The use of the full-block button by a sufficient number of users may prompt a review of the business's interactions with users in general, while the user of the sponsored-message block button by a sufficient number of users may prompt a review of the business's use of sponsored messages.

[0041] Further, businesses may be required to submit an application that outlines their intended integration with the messaging system prior to being authorized to use the messaging system. Businesses that violate their agreed-to use without re-submission, re-review, and re-approval may also be removed, at least until such time that a new application is approved. Messages sent by messaging bots may be randomly selected and presented to operators in comparison with their approved integration application, and penalized when the messages fail to meet the outline they were approved for. In particular, the message system may enforce a prevention of using message threads for advertising, with bots that routinely or repeatedly engage in advertising being removed from the system. Businesses may be initially warned that messages are too similar to advertisements, so

as to encourage correction of behavior, with repeated offenses resulting in removal.

[0042] Businesses may also be monitored for the sending of large numbers of identical or highly-similar messages within a short period of time. Comparisons may be made between the messages sent by a business and the business may be rate-limited or removed for doing so except where approved for doing so as part of their proposal for using the messaging system. For example, a messaging bot for the providing of location-specific weather reports, or for the sending of emergency weather alerts or other emergency alerts (e.g., missing children), may be approved to send highly-similar mass messages to users requesting this service as the users are explicitly requesting to be informed of broadly-applicable information. However, businesses may need to be explicitly approved for such sending patterns and businesses without this approval may be automatically rate-limited temporarily shut out if they engage in mass messaging of identical or highly-similar messages, until such time a human review may be performed. Businesses with explicit approval may be flagged in the messaging system as having such so as to avoid automatic or manual restriction.

[0043] Businesses may be provided with access to a messaging system using messaging-style semantics, in which the interaction is constructed out of atomic interchanges of information with a strict order applied by the messaging system. After a registration of a messaging bot, which may be performed using non-messaging semantics, the performance of the messaging bot itself by a business may be built on messaging interactions. Businesses of any type may receive access to a generic application program interface (API) with generic templates empowering the sending of various types of messages. These generic message templates may include text, images, and call-to-action (CTA) controls to power their specific functions. A CTA may be displayed as a visual control, such as a button, and may result in access to uniform resource location (URL) addresses, to posting messages back to the business, or triggering other automated responses. As such, a business may build their experience out of generally-available tools, sending messages that include text, rich media, and even controls that the user can act on. As a CTA can send back a message or access a URL, any action that a business can trigger through a URL access or off a message, including purchases, cancellations, requests for status updates, or anything else, can be empowered for a user by a message from a business. However, businesses may also be empowered to construct custom templates where needed and approved as part of an approval process by the messaging platform.

[0044] Businesses may be empowered to customize a user's experience with the business via the messaging system. When first accessing a message thread with a messaging bot, the message thread may be customized by the business in its null or empty state. The context banner that may be displayed at the top of a messaging client may be customized, such as with the logo of the business. The background of the thread display may have introductory text customized by the business. A "get started" button may be displayed, which may, for example, send a message to the business informing them that a new user is requesting to begin a conversation with the business. This may authorize the business with the messaging system to begin messaging with the user, which they may take advantage of by sending

additional introductory information. Further, this may empower the business to retrieve identifying information for the user—such as a phone number registered with the user's profile—that they may match against their own repository of customer information, thereby empowering the business to engage in a conversation with the user that incorporates the status that customer has already achieved with the business.

[0045] For instance, a user may open a message thread with a business and hit a “get started” button, which sends a message to the business notifying the business that the user wishes to engage with it via a messaging channel. The business may be provided with an identifier for the user, with the business empowered to use the identifier to retrieve at least a portion of the profile information for the user. The business may retrieve a phone number for the user and match this phone number against its own database of user information. If the user is an existing customer, the business may then be able to respond to the “get started” button with a personalized introduction for the user. For example, a user messaging a hotel chain or airline may be greeted with a reference to a reward level that they've achieved, letting the user know that the same customized service they've typically received over the phone or in person will be provided via the messaging system.

[0046] Businesses may be empowered to guide users to interactions via the messaging system from their web pages. A messaging-contact button may be provided by the messaging system via a web plugin that a business can place on their web page. When pressed, an identifier for a user may be sent to the business that may be used by the business to address messages to the user via the messaging system. The messaging-contact button may empower a business to start a business-first messaging conversation with the user, where the first message in the conversation is sent by the business. The use of this type of button may keep a user within the interface for the business's webpage, with the empowering of a business to message the user occurring behind the scenes without interrupting the user's experience.

[0047] An alternative or additional web plugin may be provided by the messaging system to businesses that may be placed on the businesses web page. This web plugin may instantiate a message-initiation button that, when pressed, takes the activating user to a messaging client and directly to a message thread with the business, which may be an existing message thread or may be a new message thread created in response to the user activating the button. When accessed from a personal computer, this messaging client may be a web-based messaging client. When accessed from a smartphone or tablet device, the messaging client may be a dedicated messaging-specific client for the messaging system. The use of this type of button may transition the user's experience from the business's web page to a messaging interface.

[0048] Either type of button may be customized according to the current web viewing experience of the user. For instance, the web plugin may empower the passing of a parameter specifying the specific URL on which the button was pressed. This may be used to customize the initial experience in a message thread, such as by opening a discussion in relation to a specific product or service represented on the web page. A user may be protected from accidentally using one of these buttons by having a confirmation dialog box temporarily placed over the web page confirming the user account with the messaging system that

will be linked and empowering either approval or cancellation of the linking. A not-me button may be included so that if the wrong account is presented, the user may log out an existing account and log in as themselves. If no account is currently logged in with the messaging system, a login dialog box may be presented. Web plugins may be implemented using the Javascript™ scripting language.

[0049] As such, businesses that engage in personal messaging experiences with consenting users may be empowered to expand the scope and desirability of their business to their customers. The messaging system may increase its utility for its users and therefore its engagement with its users, increasing its scope of use.

[0050] Reference is now made to the drawings, wherein like reference numerals are used to refer to like elements throughout. In the following description, for purposes of explanation, numerous specific details are set forth in order to provide a thorough understanding thereof. It may be evident, however, that the novel embodiments can be practiced without these specific details. In other instances, well known structures and devices are shown in block diagram form in order to facilitate a description thereof. The intention is to cover all modifications, equivalents, and alternatives consistent with the claimed subject matter.

[0051] It is worthy to note that “a” and “b” and “c” and similar designators as used herein are intended to be variables representing any positive integer. Thus, for example, if an implementation sets a value for a=5, then a complete set of components 122 illustrated as components 122-1 through 122-a may include components 122-1, 122-2, 122-3, 122-4 and 122-5. The embodiments are not limited in this context.

[0052] FIG. 1 illustrates a block diagram for a consumer-to-business messaging system 100. In one embodiment, the consumer-to-business messaging system 100 may comprise a computer-implemented system having software applications comprising one or more components. Although the consumer-to-business messaging system 100 shown in FIG. 1 has a limited number of elements in a certain topology, it may be appreciated that the consumer-to-business messaging system 100 may include more or less elements in alternate topologies as desired for a given implementation.

[0053] A consumer-to-business service 110 may serve as an intermediary between consumers and businesses. Consumers and businesses may both be users of the consumer-to-business service 110, with consumers represented via an individual user account and businesses represented by a commerce account and, possibly, one or more individual user accounts associated with the business, such as individual user account associated with representatives and other employees of the business. A consumer user may be represented with a user entity entry in a social graph. A business or other commercial user may be represented by a commerce entity in a social graph. The relationship between the consumer user and the commercial user may be represented by one or more edges between the user entity and commerce entity in the social graph.

[0054] The consumer-to-business service 110 may comprise a messaging system 140. The messaging system 140 may be generally arranged to receive, store, and deliver between individual entities such as individual users and collective entities such as businesses and other organizations. The messaging system 140 may store messages while messaging endpoints, such as messaging endpoint 125, are offline and deliver the messages once the messaging end-

points are available. The messaging system **140** may empower a user to use multiple messaging endpoints (e.g., a messaging client on a mobile device, a web browser on a personal computer) for the same user account, with the messaging system **140** keeping all of the messaging endpoints up-to-date as to the messaging state of the user account.

[0055] The consumer-to-business service **110** may comprise a social networking service **170**. The social networking service **170** may maintain a social graph data structure representing a social graph. The social graph may represent relationships between entities, such as user entities, commerce entities, and any other sort of entity. The social graph may represent the relationships as graph relationships, in which all information is encoded as either being attached to a particular node in the graph or attached to a particular edge between two nodes in the graph. The social networking service **170** may be an element of a social-networking service, with the social graph containing, at least in part, social-networking information. The whole of the consumer-to-business service **110** may be an element or composed of elements of a social-networking service.

[0056] The consumer-to-business service **110** may comprise a consumer portal **150**. The consumer portal **150** may be a unified entry point into the consumer-to-business service **110** for client applications being used by consumers. The consumer portal **150** may serve as a general user portal for non-commerce entities, including users that are not or do not engage in commerce using the consumer-to-business service **110**. The consumer portal **150** may provide access to the messaging system **140** and the social networking service **170**. In some embodiments, all access to the social networking service **170** is used and managed on behalf of the user without the user having direct access to some or all of the social graph information. In some embodiments, the user may have direct access to the messaging system **140** using their user account, with the consumer portal **150** limited to consumer functions of the consumer-to-business service **110** with general messaging functionality (e.g., messaging with friends) provided through direct network communication between the messaging endpoint **125** and the messaging system **140** without the mediation of the consumer portal **150**.

[0057] The consumer-to-business service **110** may comprise a business portal **160**. The business portal **160** may be a unified entry point into the consumer-to-business service **110** for client application being used by business entities. The business portal **160** may provide access to the messaging system **140** and the social networking service **170**. In some embodiments, all access to the social networking service **170** may be mediated by the business portal **160** in which the information of the social networking service **170** is used and managed on behalf of the commerce entity without the commerce entity having direct access to some or all of the social graph information. In some embodiments, the commerce entity may have direct access to the messaging system **140** using their commerce account, with the business portal **160** limited to business functions of the consumer-to-business service **110** with general messaging functionality (e.g., messaging with customers) provided through direct network communication between one or more commerce applications **190** and the messaging system **140** without the mediation of the business portal **160**.

[0058] A user may participate in the consumer-to-business messaging system **100** and interact with the consumer-to-business service **110** using a messaging endpoint **125** software application executing on a client device **120**. The client device **120** may typically be a smartphone—a mobile phone capable of executing software applications that provide functionality beyond that of a conventional telephone—such as an iPhone®, Android® phone, or other smartphone. The messaging endpoint **125** may be specifically associated with a particular messaging system **140** that forms part of the consumer-to-business service **110** or may be a general-purpose messaging client operative to interact with a plurality of messaging services. The messaging endpoint **125** may interact with one or both of the consumer portal **150** and the messaging system **140** for the performance of messaging tasks and commerce tasks.

[0059] A commerce entity, such as through the actions of representatives, employees, and/or agents of the commerce entity, may participate in the consumer-to-business messaging system **100** and interact with the consumer-to-business service **110** using commerce applications **190**. Commerce applications **190** may comprise software clients used by commerce entities for participating in the consumer-to-business messaging system **100**. The commerce applications **190** may interact with one or both of the business portal **160** and the messaging system **140** for the performance of messaging tasks and commerce tasks. The commerce applications **190** may comprise applications used by individuals within a commerce entity for administration of a business's presence within the consumer-to-business messaging system **100**, for carrying out purchased services or providing purchased products, or for carrying out any other tasks related to the consumer-to-business messaging system **100**.

[0060] A commerce entity may be represented in a messaging system by a commerce representation comprising a collection of information for display to a user. A commerce representation may comprise a business page, the business page being the identity of a business within the consumer-to-business messaging system **100**. The business page may display information regarding a commerce entity. The business page may include information for the commerce entity, such as one or more of a physical location for the commerce entity, the operating hours of the physical location, or the hours in which the commerce entity (e.g., a representative of the commerce entity) is available for messaging through the consumer-to-business messaging system **100**. The business page may include social-networking information for the commerce entity, such as a list of friends of a viewing user that have “liked” or “followed” the commerce entity within a social network as may be represented in a social graph.

[0061] A commerce representation may not correspond precisely to a commerce entity. A single commerce entity, such as a business, may have multiple commerce representations and therefore multiple business pages. For example, a single business may have different representations for different brands owned and operated by the same business. A retailer or reseller may sell multiple brands and may have different representations for different brands that they sell. A business may have different representations for different geographic areas in which they operate, such as one business page for the United States, another for Europe, another for Russia, etc.

[0062] An agent for a commerce representation may be presented in messaging conversation in a messaging system

140. A user of the messaging system **140** may interact with the agent via messaging with the agent comprising a virtual representation of a business, with the agent corresponding to a commerce representation presented as a business page. Messaging with the agent may therefore extend the presence of a commerce representation as a business page, primarily dedicated to providing information from the business to users, to interactive messaging in which users and the business can engage in a conversation.

[0063] Users, consumers, may use a messaging client for the messaging system **140** to interact with the agent. An application may correspond to a specific registration empowering access to the messaging system **140** and/or social networking service **170** via an application programming interface (API). An application may be registered with the messaging system **140** via various registered hooks for the application specifying how the application can be contacted by the messaging system **140**. These hooks may be used to contact the application in response to events, such as user messaging, within the messaging system **140**. An application may be assigned a secure token that may be used for authentication and the secure reception and sending of information with the messaging system **140**. An application may correspond to a specific AppID with the messaging system **140** and/or social networking service **170**. Because the business may surface multiple aspects of the services and products it provides via the agent, multiple different applications may be used by a commerce entity to interact with a user via the messaging system **140**. Each application may be subscribed with the messaging system **140** to the one or more commerce representations, such as business pages, that it powers.

[0064] Different commerce applications of a plurality of commerce applications **190** may implement different functions for a commerce entity. For example, a first commerce application may be used by customer support representatives while a second commerce application is used by order fulfillment representatives. The former may respond to and be notified of user inquiries relating to a performed order, such as problems or complaints. The latter may respond to and be notified of user requests for products of services. In another example, a first commerce application may be used by live customer support representatives while a second commerce application is used by an automated customer support system. Other types of commerce applications may be used without limitation. As such, a given commerce representation, corresponding to a business page, may be powered by multiple commerce applications.

[0065] Similarly, a given commerce application may be power multiple commerce representations and therefore interactions with multiple business pages. For instance, a business with multiple brands, each represented by a different business pages, and therefore different commerce representations, may power multiple brands with the same application or applications. Similarly where a business has different business pages for different geographic regions. In another example, a commerce application for a delivery company may, in association with deliveries for various clients, power those clients commerce representations via the messaging system **140** for updates regarding the deliveries. The embodiments are not limited to these examples.

[0066] The network **180** may comprise any form of computer network operative to carry computer transmissions between computer devices. The network **180** may include

one or both of intranets and the Internet. The network **180** may include cellular data and/or Wi-Fi data networks, such as may be used to provide connectivity to a mobile client device **120**.

[0067] The consumer-to-business messaging system **100** may use knowledge generated from interactions between users. The consumer-to-business messaging system **100** may comprise a component of a social-networking service and may use knowledge generated from the broader interactions of the social-networking service. As such, to protect the privacy of the users of the consumer-to-business messaging system **100** and the larger social-networking service, consumer-to-business messaging system **100** may include an authorization server (or other suitable component(s)) that allows users to opt in to or opt out of having their actions logged by the consumer-to-business messaging system **100** or shared with other systems (e.g., third-party systems), for example, by setting appropriate privacy settings. A privacy setting of a user may determine what information associated with the user may be logged, how information associated with the user may be logged, when information associated with the user may be logged, who may log information associated with the user, whom information associated with the user may be shared with, and for what purposes information associated with the user may be logged or shared. Authorization servers or other authorization components may be used to enforce one or more privacy settings of the users of the consumer-to-business messaging system **100** and other elements of a social-networking service through blocking, data hashing, anonymization, or other suitable techniques as appropriate. For example, while interactions between users of a social-networking service and the social-networking service may be used to learn media content preferences and the relationship between preferences for different pieces of media content, these interactions may be anonymized prior to or as part of the learning process.

[0068] FIG. 2 illustrates an example of a social graph **200**. In particular embodiments, a social-networking system may store one or more social graphs **200** in one or more data stores as a social graph data structure.

[0069] In particular embodiments, social graph **200** may include multiple nodes, which may include multiple user nodes **202** and multiple concept nodes **204**. Social graph **200** may include multiple edges **206** connecting the nodes. In particular embodiments, a social-networking system, client system, third-party system, or any other system or device may access social graph **200** and related social-graph information for suitable applications. The nodes and edges of social graph **200** may be stored as data objects, for example, in a data store (such as a social-graph database). Such a data store may include one or more searchable or queryable indexes of nodes or edges of social graph **200**.

[0070] In particular embodiments, a user node **202** may correspond to a user of the social-networking system. As an example and not by way of limitation, a user may be an individual (human user), an entity (e.g., an enterprise, business, or third-party application), or a group (e.g., of individuals or entities) that interacts or communicates with or over the social-networking system. In particular embodiments, when a user registers for an account with the social-networking system, the social-networking system may create a user node **202** corresponding to the user, and store the user node **202** in one or more data stores. Users and user nodes **202** described herein may, where appropriate, refer to

registered users and user nodes **202** associated with registered users. In addition or as an alternative, users and user nodes **202** described herein may, where appropriate, refer to users that have not registered with the social-networking system. In particular embodiments, a user node **202** may be associated with information provided by a user or information gathered by various systems, including the social-networking system. As an example and not by way of limitation, a user may provide their name, profile picture, contact information, birth date, sex, marital status, family status, employment, education background, preferences, interests, or other demographic information. In particular embodiments, a user node **202** may be associated with one or more data objects corresponding to information associated with a user. In particular embodiments, a user node **202** may correspond to one or more webpages. A user node **202** may be associated with a unique user identifier for the user in the social-networking system.

[0071] In particular embodiments, a concept node **204** may correspond to a concept. As an example and not by way of limitation, a concept may correspond to a place (such as, for example, a movie theater, restaurant, landmark, or city); a website (such as, for example, a website associated with the social-network service or a third-party website associated with a web-application server); an entity (such as, for example, a person, business, group, sports team, or celebrity); a resource (such as, for example, an audio file, video file, digital photo, text file, structured document, or application) which may be located within the social-networking system or on an external server, such as a web-application server; real or intellectual property (such as, for example, a sculpture, painting, movie, game, song, idea, photograph, or written work); a game; an activity; an idea or theory; another suitable concept; or two or more such concepts. A concept node **204** may be associated with information of a concept provided by a user or information gathered by various systems, including the social-networking system. As an example and not by way of limitation, information of a concept may include a name or a title; one or more images (e.g., an image of the cover page of a book); a location (e.g., an address or a geographical location); a website (which may be associated with a URL); contact information (e.g., a phone number or an email address); other suitable concept information; or any suitable combination of such information. In particular embodiments, a concept node **204** may be associated with one or more data objects corresponding to information associated with concept node **204**. In particular embodiments, a concept node **204** may correspond to one or more webpages.

[0072] In particular embodiments, a node in social graph **200** may represent or be represented by a webpage (which may be referred to as a “profile page”). Profile pages may be hosted by or accessible to the social-networking system. Profile pages may also be hosted on third-party websites associated with a third-party server. As an example and not by way of limitation, a profile page corresponding to a particular external webpage may be the particular external webpage and the profile page may correspond to a particular concept node **204**. Profile pages may be viewable by all or a selected subset of other users. As an example and not by way of limitation, a user node **202** may have a corresponding user-profile page in which the corresponding user may add content, make declarations, or otherwise express himself or herself. A business page such as business page **205** may

comprise a user-profile page for a commerce entity. As another example and not by way of limitation, a concept node **204** may have a corresponding concept-profile page in which one or more users may add content, make declarations, or express themselves, particularly in relation to the concept corresponding to concept node **204**.

[0073] In particular embodiments, a concept node **204** may represent a third-party webpage or resource hosted by a third-party system. The third-party webpage or resource may include, among other elements, content, a selectable or other icon, or other inter-actable object (which may be implemented, for example, in JavaScript, AJAX, or PHP codes) representing an action or activity. As an example and not by way of limitation, a third-party webpage may include a selectable icon such as “like,” “check in,” “eat,” “recommend,” or another suitable action or activity. A user viewing the third-party webpage may perform an action by selecting one of the icons (e.g., “eat”), causing a client system to send to the social-networking system a message indicating the user’s action. In response to the message, the social-networking system may create an edge (e.g., an “eat” edge) between a user node **202** corresponding to the user and a concept node **204** corresponding to the third-party webpage or resource and store edge **206** in one or more data stores.

[0074] In particular embodiments, a pair of nodes in social graph **200** may be connected to each other by one or more edges **206**. An edge **206** connecting a pair of nodes may represent a relationship between the pair of nodes. In particular embodiments, an edge **206** may include or represent one or more data objects or attributes corresponding to the relationship between a pair of nodes. As an example and not by way of limitation, a first user may indicate that a second user is a “friend” of the first user. In response to this indication, the social-networking system may send a “friend request” to the second user. If the second user confirms the “friend request,” the social-networking system may create an edge **206** connecting the first user’s user node **202** to the second user’s user node **202** in social graph **200** and store edge **206** as social-graph information in one or more data stores. In the example of FIG. 2, social graph **200** includes an edge **206** indicating a friend relation between user nodes **202** of user “Amanda” and user “Dorothy.” Although this disclosure describes or illustrates particular edges **206** with particular attributes connecting particular user nodes **202**, this disclosure contemplates any suitable edges **206** with any suitable attributes connecting user nodes **202**. As an example and not by way of limitation, an edge **206** may represent a friendship, family relationship, business or employment relationship, fan relationship, follower relationship, visitor relationship, subscriber relationship, superior/subordinate relationship, reciprocal relationship, non-reciprocal relationship, another suitable type of relationship, or two or more such relationships. Moreover, although this disclosure generally describes nodes as being connected, this disclosure also describes users or concepts as being connected. Herein, references to users or concepts being connected may, where appropriate, refer to the nodes corresponding to those users or concepts being connected in social graph **200** by one or more edges **206**.

[0075] In particular embodiments, an edge **206** between a user node **202** and a concept node **204** may represent a particular action or activity performed by a user associated with user node **202** toward a concept associated with a concept node **204**. As an example and not by way of

limitation, as illustrated in FIG. 2, a user may “like,” “attended,” “played,” “listened,” “cooked,” “worked at,” or “watched” a concept, each of which may correspond to a edge type or subtype. A concept-profile page corresponding to a concept node **204** may include, for example, a selectable “check in” icon (such as, for example, a clickable “check in” icon) or a selectable “add to favorites” icon. Similarly, after a user clicks these icons, the social-networking system may create a “favorite” edge or a “check in” edge in response to a user’s action corresponding to a respective action. As another example and not by way of limitation, a user (user “Carla”) may listen to a particular song (“Across the Sea”) using a particular application (SPOTIFY, which is an online music application). In this case, the social-networking system may create a “listened” edge **206** and a “used” edge (as illustrated in FIG. 2) between user nodes **202** corresponding to the user and concept nodes **204** corresponding to the song and application to indicate that the user listened to the song and used the application. Moreover, the social-networking system may create a “played” edge **206** (as illustrated in FIG. 2) between concept nodes **204** corresponding to the song and the application to indicate that the particular song was played by the particular application. In this case, “played” edge **206** corresponds to an action performed by an external application (SPOTIFY) on an external audio file (the song “Across the Sea”). Although this disclosure describes particular edges **206** with particular attributes connecting user nodes **202** and concept nodes **204**, this disclosure contemplates any suitable edges **206** with any suitable attributes connecting user nodes **202** and concept nodes **204**. Moreover, although this disclosure describes edges between a user node **202** and a concept node **204** representing a single relationship, this disclosure contemplates edges between a user node **202** and a concept node **204** representing one or more relationships. As an example and not by way of limitation, an edge **206** may represent both that a user likes and has used at a particular concept. Alternatively, another edge **206** may represent each type of relationship (or multiples of a single relationship) between a user node **202** and a concept node **204** (as illustrated in FIG. 2 between user node **202** for user “Edwin” and concept node **204** for “SPOTIFY”).

[0076] In particular embodiments, the social-networking system may create an edge **206** between a user node **202** and a concept node **204** in social graph **200**. As an example and not by way of limitation, a user viewing a concept-profile page (such as, for example, by using a web browser or a special-purpose application hosted by the user’s client system) may indicate that he or she likes the concept represented by the concept node **204** by clicking or selecting a “Like” icon, which may cause the user’s client system to send to the social-networking system a message indicating the user’s liking of the concept associated with the concept-profile page. In response to the message, the social-networking system may create an edge **206** between user node **202** associated with the user and concept node **204**, as illustrated by “like” edge **206** between the user and concept node **204**. In particular embodiments, the social-networking system may store an edge **206** in one or more data stores. In particular embodiments, an edge **206** may be automatically formed by the social-networking system in response to a particular user action. As an example and not by way of limitation, if a first user uploads a picture, watches a movie, or listens to a song, an edge **206** may be formed between

user node **202** corresponding to the first user and concept nodes **204** corresponding to those concepts. Although this disclosure describes forming particular edges **206** in particular manners, this disclosure contemplates forming any suitable edges **206** in any suitable manner.

[0077] The social graph **200** may further comprise a plurality of product nodes. Product nodes may represent particular products that may be associated with a particular business. A business may provide a product catalog to the consumer-to-business service **110** and the consumer-to-business service **110** may therefore represent each of the products within the product in the social graph **200** with each product being in a distinct product node. A product node may comprise information relating to the product, such as pricing information, descriptive information, manufacturer information, availability information, and other relevant information. For example, each of the items on a menu for a restaurant may be represented within the social graph **200** with a product node describing each of the items. A product node may be linked by an edge to the business providing the product. Where multiple businesses provide a product, each business may have a distinct product node associated with its providing of the product or may each link to the same product node. A product node may be linked by an edge to each user that has purchased, rated, owns, recommended, or viewed the product, with the edge describing the nature of the relationship (e.g., purchased, rated, owns, recommended, viewed, or other relationship). Each of the product nodes may be associated with a graph id and an associated merchant id by virtue of the linked merchant business. Products available from a business may therefore be communicated to a user by retrieving the available product nodes linked to the user node for the business within the social graph **200**. The information for a product node may be manipulated by the social-networking system as a product object that encapsulates information regarding the referenced product.

[0078] FIG. 3A illustrates an embodiment of a user interface **300** for a business web page.

[0079] A client device **301** may correspond to any device used to access a consumer-to-business messaging system **100**. While in the illustrated embodiment of FIG. 3A the client device **301** resembles a smartphone device, it will be appreciated that the techniques described herein may be used with any type of device.

[0080] The user interface **300** may generally correspond to a web page display **303** for a partner of the consumer-to-business messaging system **100**. The web page display **303** may be a display of a web page created and operated by the partner rather than being created and operated by the operator of the consumer-to-business messaging system **100**. For instance, a business web page may be hosted by a business distinct from the consumer-to-business messaging system **100**. The web page may be identified by a uniform resource locator (URL) which may be visually displayed or represented in a URL bar **302** displayed on the client device **301**.

[0081] The web page may comprise a messaging initiation control **305**. Selection of the messaging initiation control **305** by a user may redirect a client device to a messaging client and specifically to a message thread with a messaging bot for the business in the messaging client. The messaging initiation control **305** may be instantiated by a web plugin. A web plugin may be provided by the consumer-to-business messaging system **100** and installed by the business in the web page. Alternatively, the messaging initiation control **305**

may be a link, the link comprising a uniform resource identifier (URI). The messaging initiation control **305** may deep link into an application on the client device **301**. Such an application may be, without limitation, a native application or a web application comprising a messaging client. The application may be identified according to various techniques for deep linking. A messaging client may receive a URI and extract an identifier that identifies the messaging bot with the messaging system so as to empower the messaging client to direct the user of the messaging client to a message thread with the messaging bot.

[0082] FIG. 3B illustrates an embodiment of a user interface **310** for a message thread displaying a get-started message **1015**.

[0083] The client device **301** may display a messaging client in response to the selection of a messaging initiation control **305** on a web page. It will be appreciated, however, that the display of the messaging client may also be initiated by a user using other techniques, such as the direct selection of the messaging client in an application-selection user interface for the operating system of the client device **301**. Further, the display of a message thread with a messaging bot with a get-started message **1015** may be initiated within the messaging client—such as through a selection of the messaging bot or a selection of a message thread with the messaging bot—rather than in response to the selection of a control embedded in a web page.

[0084] A messaging client may display a messaging client header **312**. The messaging client header **312** may comprise a title for a message thread, such as the name of a messaging bot with which the user may engage via the message thread, which may correspond to the name of a business that the messaging bot represents. The messaging client header **312** may comprise a control to return a user to an inbox view for the messaging client. An inbox view control may be augmented with a number of recent message threads with unread messages.

[0085] The user interface **310** for the message thread may include a messaging bot information display **314**. The messaging bot information display **314** may include a name and avatar for the messaging bot with which the message thread is associated. The avatar for a messaging bot may be a logo for a business with which the messaging bot is associated. The messaging bot information display **314** may include a category for the messaging bot, such as a type of commerce associate with the messaging bot. For example, the messaging bot information display **314** includes the “Shopping & Retail” category. These categories may be selected by an operator for the messaging bot associated with a business for the messaging bot or may be assigned by the consumer-to-business messaging system **100**. The messaging bot information display **314** may include a listing of the number of people who have liked, favorite, or otherwise associated themselves with the messaging bot and/or the business or a page for the business. In some embodiments, the messaging bot information display **314** may eventually be removed from the initial display of a message thread when activated once sufficient messages are received as to occupy its screen space.

[0086] The user interface **310** for a message thread may include composition controls **319** that are persistently visible during the display of a message thread. Many, most, or nearly all of the composition controls **319** may empower access to further user interface controls for the performance

of various tasks, such as text entry, media selection, emoji selection, camera use, a social approval icon, etc.

[0087] The user interface **310** for the message thread may comprise a message interaction display **313**. The message interaction display **313** may comprise the messages exchanged within the message thread. The message interaction display **313** may be initially empty due to no messages having been exchanged at the time of the creation of the message thread.

[0088] However, in some embodiments, a get-started message **315** may be automatically displayed in a first access to a message thread with a messaging bot by the user. A get-started message **315** may comprise one or more CTA controls for initiating service with the messaging bot, such as different product areas offered by a business. A message thread may include a display of messaging bot information and/or business information, such as a product or service category (e.g., “Shopping & Retail”) and a number of people who have liked the business page for the business.

[0089] A get-started message **315** may include one or more CTA controls. A CTA control **316** displayed as part of the get-started message **315** may be oriented towards guiding a user’s initial interactions with a messaging bot, and as such may ask broad or general questions regarding a user’s interest in interacting with the messaging bot. However, any type of CTA control may be displayed.

[0090] FIG. 3C illustrates an embodiment of a user interface **320** for a message thread displaying a user message **323** and responding bot message **326**.

[0091] The user message **323** may comprise a user response to messaging bot options presented in the message thread. In some cases, the user message **323** may be automatically generated based on a user selecting a CTA control. The user may select a CTA control, which may initiate the sending of a message to the business as addressed to the messaging bot. At least a portion of this message may be displayed in the message thread to display the flow of the messaging conversation to the user, in this case that the user has selected the “Shoes” option from the plurality of CTA controls of the get-started message **315**. This same text may be sent to the messaging bot to indicate the selected control. In some implementations, additional information may be sent to the messaging bot, and not displayed to the user, such as metadata indicating that a particular control was selected. In some cases, a user may respond to a series of options by entering the text option via text controls, such as by typing and sending “Shoes” via the messaging interface.

[0092] The responding bot message **326** may comprise a response to the user message **323** by the messaging bot. The responding message **326** may comprise further CTA controls empowering the refinement of a user’s configuration of a requested product or service. The plurality of CTA controls may be received as part of a template, where the template includes a text segment as a message to the user and allows the specification of one or more CTA controls.

[0093] FIG. 3D illustrates an embodiment of a user interface **330** for a message thread displaying a user message **333** and a responding bot message **336**. The user message **333** and the responding bot message **336** may further refine a user’s configuration of a requested product or service.

[0094] FIG. 3E illustrates an embodiment of a user interface **340** for a message thread displaying a carousel **345**. In

some instances, a messaging bot may send a bot message that comprises a carousel **345**, such as in response to a user message **343**.

[0095] A carousel **345** may comprise a template empowering the sending of multiple items for display, each with one or more associated CTA controls. The carousel **1045** may comprise a title, the title used as a message to the user contextualizing the carousel **345**, such as inviting the user to consider a variety of options. The carousel **1045** may comprise a plurality of items, where each item comprises an item image **347** (e.g., an image of the product), text (e.g., an item description **348** as descriptive text for the product), and a plurality of controls (e.g., a buy control as a CTA purchase control **349**, a see-more-like-this control, and an ask-a-question control). The carousel **345** may be scrolled horizontally to view additional items, though vertical carousels may also be supported by the consumer-to-business messaging system **100**. In some embodiments, a title for the carousel may be sent as a distinct message from the horizontally-scrollable set of items comprising the carousel.

[0096] FIG. 3F illustrates an embodiment of a user interface **350** for a message thread displaying a scrolled carousel **355**.

[0097] The scrolled carousel **355** may comprise a carousel **345** that has been horizontally scrolled by the user to display additional items, each comprising an image, text segment, and plurality of CTA controls. The title for the carousel may remain in position to continue to contextualize the plurality of items. The messaging client may be operative to perform intelligent scrolling of a carousel so as to automatically position an entire display of a particular item for view rather than stopping scrolling in a transition point between two items.

[0098] FIG. 3G illustrates an embodiment of a user interface **360** for a message thread displaying an order template **365**.

[0099] An order template **365** may comprise a form used to configure the purchase of a particular product. The order template **365** may comprise one or more images—such as product images that may be scrolled between—a name of the product, a description of the product, a price for a product, and one or more controls for configuring options for the product (e.g., a configuration control **366** empowering configuration of the size of a pair of shoes).

[0100] The order template **365** may comprise a purchase control **367** empowering purchase of the product. In some embodiments, a purchase control **367** may be prebuilt CTA in which a financial transaction for a purchase is processed by the consumer-to-business messaging system **100**, with a confirmation of the financial transaction sent to the business for the messaging bot to confirm payment and initiate delivery of the product.

[0101] FIG. 3H illustrates an embodiment of a user interface **370** for a message thread displaying an order receipt message **375**.

[0102] An order receipt message **375** may comprise a message template providing a receipt for a purchased product or service. The order receipt message **375** may comprise a personal message to the user customized by the business for the messaging bot, such as thanking or congratulating the user for their purchase. The order receipt message **375** may comprise a title (e.g., that it is an order confirmation), an image of the product, a text description of the product, a text description of any configured options, a payment descrip-

tion, a delivery summary, and a price. A template for receipt messages may be provided so as to instruct businesses as to the information that should be provided to a user as part of their receipt. In some embodiments, a portion of an order receipt message **375** may be specified by the consumer-to-business messaging system **100**, such as a payment description section where a financial transaction is performed by the consumer-to-business messaging system **100** on behalf of the user and the business.

[0103] FIG. 4A illustrates an embodiment of a user interface **400** for search.

[0104] A search interface may comprise a search field **410**, the search field **410** empowering a user to enter text for use in a search. The search interface may comprise composition controls **440**. The composition controls **440** may be substantially similar to the composition controls **319** described with reference to FIG. 3B, and may similarly empower access to further user interface controls for the performance of various tasks, such as text entry, media selection, emoji selection, camera use, a social approval icon, etc.

[0105] A search interface may also comprise one or more suggested contacts, wherein these suggested contacts are displayed in an initial display of the search interface prior to the user entering search information prompting the display of search results in response to the entered search information. The suggested contacts may therefore augment the search interface into a discovery interface, wherein the discovery interface initially displays suggestions for a user without the use of user-specified search information and then transitions to suggestions based on user-specified search information.

[0106] The suggested contacts may be determined based on user information and contextual information, and therefore may comprise predictions as to the people, groups, and/or messaging bots that a user may desire to contact. The suggestion of contacts may incorporate, as well as predictions as to user interest, an incorporation of value to the consumer-to-business messaging system **100** in the user messaging with the contact. Suggested contacts may include people, such as suggested people and groups **420**. Suggested contacts may include suggested messaging bots **430**.

[0107] FIG. 4B illustrates an embodiment of a user interface **450** for search results **470**.

[0108] The search interface may comprise a search field **460**, which may comprise a complete or partial entry of text. The search results **470** may be updated as additional text is entered in the search field **1160**. For instance, text entry controls **480** may be used to enter text into the search **460**. Text entry controls **480** may be reached by selecting a text entry selection control as part of composition controls **440** as described with reference to FIG. 4A.

[0109] The search results **470** may comprise matches to the text of the search field **460**. The search results **470** may comprise suggested results based on the text of the search field **460**, which may be ranked and displayed in order based on one or more of predicted user interest and promotion value to the consumer-to-business messaging system **100**. As illustrated, the search results **470** may include a plurality of different types of contacts. Search results **470** may include personal contacts (e.g., friends or previous individual messaging partners), groups (e.g., previous or otherwise available group conversation), and/or businesses as represented by messaging bots. Alternatively, in some embodiments, a

search interface may be provided that is exclusive to messaging bots in which all search results 470 will be messaging bots.

[0110] Search results 470 may include information about one or more of the results. Included information may comprise one or more of a number of mutual friends for a contact, a product or service area for a messaging bot, and an indication of whether a personal or messaging bot search result is currently available for messaging. For instance, an availability indicator 475 may be displayed in association with all those and only those contacts that are currently available for messaging. The consumer-to-business messaging system 100 may determine availability according to a variety of techniques, such as whether the consumer-to-business messaging system 100 currently has network connectivity to a client device associated with the contact.

[0111] FIG. 5 illustrates an embodiment of the consumer-to-business messaging system 100 engaging in messaging operations.

[0112] A commerce entity, such as a business, may be represented via one or more commerce applications 190 in its interactions with the consumer-to-business messaging system 100. These commerce applications 190. The commerce applications 190 may be used by human agent, representative, or other operator performing human-based actions for the commerce entity. A commerce application may comprise a commerce front-end application 590, commerce messaging application 593, and/or commerce contact application 596. Other commerce applications may be used, with various functions implemented by different commerce applications in different embodiments. For instance, a commerce front-end application 590, commerce messaging application 593, and commerce contact application 596 may comprise distinct applications. Alternatively, any or all of a commerce front-end application 590, a commerce messaging application 593, and a commerce contact application 596 may be a common application implementing one or more of front-end, messaging, and contact features. In various embodiments, various functions may be implemented by different combinations of applications.

[0113] The consumer-to-business service 110 may aid in the development of the presence on the consumer-to-business messaging system 100 of a business. This aid may be based, at least in part, on an identification of an area of commerce in which a business operates. For example, an airline may be associated, as a business, with airline commerce and may, therefore, be provided with information and functionality to aid in the performance of operations related to the airline industry. As such, in its operations with the consumer-to-business messaging system 100, a commerce entity, such as a business, may correspond to a commerce type, such as a clothing retailer being associated with a clothing type, retail sales type, clothing retail type, etc. A commerce intermediary server may provide access to the consumer-to-business service 110 supporting a plurality of commerce types, where the commerce type of a particular commerce entity comprises one of the plurality of commerce types.

[0114] A commerce type may comprise the local travel commerce type, ride-sharing commerce type, airline commerce type, hotel commerce type, retail commerce type, or any other commerce type. Each commerce type may be supported by the consumer-to-business service 110 using commerce-type-specific message templates, commerce-type-

specific attachment types, commerce-type-specific forms, or other commerce-type-specific templates. For instance, the airline commerce type may be supported by airline-specific message templates for communicating airline information (e.g., arrival times, departure times, departure gate specifications, baggage claim specifications, connecting flight specifications, flight delay updates), airline-specific attachment types for providing air-transport information (e.g., a ticket receipt, a boarding pass, a baggage claim ticket), airline-specific forms for configuring air-transport services (e.g., booking a ticket, rescheduling a ticket, checking-in to a flight, arranging for checked baggage), and other airline-specific templates. These templates may reduce the burden of effort in an airline, or other business, in supporting the consumer-to-business messaging system 100, reduce the duplication in effort between businesses in creating templates, and may standardize and improve the quality of the templates used by businesses.

[0115] For example, prebuilt templates may include different combinations of text, images, titles, subtitles, and CTA buttons. Templates may be combined together, such as sending multiple messages in one call to the messaging system to invoke the rendering of them as a single stack. A stack of messages may be presented as a scrollable horizontal or vertical arrangement of a list of items, such as may be used when sending a variety of suggested products to a user. Similarly, controls may be presented as a unit. A form template may be used to specify multiple controls, which may also include text or images. A user may be presented a form with a title text inviting them to select an option, with each of the options presented in a vertical or horizontal stack, with each of the options selectable by the user and invoking an action with the business, such as by having each of the options be a CTA control. For example, a user ordering up of coffee while on their way to a coffee shop may be presented with a dialog, built out of a form, listing the available sizes of coffee as options. The selected size may be posted back to the business as a message as each of the options may be configured with a particular message to send to the business when selected.

[0116] The instantiation of a messaging relationship between a business and a user may be invoked by either party. Such an invocation may be referred to as a user-to-commerce invocation. The consumer-to-business service 110 may receive a user-to-commerce invocation associated with a commerce entity in association with a user account. A user-to-commerce invocation may comprise an invocation of a messaging relationship between a particular user and a particular commerce entity. The user-to-commerce invocation may comprise a commerce messaging invocation 515 sent by a commerce front-end application 590 used by a representative of the commerce entity. Alternatively, the user-to-commerce invocation may comprise a user messaging invocation 514 sent by a user client device 120. The consumer-to-business service 110 may generate a scoped identifier 510 in response to the user-to-commerce invocation.

[0117] A scoped identifier 510 may comprise an identifier, such as a numerical identifier, that identifies a user within a particular scope narrower than the entire scope of the consumer-to-business messaging system 100. This empowers the consumer-to-business messaging system 100 to control the scope of privileges and information available to a commerce entity, which aids in the implementation of, for example, privacy protections for users of the consumer-to-

business messaging system **100**. For instance, the scoped identifier **510** may be a page-scoped identifier, with the scoped identifier **510** identifying a user for the business entity across the scope of a business page, with the scoped identifier **510** a unique identifier for a user account within a particular business page, but independent of an identifier that may be used for the user account in regards to other business pages. A page-scoped identifier may be usable by any of one or more commerce applications powering a business page, the page-scoped identifier thereby unifying the identification of a user across multiple commerce applications and empowering the coordinated support of a user by a commerce entity. A page-scoped identifier may be submitted to the consumer-to-business service **110** by a commerce application in association with a page identifier for a business page, the combination of the page identifier and page-scoped identifier identifying a single user account.

[0118] The use of a scoped identifier **510**, such as a page-scoped identifier, may serve to protect the privacy of a user through a variety of techniques. These privacy protections may be enforced at the application programming interface (API) level by the consumer-to-business service **110**. By being limited in scope to a particular business page, the tracking of a user between business pages may be partially or wholly restricted to the consumer-to-business service **110** and therefore subject to the privacy protections of the consumer-to-business service **110**. Further, the consumer-to-business service **110** may restriction the information available to a commerce entity until a user has consented to the sharing of information. For instance, the consumer-to-business service **110** may restrict the providing of name information (e.g., a full name, a first name, a last name), contact information (e.g., an email address, a postal address, a phone number), and/or biographical information (e.g., age, date of birth, gender, sex, race, ethnicity) until the user has provided consent to the sharing of such information. In some embodiments, the consumer-to-business service **110** may infer user consent if the user messages—engages in messaging—with the commerce representation (i.e., business page) or a commerce entity for sharing of information in reference to the page-scoped identifier for a business page, and infer lack of user consent if the user has not messages with the commerce representation.

[0119] The consumer-to-business service **110** may send the scoped identifier **510** to the commerce front-end application **590** in response to the user-to-commerce invocation. The scoped identifier **510** sent to the commerce front-end application **590** may comprise a page-scoped identifier, the page-scoped identifier specific to a commerce representation, such as a business page, identified based on its associated to the user-to-commerce invocation. The consumer-to-business service **110** may send a scoped identifier **510** to a commerce front-end application **590** from a commerce intermediary server, the commerce front-end application **590** associated with a commerce entity, the scoped identifier **510** identifying a user account with a messaging system in relation to a commerce representation for the commerce entity within the messaging system. This may, as a result, authorize an operator of the commerce front-end application **590** to engage in messaging with the user via the consumer-to-business messaging system **100**.

[0120] An invocation of a message thread with a commerce entity by a user may mark the initiation of a messaging relationship between the user and the commerce

entity. The message thread may be invoked by selecting the commerce entity in an interface for a messaging client. Different techniques may be used to find the commerce entity in the messaging client. The messaging client may present a discovery interface for the exploration and discovery of various commerce entities available via the consumer-to-business messaging system **100**. Alternatively, the user may have commerce entities promoted to them outside a discovery interface. Such promotion may occur within in a messaging inbox, within a message thread, or in any other portion of the messaging client. For example, a user may be promoted a commerce entity in response to the content of a message thread.

[0121] A user-to-commerce message thread invocation may be received from a client device **120** associated with the user account, where the user-to-commerce message thread invocation is in association with a commerce-entity discovery interface on the client device. A commerce-entity discover interface may display a plurality of commerce representations for commerce entities and empower the selection of a particular commerce representation for a particular commerce entity. The consumer-to-business service **110** may send the scoped identifier **510** to the commerce front-end application **590** in response to receiving the user-to-commerce message thread invocation from the client device **120**. The commerce front-end application **590** may, for instance, be registered for the receiving of scoped identifiers for users that select a commerce representation via a discovery interface.

[0122] A user-to-commerce message thread invocation may be received from a client device **120** associated with the user account, where the user-to-commerce message thread invocation is in association with a commerce-entity trigger suggestion on the client device **120**. A commerce-entity trigger suggestion may comprise a suggestion displayed on the client device **120** in response to the context of a messaging conversation, such as in a user-to-user message thread. A client device **120**, in coordination with the consumer-to-business service **110**, may detect a context for a user-to-user message thread and suggest commerce options in response to the context, with may comprise the commerce-entity trigger suggestion. The consumer-to-business service **110** may send the scoped identifier **510** to the commerce front-end application **590** in response to receiving the user-to-commerce message thread invocation from the client device **120**.

[0123] A user-to-commerce invocation may be received in association with a web plugin on a web page associated with the commerce entity. The consumer-to-business messaging system **100** may empower commerce entities to add a web plugin to web pages for their business, with the web plugin empowering users to select a control invoked by the web plugin for access to the consumer-to-business service **110** in association with the particular commerce representation for the commerce entity. The consumer-to-business service **110** may send the scoped identifier **510** to the commerce front-end application **590** in response to receiving the user-to-commerce invocation in association with a web plugin. As such, a businesses may promote their presence on the consumer-to-business messaging system **100** on their web page and therefore encouraging the extension of their interaction with their customers to the messaging platform of the consumer-to-business messaging system **100**.

[0124] A business may promote its presence on the consumer-to-business messaging system 100 in physical displays as well as in web displays. The consumer-to-business service 110 may receive a user-to-commerce invocation from a client device 120 associated with the user account, the user-to-commerce invocation in association with a visual code capture by the client device 120, the visual code capture identifying the commerce entity. A visual code may comprise, for instance, a barcode, a matrix barcode, a one-dimensional barcode, a two-dimensional barcode, a consumer-to-business messaging system-specific barcode, or any other form of visual code. The consumer-to-business service 110 may send the scoped identifier 510 to the commerce front-end application in response to receiving the user-to-commerce invocation from a client device. A visual code may be captured by a camera of a client device 120 and thereafter submitted to the consumer-to-business service 110.

[0125] The consumer-to-business service 110 may be operative to perform phone-number matching for a business of phone numbers of customers of the business. A commerce messaging invocation 515 may comprise a submission of one or more customer phone numbers from a business. The consumer-to-business service 110 may receive a phone number record from a commerce front-end application 590, match the phone number record to a user account, and send a scoped identifier 510 for the user account to the commerce front-end application 590 in response to matching the phone number record received from the commerce front-end application 590 to the user account. As such, a business may be empowered to transition from using phone call or short message service (SMS) contact to using the consumer-to-business messaging system 100 for communication with its customers. This may provide the business with reliable message delivery including message receipts, as compared to potentially unreliable SMS service. This may provide both customers and businesses with the rich commerce interfaces that may be made available by the consumer-to-business service 110, thereby potentially increasing a customer's use of a business and the customer's ease of using the business.

[0126] The consumer-to-business service 110 may receive a user account access associated with the user account to the commerce representation for the commerce entity within the messaging system. For instance, the user may visit a business page for a business via their client device 120. The business may be provided with the scoped identifier 510 in case they wish to follow up with a user following their visit to the business page. The consumer-to-business service 110 may send the scoped identifier 510 to the commerce front-end application in response to receiving the user account access.

[0127] The consumer-to-business service 110 may receive a commerce-to-user message package 530 from a commerce messaging application 593 associated with the commerce entity, the commerce-to-user message addressed to the scoped identifier 510, the commerce-to-user message package 530 comprising a commerce-to-user message. The consumer-to-business service 110 may identify the user account based on the scoped identifier. The commerce-to-user message package 530 may comprise both a page-scoped identifier and a page identifier, which may, in combination, uniquely identify a user account. The consumer-to-business service 110 may send the commerce-to-user message to a

client device 120 associated with the user account. The sending of a message to a client device 120 may comprise push and/or pull operations as part of the operation of a messaging client with a messaging system 140.

[0128] A commerce-to-user message package 530 may be addressed to a specific message thread by the commerce messaging application 593. The message thread may be a user-to-commerce message thread uniquely associated with the combination of a particular user account and commerce representation (e.g., business page). As such, the consumer-to-business service 110 may receive a commerce-to-user message package 530 at a commerce intermediary server from a commerce messaging application 593, the commerce messaging application 593 associated with a commerce entity, the commerce-to-user message package 530 addressed to a message thread with a messaging system 140.

[0129] In some embodiments, a commerce-to-user message package 530 may be specified according to a custom message template associated with the commerce entity. A custom template may be defined according to a scripting language, such as JavaScript™. The consumer-to-business service 110 may provide tools for the creation of custom templates, such as custom message templates. These tools may provide a live preview of the custom template. Custom templates, including custom message templates, may be subject to a review by a human administrator of a consumer-to-business service 110, which may be performed as part of an application review process. Custom templates may be defined and approved in association with a specific commerce application.

[0130] The consumer-to-business service 110 may receive an application registration package in association with the commerce messaging application 593. The consumer-to-business service 110 may register the commerce messaging application 593 for access to a commerce intermediary server in response to the application registration package. The application registration package may define various custom templates for use in its communication with users. An application registration package may define one or more of a custom message template, a custom form template, and a custom call-to-action button.

[0131] A call-to-action button may comprise a control empowering access to a particular action with an associated visual representation inviting the user to engage in that action. Some call-to-action buttons may be prebuilt in the consumer-to-business messaging system 100 and provided to businesses for use with their commerce applications. For instance, call-to-action buttons for any or all of location sharing, content sharing, and tokenized payments may be made available for use with commerce applications. Custom versions for some of these functions may also be built by businesses, such as where only a general location is used by a commerce application (e.g., at the specificity of a city), so that a less-specific location sharing call-to-action button is used that can take advantage of lower-power location-determination techniques. Custom CTAs can be used either with custom templates, or as a CTA included as an element of a prebuilt template.

[0132] An application registration package may define one or more of a custom welcome text message for the message thread, a custom get-started call-to-action button for the message thread, one or more custom persistent call-to-action buttons for the message thread, and one or more custom dynamic triggers to start an interaction. A get-started call-

to-action button may comprise a button displayed during an initial access by a user to a user-to-commerce message thread, the get-started call-to-action button initiating initial functions for a user's interactions with a business. Pestilent call-to-action buttons may provide access to interactions with a business that may retain their usefulness persistently across a user's relationship with a business, such as invoking an order process or requesting an order status update. Custom dynamic triggers may associate context, such as inferred intent, from a message thread with commerce actions.

[0133] An application registration package may define a custom call-to-action button, the custom call-to-action button comprising visual representation information and activation response information, the activation response information comprising one or more of a uniform resource locator (URL), an application link, and a messaging invocation. A selected call-to-action button with activation response information comprising a URL may invoke a web access to that URL. A selected call-to-action button with activation response information comprising an application link may invoke an access to an application using the application link. A selected call-to-action button with activation response information comprising a messaging invocation may transmit a message to a commerce messaging application **593**.

[0134] The custom templates for a commerce application, or for a plurality of commerce applications, may be provided to one or more client devices of a user in response to a user engaging with a commerce representation powered by the one or more commerce applications. The consumer-to-business service **110** may send one or more of a custom message template, a custom form template, and a custom call-to-action button to the client device in response to the client device **120** accessing a commerce entity within the messaging system **140**.

[0135] In response to receiving a commerce-to-user **330** message package from a commerce messaging application **593**, the consumer-to-business service **110** may determine commerce access privileges for the commerce messaging application **593** in association with the message thread. The commerce access privileges may determine whether the commerce messaging application **593** has permission to post a commerce-to-user message package **530** to the message thread. The consumer-to-business service **110** may send the commerce-to-user message package **530** to a client device **120** associated with the message thread when the commerce access privileges indicate access to the message thread and reject the commerce message package when the commerce access privileges reject access to the message thread. This message thread may be associated with a user account for a user of the messaging system, the user identifier comprising a page-scoped identifier for the user account, the page-scoped identifier identifying the user account with the messaging system in relation to a commerce representation for the commerce entity within the messaging system, such as a businesses page.

[0136] Commerce access privileges may be determined according to a limited-time access token received in association with the commerce message package. The consumer-to-business service **110** may provide a limited-time access token in response to a user engaging with a business in a user-to-user message thread. For instance, a user may engage a commerce interface in a user-to-user message

thread for the arrangement of a business service. This user engagement, in some cases whether or not the arrangement of the service is completed, may authorize the commerce entity to send messages to the user-to-user message thread for a limited, defined period of time in order to engage with the one or more users in the thread for the arrangement of the service. As the message thread may be a user-to-user message thread, the commerce-to-user message package **530** may also be sent by the consumer-to-business service **110** to an additional recipient client device **125** used by a different user also involved in the user-to-user message thread, or a plurality of additional recipient client devices, each used by another user of a plurality of other users involved in the user-to-user message thread. Similarly, messaging in a user-to-user message thread by a user directed to a commerce entity may also be sent to other participants in the user-to-user message thread via a distribution of a user-to-commerce message package **535** to other recipient client devices associated with other users.

[0137] The commerce access privileges may be determined according to a sponsored messaging request associated with the commerce-to-user message package **530**. A sponsored messaging request may be associated with a payment from a business to the consumer-to-business service **110** to gain the privilege to contact users. Where a business requests to send a commerce-to-user message package **530** to a message thread outside of the authorization granted in response to user engagement with the business in the message thread, the consumer-to-business service **110** may engage with the commerce entity to authorize the sending only once payment is made.

[0138] The consumer-to-business service **110** may enforce spam prevention policies to prevent abuse of the consumer-to-business system messaging **100**. As such, the commerce access privilege may be determined according to a message throttling policy. A commerce entity, commerce representation, or commerce application may be subjected to a limit in a number of messages it may send in a defined time period. The consumer-to-business service **110** may select a commerce access privilege for automatic sampling based on an automatic sampling policy. A sample of messages sent by a commerce application may be collected and subjected to human review, with the privilege of the commerce application or commerce entity to submit messages to users cut off if a particular proportion of the human review indicates that spam is being sent. The consumer-to-business service **110** may additionally or alternatively perform a keyword-based spam analysis of the commerce-to-user message package and reject it or subject it to human review if the keyword-based spam analysis indicates that the message is spam.

[0139] A messaging client on a client device **120** may comprise a block control in relation to a commerce entity or commerce representation. A messaging client may receive a user block command in association with the message thread and pass the user block command to the consumer-to-business service **110**, which may thereafter block access by a commerce entity associated with the message thread for messaging the user. The consumer-to-business service **110** may register a negative reputation adjustment in association with the commerce entity in response to the user block command. The consumer-to-business service **110** may maintain a reputation score for each commerce entity, and the reception of a user block command may result in the reputation score for a commerce entity being lowered.

[0140] A client device **120** or recipient client device **125** may receive a commerce-to-user message package **530** comprising a commerce-to-user message from a commerce entity via a messaging system **140**. The messaging client on the client device **120** may receive the commerce-to-user message package **530** and display the commerce-to-user message in association with a user-to-commerce message thread on the client device. This commerce-to-user message may be defined according to a custom message template associated with a commerce entity, with the commerce-to-user message received from a commerce messaging application **593** registered with the messaging system **140**, the commerce messaging application **593** associated with the commerce entity, the custom message template registered for the commerce messaging application **593** with the messaging system.

[0141] A messaging client on a client device **120** may comprise a user-to-commerce message thread interface for a user-to-commerce message thread. The user-to-commerce message thread interface may comprise a custom call-to-action button for the commerce entity. The messaging client may receive a user call-to-action button activation of the custom call-to-action button and generate the user-to-commerce message in response to receiving the user call-to-action button activation of the custom call-to-action button. The user-to-commerce message thread interface in a messaging client may comprise one or more of a custom welcome text message for the message thread, a custom get-started call-to-action button for the message thread, one or more custom pestilent call-to-action buttons for the message thread, and one or more custom triggers to start an interaction.

[0142] A user-to-commerce message thread may be associated with a user account, being used to organize the interactions between a user and a commerce entity. The messaging client may display a user-to-commerce discovery interface on the client device, the user-to-commerce discovery interface comprising a plurality of suggested user-to-commerce options. This plurality of suggested user-to-commerce options may be selected according to one or more of profile information for the user account and promotional consideration information for one or more commerce entities. The consumer-to-business service **110** may generate a prediction of user-to-commerce options that the user may be interested in. These options may be customized to a user based on profile information for the user's user account, such as by customizing based on the detected preferences of other users with similar profiles. The options may additionally or alternatively be customized based on a detected context for a user, such as their current location. Customizing the options may include both selecting the options for display and ranking the options. Promotional consideration information may indicate that a commerce entity has paid to receive preferential selection for inclusion in options or preferential placement within the ranking of options.

[0143] The consumer-to-business service **110** may send user credentials to a commerce entity in association with a user-to-commerce message, the user credentials included in a user-to-commerce message package **535**. The user credentials may authenticate a user to the commerce application. In some cases, a user may be asked to enter their user credentials into a messaging client to empower the messaging client to use the user credentials to arrange for service with a business on behalf of the user. In some cases, however, the

user credentials may be retrieved from a local application for the business. A commerce entity may be associated with a local application on the client device and the messaging client may retrieve the user credentials from the local application via deep-linking within the local application.

[0144] A consumer-to-business service **110**, and in particular the messaging system **140**, may receive a user-to-commerce message package **535** comprising a user-to-commerce message from a client device **120** associated with the user account. The user-to-commerce message may be addressed to a user-to-commerce message thread associated with the commerce entity. The user sending this user-to-commerce message may indicate consent by the user to engaging with the commerce entity. The consumer-to-business service **110** may set a user access consent setting for the page-scoped identifier for the user account to indicate user consent. In some cases, the user-to-commerce message may comprise a response to a commerce-to-user message sent to the client device **120** by a commerce messaging application **593** associated with the commerce entity.

[0145] A user-to-commerce message thread may comprise one of a plurality of message threads available to a user via a messaging client. A message thread selection interface may be displayed by a messaging client empowering the user to select a message thread to view. The messaging client may receive a user interface selection of a user-to-commerce message thread on a client device **120**, the user-to-commerce message thread associated with a commerce entity with a messaging system **140**. The messaging client may display a user-to-commerce message thread interface for the user-to-commerce message thread in response to the user interface selection. The user may compose a user-to-commerce message via a user-to-commerce message thread interface. The messaging client may receive a user-to-commerce message via the user-to-commerce message thread interface for the user-to-commerce message thread and send the user-to-commerce message to the commerce entity via the messaging system **140** as a user-to-commerce message package **535**.

[0146] A user-to-user message thread may comprise one of a plurality of messages threads. A user-to-user message thread may be displayed with a user-to-user message thread interface, the user-to-user message thread interface organizing the messaging interaction between two or more users. A messaging client may receive a commerce interface control selection in the user-to-user message thread interface on a client device **120**, the user-to-user message thread associated with a user-to-user message thread for a plurality of users with a messaging system **140**. A commerce interface control selection may comprise a selection of a commerce entity with which to engage in a commerce interaction. The messaging client may display a commerce interface in association with the user-to-user message thread interface, the commerce interface comprising a plurality of commerce configuration options. The commerce interface being displayed in association with the user-to-user message thread interface may comprise at least a portion of the user-to-user message thread interface being visible during display of the commerce interface.

[0147] The messaging client may receive a commerce option share control selection in association with the commerce interface. The messaging client may share the plurality of commerce configuration options with the user-to-user message thread in response to the commerce option

share control selection. Sharing the plurality of commerce configuration options with the user-to-user message thread may comprise posting the plurality of commerce configuration options to the user-to-user message thread as a user-to-user message. As such, the plurality of commerce configuration options may be sent as a message to a plurality of client devices associated with the plurality of users associated with a user-to-user message thread. This may encourage discussion of the commerce configuration options by the users, thereby helping the users collectively decide on the configuration of a service, such as collectively deciding on a restaurant to eat dinner at, when to eat dinner, and so forth.

[0148] Sharing the plurality of commerce configuration options with the user-to-user message thread may comprise submitting a commerce configuration option poll to the user-to-user message thread. Client devices used by members of the message thread may receive the commerce configuration option poll which may be displayed on the client devices, empowering the users to select their preferred configuration option. The user of the client device **120** that initiated the poll may also be empowered to engage in the poll or refrain from engaging in the poll. The client device **120** may receive poll result information for the commerce configuration option poll from the other client devices via the messaging system **140**. The messaging client on the client device **120** may display the poll result information for the commerce configuration option poll, such as by displaying the number of votes for each of the options and/or displaying the winning poll option with the most votes. As such, the poll result information for the commerce configuration option poll may be displayed in association with the plurality of commerce configuration options in the commerce interface. The poll result information may comprise a poll winner option corresponding to one of the plurality of commerce configuration options, and the messaging client may display a poll winner indicator in association with the poll winner option in the display of the plurality of commerce configuration options in the commerce interface.

[0149] The commerce interface may be associated with a commerce entity, the plurality of commerce configuration options selected for the commerce interface according to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity. Additionally or alternative, the plurality of commerce configuration options may be ranked in the commerce interface according to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity. The commerce entity selected may have been promoted based on the message-thread context and/or promotional consideration. A commerce interface control selection may be for a commerce interface control, with the messaging client displaying the commerce interface control in response to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity. Alternatively, the messaging client may display the commerce interface control in response to one or more of a trigger detected in the user-to-user message thread and a discovery control selection. The messaging client may receive a commerce option selection via the commerce interface and send a commerce configuration command from the client device **120** to the commerce entity via the messaging system **140**.

[0150] A commerce entity, as may be represented through a commerce messaging application **593**, may respond to a user-to-commerce message. The client device **120** may receive a user-to-user message-thread message from the commerce entity via the messaging system **140** in a commerce-to-user message package. The user-to-user message-thread message may be a message addressed by a commerce entity to a user-to-user message thread. The messaging client on the client device **120** may store the user-to-user message-thread message in association with the user-to-user message thread and display the user-to-user message-thread message in the user-to-user message thread interface. The user-to-user message-thread message may also be received by a different recipient client device **125** associated with another user due to the user-to-user message thread being associated with multiple users and therefore multiple client devices.

[0151] A commerce messaging application **593** may also submit a user-to-commerce message-thread message in a commerce-to-user message package. A client device **120** may receive a user-to-commerce message-thread message from the commerce entity via the messaging system **140**. The messaging client on the client device **120** may store the user-to-commerce message-thread message in association with a user-to-commerce message thread and display the user-to-commerce message-thread message in a user-to-commerce message thread interface. A user-to-commerce message-thread message may be invoked in response to actions in a user-to-user message thread, with the user-to-commerce message-thread message comprising information not designated for the user-to-user message thread. The user-to-commerce message-thread message may be received in parallel or sequence with a user-to-user message-thread message, with the former comprising information for only the user requesting a service and the latter comprising information for all participants in a user-to-user message thread. For instance, in regards to local travel, a user-to-user message thread may be provided with less-personal details, such as an arrival location and predicted arrival time, such as may be used where two or more people are coordinating meeting up. The user-to-commerce message thread may be provided with more-personal details, such as may include the pickup location, a predicted cost for the trip, a receipt for the trip, a driver identity for the trip, and/or other details relevant to the user requesting a service, but not appropriate for other users, either due to privacy protection or due to not wanting to burden the user-to-user message thread, which conversation may be ongoing, with unwanted information. Which information is delivered to which thread, user-to-user or user-to-commerce, may be configured by the commerce messaging application **593**.

[0152] A commerce contact application **596** may be used to request information about a user. The consumer-to-business service **110** may receive a user information request **540** from a commerce contact application **596** at a commerce intermediary server, the commerce contact application **596** associated with the commerce representation for the commerce entity within the messaging system **140**. The user information request for the scoped identifier **510** for the user account.

[0153] The consumer-to-business service **110** may determine a user access consent setting for the scoped identifier **510** for the user account. The user access consent setting may control whether private information for a user is distributed to a commerce entity. The consumer-to-business

service 110 may send a user information data package 545 to the commerce contact application 596 from the commerce intermediary server in response to the user information request 540 when the user access consent setting for the scoped identifier 510 indicates user consent. The consumer-to-business service 110 may reject the user information request 540 when the user access consent setting for the scoped identifier 510 indicates user non-consent. Rejecting the user information request 540 may comprise sending a rejection message to the commerce contact application 596. A user information data package 545 may comprise one or more of name information for the user account, contact information for the user account, and biographical information for the user account.

[0154] Included herein is a set of flow charts representative of exemplary methodologies for performing novel aspects of the disclosed architecture. While, for purposes of simplicity of explanation, the one or more methodologies shown herein, for example, in the form of a flow chart or flow diagram, are shown and described as a series of acts, it is to be understood and appreciated that the methodologies are not limited by the order of acts, as some acts may, in accordance therewith, occur in a different order and/or concurrently with other acts from that shown and described herein. For example, those skilled in the art will understand and appreciate that a methodology could alternatively be represented as a series of interrelated states or events, such as in a state diagram. Moreover, not all acts illustrated in a methodology may be required for a novel implementation.

[0155] FIG. 6A illustrates one embodiment of a first logic flow 600. The logic flow 600 may be representative of some or all of the operations executed by one or more embodiments described herein.

[0156] In the illustrated embodiment shown in FIG. 6A, the logic flow 600 may send a page-scoped identifier to a commerce front-end application from a commerce intermediary server, the commerce front-end application associated with a commerce entity, the page-scoped identifier identifying a user account with a messaging system in relation to a commerce representation for the commerce entity within the messaging system at block 602.

[0157] The logic flow 600 may receive a user information request from a commerce contact application at the commerce intermediary server, the commerce contact application associated with the commerce representation for the commerce entity within the messaging system, the user information request for the page-scoped identifier at block 604.

[0158] The logic flow 600 may determine a user access consent setting for the page-scoped identifier for the user account at block 606.

[0159] The logic flow 600 may send a user information data package to the commerce contact application from the commerce intermediary server in response to the user information request when the user access consent setting for the page-scoped identifier indicates user consent at block 608.

[0160] The logic flow 600 may reject the user information request when the user access consent setting for the page-scoped identifier indicates user non-consent at block 610.

[0161] FIG. 6B illustrates one embodiment of a second logic flow 620. The logic flow 620 may be representative of some or all of the operations executed by one or more embodiments described herein.

[0162] In the illustrated embodiment shown in FIG. 6B, the logic flow 620 may receive a commerce message package at a commerce intermediary server from a commerce messaging application, the commerce messaging application associated with a commerce entity, the commerce message package addressed to a message thread with a messaging system at block 622.

[0163] The logic flow 620 may determine commerce access privileges for the commerce messaging application in association with the message thread at block 624.

[0164] The logic flow 620 may send the commerce message package to a client device associated with the message thread when the commerce access privileges indicate access to the message thread at block 626.

[0165] The logic flow 620 may reject the commerce message package when the commerce access privileges reject access to the message thread at block 628.

[0166] FIG. 6C illustrates one embodiment of a third logic flow 640. The logic flow 640 may be representative of some or all of the operations executed by one or more embodiments described herein.

[0167] In the illustrated embodiment shown in FIG. 6C, the logic flow 640 may receive a user interface selection of a user-to-commerce message thread on a client device, the user-to-commerce message thread associated with a commerce entity with a messaging system at block 642.

[0168] The logic flow 640 may display a user-to-commerce message thread interface for the user-to-commerce message thread at block 644.

[0169] The logic flow 640 may receive a user-to-commerce message via the user-to-commerce message thread interface for the user-to-commerce message thread at block 646.

[0170] The logic flow 640 may send the user-to-commerce message to the commerce entity via the messaging system at block 648.

[0171] FIG. 6D illustrates one embodiment of a fourth logic flow 660. The logic flow 660 may be representative of some or all of the operations executed by one or more embodiments described herein.

[0172] In the illustrated embodiment shown in FIG. 6D, the logic flow 660 may receive a commerce interface control selection in a user-to-user message thread interface on a client device, the user-to-user message thread associated with a user-to-user message thread for a plurality of users with a messaging system at block 662.

[0173] The logic flow 660 may display a commerce interface in association with the user-to-user message thread interface, the commerce interface comprising a plurality of commerce configuration options at block 664.

[0174] The logic flow 660 may receive a commerce option share control selection in association with the commerce interface at block 666.

[0175] The logic flow 660 may share the plurality of commerce configuration options with the user-to-user message thread at block 668.

[0176] The embodiments are not limited to these examples.

[0177] FIG. 7 illustrates a block diagram of a centralized system 700. The centralized system 700 may implement some or all of the structure and/or operations for the consumer-to-business messaging system 100 in a single computing entity, such as entirely within a single centralized server device 720.

[0178] The centralized server device **720** may comprise any electronic device capable of receiving, processing, and sending information for the consumer-to-business messaging system **100**. Examples of an electronic device may include without limitation an ultra-mobile device, a mobile device, a personal digital assistant (PDA), a mobile computing device, a smart phone, a telephone, a digital telephone, a cellular telephone, ebook readers, a handset, a one-way pager, a two-way pager, a messaging device, a computer, a personal computer (PC), a desktop computer, a laptop computer, a notebook computer, a netbook computer, a handheld computer, a tablet computer, a server, a server array or server farm, a web server, a network server, an Internet server, a work station, a mini-computer, a main frame computer, a supercomputer, a network appliance, a web appliance, a distributed computing system, multiprocessor systems, processor-based systems, consumer electronics, programmable consumer electronics, game devices, television, digital television, set top box, wireless access point, base station, subscriber station, mobile subscriber center, radio network controller, router, hub, gateway, bridge, switch, machine, or combination thereof. The embodiments are not limited in this context.

[0179] The centralized server device **720** may execute processing operations or logic for the consumer-to-business messaging system **100** using a processing component **730**. The processing component **730** may comprise various hardware elements, software elements, or a combination of both. Examples of hardware elements may include devices, logic devices, components, processors, microprocessors, circuits, processor circuits, circuit elements (e.g., transistors, resistors, capacitors, inductors, and so forth), integrated circuits, application specific integrated circuits (ASIC), programmable logic devices (PLD), digital signal processors (DSP), field programmable gate array (FPGA), memory units, logic gates, registers, semiconductor device, chips, microchips, chip sets, and so forth. Examples of software elements may include software components, programs, applications, computer programs, application programs, system programs, software development programs, machine programs, operating system software, middleware, firmware, software modules, routines, subroutines, functions, methods, procedures, software interfaces, application program interfaces (API), instruction sets, computing code, computer code, code segments, computer code segments, words, values, symbols, or any combination thereof. Determining whether an embodiment is implemented using hardware elements and/or software elements may vary in accordance with any number of factors, such as desired computational rate, power levels, heat tolerances, processing cycle budget, input data rates, output data rates, memory resources, data bus speeds and other design or performance constraints, as desired for a given implementation.

[0180] The centralized server device **720** may execute communications operations or logic for the consumer-to-business messaging system **100** using communications component **740**. The communications component **740** may implement any well-known communications techniques and protocols, such as techniques suitable for use with packet-switched networks (e.g., public networks such as the Internet, private networks such as an enterprise intranet, and so forth), circuit-switched networks (e.g., the public switched telephone network), or a combination of packet-switched networks and circuit-switched networks (with suitable gate-

ways and translators). The communications component **740** may include various types of standard communication elements, such as one or more communications interfaces, network interfaces, network interface cards (NIC), radios, wireless transmitters/receivers (transceivers), wired and/or wireless communication media, physical connectors, and so forth. By way of example, and not limitation, communication media **712** includes wired communications media and wireless communications media. Examples of wired communications media may include a wire, cable, metal leads, printed circuit boards (PCB), backplanes, switch fabrics, semiconductor material, twisted-pair wire, co-axial cable, fiber optics, a propagated signal, and so forth. Examples of wireless communications media may include acoustic, radio-frequency (RF) spectrum, infrared and other wireless media.

[0181] The centralized server device **720** may implement the consumer-to-business service **110** in a single computing entity. The centralized server device **720** may communicate with other devices over a communications media **712** using communications signals **714** via the communications component **740**. The devices may be internal or external to the centralized server device **720** as desired for a given implementation. The centralized server device **720** may communicate with a plurality of client devices **710**, such as may comprise the client device **120** and the recipient client device **125**.

[0182] FIG. 8 illustrates a block diagram of a distributed system **800**. The distributed system **800** may distribute portions of the structure and/or operations for the consumer-to-business messaging system **100** across multiple computing entities. Examples of distributed system **800** may include without limitation a client-server architecture, a 3-tier architecture, an N-tier architecture, a tightly-coupled or clustered architecture, a peer-to-peer architecture, a master-slave architecture, a shared database architecture, and other types of distributed systems. The embodiments are not limited in this context.

[0183] The distributed system **800** may comprise a plurality of distributed server devices **810**. In general, the distributed server devices **810** may be the same or similar to the centralized server device **720** as described with reference to FIG. 7. For instance, the distributed server devices **810** may each comprise a processing component **830** and a communications component **840** which are the same or similar to the processing component **730** and the communications component **740**, respectively, as described with reference to FIG. 7. In another example, the distributed server devices **810** may communicate over a communications media **812** using communications signals **814** via the communications components **840**.

[0184] The distributed server devices **810** may comprise or employ one or more server programs that operate to perform various methodologies in accordance with the described embodiments. In one embodiment, for example, the distributed server devices **810** may each implement one or more consumer-to-business servers **815**. The consumer-to-business servers **815** may collectively implement the consumer-to-business service **110** as a distributed computing entity. The consumer-to-business servers **815** may communicate with a plurality of client devices **820**, such as may comprise the client device **120**, the recipient client device **125**, and client devices **710**.

[0185] FIG. 9 illustrates an embodiment of an exemplary computing architecture 900 suitable for implementing various embodiments as previously described. In one embodiment, the computing architecture 900 may comprise or be implemented as part of an electronic device. Examples of an electronic device may include those described with reference to FIG. 7, 8, among others. The embodiments are not limited in this context.

[0186] As used in this application, the terms “system” and “component” are intended to refer to a computer-related entity, either hardware, a combination of hardware and software, software, or software in execution, examples of which are provided by the exemplary computing architecture 900. For example, a component can be, but is not limited to being, a process running on a processor, a processor, a hard disk drive, multiple storage drives (of optical and/or magnetic storage medium), an object, an executable, a thread of execution, a program, and/or a computer. By way of illustration, both an application running on a server and the server can be a component. One or more components can reside within a process and/or thread of execution, and a component can be localized on one computer and/or distributed between two or more computers. Further, components may be communicatively coupled to each other by various types of communications media to coordinate operations. The coordination may involve the uni-directional or bi-directional exchange of information. For instance, the components may communicate information in the form of signals communicated over the communications media. The information can be implemented as signals allocated to various signal lines. In such allocations, each message is a signal. Further embodiments, however, may alternatively employ data messages. Such data messages may be sent across various connections. Exemplary connections include parallel interfaces, serial interfaces, and bus interfaces.

[0187] The computing architecture 900 includes various common computing elements, such as one or more processors, multi-core processors, co-processors, memory units, chipsets, controllers, peripherals, interfaces, oscillators, timing devices, video cards, audio cards, multimedia input/output (I/O) components, power supplies, and so forth. The embodiments, however, are not limited to implementation by the computing architecture 900.

[0188] As shown in FIG. 9, the computing architecture 900 comprises a processing unit 904, a system memory 906 and a system bus 908. The processing unit 904 can be any of various commercially available processors, including without limitation an AMD® Athlon®, Duron® and Opteron® processors; ARM® application, embedded and secure processors; IBM® and Motorola® DragonBall® and PowerPC® processors; IBM and Sony® Cell processors; Intel® Celeron®, Core (2) Duo®, Itanium®, Pentium®, Xeon®, and XScale® processors; and similar processors. Dual microprocessors, multi-core processors, and other multi-processor architectures may also be employed as the processing unit 904.

[0189] The system bus 908 provides an interface for system components including, but not limited to, the system memory 906 to the processing unit 904. The system bus 908 can be any of several types of bus structure that may further interconnect to a memory bus (with or without a memory controller), a peripheral bus, and a local bus using any of a variety of commercially available bus architectures. Interface adapters may connect to the system bus 908 via a slot

architecture. Example slot architectures may include without limitation Accelerated Graphics Port (AGP), Card Bus, (Extended) Industry Standard Architecture ((E)ISA), Micro Channel Architecture (MCA), NuBus, Peripheral Component Interconnect (Extended) (PCI(X)), PCI Express, Personal Computer Memory Card International Association (PCMCIA), and the like.

[0190] The computing architecture 900 may comprise or implement various articles of manufacture. An article of manufacture may comprise a computer-readable storage medium to store logic. Examples of a computer-readable storage medium may include any tangible media capable of storing electronic data, including volatile memory or non-volatile memory, removable or non-removable memory, erasable or non-erasable memory, writeable or re-writable memory, and so forth. Examples of logic may include executable computer program instructions implemented using any suitable type of code, such as source code, compiled code, interpreted code, executable code, static code, dynamic code, object-oriented code, visual code, and the like. Embodiments may also be at least partly implemented as instructions contained in or on a non-transitory computer-readable medium, which may be read and executed by one or more processors to enable performance of the operations described herein.

[0191] The system memory 906 may include various types of computer-readable storage media in the form of one or more higher speed memory units, such as read-only memory (ROM), random-access memory (RAM), dynamic RAM (DRAM), Double-Data-Rate DRAM (DDRAM), synchronous DRAM (SDRAM), static RAM (SRAM), programmable ROM (PROM), erasable programmable ROM (EPROM), electrically erasable programmable ROM (EEPROM), flash memory, polymer memory such as ferroelectric polymer memory, ovonic memory, phase change or ferroelectric memory, silicon-oxide-nitride-oxide-silicon (SONOS) memory, magnetic or optical cards, an array of devices such as Redundant Array of Independent Disks (RAID) drives, solid state memory devices (e.g., USB memory, solid state drives (SSD) and any other type of storage media suitable for storing information. In the illustrated embodiment shown in FIG. 9, the system memory 906 can include non-volatile memory 910 and/or volatile memory 912. A basic input/output system (BIOS) can be stored in the non-volatile memory 910.

[0192] The computer 902 may include various types of computer-readable storage media in the form of one or more lower speed memory units, including an internal (or external) hard disk drive (HDD) 914, a magnetic floppy disk drive (FDD) 916 to read from or write to a removable magnetic disk 918, and an optical disk drive 920 to read from or write to a removable optical disk 922 (e.g., a CD-ROM or DVD). The HDD 914, FDD 916 and optical disk drive 920 can be connected to the system bus 908 by a HDD interface 924, an FDD interface 926 and an optical drive interface 928, respectively. The HDD interface 924 for external drive implementations can include at least one or both of Universal Serial Bus (USB) and IEEE 1394 interface technologies.

[0193] The drives and associated computer-readable media provide volatile and/or nonvolatile storage of data, data structures, computer-executable instructions, and so forth. For example, a number of program modules can be stored in the drives and memory units 910, 912, including an

operating system **930**, one or more application programs **932**, other program modules **934**, and program data **936**. In one embodiment, the one or more application programs **932**, other program modules **934**, and program data **936** can include, for example, the various applications and/or components of the consumer-to-business messaging system **100**.

[0194] A user can enter commands and information into the computer **902** through one or more wire/wireless input devices, for example, a keyboard **938** and a pointing device, such as a mouse **940**. Other input devices may include microphones, infra-red (IR) remote controls, radio-frequency (RF) remote controls, game pads, stylus pens, card readers, dongles, finger print readers, gloves, graphics tablets, joysticks, keyboards, retina readers, touch screens (e.g., capacitive, resistive, etc.), trackballs, trackpads, sensors, styluses, and the like. These and other input devices are often connected to the processing unit **904** through an input device interface **942** that is coupled to the system bus **908**, but can be connected by other interfaces such as a parallel port, IEEE 1394 serial port, a game port, a USB port, an IR interface, and so forth.

[0195] A monitor **944** or other type of display device is also connected to the system bus **908** via an interface, such as a video adaptor **946**. The monitor **944** may be internal or external to the computer **902**. In addition to the monitor **944**, a computer typically includes other peripheral output devices, such as speakers, printers, and so forth.

[0196] The computer **902** may operate in a networked environment using logical connections via wire and/or wireless communications to one or more remote computers, such as a remote computer **948**. The remote computer **948** can be a workstation, a server computer, a router, a personal computer, portable computer, microprocessor-based entertainment appliance, a peer device or other common network node, and typically includes many or all of the elements described relative to the computer **902**, although, for purposes of brevity, only a memory/storage device **950** is illustrated. The logical connections depicted include wire/wireless connectivity to a local area network (LAN) **952** and/or larger networks, for example, a wide area network (WAN) **954**. Such LAN and WAN networking environments are commonplace in offices and companies, and facilitate enterprise-wide computer networks, such as intranets, all of which may connect to a global communications network, for example, the Internet.

[0197] When used in a LAN networking environment, the computer **902** is connected to the LAN **952** through a wire and/or wireless communication network interface or adaptor **956**. The adaptor **956** can facilitate wire and/or wireless communications to the LAN **952**, which may also include a wireless access point disposed thereon for communicating with the wireless functionality of the adaptor **956**.

[0198] When used in a WAN networking environment, the computer **902** can include a modem **958**, or is connected to a communications server on the WAN **954**, or has other means for establishing communications over the WAN **954**, such as by way of the Internet. The modem **958**, which can be internal or external and a wire and/or wireless device, connects to the system bus **908** via the input device interface **942**. In a networked environment, program modules depicted relative to the computer **902**, or portions thereof, can be stored in the remote memory/storage device **950**. It will be appreciated that the network connections shown are

exemplary and other means of establishing a communications link between the computers can be used.

[0199] The computer **902** is operable to communicate with wire and wireless devices or entities using the IEEE 802 family of standards, such as wireless devices operatively disposed in wireless communication (e.g., IEEE 802.9 over-the-air modulation techniques). This includes at least Wi-Fi (or Wireless Fidelity), WiMax, and Bluetooth™ wireless technologies, among others. Thus, the communication can be a predefined structure as with a conventional network or simply an ad hoc communication between at least two devices. Wi-Fi networks use radio technologies called IEEE 802.9x (a, b, g, n, etc.) to provide secure, reliable, fast wireless connectivity. A Wi-Fi network can be used to connect computers to each other, to the Internet, and to wire networks (which use IEEE 802.3-related media and functions).

[0200] FIG. 10 illustrates a block diagram of an exemplary communications architecture **1000** suitable for implementing various embodiments as previously described. The communications architecture **1000** includes various common communications elements, such as a transmitter, receiver, transceiver, radio, network interface, baseband processor, antenna, amplifiers, filters, power supplies, and so forth. The embodiments, however, are not limited to implementation by the communications architecture **1000**.

[0201] As shown in FIG. 10, the communications architecture **1000** comprises includes one or more clients **1002** and servers **1004**. The clients **1002** may implement client devices, such as may include the client device **120**, the recipient client device **125**, the client devices **710**, and the client devices **820**. The servers **1004** may implement the consumer-to-business service **110** as a centralized or distributed entity. The clients **1002** and the servers **1004** are operatively connected to one or more respective client data stores **1008** and server data stores **1010** that can be employed to store information local to the respective clients **1002** and servers **1004**, such as cookies and/or associated contextual information.

[0202] The clients **1002** and the servers **1004** may communicate information between each other using a communication framework **1006**. The communications framework **1006** may implement any well-known communications techniques and protocols. The communications framework **1006** may be implemented as a packet-switched network (e.g., public networks such as the Internet, private networks such as an enterprise intranet, and so forth), a circuit-switched network (e.g., the public switched telephone network), or a combination of a packet-switched network and a circuit-switched network (with suitable gateways and translators).

[0203] The communications framework **1006** may implement various network interfaces arranged to accept, communicate, and connect to a communications network. A network interface may be regarded as a specialized form of an input output interface. Network interfaces may employ connection protocols including without limitation direct connect, Ethernet (e.g., thick, thin, twisted pair 10/100/1000 Base T, and the like), token ring, wireless network interfaces, cellular network interfaces, IEEE 802.11a-x network interfaces, IEEE 802.16 network interfaces, IEEE 802.20 network interfaces, and the like. Further, multiple network interfaces may be used to engage with various communications network types. For example, multiple network inter-

faces may be employed to allow for the communication over broadcast, multicast, and unicast networks. Should processing requirements dictate a greater amount speed and capacity, distributed network controller architectures may similarly be employed to pool, load balance, and otherwise increase the communicative bandwidth required by clients **1002** and the servers **1004**. A communications network may be any one and the combination of wired and/or wireless networks including without limitation a direct interconnection, a secured custom connection, a private network (e.g., an enterprise intranet), a public network (e.g., the Internet), a Personal Area Network (PAN), a Local Area Network (LAN), a Metropolitan Area Network (MAN), an Operating Missions as Nodes on the Internet (OMNI), a Wide Area Network (WAN), a wireless network, a cellular network, and other communications networks.

[0204] FIG. 11 illustrates an embodiment of a device **1100** for use in a multicarrier OFDM system, such as the consumer-to-business messaging system **100**. Device **1100** may implement, for example, software components **1160** as described with reference to system **100** and/or a logic circuit **1135**. The logic circuit **1135** may include physical circuits to perform operations described for the consumer-to-business messaging system **100**. As shown in FIG. 11, device **1100** may include a radio interface **1110**, baseband circuitry **1120**, and computing platform **1130**, although embodiments are not limited to this configuration.

[0205] The device **1100** may implement some or all of the structure and/or operations for the consumer-to-business messaging system **100** and/or logic circuit **1135** in a single computing entity, such as entirely within a single device. Alternatively, the device **1100** may distribute portions of the structure and/or operations for the consumer-to-business messaging system **100** and/or logic circuit **1135** across multiple computing entities using a distributed system architecture, such as a client-server architecture, a 3-tier architecture, an N-tier architecture, a tightly-coupled or clustered architecture, a peer-to-peer architecture, a master-slave architecture, a shared database architecture, and other types of distributed systems. The embodiments are not limited in this context.

[0206] In one embodiment, radio interface **1110** may include a component or combination of components adapted for transmitting and/or receiving single carrier or multicarrier modulated signals (e.g., including complementary code keying (CCK) and/or orthogonal frequency division multiplexing (OFDM) symbols) although the embodiments are not limited to any specific over-the-air interface or modulation scheme. Radio interface **1110** may include, for example, a receiver **1112**, a transmitter **1116** and/or a frequency synthesizer **1114**. Radio interface **1110** may include bias controls, a crystal oscillator and/or one or more antennas **1118**. In another embodiment, radio interface **1110** may use external voltage-controlled oscillators (VCOs), surface acoustic wave filters, intermediate frequency (IF) filters and/or RF filters, as desired. Due to the variety of potential RF interface designs an expansive description thereof is omitted.

[0207] Baseband circuitry **1120** may communicate with radio interface **1110** to process receive and/or transmit signals and may include, for example, an analog-to-digital converter **1122** for down converting received signals, a digital-to-analog converter **1124** for up converting signals for transmission. Further, baseband circuitry **1120** may

include a baseband or physical layer (PHY) processing circuit **1156** for PHY link layer processing of respective receive/transmit signals. Baseband circuitry **1120** may include, for example, a processing circuit **1128** for medium access control (MAC)/data link layer processing. Baseband circuitry **1120** may include a memory controller **1132** for communicating with processing circuit **1128** and/or a computing platform **1130**, for example, via one or more interfaces **1134**.

[0208] In some embodiments, PHY processing circuit **1126** may include a frame construction and/or detection module, in combination with additional circuitry such as a buffer memory, to construct and/or deconstruct communication frames, such as radio frames. Alternatively or in addition, MAC processing circuit **1128** may share processing for certain of these functions or perform these processes independent of PHY processing circuit **1126**. In some embodiments, MAC and PHY processing may be integrated into a single circuit.

[0209] The computing platform **1130** may provide computing functionality for the device **1100**. As shown, the computing platform **1130** may include a processing component **1140**. In addition to, or alternatively of, the baseband circuitry **1120**, the device **1100** may execute processing operations or logic for the consumer-to-business messaging system **100** and logic circuit **1135** using the processing component **1140**. The processing component **1140** (and/or PHY **1126** and/or MAC **1128**) may comprise various hardware elements, software elements, or a combination of both. Examples of hardware elements may include devices, logic devices, components, processors, microprocessors, circuits, processor circuits, circuit elements (e.g., transistors, resistors, capacitors, inductors, and so forth), integrated circuits, application specific integrated circuits (ASIC), programmable logic devices (PLD), digital signal processors (DSP), field programmable gate array (FPGA), memory units, logic gates, registers, semiconductor device, chips, microchips, chip sets, and so forth. Examples of software elements may include software components, programs, applications, computer programs, application programs, system programs, software development programs, machine programs, operating system software, middleware, firmware, software modules, routines, subroutines, functions, methods, procedures, software interfaces, application program interfaces (API), instruction sets, computing code, computer code, code segments, computer code segments, words, values, symbols, or any combination thereof. Determining whether an embodiment is implemented using hardware elements and/or software elements may vary in accordance with any number of factors, such as desired computational rate, power levels, heat tolerances, processing cycle budget, input data rates, output data rates, memory resources, data bus speeds and other design or performance constraints, as desired for a given implementation.

[0210] The computing platform **1130** may further include other platform components **1150**. Other platform components **1150** include common computing elements, such as one or more processors, multi-core processors, co-processors, memory units, chipsets, controllers, peripherals, interfaces, oscillators, timing devices, video cards, audio cards, multimedia input/output (I/O) components (e.g., digital displays), power supplies, and so forth. Examples of memory units may include without limitation various types of computer readable and machine readable storage media in the

form of one or more higher speed memory units, such as read-only memory (ROM), random-access memory (RAM), dynamic RAM (DRAM), Double-Data-Rate DRAM (DDRAM), synchronous DRAM (SDRAM), static RAM (SRAM), programmable ROM (PROM), erasable programmable ROM (EPROM), electrically erasable programmable ROM (EEPROM), flash memory, polymer memory such as ferroelectric polymer memory, ovonic memory, phase change or ferroelectric memory, silicon-oxide-nitride-oxide-silicon (SONOS) memory, magnetic or optical cards, an array of devices such as Redundant Array of Independent Disks (RAID) drives, solid state memory devices (e.g., USB memory, solid state drives (SSD) and any other type of storage media suitable for storing information.

[0211] Device **1100** may be, for example, an ultra-mobile device, a mobile device, a fixed device, a machine-to-machine (M2M) device, a personal digital assistant (PDA), a mobile computing device, a smart phone, a telephone, a digital telephone, a cellular telephone, user equipment, eBook readers, a handset, a one-way pager, a two-way pager, a messaging device, a computer, a personal computer (PC), a desktop computer, a laptop computer, a notebook computer, a netbook computer, a handheld computer, a tablet computer, a server, a server array or server farm, a web server, a network server, an Internet server, a work station, a mini-computer, a main frame computer, a supercomputer, a network appliance, a web appliance, a distributed computing system, multiprocessor systems, processor-based systems, consumer electronics, programmable consumer electronics, game devices, television, digital television, set top box, wireless access point, base station, node B, evolved node B (eNB), subscriber station, mobile subscriber center, radio network controller, router, hub, gateway, bridge, switch, machine, or combination thereof. Accordingly, functions and/or specific configurations of device **1100** described herein, may be included or omitted in various embodiments of device **1100**, as suitably desired. In some embodiments, device **1100** may be configured to be compatible with protocols and frequencies associated one or more of the 3GPP LTE Specifications and/or IEEE 1102.16 Standards for WMANs, and/or other broadband wireless networks, cited herein, although the embodiments are not limited in this respect.

[0212] Embodiments of device **1100** may be implemented using single input single output (SISO) architectures. However, certain implementations may include multiple antennas (e.g., antennas **1118**) for transmission and/or reception using adaptive antenna techniques for beamforming or spatial division multiple access (SDMA) and/or using MIMO communication techniques.

[0213] The components and features of device **1100** may be implemented using any combination of discrete circuitry, application specific integrated circuits (ASICs), logic gates and/or single chip architectures. Further, the features of device **1100** may be implemented using microcontrollers, programmable logic arrays and/or microprocessors or any combination of the foregoing where suitably appropriate. It is noted that hardware, firmware and/or software elements may be collectively or individually referred to herein as “logic” or “circuit.”

[0214] It should be appreciated that the exemplary device **1100** shown in the block diagram of FIG. **11** may represent one functionally descriptive example of many potential implementations. Accordingly, division, omission or inclu-

sion of block functions depicted in the accompanying figures does not infer that the hardware components, circuits, software and/or elements for implementing these functions would be necessarily be divided, omitted, or included in embodiments.

[0215] A computer-implemented method may comprise sending a page-scoped identifier to a commerce front-end application from a commerce intermediary server, the commerce front-end application associated with a commerce entity, the page-scoped identifier identifying a user account with a messaging system in relation to a commerce representation for the commerce entity within the messaging system; receiving a user information request from a commerce contact application at the commerce intermediary server, the commerce contact application associated with the commerce representation for the commerce entity within the messaging system, the user information request for the page-scoped identifier; determining a user access consent setting for the page-scoped identifier for the user account; sending a user information data package to the commerce contact application from the commerce intermediary server in response to the user information request when the user access consent setting for the page-scoped identifier indicates user consent; and rejecting the user information request when the user access consent setting for the page-scoped identifier indicates user non-consent.

[0216] A computer-implemented method may further comprise wherein the commerce front-end application and the commerce contact application comprise distinct applications.

[0217] A computer-implemented method may further comprise wherein the commerce front-end application and the commerce contact application are a common application.

[0218] A computer-implemented method may further comprise the commerce entity corresponding to a commerce type, the commerce intermediary server supporting a plurality of commerce types, the commerce type comprising one of the plurality of commerce types.

[0219] A computer-implemented method may further comprise the user information data package comprising one or more of name information for the user account, contact information for the user account, and biographical information for the user account.

[0220] A computer-implemented method may further comprise receiving a user-to-commerce invocation associated with the commerce entity in association with the user account; generating the page-scoped identifier in response to the user-to-commerce invocation; and sending the page-scoped identifier to the commerce front-end application in response to the user-to-commerce invocation.

[0221] A computer-implemented method may further comprise receiving a user-to-commerce message thread invocation from a client device associated with the user account, the user-to-commerce message thread invocation in association with a commerce-entity discovery interface on the client device; and sending the page-scoped identifier to the commerce front-end application in response to receiving the user-to-commerce message thread invocation from the client device.

[0222] A computer-implemented method may further comprise receiving a user-to-commerce message thread invocation from a client device associated with the user account, the user-to-commerce message thread invocation in association with a commerce-entity trigger suggestion on the

client device; and sending the page-scoped identifier to the commerce front-end application in response to receiving the user-to-commerce message thread invocation from the client device.

[0223] A computer-implemented method may further comprise receiving a user-to-commerce invocation in association with a web plugin on a web page associated with the commerce entity; and sending the page-scoped identifier to the commerce front-end application in response to receiving the user-to-commerce invocation in association with the web plugin.

[0224] A computer-implemented method may further comprise receiving a phone number record from the commerce front-end application; matching the phone number record to the user account; and sending the page-scoped identifier to the commerce front-end application in response to matching the phone number record received from the commerce front-end application to the user account.

[0225] A computer-implemented method may further comprise receiving a user-to-commerce invocation from a client device associated with the user account, the user-to-commerce invocation in association with a visual code capture by the client device, the visual code capture identifying the commerce entity; and sending the page-scoped identifier to the commerce front-end application in response to receiving the user-to-commerce invocation from a client device.

[0226] A computer-implemented method may further comprise receiving a user account access associated with the user account to the commerce representation for the commerce entity within the messaging system; and sending the page-scoped identifier to the commerce front-end application in response to receiving the user account access.

[0227] A computer-implemented method may further comprise receiving a commerce-to-user message from a commerce messaging application, the commerce-to-user message addressed to the page-scoped identifier; identifying the user account based on the page-scoped identifier; and sending the commerce-to-user message to a client device associated with the user account.

[0228] A computer-implemented method may further comprise receiving a user-to-commerce message from a client device associated with the user account, the user-to-commerce message addressed to a user-to-commerce message thread associated with the commerce entity; and setting the user access consent setting for the page-scoped identifier for the user account to indicate user consent.

[0229] A computer-implemented method may further comprise the user-to-commerce message comprising a response to a commerce-to-user message sent to the client device by a commerce messaging application associated with the commerce entity.

[0230] An apparatus may comprise a processor circuit on a device; and a commerce intermediary server operative on the processor circuit to send a page-scoped identifier to a commerce front-end application, the commerce front-end application associated with a commerce entity, the page-scoped identifier identifying a user account with a messaging system in relation to a commerce representation for the commerce entity within the messaging system; receive a user information request from a commerce contact application at the commerce intermediary server, the commerce contact application associated with the commerce representation for the commerce entity within the messaging system,

the user information request for the page-scoped identifier; determine a user access consent setting for the page-scoped identifier for the user account; send a user information data package to the commerce contact application in response to the user information request when the user access consent setting for the page-scoped identifier indicates user consent; and reject the user information request when the user access consent setting for the page-scoped identifier indicates user non-consent. The apparatus may be operative to implement any of the computer-implemented methods described herein.

[0231] A computer-implemented method may comprise receiving a commerce message package at a commerce intermediary server from a commerce messaging application, the commerce messaging application associated with a commerce entity, the commerce message package addressed to a message thread with a messaging system; determining commerce access privileges for the commerce messaging application in association with the message thread; sending the commerce message package to a client device associated with the message thread when the commerce access privileges indicate access to the message thread; and rejecting the commerce message package when the commerce access privileges reject access to the message thread.

[0232] A computer-implemented method may further comprise the message thread associated with a user account for a user of the messaging system, the user identifier comprising a page-scoped identifier for the user account, the page-scoped identifier identifying the user account with the messaging system in relation to a commerce representation for the commerce entity within the messaging system.

[0233] A computer-implemented method may further comprise the commerce access privileges determined according to a limited-time access token received in association with the commerce message package.

[0234] A computer-implemented method may further comprise the commerce access privilege determined according to a sponsored messaging request associated with the commerce message package.

[0235] A computer-implemented method may further comprise the commerce access privilege determined according to a message throttling policy.

[0236] A computer-implemented method may further comprise selecting the commerce access privilege for automatic sampling based on an automatic sampling policy.

[0237] A computer-implemented method may further comprise performing a keyword-based spam analysis of the commerce message package.

[0238] A computer-implemented method may further comprise receiving a user block command in association with the message thread; and registering a negative reputation adjustment in association with the commerce entity.

[0239] A computer-implemented method may further comprise the commerce message package specified according to a custom message template associated with the commerce entity.

[0240] A computer-implemented method may further comprise receiving an application registration package in association with the commerce messaging application; and registering the commerce messaging application for access to the commerce intermediary server in response to the application registration package.

[0241] A computer-implemented method may further comprise the application registration package defining one

or more of a custom message template, a custom form template, and a custom call-to-action button.

[0242] A computer-implemented method may further comprise sending one or more of the custom message template, the custom form template, and the custom call-to-action button to the client device in response to the client device accessing the commerce entity within the messaging system.

[0243] A computer-implemented method may further comprise the application registration package defining a custom call-to-action button, the custom call-to-action button comprising visual representation information and activation response information, the activation response information comprising one or more of a uniform resource locator, an application link, and a messaging invocation.

[0244] A computer-implemented method may further comprise the application registration package defining one or more of a custom welcome text message for the message thread, a custom get-started call-to-action button for the message thread, one or more custom pestilent call-to-action buttons for the message thread, and one or more custom dynamic triggers to start an interaction.

[0245] An apparatus may comprise a processor circuit on a device; and a commerce intermediary server operative on the processor circuit to receive a commerce message package from a commerce messaging application, the commerce messaging application associated with a commerce entity, the commerce message package addressed to a message thread with a messaging system; determine commerce access privileges for the commerce messaging application in association with the message thread; send the commerce message package to a client device associated with the message thread when the commerce access privileges indicate access to the message thread; and reject the commerce message package when the commerce access privileges reject access to the message thread. The apparatus may be operative to implement any of the computer-implemented methods described herein.

[0246] A computer-implemented method may comprise receiving a user interface selection of a user-to-commerce message thread on a client device, the user-to-commerce message thread associated with a commerce entity with a messaging system; displaying a user-to-commerce message thread interface for the user-to-commerce message thread; receiving a user-to-commerce message via the user-to-commerce message thread interface for the user-to-commerce message thread; and sending the user-to-commerce message to the commerce entity via the messaging system.

[0247] A computer-implemented method may further comprise receiving a commerce-to-user message from the commerce entity via the messaging system; and displaying the commerce-to-user message in association with the user-to-commerce message thread on the client device.

[0248] A computer-implemented method may further comprise the commerce-to-user message defined according to a custom message template associated with the commerce entity.

[0249] A computer-implemented method may further comprise the commerce-to-user message received from a commerce messaging application registered with the messaging system, the commerce messaging application associated with the commerce entity, the custom message template registered for the commerce messaging application with the messaging system.

[0250] A computer-implemented method may further comprise the user-to-commerce message thread interface comprising a custom call-to-action button for the commerce entity, further comprising: receiving a user call-to-action button activation of the custom call-to-action button; and generating the user-to-commerce message in response to receiving the user call-to-action button activation of the custom call-to-action button.

[0251] A computer-implemented method may further comprise the user-to-commerce message thread interface comprising one or more of a custom welcome text message for the message thread, a custom get-started call-to-action button for the message thread, one or more custom pestilent call-to-action buttons for the message thread, and one or more custom triggers to start an interaction.

[0252] A computer-implemented method may further comprise the user-to-commerce message thread associated with a user account, further comprising: displaying a user-to-commerce discovery interface on the client device, the user-to-commerce discovery interface comprising a plurality of suggested user-to-commerce options, the plurality of suggested user-to-commerce options selected according to one or more of profile information for the user account and promotional consideration information for one or more commerce entities.

[0253] A computer-implemented method may further comprise sending user credentials to the commerce entity in association with the user-to-commerce message.

[0254] A computer-implemented method may further comprise the commerce entity associated with a local application on the client device, further comprising: retrieving the user credentials from the local application via deep-linking within the local application.

[0255] An apparatus may comprise a processor circuit on a device; and a commerce intermediary server operative on the processor circuit to receive a user interface selection of a user-to-commerce message thread on a client device, the user-to-commerce message thread associated with a commerce entity with a messaging system; display a user-to-commerce message thread interface for the user-to-commerce message thread; receive a user-to-commerce message via the user-to-commerce message thread interface for the user-to-commerce message thread; and send the user-to-commerce message to the commerce entity via the messaging system. The apparatus may be operative to implement any of the computer-implemented methods described herein.

[0256] A computer-implemented method may comprise receiving a commerce interface control selection in a user-to-user message thread interface on a client device, the user-to-user message thread associated with a user-to-user message thread for a plurality of users with a messaging system; displaying a commerce interface in association with the user-to-user message thread interface, the commerce interface comprising a plurality of commerce configuration options; receiving a commerce option share control selection in association with the commerce interface; and sharing the plurality of commerce configuration options with the user-to-user message thread.

[0257] A computer-implemented method may further comprise wherein sharing the plurality of commerce configuration options with the user-to-user message thread comprises posting the plurality of commerce configuration options to the user-to-user message thread as a user-to-user message.

[0258] A computer-implemented method may further comprise wherein sharing the plurality of commerce configuration options with the user-to-user message thread comprises submitting a commerce configuration option poll to the user-to-user message thread.

[0259] A computer-implemented method may further comprise receiving poll result information for the commerce configuration option poll; and displaying the poll result information for the commerce configuration option poll.

[0260] A computer-implemented method may further comprise the poll result information for the commerce configuration option poll displayed in association with the plurality of commerce configuration options in the commerce interface.

[0261] A computer-implemented method may further comprise the poll result information comprising a poll winner option corresponding to one of the plurality of commerce configuration options, further comprising: displaying a poll winner indicator in association with the poll winner option in the display of the plurality of commerce configuration options in the commerce interface.

[0262] A computer-implemented method may further comprise the commerce interface associated with a commerce entity, the plurality of commerce configuration options selected for the commerce interface according to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity.

[0263] A computer-implemented method may further comprise the commerce interface associated with a commerce entity, the plurality of commerce configuration options ranked in the commerce interface according to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity.

[0264] A computer-implemented method may further comprise the commerce interface associated with a commerce entity, the commerce interface control selection for a commerce interface control, further comprising: displaying the commerce interface control in response to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity.

[0265] A computer-implemented method may further comprise wherein displaying the commerce interface control is in response to one or more of a trigger detected in the user-to-user message thread and a discovery control selection.

[0266] A computer-implemented method may further comprise the commerce interface associated with a commerce entity, further comprising: receiving a commerce option selection via the commerce interface; and sending a commerce configuration command from the client device to the commerce entity via the messaging system.

[0267] A computer-implemented method may further comprise receiving a user-to-user message-thread message from the commerce entity via the messaging system; storing the user-to-user message-thread message in association with the user-to-user message thread; and displaying the user-to-user message-thread message in the user-to-user message thread interface.

[0268] A computer-implemented method may further comprise receiving a user-to-commerce message-thread message from the commerce entity via the messaging sys-

tem; and storing the user-to-commerce message-thread message in association with a user-to-commerce message thread.

[0269] A computer-implemented method may further comprise displaying the user-to-commerce message-thread message in a user-to-commerce message thread interface.

[0270] An apparatus may comprise a processor circuit on a device; and a commerce intermediary server operative on the processor circuit to receive a commerce interface control selection in a user-to-user message thread interface on a client device, the user-to-user message thread associated with a user-to-user message thread for a plurality of users with a messaging system; display a commerce interface in association with the user-to-user message thread interface, the commerce interface comprising a plurality of commerce configuration options; receive a commerce option share control selection in association with the commerce interface; and share the plurality of commerce configuration options with the user-to-user message thread. The apparatus may be operative to implement any of the computer-implemented methods described herein.

[0271] At least one computer-readable storage medium may comprise instructions that, when executed, cause a system to perform any of the computer-implemented methods described herein.

[0272] Some embodiments may be described using the expression “one embodiment” or “an embodiment” along with their derivatives. These terms mean that a particular feature, structure, or characteristic described in connection with the embodiment is included in at least one embodiment. The appearances of the phrase “in one embodiment” in various places in the specification are not necessarily all referring to the same embodiment. Further, some embodiments may be described using the expression “coupled” and “connected” along with their derivatives. These terms are not necessarily intended as synonyms for each other. For example, some embodiments may be described using the terms “connected” and/or “coupled” to indicate that two or more elements are in direct physical or electrical contact with each other. The term “coupled,” however, may also mean that two or more elements are not in direct contact with each other, but yet still co-operate or interact with each other.

[0273] With general reference to notations and nomenclature used herein, the detailed descriptions herein may be presented in terms of program procedures executed on a computer or network of computers. These procedural descriptions and representations are used by those skilled in the art to most effectively convey the substance of their work to others skilled in the art.

[0274] A procedure is here, and generally, conceived to be a self-consistent sequence of operations leading to a desired result. These operations are those requiring physical manipulations of physical quantities. Usually, though not necessarily, these quantities take the form of electrical, magnetic or optical signals capable of being stored, transferred, combined, compared, and otherwise manipulated. It proves convenient at times, principally for reasons of common usage, to refer to these signals as bits, values, elements, symbols, characters, terms, numbers, or the like. It should be noted, however, that all of these and similar terms are to be associated with the appropriate physical quantities and are merely convenient labels applied to those quantities.

[0275] Further, the manipulations performed are often referred to in terms, such as adding or comparing, which are commonly associated with mental operations performed by a human operator. No such capability of a human operator is necessary, or desirable in most cases, in any of the operations described herein which form part of one or more embodiments. Rather, the operations are machine operations. Useful machines for performing operations of various embodiments include general purpose digital computers or similar devices.

[0276] Various embodiments also relate to apparatus or systems for performing these operations. This apparatus may be specially constructed for the required purpose or it may comprise a general purpose computer as selectively activated or reconfigured by a computer program stored in the computer. The procedures presented herein are not inherently related to a particular computer or other apparatus. Various general purpose machines may be used with programs written in accordance with the teachings herein, or it may prove convenient to construct more specialized apparatus to perform the required method steps. The required structure for a variety of these machines will appear from the description given.

[0277] It is emphasized that the Abstract of the Disclosure is provided to allow a reader to quickly ascertain the nature of the technical disclosure. It is submitted with the understanding that it will not be used to interpret or limit the scope or meaning of the claims. In addition, in the foregoing Detailed Description, it can be seen that various features are grouped together in a single embodiment for the purpose of streamlining the disclosure. This method of disclosure is not to be interpreted as reflecting an intention that the claimed embodiments require more features than are expressly recited in each claim. Rather, as the following claims reflect, inventive subject matter lies in less than all features of a single disclosed embodiment. Thus the following claims are hereby incorporated into the Detailed Description, with each claim standing on its own as a separate embodiment. In the appended claims, the terms “including” and “in which” are used as the plain-English equivalents of the respective terms “comprising” and “wherein,” respectively. Moreover, the terms “first,” “second,” “third,” and so forth, are used merely as labels, and are not intended to impose numerical requirements on their objects.

[0278] What has been described above includes examples of the disclosed architecture. It is, of course, not possible to describe every conceivable combination of components and/or methodologies, but one of ordinary skill in the art may recognize that many further combinations and permutations are possible. Accordingly, the novel architecture is intended to embrace all such alterations, modifications and variations that fall within the spirit and scope of the appended claims.

What is claimed is:

1. A computer-implemented method, comprising:

receiving a commerce interface control selection in a user-to-user message thread interface on a client device, the user-to-user message thread associated with a user-to-user message thread for a plurality of users with a messaging system;

displaying a commerce interface in association with the user-to-user message thread interface, the commerce interface comprising a plurality of commerce configuration options;

receiving a commerce option share control selection in association with the commerce interface; and
sharing the plurality of commerce configuration options with the user-to-user message thread.

2. The method of claim 1, wherein sharing the plurality of commerce configuration options with the user-to-user message thread comprises submitting a commerce configuration option poll to the user-to-user message thread.

3. The method of claim 2, further comprising:

receiving poll result information for the commerce configuration option poll;

displaying the poll result information for the commerce configuration option poll, the poll result information for the commerce configuration option poll displayed in association with the plurality of commerce configuration options in the commerce interface, the poll result information comprising a poll winner option corresponding to one of the plurality of commerce configuration options; and

displaying a poll winner indicator in association with the poll winner option in the display of the plurality of commerce configuration options in the commerce interface.

4. The method of claim 1, the commerce interface associated with a commerce entity, the plurality of commerce configuration options selected for the commerce interface according to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity, the plurality of commerce configuration options ranked in the commerce interface according to one or more of the message-thread context for the user-to-user message thread and the promotional consideration transaction with the commerce entity.

5. The method of claim 1, the commerce interface associated with a commerce entity, further comprising:

receiving a commerce option selection via the commerce interface; and

sending a commerce configuration command from the client device to the commerce entity via the messaging system.

6. The method of claim 5, further comprising:

receiving a user-to-user message-thread message from the commerce entity via the messaging system;

storing the user-to-user message-thread message in association with the user-to-user message thread; and

displaying the user-to-user message-thread message in the user-to-user message thread interface.

7. The method of claim 5, further comprising:

receiving a user-to-commerce message-thread message from the commerce entity via the messaging system; and

storing the user-to-commerce message-thread message in association with a user-to-commerce message thread.

8. The method of claim 5, further comprising:

displaying the user-to-commerce message-thread message in a user-to-commerce message thread interface.

9. An apparatus, comprising:

a processor circuit on a device; and

a commerce intermediary server operative on the processor circuit to receive a commerce interface control selection in a user-to-user message thread interface on a client device, the user-to-user message thread associated with a user-to-user message thread for a plurality of users with a messaging system; display a commerce

interface in association with the user-to-user message thread interface, the commerce interface comprising a plurality of commerce configuration options; receive a commerce option share control selection in association with the commerce interface; and share the plurality of commerce configuration options with the user-to-user message thread.

10. The apparatus of claim **9**, wherein sharing the plurality of commerce configuration options with the user-to-user message thread comprises submitting a commerce configuration option poll to the user-to-user message thread.

11. The apparatus of claim **10**, further comprising:

the commerce intermediary server operative to receive poll result information for the commerce configuration option poll; display the poll result information for the commerce configuration option poll, the poll result information for the commerce configuration option poll displayed in association with the plurality of commerce configuration options in the commerce interface, the poll result information comprising a poll winner option corresponding to one of the plurality of commerce configuration options; and display a poll winner indicator in association with the poll winner option in the display of the plurality of commerce configuration options in the commerce interface.

12. The apparatus of claim **9**, the commerce interface associated with a commerce entity, the plurality of commerce configuration options selected for the commerce interface according to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity, the plurality of commerce configuration options ranked in the commerce interface according to one or more of the message-thread context for the user-to-user message thread and the promotional consideration transaction with the commerce entity.

13. The apparatus of claim **9**, the commerce interface associated with a commerce entity, further comprising:

the commerce intermediary server operative to receive a commerce option selection via the commerce interface; and send a commerce configuration command from the client device to the commerce entity via the messaging system.

14. The apparatus of claim **13**, further comprising:

the commerce intermediary server operative to receive a user-to-user message-thread message from the commerce entity via the messaging system; store the user-to-user message-thread message in association with the user-to-user message thread; and display the user-to-user message-thread message in the user-to-user message thread interface.

15. At least one computer-readable storage medium comprising instructions that, when executed, cause a system to: receive a commerce interface control selection in a user-to-user message thread interface on a client device, the user-to-user message thread associated with a user-to-user message thread for a plurality of users with a messaging system;

display a commerce interface in association with the user-to-user message thread interface, the commerce interface comprising a plurality of commerce configuration options;

receive a commerce option share control selection in association with the commerce interface; and share the plurality of commerce configuration options with the user-to-user message thread.

16. The computer-readable storage medium of claim **15**, wherein sharing the plurality of commerce configuration options with the user-to-user message thread comprises submitting a commerce configuration option poll to the user-to-user message thread.

17. The computer-readable storage medium of claim **16**, comprising further instructions that, when executed, cause a system to:

receive poll result information for the commerce configuration option poll;

display the poll result information for the commerce configuration option poll, the poll result information for the commerce configuration option poll displayed in association with the plurality of commerce configuration options in the commerce interface, the poll result information comprising a poll winner option corresponding to one of the plurality of commerce configuration options; and

display a poll winner indicator in association with the poll winner option in the display of the plurality of commerce configuration options in the commerce interface.

18. The computer-readable storage medium of claim **15**, the commerce interface associated with a commerce entity, the plurality of commerce configuration options selected for the commerce interface according to one or more of message-thread context for the user-to-user message thread and a promotional consideration transaction with the commerce entity, the plurality of commerce configuration options ranked in the commerce interface according to one or more of the message-thread context for the user-to-user message thread and the promotional consideration transaction with the commerce entity.

19. The computer-readable storage medium of claim **15**, the commerce interface associated with a commerce entity, comprising further instructions that, when executed, cause a system to:

receive a commerce option selection via the commerce interface; and

send a commerce configuration command from the client device to the commerce entity via the messaging system.

20. The computer-readable storage medium of claim **19**, comprising further instructions that, when executed, cause a system to:

receive a user-to-user message-thread message from the commerce entity via the messaging system;

store the user-to-user message-thread message in association with the user-to-user message thread; and

display the user-to-user message-thread message in the user-to-user message thread interface.
